Onboarding Certificates for AWS Resources in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for AWS Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to AWS Resources with IAM Integration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for AWS Resources with IAM Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **AWS**.
Service Types	From the dropdown list, **IAM**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

   a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

   b. Click **Add**.
      The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Name	Enter the file name of the post push script.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

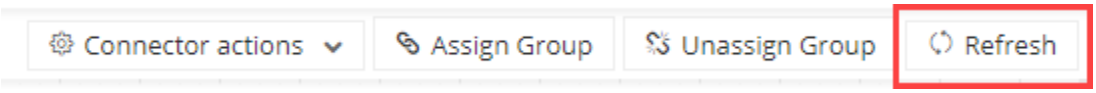
a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting for AWS IAM

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for ACM & IAM service like server addition using AppViewX, fetch, certificate discovery & certificate push.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Browser	Version	Notes
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Issues in Server Addition using AppViewX GUI

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	Provided credential is invalid.	1. Provide valid Access Key. 2. Provide valid Secret Key.
Provide valid account name	Account name can be duplicate or not as per standard.	1. Provide unique name for account name. 2. Account name can be alphanumeric and can also have period (.) in it.
Details Incorrect	Provide mandatory fields.	Enter mandatory fields like 1. Account Number 2. Access Key 3. Secret Key 4. Data Center

Error Message	Possible Cause	Possible Solution
		5. Services 6. Regions

Issues in Fetch Regions

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	The provided credential is invalid.	1. Provide valid Access Key. 2. Provide a valid Secret key.

Issues in Discovery in IAM

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or the length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device from which to discover certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Push and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, such as in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	Userdoes not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	Provided certificate is not a valid certificate.	Push a valid certificate.
Push failed as there exists another certificate with commonName	Certificate with same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.

With ELB Integration

This document will guide you through the process of integrating the ELB AWS service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Elastic Load Balancer (ELB)

Elastic Load Balancer, ELB, is a service that automatically distributes incoming application traffic across multiple targets, such as Amazon EC2 instances, containers, and IP addresses, in one or more Availability Zones. ELB helps ensure the availability, scalability, and fault tolerance of your applications.

AWS provides three types of load balancers:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Application Load Balancer** (**ALB**): Best suited for HTTP and HTTPS traffic, providing advanced request routing features targeted at the delivery of modern application architectures, including microservices and containers.
- **Network Load Balancer** (**NLB**): Designed to handle millions of requests per second while maintaining ultra-low latencies, best suited for TCP, UDP, and TLS traffic where extreme performance is required.
- **Classic Load Balancer** (**CLB**): Provides support for basic load balancing of HTTP/HTTPS and TCP/SSL traffic

Onboarding AWS Resources with ELB Integration in AppViewX

Onboarding AWS Standalone Accounts in AppViewX

A standalone AWS account operates independently with its own set of resources and is not connected to any other AWS accounts.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important:

- AWS standalone device migration is supported only from the following versions of CERT + SaaS: v2020.1, v2020.2, v2020.3 - v2020.3 FP7. The following prerequisites are also applicable to only these versions.
- AWS device migration is not supported from the following versions of CERT+ SaaS: v2012.x, v2019.x, and v2021.x. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- For customers migrating from versions 20.1.x, 20.2.x, and 20.3.6, AppViewX recommends that you delete the following before migration:
  - All of their Amazon CA settings
  - Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).
- For customers migrating from version v2020.3.10 (mandatory):
  - Delete all of their Amazon CA settings before migration.
  - Trigger config fetch for all of their cloud accounts after migration.

The following actions have to be performed for the standalone AWS cloud accounts migrated from the above listed versions to version v2022.1 FP1:

For standalone accounts where one of the associated services is not EC2

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.

   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.

   The **Device :: Cloud** page is displayed.
3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

   Troubleshooting: If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.
4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).

   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

Note: For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

- Before migration
  1. Merge permissions from all individual buckets into any one S3 bucket.
- After migration
  1. Select a migrated standalone account from the **Device :: Cloud** page.

     The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.
  2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
  3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
  4. Click **Add**.
  5. Click **Save**.

     Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

Onboarding AWS Standalone Accounts with ELB Integration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Account Type*	From the dropdown list, select **Standalone**.
Account name*	Enter the customer's unique AWS account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Account number*	Enter the customer's AWS account number.
Account Description	Enter a description of the device to be added.
Proxy required	To use a proxy server for communication, select this checkbox.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: Manually enter the access and secret key for the customer's AWS account).
Access Key ID*	Enter the access key for the customer's AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when **Credential** type is set to **Manual Entry**.
Secret Access Key*	Enter the secret key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Credential name*	If the customer's AWS credentials are stored in CyberArk, from the dropdown list, select the CyberArk credential name. **Note:** This field is displayed only when **Credential** type is set to **Credential List - CyberArk**.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	From the dropdown list, select **ELB**.
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Service region*	Service regions are regions that are supported by the selected service. From the dropdown list, select the service regions that should be scanned for certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: To be able to fetch and select from the available regions, ensure that the credentials have been provided in the **Credentials** section.
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

Onboarding AWS Cross Accounts in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

This section of the documentation will guide you through the process of onboarding an AWS cross account, for both discovery types, in AppViewX. In AWS, cross-account discovery can be set up in two ways:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.
    3. Attach policies to the created user.

       For the AWS IAM permissions to be added for the master account, click here.
  - In your AWS child account:
    1. Create a role in the child account in AWS.
    2. Attach policies to the created role.

       For the AWS IAM permissions to be added for the child account, click here.
    3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
    4. Attach policies to the EC2 role.

       For the AWS IAM permissions for the EC2 policy, click here.

       For the AWS IAM permissions for the EC2 role, click here.

> **Note:** For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX for Organization-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the ELB service component(s) required for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section. To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

Note: This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.
Auto Discovery Mode*	To onboard a cross account for IAM policy-based discovery: a. Select **Policy Based Discovery**. The **Policy based Discovery** dialog box is displayed. b. Enter/Select the details required to configure IAM policy-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Organization Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the ELB service component(s) required for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.

   The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
• In-Progress: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is In-Progress till the resource discovery status for all individual entities is Completed.

Note: This is possible only when the account is in the Managed state.

• Completed: Resource discovery by AppViewX in the customer's AWS environment is complete.

Note: This is possible only when the account is in the Managed state.

Note:
• Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting.
• The resource discovery status of all entities mapped to the account should be Completed.

• Not Applicable: The resource discovery status is set to Not Applicable:
• when Status = Failed or Resolved,
• for ACM and ELB resources,
• for all existing devices and child accounts as part of data migration.
</td></tr>
<tr><td>Cert Discovery Status</td><td>
Note: Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to Not Applicable.

This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values:

• Not started: Certificate discovery for the entity is yet to begin

Note: At this point, the resource discovery status of the associated account can be Not started, In-Progress, or Completed.
</td></tr>
</table>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {

Onboarding Certificates for AWS Resources in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Discovering Certificates for AWS Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled cloud certificate discovery scan**.

   Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Note: Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.

5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to AWS Resources with ELB Integration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for AWS Resources with ELB Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **AWS**.
Service Types	From the dropdown list, **ELB**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	Certificates can be stored in either AWS Certificate Manager (**ACM**) or AWS Identity and Access Management (**IAM**).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the options given, select the required certificate location.
Certificate ARN	**Note:** This field is displayed when **Certificate Location** = **ACM**. The ARN (Amazon Resource Name) is a unique identifier assigned to each certificate that is managed by ACM. It is used to reference the certificate in API calls, policies, and so on. In this field, enter the ARN of the certificate to be pushed.
***Certificate File Name**	**Note:** This field is displayed when **Certificate Location** = **IAM**. In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.
Default Certificate	In the event that a certificate cannot be pushed, a default certificate is pushed as a fall back option. To enable this, select the **Default Certificate** checkbox.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

b. Click **Add**.

The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.
Post - Push Script File Name	Enter the file name of the post push script.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.

The connector is displayed on the certificate holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

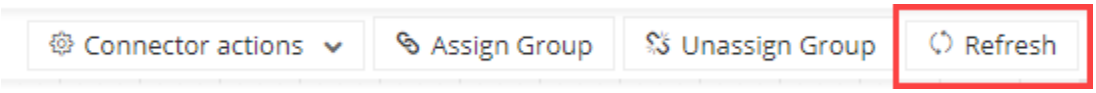
   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting AWS ELB

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for ELB service. This guide will give more troubleshooting processes on certificate discovery & certificate push.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Issues in Discovery in ELB

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in Push-Bind and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in an enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
1 validation error detected: Value at 'privateKey' failed to satisfy constraint.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because the push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to the device when certificate is unavailable, i.e, in a new state.	Push to the device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	The provided certificate is not a valid certificate.	Push a valid certificate.
Push failed as there exists another certificate with commonName	Certificate with the same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.
Cert Association failed with profile	Modify access may not be available on the selected resource	Provide Modify access for the resource and retry
Association failed with profile-<PROFILE_NAME>as no such profile available	Profile may not be available on the cloud account	Perform config fetch on the device from ADC module and retry association of cert.

With CloudFront Integration

This document will guide you through the process of integrating the CloudFront AWS service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

CloudFront

CloudFront is a Content Delivery Network (CDN) service. It speeds up the delivery of your web content by caching copies of your content at edge locations around the world.

Onboarding AWS Resources with CloudFront Integration in AppViewX

Onboarding AWS Standalone Accounts in AppViewX

A standalone AWS account operates independently with its own set of resources and is not connected to any other AWS accounts.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important:

- AWS standalone device migration is supported only from the following versions of CERT + SaaS: v2020.1, v2020.2, v2020.3 - v2020.3 FP7. The following prerequisites are also applicable to only these versions.
- AWS device migration is not supported from the following versions of CERT+ SaaS: v2012.x, v2019.x, and v2021.x. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- For customers migrating from versions 20.1.x, 20.2.x, and 20.3.6, AppViewX recommends that you delete the following before migration:
  - All of their Amazon CA settings
  - Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).
- For customers migrating from version v2020.3.10 (mandatory):
  - Delete all of their Amazon CA settings before migration.
  - Trigger config fetch for all of their cloud accounts after migration.

The following actions have to be performed for the standalone AWS cloud accounts migrated from the above listed versions to version v2022.1 FP1:

For standalone accounts where one of the associated services is not EC2

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.

   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.

   The **Device :: Cloud** page is displayed.
3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

   Troubleshooting: If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.
4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).

   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

Note: For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

- Before migration
  1. Merge permissions from all individual buckets into any one S3 bucket.
- After migration
  1. Select a migrated standalone account from the **Device :: Cloud** page.

     The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.
  2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
  3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
  4. Click **Add**.
  5. Click **Save**.

     Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

Onboarding AWS Standalone Accounts with CloudFront Integration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Account Type*	From the dropdown list, select **Standalone**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account name*	Enter the customer's unique AWS account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Account number*	Enter the customer's AWS account number.
Account Description	Enter a description of the device to be added.
Proxy required	To use a proxy server for communication, select this checkbox.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: Manually enter the access and secret key for the customer's AWS account).
Access Key ID*	Enter the access key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Secret Access Key*	Enter the secret key for the customer's AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when **Credential** type is set to **Manual Entry**.
Credential name*	If the customer's AWS credentials are stored in CyberArk, from the dropdown list, select the CyberArk credential name. **Note:** This field is displayed only when **Credential** type is set to **Credential List - CyberArk**.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	From the dropdown list, select **CloudFront**.
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Custom SSL Client Support	For configuring custom SSL client support for CloudFront, from the dropdown list, you need to specify how CloudFront will handle the SSL/TLS connections from different types of clients.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select one from the following options: • **Clients that Support Server Name Indication** Server Name Indication (SNI) is an extension of the SSL/TLS protocol that allows a client to specify the hostname it is trying to connect to at the start of the handshake process. This allows a server to present multiple SSL/TLS certificates on the same IP address and TCP port number, enabling the use of different certificates for different domains. • **Legacy Clients Support'** **Legacy clients** refer to older browsers and devices that do not support SNI. These clients cannot specify the hostname during the SSL/TLS handshake, meaning they may not be able to establish a secure connection if the server relies on SNI to serve the correct certificate.
Security Policy	The security policy determines which cryptographic algorithms and protocols are available for secure communication, ensuring data integrity, confidentiality, and protection against various security threats. From the dropdown list, select the protocol CloudFront will use to establish secure SSL/TLS connections with viewers.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

Onboarding AWS Cross Accounts in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

This section of the documentation will guide you through the process of onboarding an AWS cross account, for both discovery types, in AppViewX. In AWS, cross-account discovery can be set up in two ways:

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.
    3. Attach policies to the created user.

       For the AWS IAM permissions to be added for the master account, click here.
  - In your AWS child account:
    1. Create a role in the child account in AWS.
    2. Attach policies to the created role.

       For the AWS IAM permissions to be added for the child account, click here.
    3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
    4. Attach policies to the EC2 role.

       For the AWS IAM permissions for the EC2 policy, click here.

       For the AWS IAM permissions for the EC2 role, click here.

> **Note:** For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX for Organization-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the CloudFront service component required for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section. To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

Note: This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.
Auto Discovery Mode*	To onboard a cross account for IAM policy-based discovery: a. Select **Policy Based Discovery**. The **Policy based Discovery** dialog box is displayed. b. Enter/Select the details required to configure IAM policy-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Organization Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the CloudFront service component required for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.

   The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **In-Progress**: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**. **Note:** This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved,** • for ACM and ELB resources, • for all existing devices and child accounts as part of data migration.
Cert Discovery Status	**Note:** Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to **Not Applicable**. This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Certificate discovery for the entity is yet to begin **Note:** At this point, the resource discovery status of the associated account can be **Not started**, **In-Progress**, or **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",

```
            "organizations:List*"
        ],
        "Resource": "*"
    }
  ]
}
```

Permissions for Enabling Assume Role Access to all AWS Accounts

Note: This action helps to automatically discover CLM resources in the newly created cloud accounts without manual intervention. This is an optional action, required only if the user prefers to grant access to all the child accounts for the IAM user.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": "sts:AssumeRole",
   "Resource": [
    "arn:aws:iam::<child account 1>:role/<Assume-role>",
    "arn:aws:iam::<child account 2>:role/< Assume-role>",
    "arn:aws:iam::<child account 3>:role/< Assume-role>"
   ]
  }
 ]
}
```

Permissions for Enabling Assume Role Access for a Specific Child Account

Note: If a user prefers not to grant assume role access to all accounts, they can define the RoleARN of a specific child account in the IAM policy, as is shown in the policy below.

Note: This is mandatory when IAM Policy-based account discovery is enabled in AppViewX for child account discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```

Onboarding Certificates for AWS Resources in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for AWS Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	• **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to AWS Resources with CloudFront Integration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for AWS Resources with CloudFront Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **AWS**.
Service Types	From the dropdown list, **CloudFront**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	Certificates can be stored in either AWS Certificate Manager (**ACM**) or AWS Identity and Access Management (**IAM**).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the options given, select the required certificate location.
Certificate ARN	**Note:** This field is displayed when **Certificate Location** = **ACM**. The ARN (Amazon Resource Name) is a unique identifier assigned to each certificate that is managed by ACM. It is used to reference the certificate in API calls, policies, and so on. In this field, enter the ARN of the certificate to be pushed.
***Certificate File Name**	**Note:** This field is displayed when **Certificate Location** = **IAM**. In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

   a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

   b. Click **Add**.
      The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter/Select the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.
Post - Push Script File Name	Enter the file name of the post push script.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

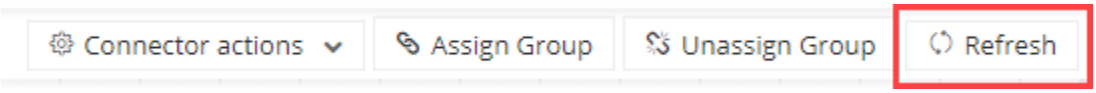
   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting AWS CloudFront

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for CloudFront service. This guide will give more troubleshooting processes on certificate discovery & certificate push.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Issues in Discovery in CloudFront

Issues in Push-Bind and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
	progress and not completed. 3. AppConnector might not be in sync.	
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private Key is required to push certificate to ACM inventory	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	Provided certificate is not a valid certificate.	Push a valid certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Push failed as there exists another certificate with commonName	Certificate with the same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.
Cert Association failed with profile	Modify access may not be available on the selected resource	Provide “Modify” access for the resource and retry.
Association failed with profile-<PROFILE_NAME>as no such profile available	Profile may not be available on the cloud account	Perform config fetch on the device from ADC module and retry association of cert.
Certificate cannot be pushed as selected Amazon CA certificate is in <SOURCE_REGION> region and region you tried is <DESTINATION_REGION>	Selected certificate is in ACM in a different region than the region to be pushed	Use certificates available in the <DESTINATION_REGION> (or) Push a new certificate to the <DESTINATION_REGION>

With EC2 Integration

This document will guide you through the process of integrating the EC2 AWS service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Amazon Elastic Compute Cloud (EC2)

Amazon Elastic Compute Cloud (EC2) is a web service provided by Amazon Web Services (AWS) that offers resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers by providing a secure, resizable, and flexible environment for running applications.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding AWS Resources with EC2 Integration in AppViewX

Onboarding AWS Standalone Accounts in AppViewX

A standalone AWS account operates independently with its own set of resources and is not connected to any other AWS accounts.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important:

- AWS standalone device migration is supported only from the following versions of CERT + SaaS: v2020.1, v2020.2, v2020.3 - v2020.3 FP7. The following prerequisites are also applicable to only these versions.
- AWS device migration is not supported from the following versions of CERT+ SaaS: v2012.x, v2019.x, and v2021.x. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Note:

- For customers migrating from versions 20.1.x, 20.2.x, and 20.3.6, AppViewX recommends that you delete the following before migration:
  - All of their Amazon CA settings
  - Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).
- For customers migrating from version v2020.3.10 (mandatory):
  - Delete all of their Amazon CA settings before migration.
  - Trigger config fetch for all of their cloud accounts after migration.

The following actions have to be performed for the standalone AWS cloud accounts migrated from the above listed versions to version v2022.1 FP1:

For standalone accounts where one of the associated services is not EC2

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.

   The **Device :: ADC** page is displayed.

2. From the **Device :: ADC** page, select **Cloud**.

   The **Device :: Cloud** page is displayed.

3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

   Troubleshooting: If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.

4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).

   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

Note: For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

- Before migration
  1. Merge permissions from all individual buckets into any one S3 bucket.
- After migration
  1. Select a migrated standalone account from the **Device :: Cloud** page.

     The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
4. Click **Add**.
5. Click **Save**.

   Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

Onboarding AWS Standalone Accounts with EC2 Integration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Account Type*	From the dropdown list, select **Standalone**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account name*	Enter the customer's unique AWS account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Account number*	Enter the customer's AWS account number.
Account Description	Enter a description of the device to be added.
Proxy required	To use a proxy server for communication, select this checkbox.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: Manually enter the access and secret key for the customer's AWS account).
Access Key ID*	Enter the access key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Secret Access Key*	Enter the secret key for the customer's AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when **Credential** type is set to **Manual Entry**.
Credential name*	If the customer's AWS credentials are stored in CyberArk, from the dropdown list, select the CyberArk credential name. **Note:** This field is displayed only when **Credential** type is set to **Credential List - CyberArk**.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	From the dropdown list, select **EC2**.
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

Onboarding AWS Cross Accounts in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

This section of the documentation will guide you through the process of onboarding an AWS cross account, for both discovery types, in AppViewX. In AWS, cross-account discovery can be set up in two ways:

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.
    3. Attach policies to the created user.

       For the AWS IAM permissions to be added for the master account, click here.
  - In your AWS child account:
    1. Create a role in the child account in AWS.
    2. Attach policies to the created role.

       For the AWS IAM permissions to be added for the child account, click here.
    3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
    4. Attach policies to the EC2 role.

       For the AWS IAM permissions for the EC2 policy, click here.

       For the AWS IAM permissions for the EC2 role, click here.
  - If account specific S3 buckets have been deployed for EC2 integration, ensure that the bucket names are suffixed with the corresponding account number.

    For instruction on creating an S3 bucket in your AWS account, see References.

> **Note:** For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX for Organization-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the EC2 service component(s) required for the CLM operations. For the EC2 service, a set of additional fields is displayed, the instructions for which are covered in the subsequent steps.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **EC2 Services** section.

Field description for the EC2 Services section

Field	Description
Communication mode	By default, the **SSM** communication mode is selected.
Certificate Discovery Mode	By default, the **File System Scanning** certificate discovery mode is selected.
***S3 Deployment Type**	From the dropdown list, from the following options, select the deployment type used for the S3 bucket that will be used for the EC2 integration: • **Centralized**: Select this if the S3 bucket that will be used for the EC2 integration is managed centrally across all accounts. • **Account Specific**: Select this if each account manages individual S3 buckets.
***S3 Bucket Name**	Enter the name of the S3 bucket that will be used for EC2 integration. For account specific S3 buckets, enter the bucket name **without** the account number suffix. AppViewX will automatically append the account number based on the value entered here. To configure the ARN advanced settings for the specified S3 bucket, follow the instructions given below: a. Click . The **ARN Advanced Settings** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>b. In the ARN Advanced Settings dialog box, enter the following details:

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Role ARN*</td><td>Amazon Resource Name of the role that the caller is assuming.</td></tr>
<tr><td>Role Session name*</td><td>Role Session name is an identifier for the assumed role session.

Use the Role Session name to uniquely identify a session when the same rule is assumed by different principals or for different reasons.</td></tr>
<tr><td>Duration Seconds</td><td>Enter the duration, in seconds, for which the credentials should remain valid.

Acceptable durations for IAM user sessions:
• Minimum: 900 seconds (15 minutes)
• Maximum: 129,600 seconds (36 hours)
• Default: 3600 seconds (1 hour)</td></tr>
<tr><td>External Id</td><td>External Id is a unique identifier that might be required when you assume a role in another account.</td></tr>
<tr><td>Source Identity</td><td>The source identity is specified by the principal that is calling the AssumeRole operation.</td></tr>
<tr><td>Session Tags</td><td>Session Tags are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>To create a session tag:
i. In the Enter Key field, enter a key for the key-value pair.
ii. In the Enter Value field, enter a value for the key-value pair.
iii. Click Add.

The added key-value pair is shown in the table below the fields.</td></tr>
</table>
</td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

9. To add the new device to the cloud device inventory, click **Add**.
10. Click **Save**.

    The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.
   The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

> **Note:**
> - If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
> - Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account.

Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **EC2 Services** section.

Field description for the EC2 Services section

Field	Description
Communication mode	By default, the **SSM** communication mode is selected.
Certificate Discovery Mode	By default, the **File System Scanning** certificate discovery mode is selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***S3 Deployment Type**	From the dropdown list, from the following options, select the deployment type used for the S3 bucket that will be used for the EC2 integration: • **Centralized**: Select this if the S3 bucket that will be used for the EC2 integration is managed centrally across all accounts. • **Account Specific**: Select this if each account manages individual S3 buckets.
***S3 Bucket Name**	Enter the name of the S3 bucket that will be used for EC2 integration. For account specific S3 buckets, enter the bucket name **without** the account number suffix. AppViewX will automatically append the account number based on the value entered here. To configure the ARN advanced settings for the specified S3 bucket, follow the instructions given below: a. Click . The **ARN Advanced Settings** dialog box is displayed. b. In the **ARN Advanced Settings** dialog box, enter the following details: **Field** / **Description** **Role ARN*** — Amazon Resource Name of the role that the caller is assuming. **Role Session name*** — **Role Session name** is an identifier for the assumed role session. Use the **Role Session name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons. **Duration Seconds** — Enter the duration, in seconds, for which the credentials should remain valid.

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device
Status	Status of the discovered accounts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**. **Note:** This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the account is in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved,** • for ACM and ELB resources, • for all existing devices and child accounts as part of data migration.
Cert Discovery Status	**Note:** Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to **Not Applicable**. This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Certificate discovery for the entity is yet to begin **Note:** At this point, the resource discovery status of the associated account can be **Not started**, **In-Progress**, or **Completed**. • **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "iam:GetPolicyVersion",
    "iam:GetPolicy",
    "iam:GetUserPolicy",
```

        "organizations:Describe*",
        "organizations:List*"
      ],
      "Resource": "*"
    }
  ]
}
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Permissions for Enabling Assume Role Access to all AWS Accounts

Note: This action helps to automatically discover CLM resources in the newly created cloud accounts without manual intervention. This is an optional action, required only if the user prefers to grant access to all the child accounts for the IAM user.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": "sts:AssumeRole",
   "Resource": [
    "arn:aws:iam::<child account 1>:role/<Assume-role>",
    "arn:aws:iam::<child account 2>:role/< Assume-role>",
    "arn:aws:iam::<child account 3>:role/< Assume-role>"
   ]
  }
 ]
}
```

Permissions for Enabling Assume Role Access for a Specific Child Account

Note: If a user prefers not to grant assume role access to all accounts, they can define the RoleARN of a specific child account in the IAM policy, as is shown in the policy below.

Note: This is mandatory when IAM Policy-based account discovery is enabled in AppViewX for child account discovery.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
```

```
    "Action": [
      "sts:AssumeRole"
    ],
    "Resource": "arn:aws:iam::<child-account>:role/AppViewX"
  }
 ]
}
```

Permissions for Enabling S3 Bucket Access to the AppViewX Platform

Note: The permissions mentioned below are required only if the EC2 service has been added in AppViewX. IAM role should be created in the account with S3 permissions where the S3 bucket resides.

Note: This permission is required when assume role access is granted only to a specific RoleARN.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "sts:AssumeRole"
      ],
      "Resource": "arn:aws:iam::<child-account>:role/AppViewX-S3-Bucket-Access"
    }
  ]
}
```

Permissions for Accessing Organization Services to Discover AWS Accounts

Note: This permission is required when assume role access is granted only to a specific RoleARN.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: This permission enables AppViewX to discover the AWS accounts associated to a specific organization.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "sts:AssumeRole"
   ],
   "Resource": "arn:aws:iam::<child-account>:role/AppViewX"
  }
 ]
}
```

AWS IAM Prerequisites for Child Account

Permissions for Establishing a Trust Relationship in Child Accounts

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Effect": "Allow",
   "Principal": {
    "AWS": "arn:aws:iam::master-account-number:root"
   },
   "Action": "sts:AssumeRole",
   "Condition": {}
  }

```

Onboarding Certificates for AWS Resources in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for AWS Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	• **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to AWS Resources with EC2 Integration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for AWS Resources with EC2 Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **AWS**.
Service Types	From the dropdown list, **EC2**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	Certificates can be stored in either AWS Certificate Manager (**ACM**) or AWS Identity and Access Management (**IAM**).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the options given, select the required certificate location.
Certificate ARN	**Note:** This field is displayed when **Certificate Location** = **ACM**. The ARN (Amazon Resource Name) is a unique identifier assigned to each certificate that is managed by ACM. It is used to reference the certificate in API calls, policies, and so on. In this field, enter the ARN of the certificate to be pushed.
***Certificate File Name**	**Note:** This field is displayed when **Certificate Location** = **IAM**. In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

   a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

   b. Click **Add**.
      The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter/Select the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.
Post - Push Script File Name	Enter the file name of the post push script.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

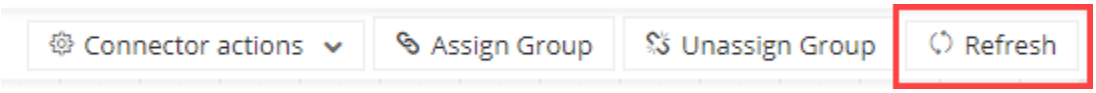
   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Automating CLM for Microsoft Azure Resources

Microsoft Azure is a comprehensive cloud computing service created by Microsoft for building, testing, deploying, and managing applications and services through Microsoft-managed data centers. It provides a wide range of cloud services, including those for computing, analytics, storage, and networking.

This section will guide you through the process of integrating Microsoft Azure with AppViewX, providing detailed steps, configuration guidelines, and automation techniques for the following services:

- With Key Vault Integration
- With Application Gateway Integration
- With Virtual Machines Integration
- With App Service Integration
- With Enterprise Application Integration
- With API Management Integration
- With App Registration Integration
- With Front Door Integration

With Key Vault Integration

This document will guide you through the process of integrating Azure Key Vault with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure Key Vault

The Azure Key Vault is a key management solution from Microsoft that offers the following features:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Secrets Management: The key vault can be used for securely storing and managing access to tokens, passwords, API keys, and other secrets.
- Key Management: The key vault simplifies the creation and management of encryption keys used for data encryption.
- Certificate Management: Azure key vault simplifies the certificate lifecycle management of TLS/SSL certificates

Prerequisites for Onboarding Azure Key Vault Settings in AppViewX

- Ensure that a key vault instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Onboarding Azure Settings in AppViewX for Key Vault

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

> **Note:** The option to **Validate Credential** is displayed only for a multi subscription account type.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Key Vault** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones. From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the General Information section

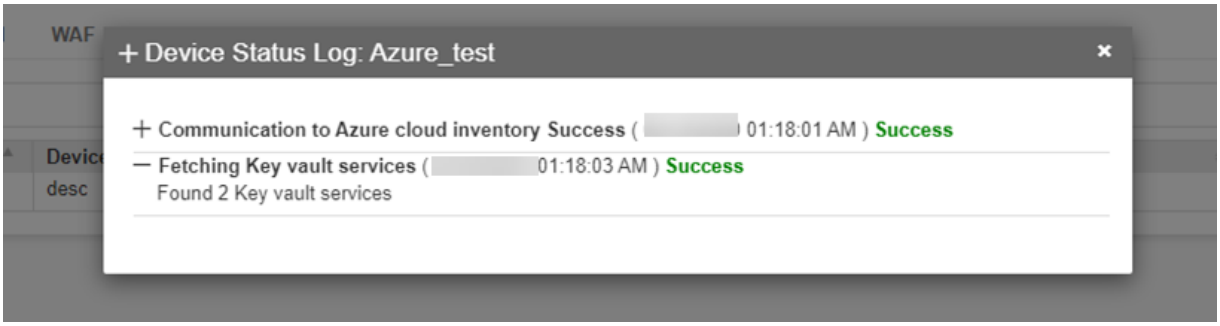
Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. From **Additional attributes**, for the **Key Vault** service, select the user permission for **Cert sync** from the following options:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
- **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
- **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.

11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.



14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure Key Vault

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure Key Vault

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **Key Vault**
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Keyvault Object Type	This fied is displayed when **Service Type** = **Key vault**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the key vault object to which the certificate will be pushed: • **Certificates** (The Azure key vault can store x509 certificates for securing communications and establishing the identity of services.) • **Secrets** (The Azure key vault secret is a secure object used for storing sensitive information, such as passwords and cryptographic keys.)
Certificate Status Enabled	This field is displayed only when **Keyvault Object Type** = **Secrets**. To enable the certificate after it is pushed to the target system, select **Yes**.
Set activation date	This field is displayed only when **Keyvault Object Type** = **Secrets**. To set an activation date for the certificate being pushed: a. Select the **Set activation date** checkbox. b. Use the calendar widget and time zone dropdown list to set the date and time for the certificate activation.
Set expiration date	This field is displayed only when **Keyvault Object Type** = **Secrets**. To set an expiration date for the certificate being pushed: a. Select the **Set expiration date** checkbox. b. Use the calendar widget and time zone dropdown list to set the date and time for the certificate expiry.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For Azure, this field is enabled by default and is non-editable.

5. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

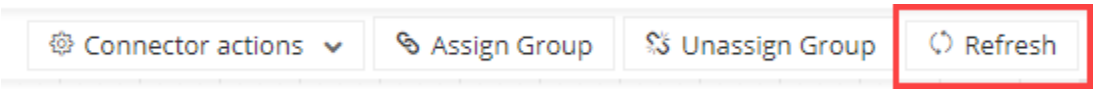
   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

With Application Gateway Integration

This document will guide you through the process of integrating Azure Application Gateway with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure Application Gateway

The Azure Application Gateway is a web traffic load balancer that helps to optimize and secure web applications traffic. The application gateway operates at the application layer of the OSI model and makes routing decisions based on attributes of an HTTP request, for example the URI path or the host headers.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites for Onboarding Azure Application Gateway Settings in AppViewX

- Ensure that an application gateway instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Onboarding Azure Settings in AppViewX for Key Vault

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The option to **Validate Credential** is displayed only for a multi subscription account type.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Application Gateway** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones. From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. From **Additional attributes**, for the **Application Gateway** service, select the user permission for **Cert sync** from the following options:
    - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
    - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
    - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure Application Gateway

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure Application Gateway

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **Application Gateway**
Target Profile	Select the app service target profiles to which the certificate will be pushed.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Certificate Push Type	Select one from the following options: • **Upload a Certificate to Gateway**: • **Replace/Update existing Certificate in Gateway**:
Certificate Location	For the **Azure Application Gateway**, from the following options, select where the certificate will be stored after it is pushed: • **Upload directly to Application Gateway**: Upload certificates directly to the Application Gateway • **Choose from Azure Key Vault**: Store certificates in Azure Key Vault and then reference them in the Application Gateway configuration.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For Azure, this field is enabled by default and is non-editable.

5. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

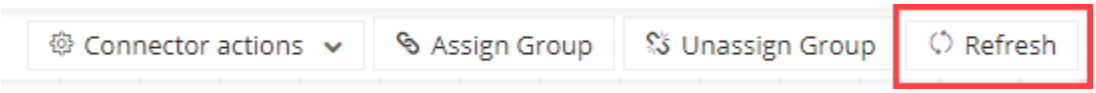
   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.
   c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

With Virtual Machines Integration

This document will guide you through the process of integrating Azure Virtual Machines with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

> **Important:** Please note the following **limitations** for Azure virtual machines:
>
> - Currently, only the Linux-based VMs (and not Windows-based VMs) are discovered.
> - The discovered/onboarded VMs are listed in the server device inventory.
>
> You are required to manually update the VM credentials in the server inventory to proceed with certificate lifecycle management for the VM.
>
> To access the server inventory, Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management** and open the **Server** tab.

Microsoft Azure Virtual Machines

Azure Virtual Machines (VMs) are scalable and flexible computing resources provided by Microsoft Azure. They enable users to run virtualized Windows or Linux servers in the cloud. Azure VMs allow you to

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

quickly deploy and manage virtualized infrastructure to support various applications, workloads, and services.

Prerequisites for Onboarding Azure Virtual Machine Settings in AppViewX

- Ensure that a virtual machine instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Onboarding Azure Settings in AppViewX for Virtual Machines

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

Note: The option to **Validate Credential** is displayed only for a multi subscription account type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Virtual Machines** to map the service to the Azure setting. Starting v2024.1.0.0, Linux-based as well as Windows-based VMs can be discovered. For instructions on managing the Linux-based/Windows-based server devices onboarded as VMs, click here.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones. From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. From **Additional attributes**, for the **Virtual Machine** services, select the user permission for **Cert sync** from the following options:
    - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
    - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
    - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Managing Server Devices Onboarded as Azure Virtual Machines

The discovered/onboarded VMs are listed in the server device inventory.

To access the server device inventory, Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management** and open the **Server** tab.

Once the server device is onboarded, you are required to manually update the VM credentials in the server inventory to proceed with certificate lifecycle management for the VM.

To do this:

1. Go to the server device inventorty.
2. On the **Device :: Server** page, click the device **Name** to modify the device details.
   You will be redirected to the **Device details** page.
3. In the **Credentials** section, update the device credentials.

For field descriptions and other details, refer from the following links:

- Configuring Linux Server
- Configuring Microsoft Server

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	<u>To search for a resource</u>: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type** iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. <u>To add an existing resource to the list</u>: a. Click . b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. <u>To delete a resource from the list</u>: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	OR Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure Virtual Machines

> **Important:** Refer to the pre- and post-push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Adding an Application Connector for Azure Virtual Machines

For Linux-based Virtual Machines

Important: If the certificate is generated with CSR generation at endpoint, if an application connector is created for the certificate, the following fields will be auto-populated/selected and cannot be modified:

- **Category**
- **Vendor**
- **Key Location**
- **Private key in Device**

Additionally, the available profiles will be filtered for the device profile selected at the time of certificate enrollment here.

1. On the client (or) server certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **LinuxServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Linux Server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Enable Truststore Update	This field is displayed for all **PEM** certificate types. Click the radio button to enable the Update System TrustStore option for root and intermediate certificates. **Note:** By default, this option is disabled. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Update System TrustStore**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Certificate Ownership & Permission	Enable the toggle button to customize the certificate ownership and define the file permissions for the certificates. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Certificate Ownership & Permission**.  Field descriptions for the Certificate Ownership & Permission Details
Custom Push	This field is displayed for all **PEM** and **DER** certificate types. From the following options, select the method of pushing certificates: • **Chain**: The full certificate chain, which includes the end, intermediate, and root certificates, will be pushed to the server. • **Issuer & Server**: The server's certificate and its issuer's certificates will be pushed to the server. • **Server Only**: Only the server's certificate will be pushed to the server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Linux Server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Certificate Location	This field is displayed for all PEM, DER and PKCS#7 certificates. Enter the path to the location on your local system where the certificate file to be pushed is stored.
Key Location	This field is displayed for all PEM, DER and PKCS#7 certificates. The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***KeyStore Location**	This field is displayed for the PKCS#12 and JKS certificates. A keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the keystore file, for the certificate to be pushed, is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KeyStore Password**	This field is displayed for the PKCS#12 and JKS certificates. Enter the password required to access the keystore file for the certificate to be pushed.
***Alias Name**	This field is displayed for the PKCS#12 and JKS certificates. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Truststore Location	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the certificates to be pushed, is stored. **Note:** Truststore Location can be specified without the file extension as well.
Truststore password	This field is displayed for the JKS certificates. Enter the password required to access the truststore file for the JKS certificate to be pushed.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

Field descriptions for the Certificate Ownership & Permission Details

Field	Description
Owner	Enter the username for certificate ownership on the target device.
Owner Permission	Select the owner permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
User Group	Enter name of the user group that requires access to the certificate.
User Group Permission	Select the group permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Other User Permission	Select the other user permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

For Windows-based Virtual Machines

Prerequisistes: When adding connectors using the Exchange Server, note the following points:

- During Microsoft Server device addition ensure that the username is added with the domain in the format—<username>@<domain>.
- The **iisreset.exe** file is expected at the default location. (C:\Windows\System32) to support IIS Service restart.
- For the certificate being enrolled, **Country name** must be provided in order to renew the certificate.

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Microsoft Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ABAP server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, from the dropdown list, select one of the following options:
   - **MS Server**
   - **Exchange Server**
   - **Windows Gateway**

   Note: If you have selected **Exchange Server**, profiles will be displayed in the format, **Server type : Service name : Node details**.

4. Under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For MS Server: Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select the location to which the certificate will be pushed: • **File System** (a storage location on your computer) • **Certificate Store** (a specialized location within the operating system for managing digital certificates)
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Credential Type**	This field is displayed for the JKS certificates. From the dropdown list, select the source of the access credentials.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the server, or a URL from where the server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	This field is displayed for the **PEM**, **DER**, and **PKCS#7** certificates. The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***KeyStore Password**	This field is displayed for JKS certificate types. Enter the password required to access the keystore that contains the JKS certificate to be pushed.
Alias Name	This field is displayed for the PKCS#12 and CERTDB certificate types.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Private key entry password	This field is displayed for the JKS certificates. Enter the password required to decrypt the private key associated with the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate Certificate Alias Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. This field is not displayed for the JKS certificate types. Enter the alias name of the intermediate certificate file.
***Root Certificate Alias Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the alias name of the root certificate file.

For Exchange Server: Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	The certificate type is defaulted to the following values • For AppViewX CSR generation - certificates which have private key, **PKCS#12(*.p12)** is the supported certificate format. • For Endpoint CSR generation **PKCS#7(*.p7b)** is the supported certificate format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The password field in not set for **PKCS#12(*.p12)** since its a transactional password and handled by AppViewX.
***Friendly Name**	• For **PKCS#12(*.p12)** it is the user specified input. • For **PKCS#7(*.p7b)** certificate type, the friendly name is the common name of the certificate specified at the time of Endpoint CSR generation. During the push operation the common name is populated in the friendly name field (it is not editable).
Services	From the dropdown list, select one from the following services: • **POP** • **IIS** • **SMTP** • **IMAP**
Restart Service	This field is displayed only when **Services** = **IIS**. To restart the IIS service after the certificate is pushed, to ensure all changes have taken effect as required, select this checkbox.

For Windows Gateway: Field descriptions for the Certificate Details

Field	Description
Location Type	The **Certificate Store** option is selected by default—a specialized location within the operating system for managing digital certificates. (**File system** is disabled).
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. **Note:** Root and intermediate names cannot be entered for this CSR/Certificate. If auto-push is enabled for CSR, try again after the certificate is generated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings This is applicable for all service/devices such as Microsoft Server, Microsoft Exchange Server, Windows Gateway.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

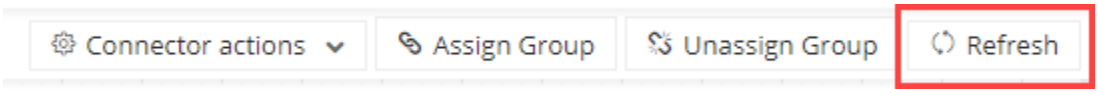
The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

With App Service Integration

This document will guide you through the process of integrating Azure App Service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure App Service

App Services is a fully managed platform for building, deploying, and scaling web apps, mobile app backends, and RESTful APIs.

Prerequisites for Onboarding Azure App Service Settings in AppViewX

- Ensure that an app service instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Permissions Required

```
{
    "properties": {
        "roleName": "AppViewX_App_Service_Permission",
        "description": "",
        "assignableScopes": [
            "/subscriptions/000-000-000-0000-000"
        ],
        "permissions": [
```

    ]
  }
}
```

Onboarding Azure Settings in AppViewX for App Service

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

> **Note:** The option to **Validate Credential** is displayed only for a multi subscription account type.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **App Service** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

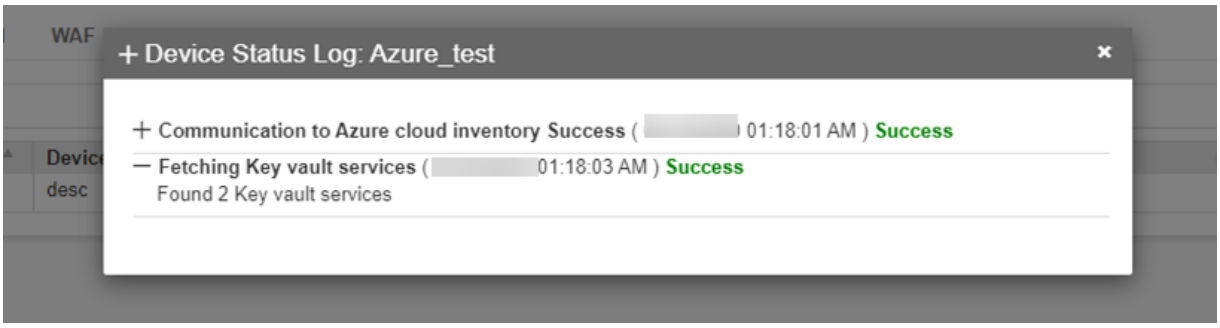
Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. From **Additional attributes**, for **App Service**, select the user permission for **Cert sync** from the following options:
    - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
    - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
    - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type** iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click . b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field.  **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure App Service

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure App Service

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **App Service**
Target Profile	Select the app service target profiles to which the certificate will be pushed.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Certificate Location	For the **Azure App Service**, from the following options, select where the certificate will be stored after it is pushed: • **Upload a Certificate to App Service** • **Replace/Update existing Certificate in App Service**: If a version of the certificate being pushed already exists in the App Service, it will be replaced/ updated with the version that will be pushed via this connector.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For Azure, this field is enabled by default and is non-editable.

5. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   > **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

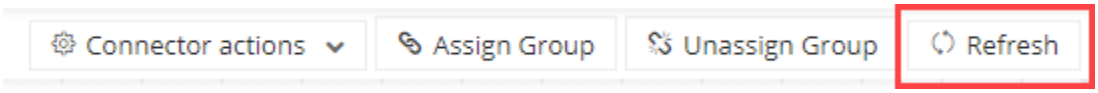
   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
    a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
    The **Group** page is displayed.
    b. From the **Name** field, select the required certificate group.
    The **Group : Modify : <group name>** page is displayed.
    c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
    d. Click **Update**.
2. To enable auto push for the certificate connector:
    a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
    To add an application connector, follow the instructions given here.
    b. From the menu displayed, click **Edit**.
    The **Edit Application Connector** pop-up is displayed.
    c. Select the **Push automatically** checkbox.

    > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

    d. Click **Save**.
    The holistic view of the selected certificate is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

References

- Getting Started with the Azure App Service.
- Configure managed identities on Azure virtual machines.

With Enterprise Application Integration

This document will guide you through the process of integrating Azure Enterprise Application with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure Enterprise Application

The Enterprise Application service in Azure Active Directory (Azure AD) is used for managing identity and access for SaaS applications, custom apps, and other resource.

Prerequisites for Onboarding Azure Enterprise Application Settings in AppViewX

- Ensure that an enterprise application instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

  For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Permissions Required

The user should have access to the following Graph APIs:

- **Application.Read.All**
- **Application.ReadWrite.All**

Onboarding Azure Settings in AppViewX for Enterprise Application

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the details needed to **Discover Resources**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Enterprise Application** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

8. Enter/Select values for the **Additional attributes** for the Enterprise Application service.

Field descriptions for the additional Enterprise Application attributes

Field	Description
Cert sync	To specify how certificates will be handled after discovery, select one from the following options: • **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
Discover Inactive Certificates	The Enterprise Application service has an active certificate associated with it, which is the default certificate used for securing communication, authentication, and encryption. The rest of the certificates associated with this service are categorized as inactive certificates. To enable discovery of inactive certificates along with the active certificate associated with the selected service(s), enable the **Discover Inacrive Certificates** toggle button.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Notify For	You can choose to receive email notifications every time: • a certificate is pushed to the Enterprise Application service • a certificate is made active certificate while being pushed to the Enterprise Application service To receive email notifications: a. Enable the **Notify For** toggle button. b. To receive notifications when a certificate is pushed, select **Push**. To receive notifications when a certificate is made active certificate while being pushed, select **Make Certificate Active**.
***Email Alert Template**	**Note:** This field is displayed only when **Notify For** is enabled. From the list of predefined email templates in the dropdown list, select the email template that will be used to send the alert. By default, the **Azure SSO Template** is selected. **Note:** To view the predefined templates, go to **Platform** > **System Administration** > **Themes & Personalization** > **Email attachment customization**. The predefined templates are listed in the **Email Template** section.
***Email Subject**	**Note:** This field is displayed only when **Notify For** is enabled. Enter a custom email subject for the notification email.
Attach Certificates to Email Body	**Note:** This field is displayed only when **Notify For** is enabled. If you need the relevant certificate(s) attached to the notification email, from the following options, select the format in which the certificate will be shared: • **Include as Content** The email body includes the contents of the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed is an inactive certificate, the email will also include instructions for manually making it the active certificate. • **Include as Downloadable Link** (to include The email body includes a link for downloading the certificate. Clicking the link will redirect you to the holistic view of the certificate, from where you can download the certificate.
**: Mandatory fields*	

9. Click **Save**.
10. Return to the **Device :: Cloud** page.
11. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
12. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure Enterprise Application

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure Enterprise Application

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **Enterprise Application**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed. For the Enterprise Application service, by default, the **PKCS#12 (*.pfx)** certificate type is selected and the field is disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Make Certificate Active	To make the certificate being pushed the active certificate for the Enterprise Application service, select this checkbox. An active certificate is the default certificate used for securing communication, authentication, and encryption. The rest of the certificates associated with this service are categorized as inactive certificates.
Notification Email Addresses	To enter email addresses that will be notified when this certificate is pushed and/or made active: a. Click . b. Enter the required email address and press **Enter**. c. To add multiple email addresses, repeat steps **a** and **b**. Alternatively, you can use the search field to add an already entered email address.

5. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   > **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

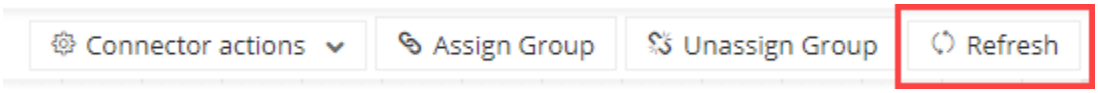
   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Managing Enterprise Application Certificates

Starting v2024.0.1.0, self-signed certificates discovered from the Enterprise Application service can be:

- Renewed
- Made active

Renewing an Enterprise Application Self-Signed Certificate

To renew an Enterprise Application Self-Signed Certificate,

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the Enterprise Application Self-Signed Certificate that you want to renew.
   The holistic view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Renew**.
4. In the **Renew** dialog box:
   a. Enter the new **Validity** for the renewed certificate.
   b. To make the certificate active, select the **Make Certificate Active** checkbox.
5. Click **Renew**.
   A request ID, which is the work order ID, is generated automatically, and work order status is displayed adjacent to the certificate in the holistic view. If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
6. In the holistic view, click **Approve** to proceed.
   The **Approve** dialog box is displayed.
7. Enter your comments in the text field.

   Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

8. Click **Yes**.
   Once the approval process is complete, the **Implement** option is displayed in the holistic view.
9. Click **Implement**.
   The **Implement** dialog box is displayed.
10. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
11. Click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The renewal process is triggered. After renewal is completed:

- Workflow status is updated to **Completed**.
- A notification email is sent.

12. To see if the certificate has been made active (if you selected the checkbox), hover over the application connector for the certificate.
    If the certificate is active, the **Is Active** field in the tooltip text is set to **Yes**.

Making an Enterprise Application Self-Signed Certificate Active

There are two ways in which you can make an Enterprise Application self-signed certificate active.

- By selecting the **Make Certificate Active** checkbox from the **Renew** dialog box for the self-signed certificate

  The instructions for this are given here.

- By selecting the **Make Certificate Active** option from the **More** menu in the holistic view

  The instructions for this are given below.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the Enterprise Application Self-Signed Certificate that you want to make active.
   The holistic view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Make Certificate Active**.
4. To see if the certificate has been made active, hover over the application connector for the certificate.
   If the certificate is active, the **Is Active** field in the tooltip text is set to **Yes**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

With API Management Integration

This document will guide you through the process of integrating the Azure API Management service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure API Management

The API Management service helps create, manage, secure, and monitor APIs. It provides a centralized platform for API publishers to control their APIs, while enabling developers to consume them in a secure and efficient manner.

Its key features include:

- API Gateway that routes all incoming requests to the appropriate backend services
- Developer Portal that can be customized to help developers discover and access APIs
- API versioning with revision tracking
- Authentication and authorization mechanisms for secure access control to APIs
- Rate limiting and throttling to protect backend services from excessive or abusive traffic
- Analytics and monitoring
- Policy Engine to implement additional logic at the API Gateway

Prerequisites for Onboarding Azure API Management Settings in AppViewX

- Ensure that a API management instance is created in your Microsoft Azure account. For link(s) to the corresponding Microsoft Azure documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
- A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
- Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

  For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Permissions Required

Onboarding Azure Settings in AppViewX for API Management

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

> **Note:** The option to **Validate Credential** is displayed only for a multi subscription account type.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Api Management** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones. From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. From **Additional attributes**, for the **Api Management** service, from the following options, select the user permission for **Cert sync**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
- **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
- **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.

11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type** iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.

5. In the **After Discover** section, enter/select the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once the certificates are discovered, you can view them in the certificate inventory.

To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure API Management

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure API Management

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **Api Management**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Push Type	Certificate push type specifies the mechanism that will be used for pushing certificates to the targeted service. For the Azure Api management service, certificate push type has the following values: • **Upload a Certificate to Api Management** (for uploading a new certificate) • **Replace/Update existing Certificate in Api Management** (for renewing/ replacing an existing certificate) **Important:** For the Azure Api management service, this field is disabled for editing and the **Upload a Certificate to App Service** is selected by default.
Certificate Location	From the following options, select where the certificate will be stored after it is pushed: • **Upload directly to Api Management**: Upload certificates directly to the Application Gateway • **Choose from Azure Key Vault**: Store certificates in Azure Key Vault and then reference them in the Api Management configuration.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

5. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

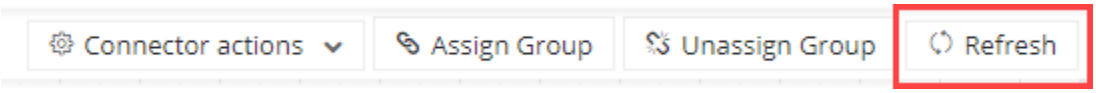
a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
b. If you select **Off**, set the date and time to schedule the certificate push.
c. Enter your comments in the text field and click **Yes**.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

References

- Create a new Azure API Management Instance by using the Azure Portal.
- Configure managed identities on Azure virtual machines.

With App Registration Integration

This document will guide you through the process of integrating Azure App Registration with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure App Registration

The App Registration service enbales identity and access management, API security, and integration capabilities. It is used for registering and configuring applications for interactions with Azure services.

App Registration service is essential when you want to allow your application to authenticate users or access resources such as APIs in a secure way.

Its key features include:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Application Identity Management
- Authentication Support
- Access permissions and scope definition for APIs
- Multi-Tenant and Single-Tenant support
- Enterprise Application Integration
- Roles and Role-Based Access Control
- Token Issuance and Validation for Authentication and Authorization
- Auditing and Monitoring
- Conditional Access and Multi-Factor Authentication

Prerequisites for Onboarding Azure App Registration Settings in AppViewX

- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Permissions Required

The user should have access to the following Graph APIs:

- **Application.Read.All**
- **Application.ReadWrite.All**

Onboarding Azure Settings in AppViewX for App Registration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. On the **Device :: Cloud** page, click + (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity**: [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the details needed to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **App Registration** to map the service to the Azure setting.
Subscription ID	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

8. From **Additional attributes**, for the **App Registration** service, select the user permission for **Cert sync** from the following options:
   - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
   - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
   - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
9. Click **Save**.
10. Return to the **Device :: Cloud** page.
11. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
12. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

   Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure App Registration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure App Registration

1. To create an application connector for pushing a certificate, go the holistic view of the certificate.
   To do this:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Go to (**Menu**) > **CERT+** > **Certificate Inventory** and select the required certificate category.

b. From the certificate inventory displayed, select the **Common Name** of the certificate you want to push.
The holistic view of the certificate is displayed.

2. On the certificate holistic view, click **Add Connector**.

3. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **App Registration**
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

4. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
5. Enter/Select the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.

6. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

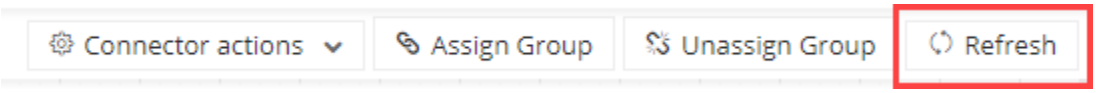
The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

With Front Door Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

This document will guide you through the process of integrating Azure Front Door with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Microsoft Azure Front Door

Azure Front Door is a modern, high-performance, and secure cloud Content Delivery Network (CDN) that serves as the global entry point for your applications. It optimizes traffic by routing users to the nearest edge location for faster, more reliable access, while built-in caching, acceleration, and a Web Application Firewall (WAF) provide enhanced performance and protection—making it ideal for global websites and SaaS applications.

Prerequisites for Onboarding Azure Front Door Settings in AppViewX

- Ensure that a Azure Front Door instance is created in your Microsoft Azure account. For link(s) to the corresponding Azure Front Door documentation, click here.
- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Onboarding Azure Settings in AppViewX for Front Door

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity** : [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the details needed to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
***Services**	From the dropdown list, select **Front Door** to map the service to the Azure setting.
***Subscription ID**	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. Enter the unique identified (GUID) of your Azure subscription.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. For instructions, see Field descriptions for the General Information section.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

8. From **Additional attributes**, for the **Front Door** service, select the user permission for **Cert sync** from the following options:
   - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
   - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
   - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.
9. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. Return to the **Device :: Cloud** page.
11. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.
12. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Onboarding Certificates for Microsoft Azure Devices in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for Microsoft Azure Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan istriggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter/Select the details for **initiating an on-demand cloud certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Note: Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter/select the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **Azure**.
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that consitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter/Select values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type** iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click . b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	OR Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered hee.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   Once the certificates are discovered, you can view them in the certificate inventory.

   To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Microsoft Azure Front Door

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Azure Front Door

1. To create an application connector for pushing a certificate, go the holistic view of the certificate.
   To do this:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Go to (**Menu**) > **CERT+** > **Certificate Inventory** and select the required certificate category.

b. From the certificate inventory displayed, select the **Common Name** of the certificate you want to push.
The holistic view of the certificate is displayed.

2. On the certificate holistic view, click **Add Connector**.

3. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **Azure**.
Service Types	From the dropdown list, select **Front Door**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure Front Door profiles and domains already onboarded in AppViewX.

You can push a certificate to a profile (and therefore to all domains within that profile) or to selected domains within a profile.

4. To select the profile(s)/domain(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required profile(s)/domain(s), click .
The **Selected devices** list is updated according to your selection.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Secret Name**	This field is displayed when **Service Type** = **Front Door**. Enter the name of the secret in Azure Key Vault that stores the certificate to be pushed to Azure Front Door.
***Key Vault Subscription ID**	This field is displayed when **Service Type** = **Front Door**. Enter (a new)/Select (from an existing list) the Azure subscription ID for the Key Vault from which the certificate is to be retrieved.
***Key Vault Name**	This field is displayed when **Service Type** = **Front Door**. From the dropdown list, select the name of the Key Vault in which the certificate is stored.
Replace Certificate in Key Vault	This field is displayed when **Service Type** = **Front Door**. Use the toggle key to specify whether an existing certificate in the specified Key Vault should be overwritten with the new one during the push operation.
***Key Vault Certificate Name**	This field is displayed when **Service Type** = **Front Door**. Enter the logical name under which the certificate is stored in the Key Vault.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

6. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

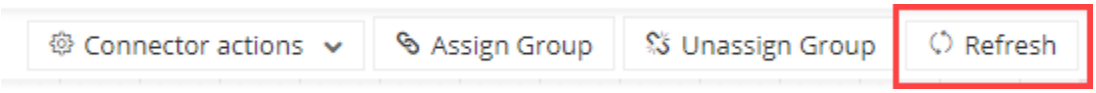
- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
   The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

References

- Create an Azure Front Door Profile using the Azure Portal.
- Configure managed identities on Azure virtual machines.

Automating CLM for Microsoft SQL

Prerequisites

- **Access Requirements:**

  To perform certificate management operations, the user managed in **AppViewX** must have the following permissions:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

  - **Read and write access to the trust store** (to discover and push certificates).
  - **Read and write access to the Windows registry** (to update certificate thumbprints and enforce encryption settings).
- Ensure that PowerShell and WinRM tools are installed and running on the Windows machine.
- Verify that Microsoft SQL instance are available and running on the Windows machine.
- (Optional) If the Gateway type is selected as WMI, ensure that WMI is properly configured.
- If the SQL Server instance is running under a service account that is neither Local System nor a member of the Administrators group:
  - **For a Domain Service Account**: Add the account to the Administrators group on the server.
  - **For a Built-in Account (for example, Network Service)**: If the service account cannot be added to the Administrators group, use the Default connector to push the certificate. For the post-script execution, refer to Certificate Post script execution approach to Bind Certificates.
    - You can then leverage post-script execution to:
      - Grant read access to the certificate's private key.
      - Perform the bind operation.

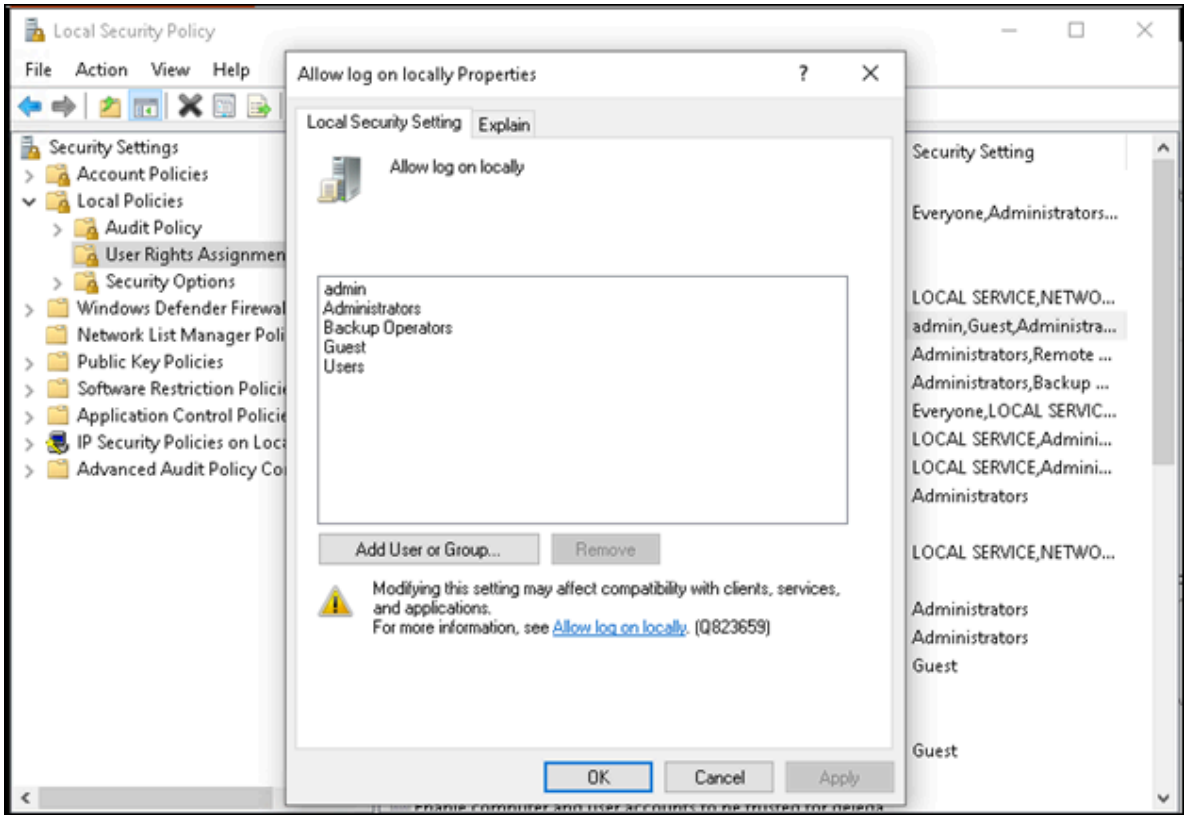
Prerequisites for Managing Windows Servers Using PowerShell Mode

To successfully manage **Windows servers** in **PowerShell mode**, ensure the following prerequisites are met.

1. Local Administrator Account on Target Machines.
   a. The **account used for onboarding** the device must be a member of the **Local Administrators Group** on the target machine.
   b. This account is required for **device onboarding** and **enabling remote PowerShell sessions**, as administrative privileges are essential for remote management.

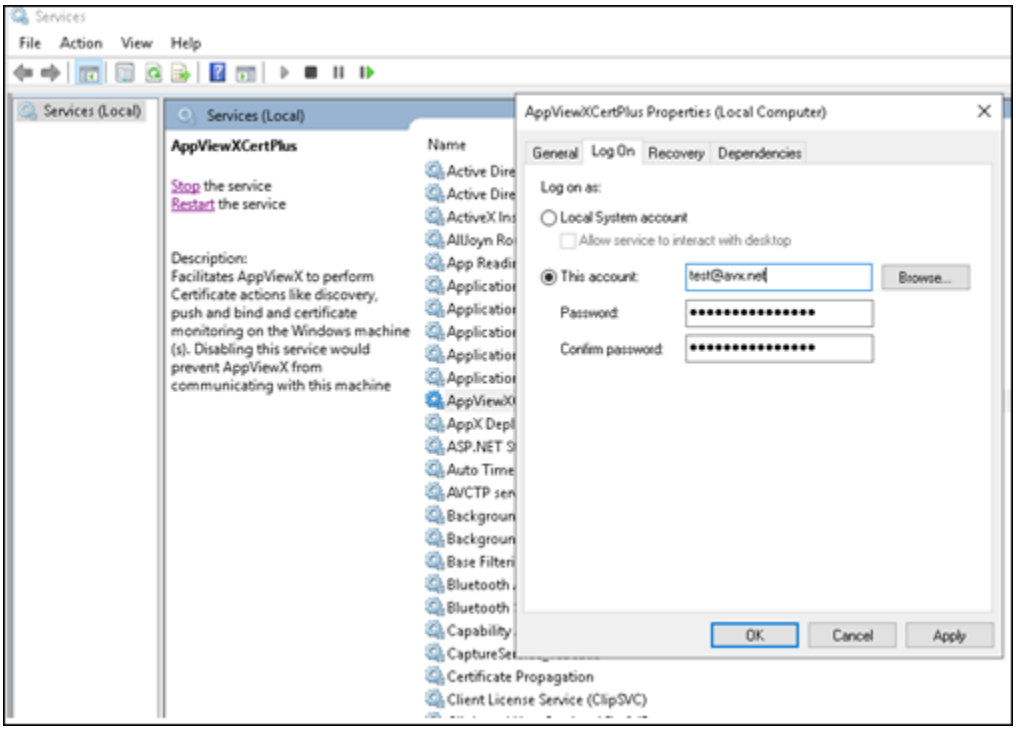
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If the onboarding account is **not** a **Local Administrator** on the Windows agent machine, it must be granted **Allow Logon** rights in the machine's policies.



2. Logon Service Account on the Windows Agent Machine: The Windows agent machine must have a logon service account with local administrator privileges to run the required services.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



3. Network Ports.

   To enable seamless communication between the **target machines**, the **Windows agent machine**, and the **Cloud Connector (CC)**, ensure the following ports are open:

   - Port 5985 (WSMAN) – Required on both the **target machines** and the **Windows agent machine** for **remote PowerShell functionality**.
   - Port 445 (SMB) – Needed for **certificate transfer** to the target machines using the **SMB protocol**.
   - Port 8999 – Must be open on the **Windows agent machine** to facilitate communication with the **Cloud Connector (CC) or AppViewX (AVX)**.

4. Check Connectivity from CC to Gateway.
   a. Login to **AppViewX** pods CLI to check communication.
      i. **On Prem :** Login in **AppViewX** CLI, go to vendor pods.
      ii. **Saas :** Login to CC, platform pod.
   b. After logging in run the below commands in terminal.

```
nc -zv <Ip or hostname> <8999 or configured port>
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:**
> - The <IP or hostname> refers to the **hostname** or **IP address** of the **Windows agent machine**.
> - **Port 8999** is the **default port** for the **Windows Agent**. *(If a custom port is configured, use the specified port instead.)*

- **Expected Output:**

```
Connection to 192.xxx.142.xx 8999 port [tcp/*] succeeded!
```

5. Check Connectivity from Windows Gateway Machine to Target Machine: Run the following command in Windows PowerShell, replacing <port> and <hostname> with the actual values of the Windows agent and target machine:

```
Test-NetConnection -ComputerName <hostname> -Port <port>
```

- Output Example:

```
ComputerName : computername
RemoteAddress : 93.184.xxx.xx
RemotePort : 80
InterfaceAlias : Ethernet
SourceAddress : 192.168.x.xx
PingSucceeded : True
TcpTestSucceeded : True
```

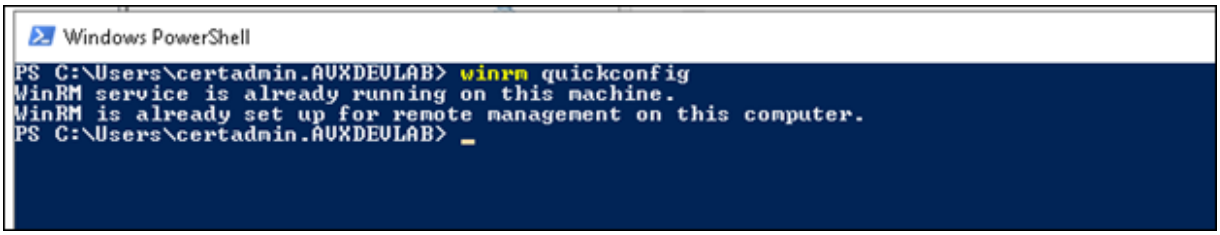
6. Check Remote Powershell Session from Windows Gateway Machine to Target Machine: Open an administrator powershell and run the following command from the Windows Gateway Machine to the target machine.

```
Enter-PSSession -computerName <hostname> -credential <username>
```

> **Note:**
> - <hostname>: Add the hostname of the remote machine.
> - <username> : Username of the service account.
> - For troubleshooting WinRM related errors, refer to PowerShell to a Remote Server via WinRM.

7. Ensure that Remote powershell is enabled in the target machines.Test using ***winrm quickconfig*** .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



8. Kerberos Authentication.
   - Ensure all accounts are within the **same domain** to enable **Kerberos authentication** for remote PowerShell connections.
   - Validate the **Kerberos setup** between the **target machines** and the **Windows agent machine** to ensure proper **authentication and communication**.

Prerequisites for Windows Gateway and Target Server Configuration

Requirement	AppViewX Windows Gateway	Target Server
User account type	Service account with local admin	Service account with local admin
Services	RPC Service WinRM Service WinRM Configuration Powershell remoting certutil.exe command availability	RPC Service WinRM Service WinRM Configuration Powershell remoting certutil.exe command availability
Ports	8999(Customisable) 5985 - WSMAN 445 - SMB: Required only for certificate push functionality.	5985 - WSMAN: Enables remote PowerShell functionality. 445 - SMB: Required only for certificate push functionality.

Onboarding Microsoft SQL Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Microsoft SQL** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the name of the designated Microsoft SQL server.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Microsoft SQL Server.
***Hostname**	Enter the hostname of the Microsoft SQL server.
Data center	Choose the desired datacenter. The communication to the device will be routed to through this datacenter from AppViewX and the communication will be routed to this datacenter alone when strict routing is enabled.
Cert Sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Microsoft SQL device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - AppViewX

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: The dropdown displays the credential types configured in the Device Credential section. Additionally, AppViewX supports the following external credential types: • HashiCorp • CyberArk • BeyondTrust • Thycotic.
***Username**	Enter the designated username for authentication. **Note:** This field is displayed only if the credential type is selected as **Manual Entry**.
***Password**	Enter the secure password. **Note:** This field is displayed only if the credential type is selected as **Manual Entry**.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. Enter/Select the **Windows gateway details**.

> **Note:** This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	**Note: Applicable only for SAAS**. For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (**enabled only in the SaaS and Managed Kubernetes installations**). Prerequisites for using the Integrated Windows Gateway mode

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production. **Note:** The integrated gateway functionality is not compatible with the following features: • Server addition using the **import** feature • Endpoint CSR generation
***Gateway type**	**Note: Applicable only for SAAS**. From the following options, select the required gateway type: • PowerShell • WMI. **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • **Remote** **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Select gateway**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. From the following options, select the gateway: • **New** • **Existing**.
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

8. Enter/Select the **Vendor Specific Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: This section is displayed only when **Communication mode** = **SSM**.

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance Id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example*: i-02573cafcftext **Note:** Click the (**Settings**) icon next to the field to configure the ARN Advanced Settings.
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2 **Note:** Click the (**Settings**) icon next to the field to configure the S3 Advanced Settings.
Proxy Required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Click **Save**.
   The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Discovering Certificates for Microsoft SQL

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.
7. AppViewX follows these steps to retrieve the appropriate server certificate.

   a. Identify the certificate thumbprint currently bound in the Windows registry.

   b. Retrieve all certificates from the local trust store.

   c. Match the retrieved certificates against the stored thumbprint to determine the active server certificate.

   AppViewX automatically detects all SQL instances running on the target Microsoft SQL Server machine and creates individual profile connectors for each instance. These connectors enable certificate push and binding operations specific to each SQL instance.

8. Each profile connector is named using the following convention:

   a. <hostName>:<instance>

   > **Note:** This format ensures the unique identification of each SQL Server instance.

   b. In addition, AppViewX automatically creates a **default connector**, which supports only the certificate push operation.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a CA+RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>To generate the private key and the CSR, based on the CSR parameters given, in an HSM device:
a. Under CSR Generation, select HSM.
b. Fields for gathering your HSM-related inputs are displayed.
To generate the private key and the CSR, enter/select the following details:
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>*Device Type</td><td>From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated:
• HSM Devices
• ADC Devices</td></tr>

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
*: Mandatory fields	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-).
Subject Alternative Name	From the dropdown list, select the Subject Alternative Name category for the certificate being enrolled. In the corresponding field(s) displayed for the selection made, enter the required values. **Note:** • Multiple values must be separated by a comma. • After enrollment, the cumulative count of SANs is displayed in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** For renewal of the certificate being enrolled, country name is required.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you've uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Last name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**. **Note:** This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

    Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to Microsoft SQL Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Microsoft SQL

MS SQL

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **MSSQL**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available MS SQL devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed. AppViewX supports only PEM (*.crt) type as the certificate is imported to certificate store irrespective of the certificate type.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on the **MS SQL machine**, select this checkbox.
***Key Location**	This field is displayed when the **Private Key in Device** option is selected. Enter the file path to the **private key** location on the **MS SQL machine**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Service Restart</td><td>Enabling this option will restart the SQL Server service to apply the configuration changes.

Note:
• By default, this setting is enabled based on the global device configuration. To modify, go to: CERT+ > Device Management > Server > Device Settings > Vendors > Microsoft SQL.
• This feature requires Windows Gateway version v2024.1.0.0 or later. In earlier versions, the service restarts automatically by default.</td></tr>
<tr><td>Force Encryption</td><td>Enabling this option enforces encryption for all SQL server connections.

Note:
• By default, this setting is enabled based on the global device configuration. To modify, go to: CERT+ > Device Management > Server > Device Settings > Vendors > Microsoft SQL.
• This feature requires Windows Gateway version v2024.1.0.0 or later. In earlier versions, the service restarts automatically by default.</td></tr>
<tr><td colspan="2">Note:
Bind Operation in AppViewX for MS SQL:
During the bind operation, AppViewX updates the registry with the following keys:
• Certificate Thumbprint Key: Stores the thumbprint of the pushed certificate.
• ForceEncryption Key: Set to 1 to enable encryption for the SQL instance.
After updating these keys, the SQL service is restarted to apply the changes.</td></tr>
</table>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

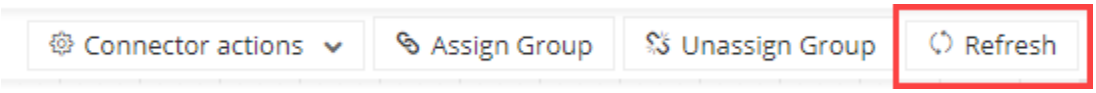
   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Certificate Post script execution approach to Bind Certificates

Use the post-script execution method to bind certificates to SQL Server instances when using non-administrator or NT Service accounts for service logon.

If the SQL Server instance is running under a service account that is not 'Local System' or a member of the 'Administrators' group:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Post Push Script:

```
$InstanceName = "MSSQLSERVER"  # Replace with your SQL instance name
$ServiceAccountName = "Domain\Username"  # Replace with actual account
$ForceEncryption = $true  # Set to $false if encryption should not be forced
$ServiceRestart = $true   # Set to $false to skip service restart

Write-Host "Checkpoint 1: Starting script"

# Decode and parse JSON
$request = [Text.Encoding]::Utf8.GetString([Convert]::FromBase64String($args[0]))
Write-Host "Checkpoint 2: Base64 decoded"

$request = $request.Replace('dNSNames','dNSNamesIgnore').Replace('iPAddresses', 'iPAddressesIgnore')
$json_request = ConvertFrom-Json -InputObject $request
Write-Host "Checkpoint 3: JSON parsed"

# Extract thumbprint
if (-not $json_request.certificate.extension.thumbPrint) {
    throw "Thumbprint field not found in JSON input."
}
$vmThumbPrint = $json_request.certificate.extension.thumbPrint.Replace(":", "")
$certificateThumbprint = $vmThumbPrint.ToLower().Replace(" ", "")
Write-Host "Checkpoint 4: Extracted thumbprint $certificateThumbprint"

try {
    # Load certificate
    $store = New-Object System.Security.Cryptography.X509Certificates.X509Store("My", "LocalMachine")
    $store.Open([System.Security.Cryptography.X509Certificates.OpenFlags]::ReadOnly)
    $cert = $store.Certificates | Where-Object { $_.Thumbprint.ToLower() -eq $certificateThumbprint }

    if (-not $cert) {
        throw "Certificate with thumbprint $certificateThumbprint not found in LocalMachine\My store."
    }
    Write-Host "Checkpoint 5: Certificate loaded"

    # Verify private key
    if (-not $cert.HasPrivateKey) {
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
    throw "The certificate does not have an associated private key."
}

# Locate private key file
$keyPath = $cert.PrivateKey.CspKeyContainerInfo.UniqueKeyContainerName
$keyFullPath = "$env:ProgramData\Microsoft\Crypto\RSA\MachineKeys\$keyPath"

if (-not (Test-Path $keyFullPath)) {
    throw "Private key file not found at $keyFullPath."
}
Write-Host "Checkpoint 6: Private key path resolved $keyFullPath"

# Grant access to specified account
Write-Host "Checkpoint 7: Using provided service account: $ServiceAccountName"
$ntAccount = New-Object System.Security.Principal.NTAccount($ServiceAccountName)
$sid = $ntAccount.Translate([System.Security.Principal.SecurityIdentifier])
Write-Host "Checkpoint 8: SID resolved: $sid"

$acl = Get-Acl $keyFullPath
$accessRule = New-Object System.Security.AccessControl.FileSystemAccessRule($sid, "Read", "Allow")
$acl.AddAccessRule($accessRule)
Set-Acl $keyFullPath $acl
Write-Host "Checkpoint 9: Granted Read access on private key to $ServiceAccountName"

# Set registry values
$sqlRegKey = Get-Item -Path 'HKLM:\Software\Microsoft\Microsoft SQL Server\Instance Names\SQL'
$sqlVersion = $sqlRegKey.GetValue($InstanceName)
if (-not $sqlVersion) {
    throw "SQL Server version key not found for instance $InstanceName."
}
Write-Host "Checkpoint 10: SQL version key resolved as $sqlVersion"

$sqlConfigPath = "HKLM:\Software\Microsoft\Microsoft SQL Server\$sqlVersion\MSSQLServer\SuperSocketNetLib"

Set-ItemProperty -Path $sqlConfigPath -Name "Certificate" -Type String -Value $certificateThumbprint

$forceVal = if ($ForceEncryption) { 1 } else { 0 }
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
    Set-ItemProperty -Path $sqlConfigPath -Name "ForceEncryption" -Type DWord -Value $forceVal
    Write-Host "Checkpoint 11: Registry updated - Certificate=$certificateThumbprint, ForceEncryption=$forceVal"

    # Optionally restart SQL service
    if ($ServiceRestart) {
        $sqlServiceName = if ($InstanceName -eq "MSSQLSERVER") { "MSSQLSERVER" } else { "MSSQL`$$InstanceName" }
        Restart-Service -Force $sqlServiceName
        Start-Sleep -Seconds 5

        $status = (Get-Service -Name $sqlServiceName).Status
        if ($status -eq "Running") {
            Write-Host "Checkpoint 12: Service $sqlServiceName restarted successfully."
            echo "AppResponseCode:0"
        } else {
            throw "Service $sqlServiceName failed to restart. Status: $status"
        }
    } else {
        Write-Host "Checkpoint 12: Service restart skipped as per input."
        echo "AppResponseCode:0"
    }
}
catch {
    Write-Error "An error occurred: $_"
    echo "AppResponseCode:1"
}
```

- The post-push script performs the following actions:
  - Grants read permission on the certificate's private key to the specified SQL Server service account.
  - Binds the certificate to the SQL Server instance using its certificate thumbprint.
  - Optionally:
    - Enables or disables **ForceEncryption** on the SQL Server instance.
    - Restarts the SQL Server service, if configured.
- **To bind a certificate to a SQL Server instance using a post-script**:
  - Place the script on the SQL Server where the certificate will be installed.
  - Update the following variables at the top of the script:
    - $InstanceName - Name of the SQL Server instance (for example, SQLEXPRESS or MSSQLSERVER).
    - $ServiceAccountName - The account under which the SQL Server service is running (for example, NT SERVICE\MSSQL$SQLEXPRESS or a domain account like domain\sqlsvc).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- $ForceEncryption - Set to $true to enable SSL encryption, or $false to disable it.
- $ServiceRestart - Set to $true to restart the SQL Server service after binding, or $false to skip the restart.

- In the AppViewX UI, while configuring the connector for MS SQL:
  - Select the Server Name (not the SQL instance name).
  - In the Push Details section:
    - Choose In Device.
    - Enter the full file path of the script placed on the server under Post-Push Script Filepath.

Note:

- You must manually update the $InstanceName, $ServiceAccountName, $ForceEncryption, and $ServiceRestart variables at the top of the script before executing it.
- The script is designed to be flexible and can be used with any SQL Server instance by modifying these variables as required.
- Optionally, you can create multiple versions of the script, each preconfigured for a specific SQL instance and service account, to simplify reuse across environments.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   > **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting MS SQL Windows

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback and other actions associated with MS SQL Windows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Communicating to MS SQL

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Gateway agent not reachable. Device not reachable from the gateway agent	Ensure gateway is configured properly and the APIs are accessible from AppViewX. Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.
Communication to <hostname> has failed	Hostname or Credentials configured is wrong	Ensure hostname and the device credentials configured while device addition is valid.
Device version fetch has failed.	MSSQLSERVER service instance is down	Restart the MSSQLSERVER instance
Device version fetch has failed.	Command not supported by MS SQL version	Execute the version command SQLCMD -Q 'SELECT @@VERSION;' -t 3 in the CLI of the device to check if it returns version response

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Gateway agent not reachable. Device not reachable from the gateway agent	Ensure gateway is configured properly and the APIs are accessible from AppViewX. Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.
PTPLD178 has 0 instances.	No installed MS SQL instances.	Execute (get-itemproperty 'HKLM:\\SOFTWARE\\Microsoft\ \Microsoft SQL Server').InstalledInstances in the device as a powershell script and check if it returns the MS SQL instances

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Installed instances are not up and running.	

Issue in Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	No valid certificates in store that are binded to the MS SQL instances.	Ensure the certificates are binded to a MS SQL instance.

Issue in CSR generation

Error Message	Possible Cause	Possible Solution
CSR Submission Failed	User may have restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issue in Push and Rollback

Error Message	Possible Cause	Possible Solution
Error while pushing certificate in Device : <device name>.PrivateKey not available.	Private key is not available to parse certs.	Kindly ensure to push certs with private key.If privatekey is available in device please select privateKeyInDevice option.
Error: “/LOCAL_MACHINE/ CertificateAuthority” does not exist	CertificateAuthority Store is removed from the Store	Create a CertificateAuthority store.

AppViewX Integration with MDM devices

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Lifecycle Management with Mobile Device Management (MDM)

Mobile Device Management

Mobile Device Management (MDM) is a type of security software used by IT departments to monitor, manage, and secure employees' mobile devices such as smartphones and tablets. It involves the following steps:

- **Enrollment** - This step includes enrolling the mobile device into the MDM system. This can be done manually by the user or automatically through methods such as QR codes, email links, or by connecting to a company network.
- **Configuration** - Administrators create configuration profiles that define the settings and policies for the devices. These profiles can include Wi-Fi settings, VPN configurations, email settings, and more.
- **Deployment** - Once profiles and policies are created, they are pushed to the enrolled devices. This can happen over the air (OTA) through cellular or Wi-Fi connections.
- **Management** - Administrators can remotely manage the devices. This includes pushing updates, locking or wiping devices if they are lost or stolen, and troubleshooting issues.
- **Security** - MDM ensures that corporate data is protected through encryption, secure access controls, and the ability to remotely wipe data if a device is compromised.
- **Compliance** - Administrators can generate reports and audit trails to ensure compliance and for review purposes.

Integration of Mobile Device Management (MDM) with Auto-Enrollment Protocols

Mobile Device Management (MDM) systems often support auto-enrollment protocols like SCEP, EST, etc to streamline the process of enrolling devices into the management system. Auto-enrollment simplifies the initial setup for users and ensures that devices comply with organizational policies from the moment they are activated.

Benefits of using MDM with Auto-Enrollment Protocols:

- **Automation** - Automates the certificate issuance and renewal process, reducing administrative overhead and minimizing the risk of errors.
- **Scalability** - Easily scales to manage certificates for a large number of devices.
- **Seamless User Experience** - Provides a seamless experience for users, who don’t need to manually request or install certificates.

Use Cases:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Wi-Fi Authentication** - Devices use certificates to authenticate to secure Wi-Fi networks, ensuring only authorized devices can connect.
- **VPN access** - Certificates authenticate devices when connecting to corporate VPNs, providing secure remote access.
- **Email encryption and signing** - Certificates enable secure email communications by supporting encryption and digital signing.
- **Application Authentication** - Certificates authenticate devices and users to enterprise applications, ensuring secure access to sensitive data.

Some of the most popular MDMs that AppViewX integrates with are:

- **Microsoft Intune** - Part of the Microsoft 365 Suite, Intune provides comprehensive MDM and mobile application management (MAM) capabilities. Supports Windows, iOS, Android, and macOS devices.
- **Jamf Pro** - A leading MDM solution for Apple devices, widely used in enterprise and education settings. Supports macOS, iOS and iPadOS.
- **MobileIron** - A UEM platform that focuses on securing endpoints, apps, and cloud services. Support for iOS, Android, Windows, and macOS.

AppVewX Integration with JAMF

What is JAMF

The advantages of using Jamf are as follows:

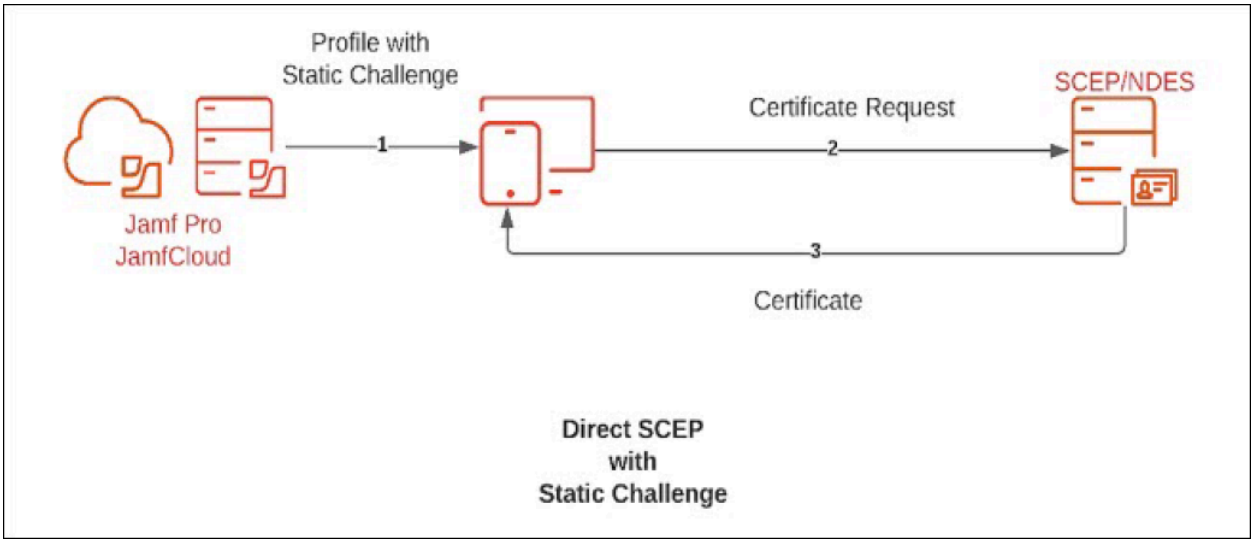
- **The Industry Standard for Apple Device Management** - The various products in the Jamf suite allow for seamless setup and deployment of devices, all offered in a single consolidated solution.
- **Cloud-Based Mobility** - Jamf Now is the ideal solution for small and medium enterprises as it empowers setting up, protecting, and managing devices right from one product.
- **Device Management Tool for The Pros** – An ultimate EMM (Enterprise Mobility Management) tool for your users. Jamf Pro features application and device management, deployment, security capabilities, inventory collection, and more.
- **Enhanced Identity Management** - Jamf Connect offers the flexibility to remotely and centrally manage passwords, groups, and users. It provides access to corporate cloud resources and applications that offer an advanced security and identity approach.
- **Mac-Exclusive Endpoint Protection** - Jamf Protect, developed natively on the iOS architecture offers deep visibility into any operations or threats at the endpoints. It has a dashboard, extensive reporting, and real-time alerts on the built-in security framework for macOS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Deployment Models

SCEP obtains certificates from the CA and distributes them to managed mobile devices, providing a simplified way of handling large-scale certificate distribution. If you do not want computers or mobile devices to communicate directly with a SCEP server, you can configure settings that enable Jamf Pro to proxy the communication between a SCEP server and the computers and mobile devices in your environment. This allows Jamf Pro to communicate directly with a SCEP server to obtain certificates and install them on the device.

Jamf Pro can be configured using computers or mobile devices to communicate directly with a SCEP server.



Prerequisites

1. Disabling the checkbox in the **Global Management** > **PKI Certificates** screen.

    a. Login to JamfCloud (Sample URLs are mentioned below):
        i. **Cloud-hosted**— https://JAMF_PRO_URL.jamfcloud.com
        ii. **On-premise**— https://JAMF_PRO_URL.com:8443

    b. Click **Settings** > **All Settings** > **Global Management** > **PKI Certificates**.

    c. Ensure to disable the checkbox labeled **Enable Jamf Pro as SCEP Proxy for configuring profiles**.

    > **Note:** This is an important step to enable this deployment model.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Configure the **Challenge Password** in the **SCEP Configuration** and **AppViewX** endpoints.

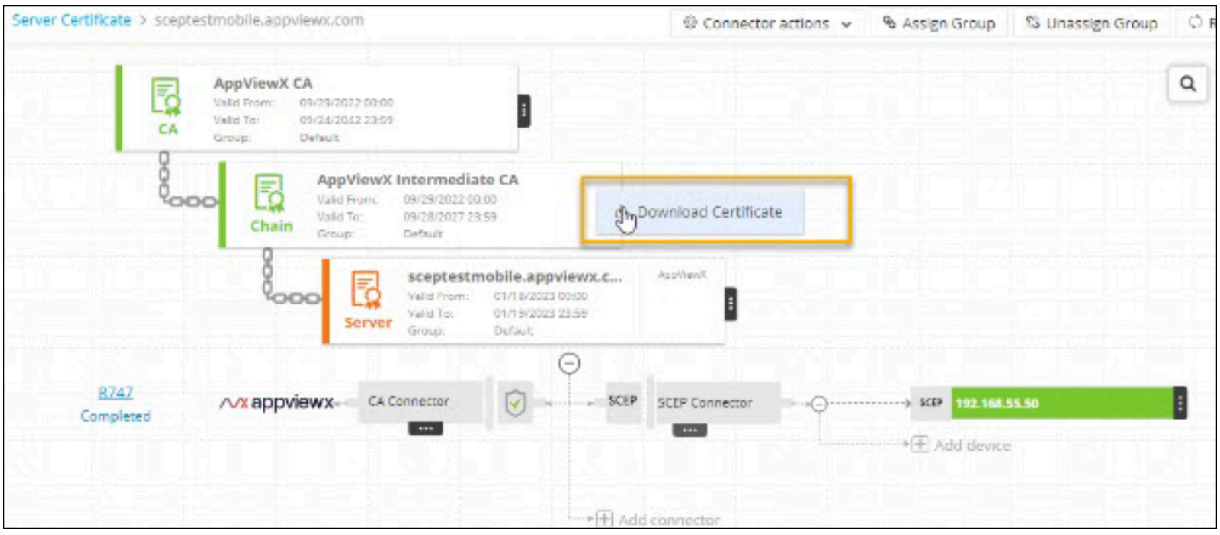
> **Note: Challenge Passphrase** is mandatory for MAC devices to connect to AppViewX SCEP Node.

3. The MAC device should be able to connect to the SCEP server on port 30022.

Direct Communication with SCEP Server

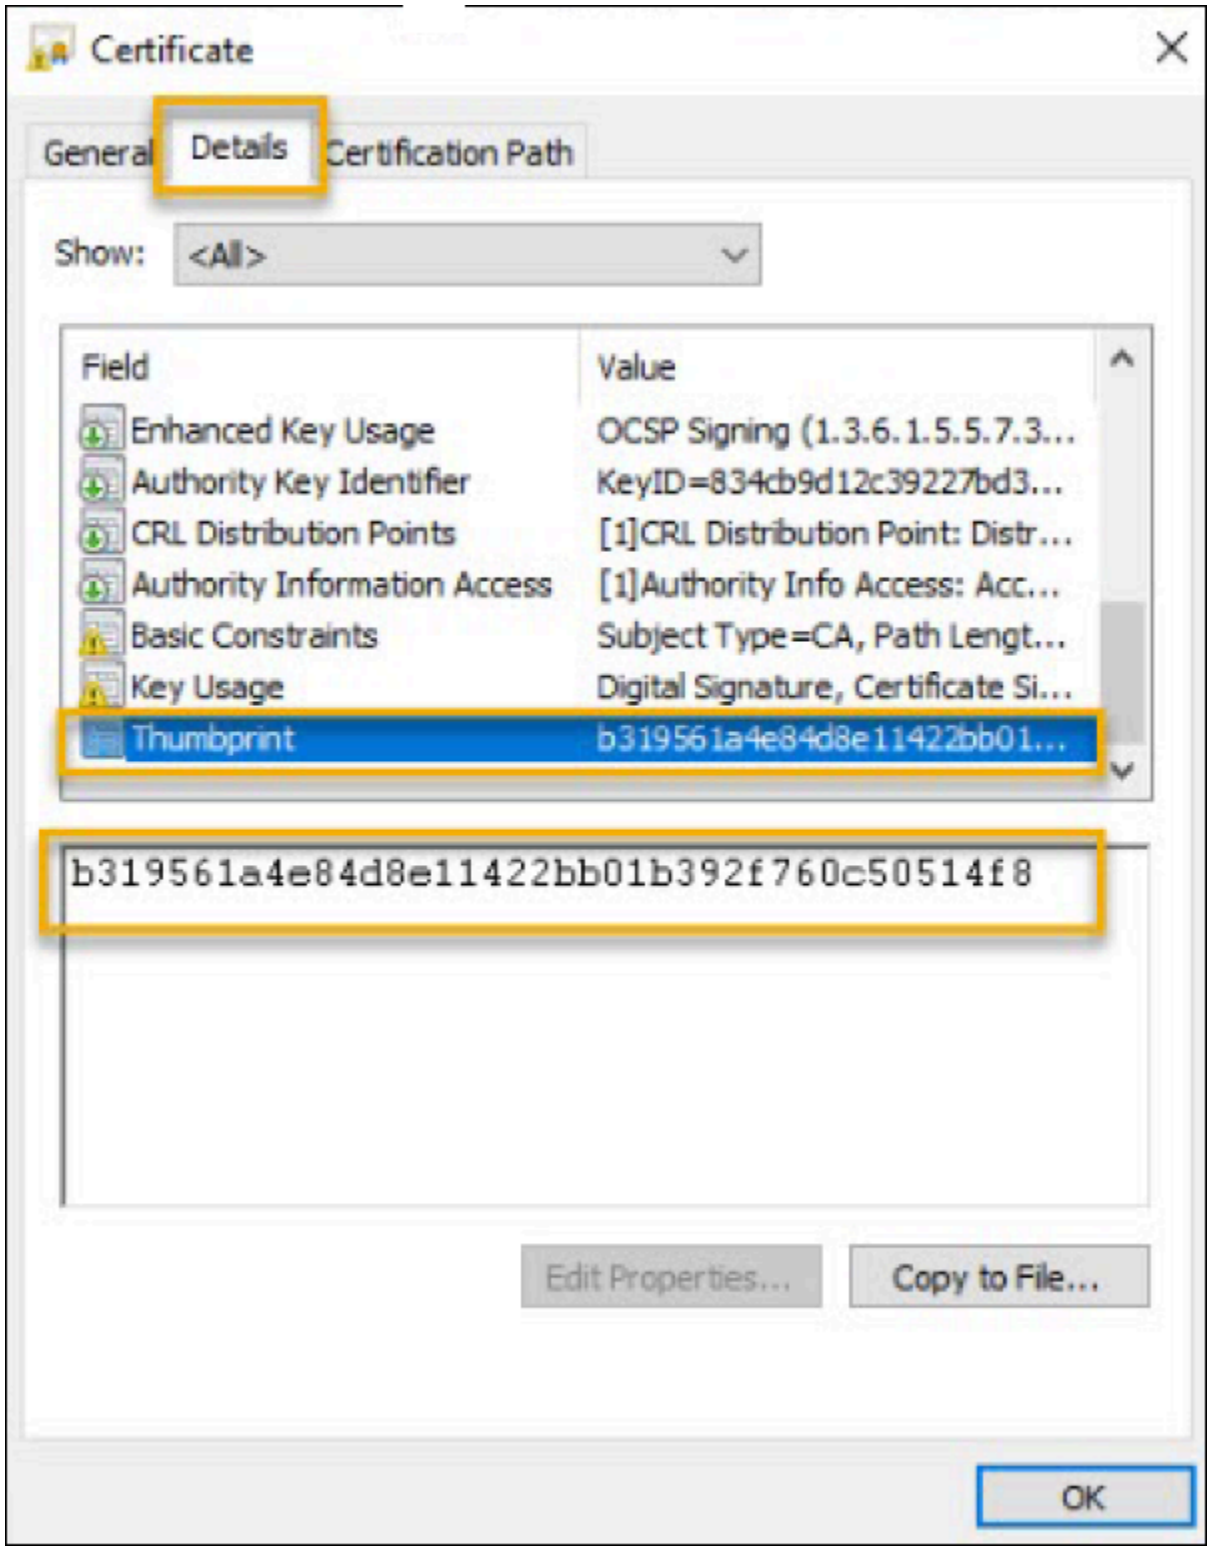
Obtaining the Certificate Thumbprint/Fingerprint

1. Log in to the AppViewX platform using valid credentials.
2. Hover on the menu icon and select CERT+.
3. Click **Certificate Inventory** on the left menu and select the certificate type (Server, Client, or Code Signing).
   The certificates with the common names are displayed on the right.
4. From the **Common Name** column, click on the desired certificate.
   All valid certificates are displayed.
5. Click the desired RA certificate to display the details.



6. Click the three dots on the issuer certificate to display the **Download Certificate** option.
7. Click **Download Certificate** and save the certificate in the desired format.
8. Open the downloaded certificate.

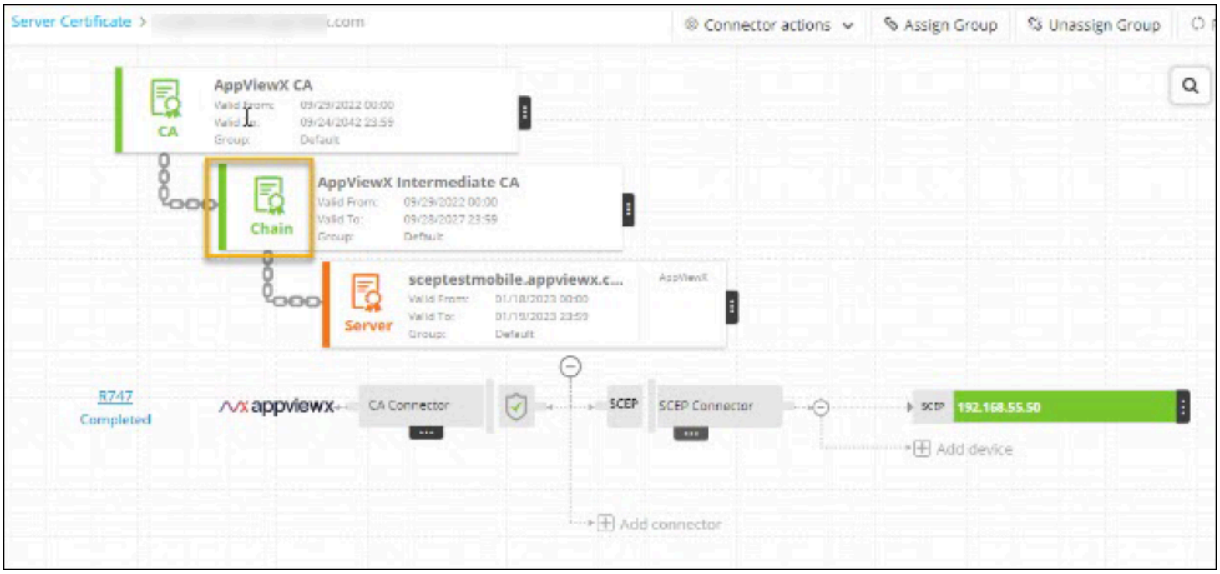
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



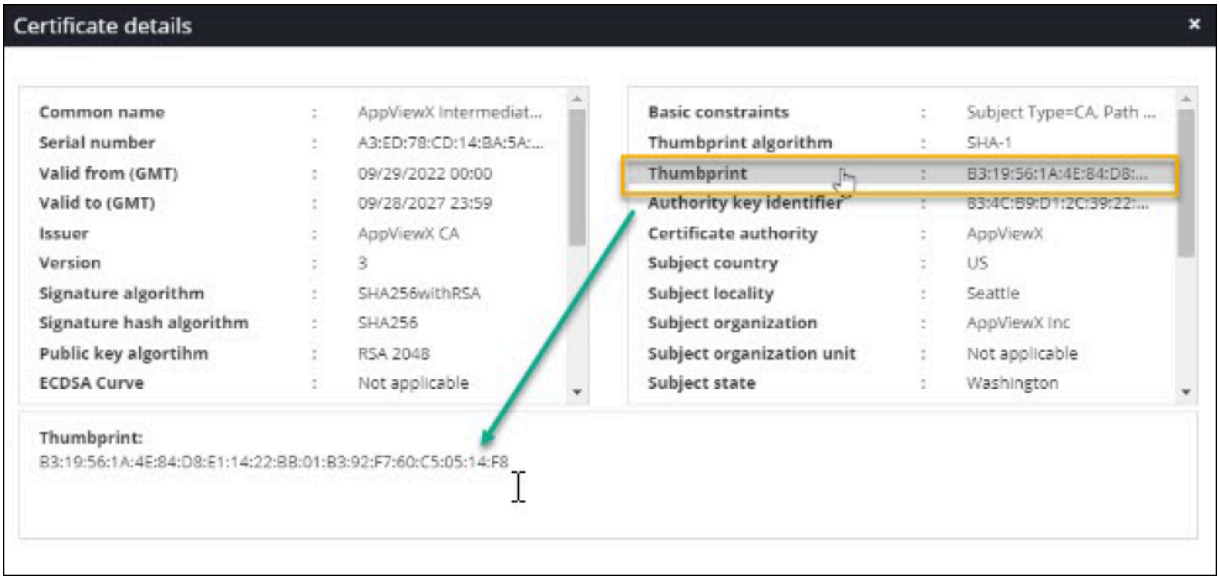
9. Click the **Details** tab and then select the Thumbprint field.
   The full value is displayed in the section below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. Copy this hex value and paste in the text pad. Use this value in the Fingerprint field in JAMF Pro (described in the section below).
    Consequently, another way to obtain the hex value without having to manually delete the colons in the thumbprint can is described below.
11. Execute steps 1 to 5 described above.



12. Click the Issuer certificate.

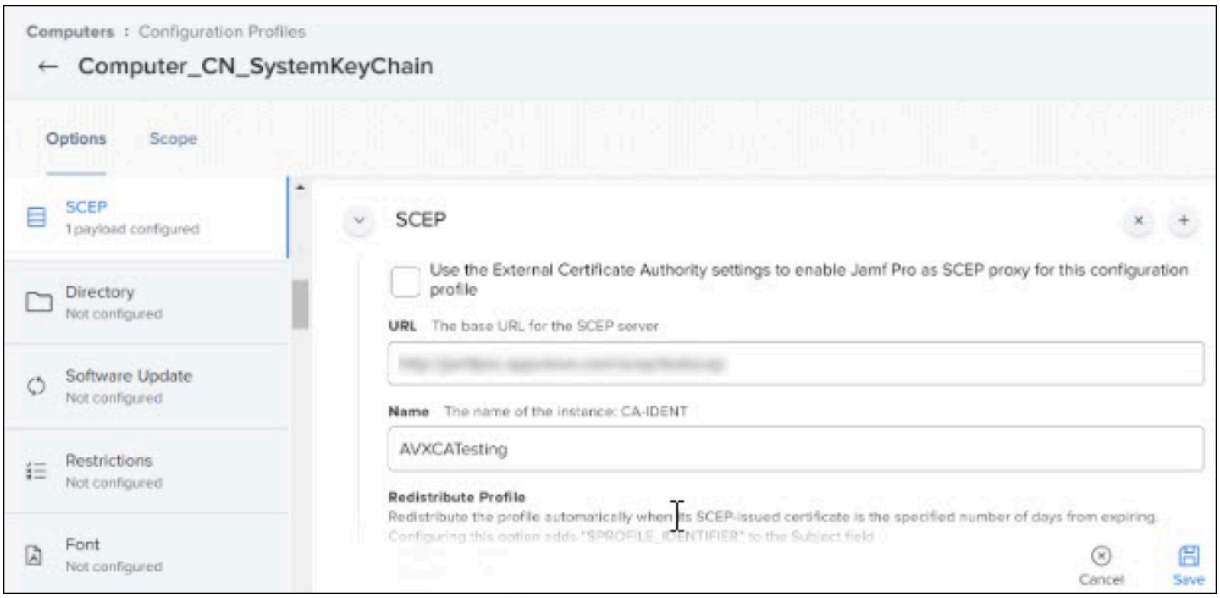


13. In the Certificate Details pop-up, click the **Thumbprint** value.
    The full value is displayed in the section below.
14. Copy this hex value and paste in the text pad. Ensure to remove all the colons before using it in the Fingerprint field in JAMF Pro (described in the section below).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

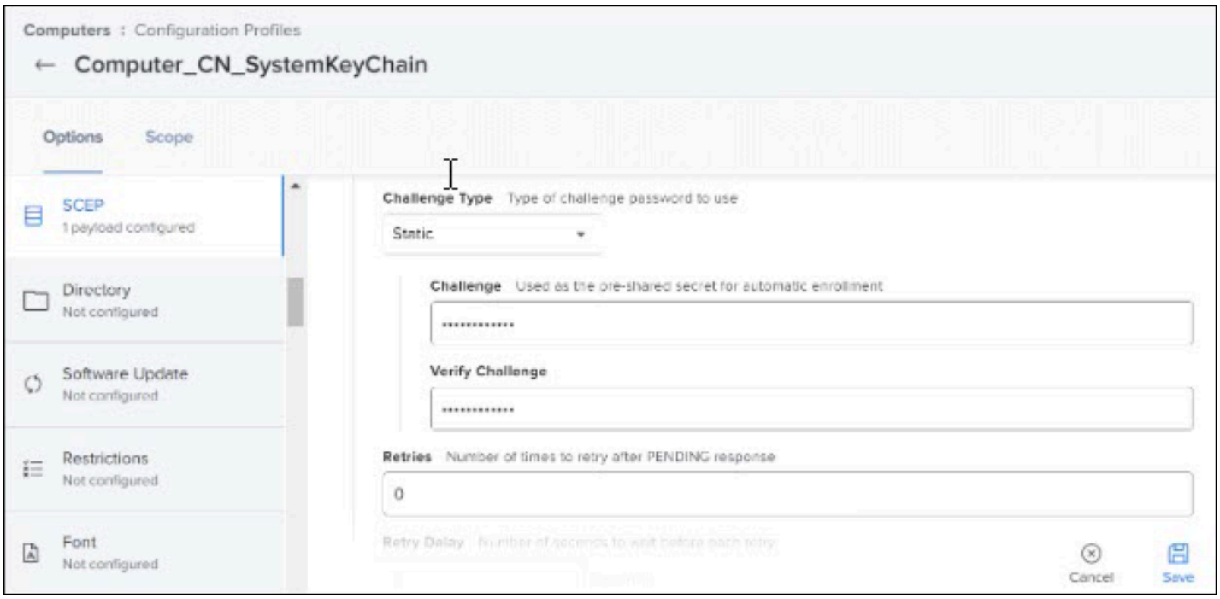
Configuring SCEP

1. Navigate to **SCEP Configuration Profiles** screen.



2. In the **URL** field, enter the AppViewX server's publicly exposed SCEP URL.
3. In the **Name** field, enter the desired name for this configuration.
4. From the **Redistribute Profile** dropdown, choose a value to specify the number of days before the certificate needs to be renewed. For example, if you want a certificate to be renewed 15 days before expiry, then set the **Redistribute Profile** to 15 days.
5. In the Subject field, enter the variable names. The $ (dollar) sign may be used with the variable name. Refer to the Mobile Device Configuration Profiles page to learn about the variable names supported in Jamf.
6. From the **Subject Alternative Name Type** dropdown, select *None*.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



7. From the Challenge Type dropdown, select the following:

   a. **Static** - If you want all computers and mobile devices to use the same challenge password, choose “Static” and specify a challenge password. The challenge password will be used as the pre-shared secret for automatic enrollment.

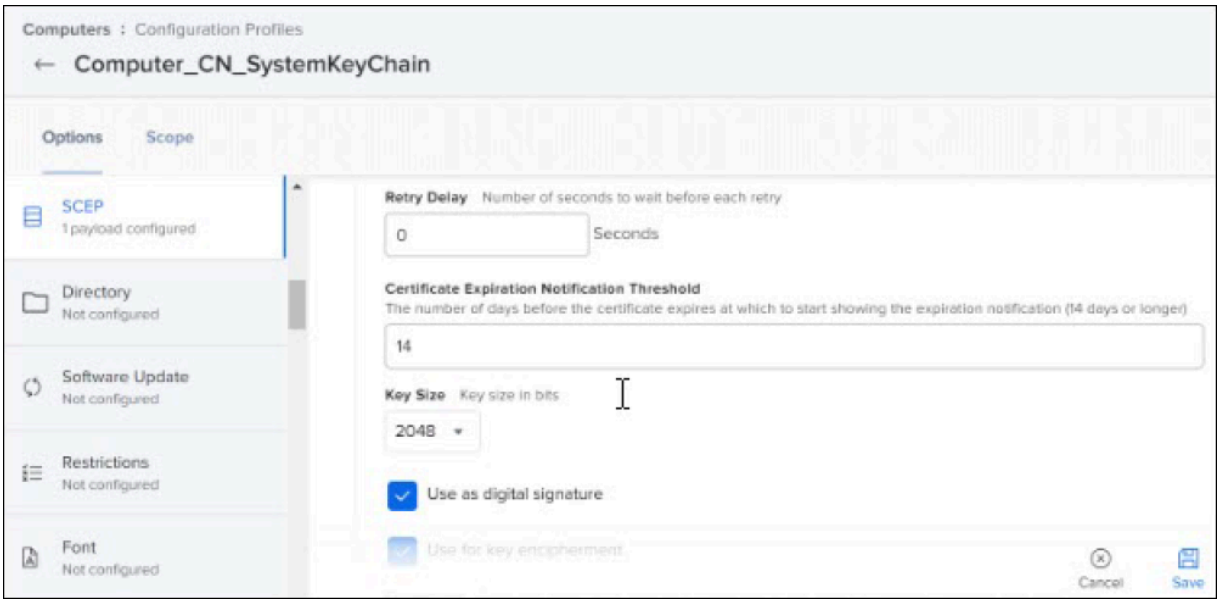
   b. **Dynamic** - If you are using a non-Microsoft CA and you want each computer and mobile device to use a unique challenge password, choose “Dynamic”. The Dynamic challenge type requires use of the Classic API and membership in the Jamf Developer Program. The Dynamic challenge uses the "Fingerprint" or "Thumbprint" to authenticate the user instead of a username and password. The Thumbprint hash value for the **Fingerprint** field in Jamf Pro can be found on the profile you receive. Before selecting this option, contact your Jamf account representative to learn more about the Jamf Developer Program and the additional steps you need to take to use this option.

   > **Note:** Currently, CERT+ does not support the dynamic challenge passphrase.

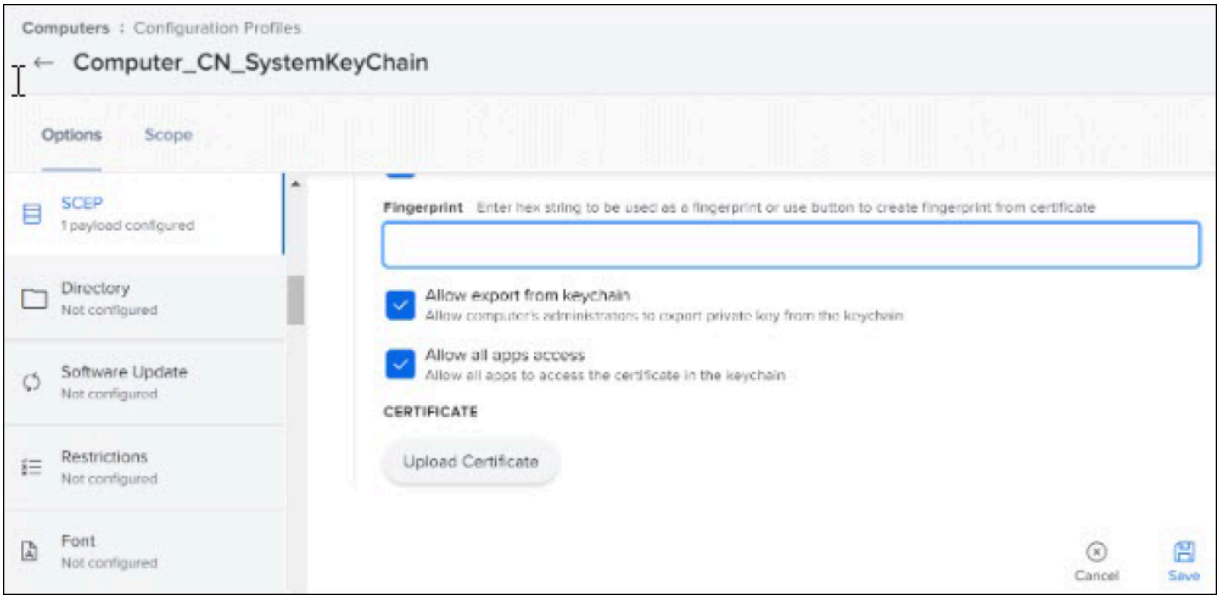
8. In the **Challenge** and **Verify Challenge** fields, enter the AppViewX SCEP Challenge Password configured in AppViewX SCEP UI.

> **Note:** This is a mandatory step. The Challenge password is mandatory while using this deployment model. The same challenge password set in the prerequisite should be configured in the JAMF.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

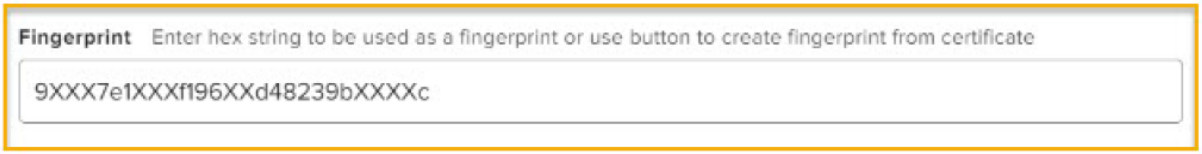


9. In the **Retry Delay** field, enter a desired value (in seconds).
10. In the **Certificate Expiration Notification Threshold** field, enter the number of days before the certificate expiration at which a notification will start displaying.
11. From the **Key Size** dropdown, select value *2048*.
12. Select the checkboxes **Use as digital signature** and **Use for key encipherment**.



13. In the **Fingerprint** field, enter the hex string to be used as a fingerprint.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

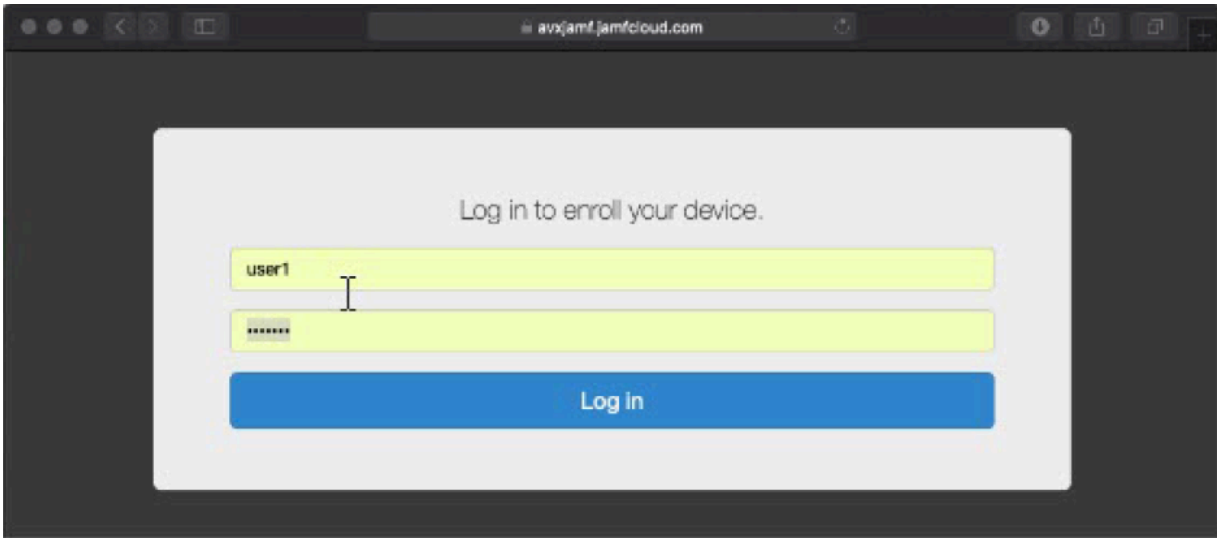


14. Select the checkboxes **Allow export from keychain** and **Allow all apps access**.
15. Click **Save**.

Initiating the Enrollment from a Device

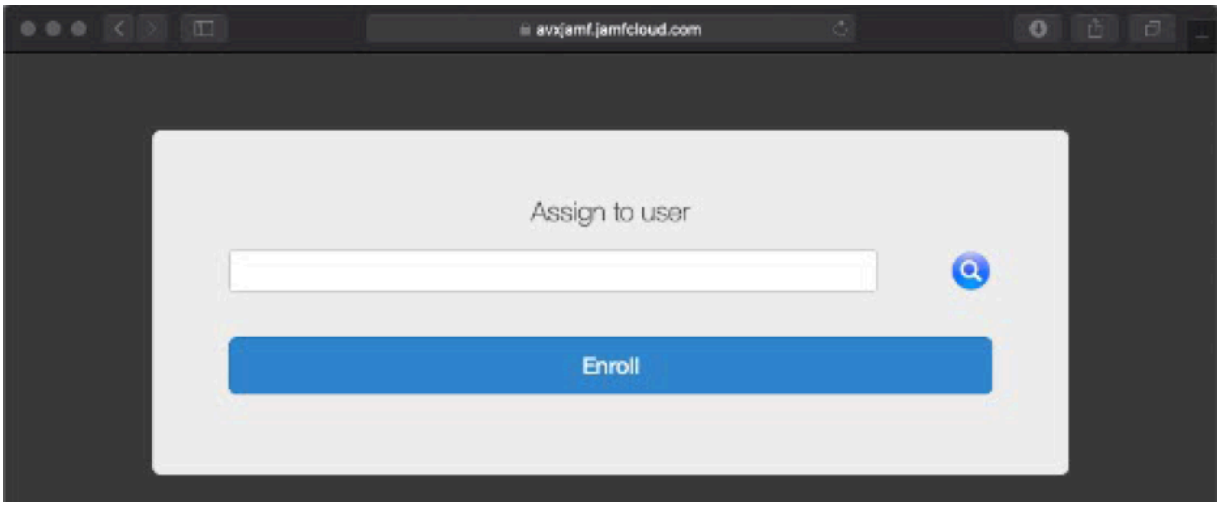
This section provides details of testing the Jamf cloud configuration performed in the previous section. It is recommended to open the JamfPro Enrollment URL using a Safari browser, as other browsers are not capable of identifying the received configuration profile and installation to the machine. Follow the instructions shown in the MacOS screen.

1. Enter the URL, for example - https://avxjamf.jamfcloud.com/enroll/ in the Safari browser.
2. Enter a valid username and password.

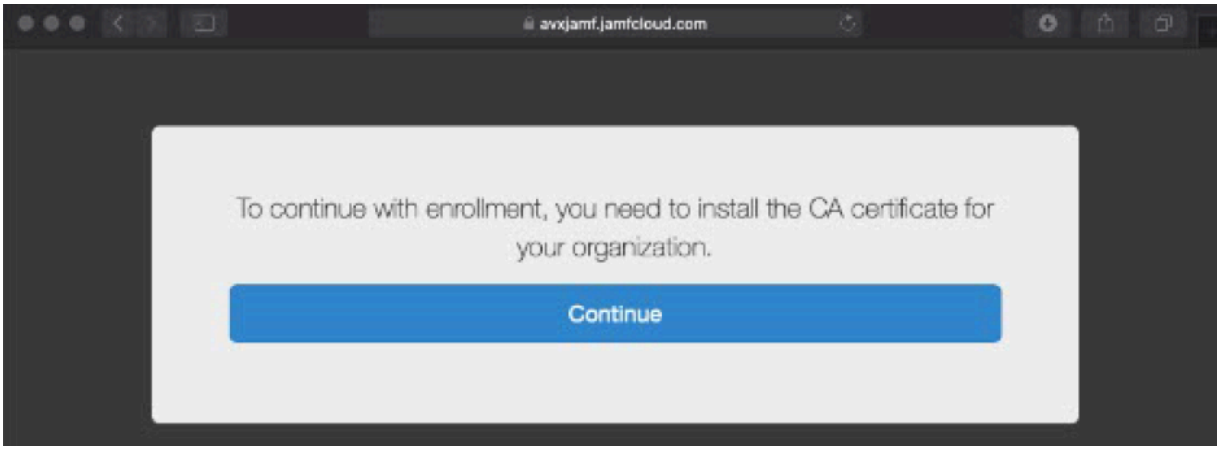


3. Leave the **Assign** to user field empty and click **Enroll**.

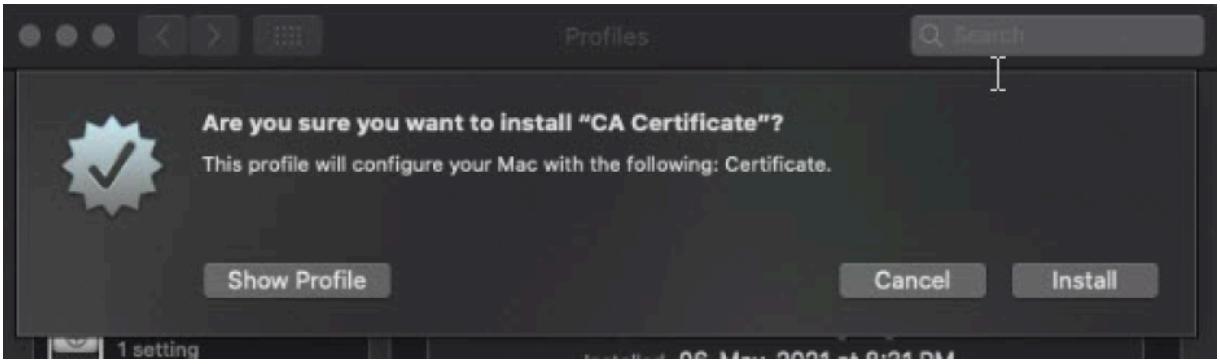
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. To continue with the enrollment (installation of CA certificate), click **Continue**.

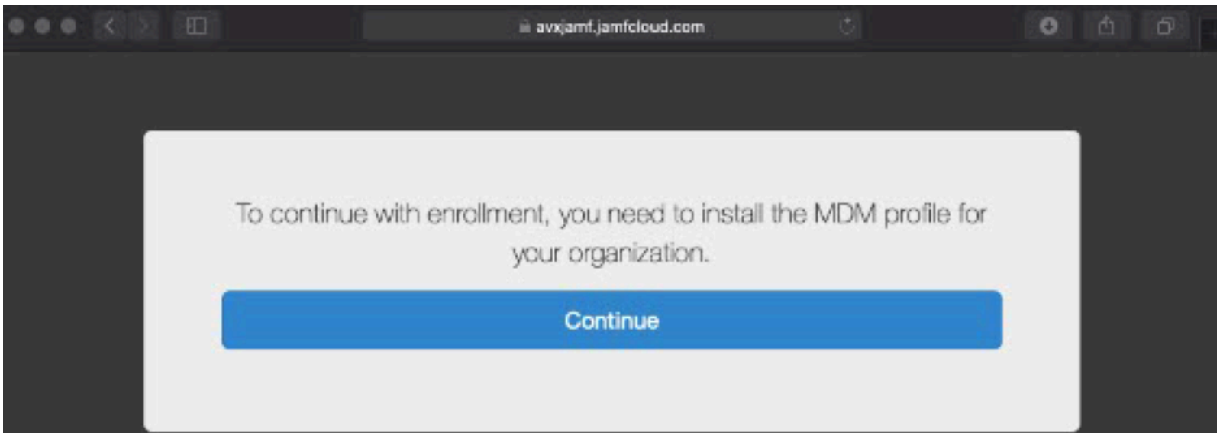


5. To confirm installation of the CA Certificate, click **Install**.

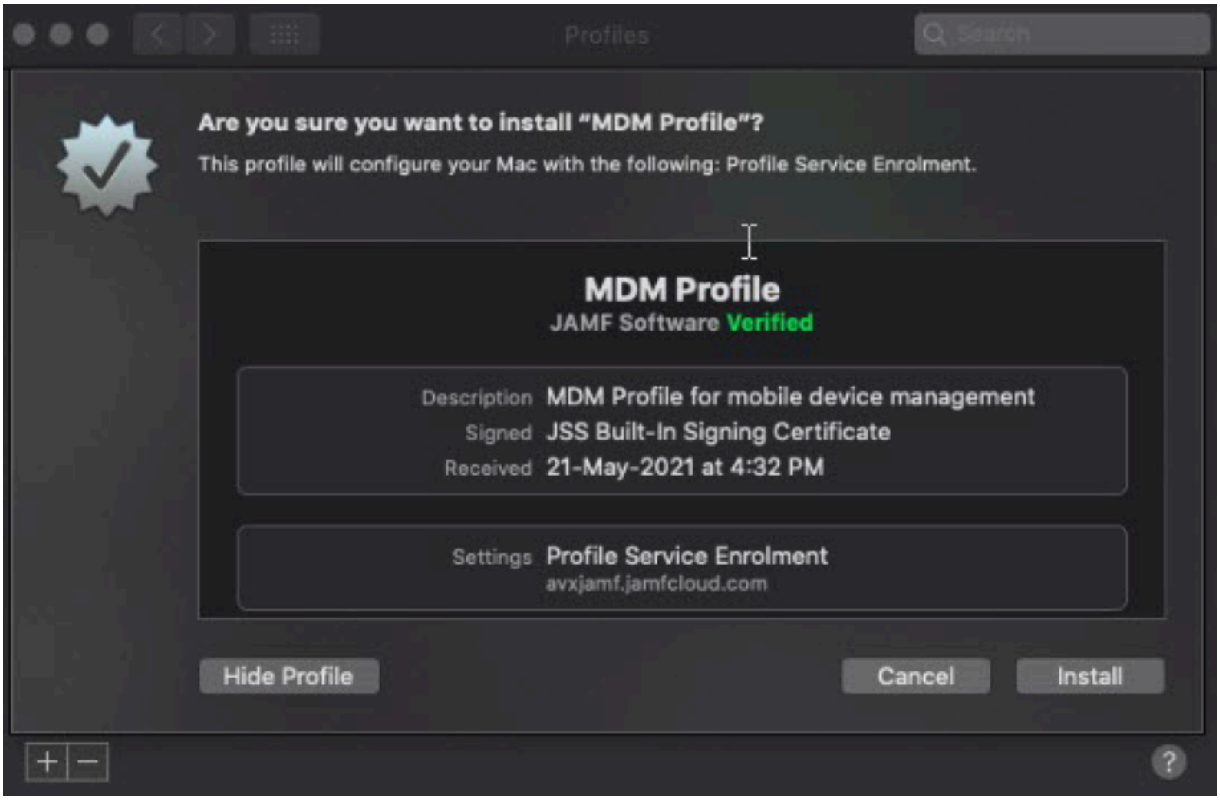


6. To continue with the enrollment (installation of the MDM profile), click **Continue**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



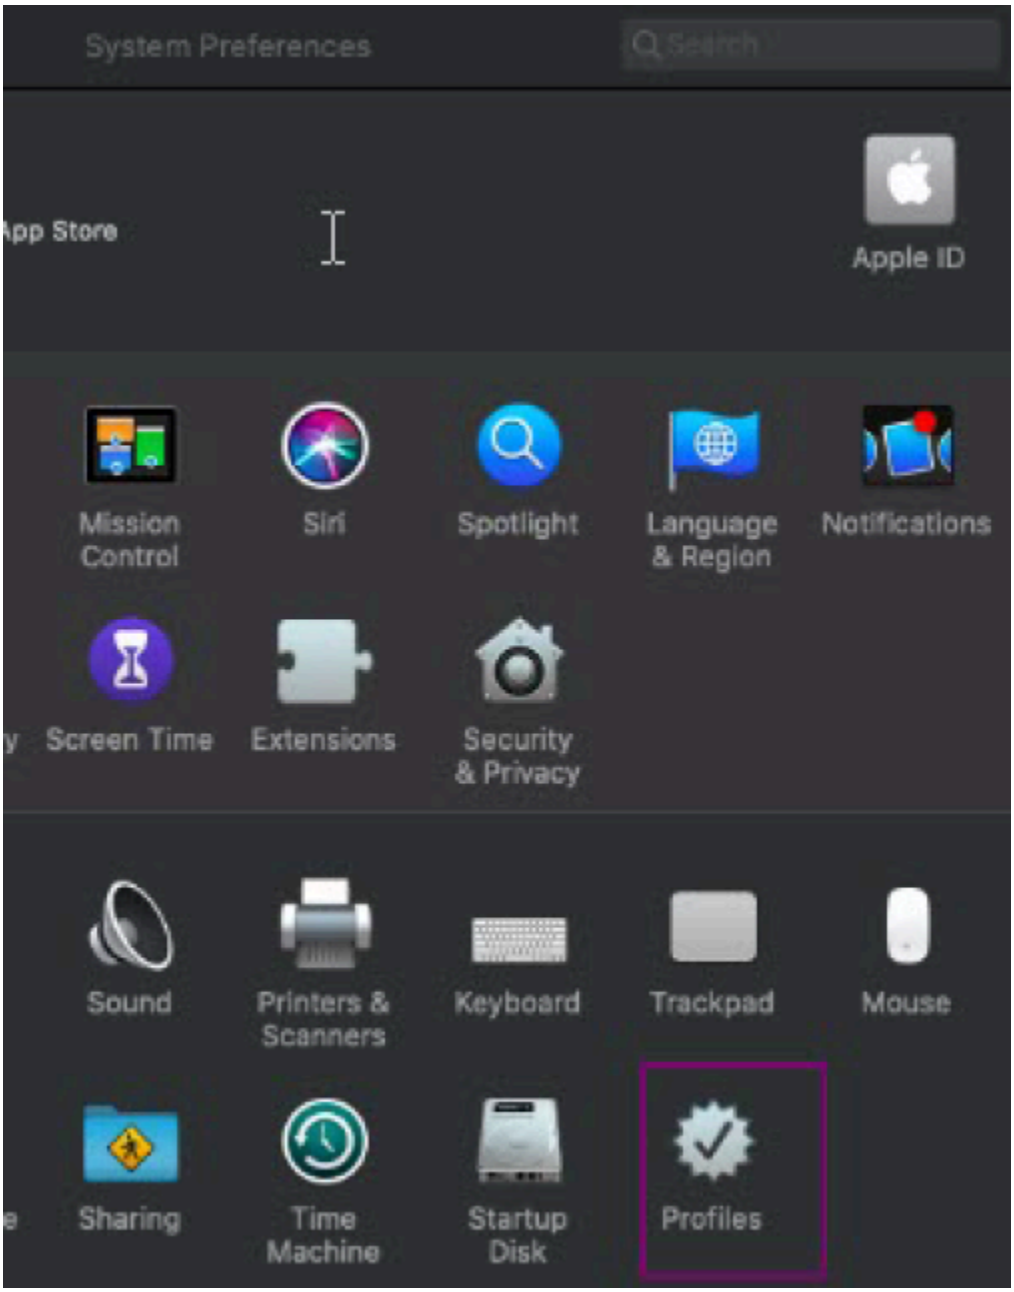
7. To confirm installation of the MDM Profile, click Install, and enter the valid credentials to carry out the installation.



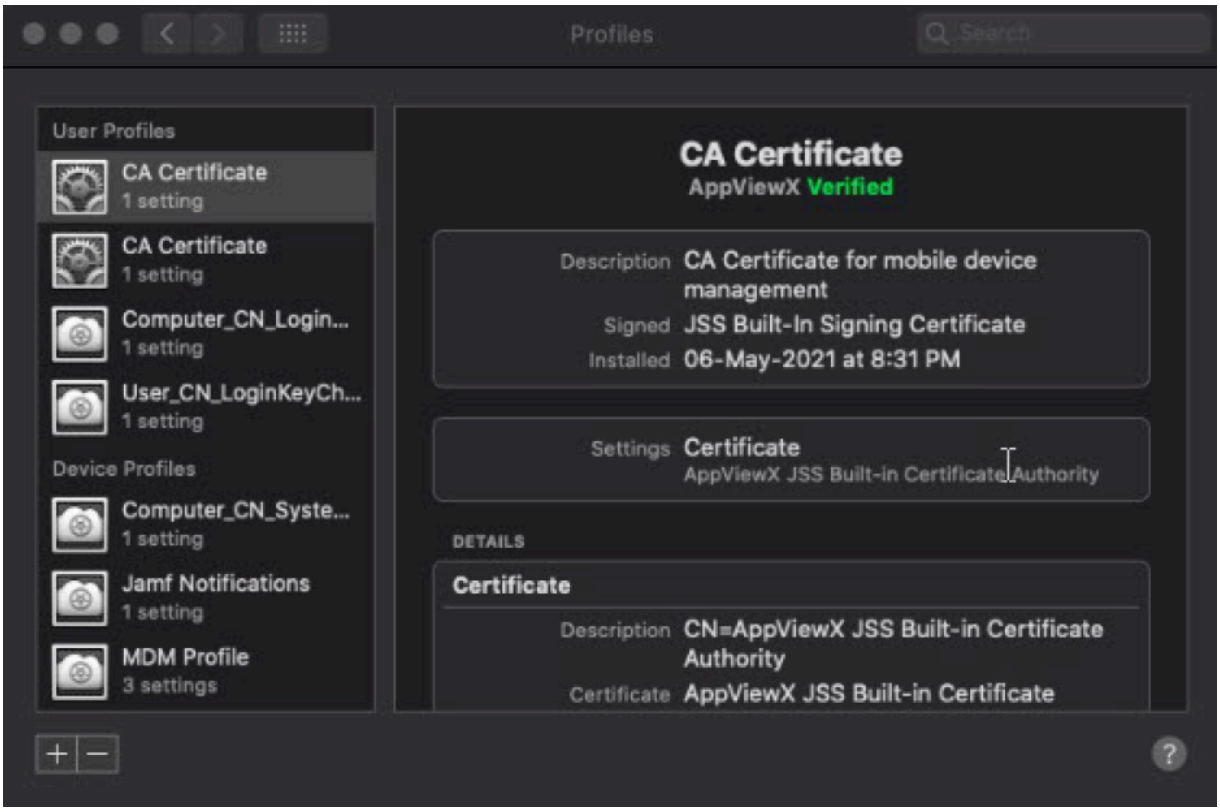
8. After the installation is complete, the following message is displayed – "The enrollment process is completed."
9. Wait for approximately one minute for the installation of the Profile and Certificate. (Profile contains SCEP configuration and during the installation process, the device directly sends a SCEP request to the AppVIewX Server.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. After the installation, the profiles can be verified by clicking **System Preferences** > **Profile**. All the installed profiles must be visible.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: Deleting the MDM profile deletes all the information from the Profiles. A fresh enroll may be tried later.

11. To verify the certificate, navigate to **Keychains** (User/System) and validate the certificates that were Installed for each configuration profiles with the respective CN Name.

Chapter 7: Glossary

Terms	Definition
ACME	Automatic Certificate Management Environment (ACME) protocol is a communications protocol for automating the certificate enrollment to the CA and provisioning the certificate on the requesting entity.
CAA Record	A Certificate Authority Authorization Record specifies which certificate authority is allowed to issue certificate for a domain. If a certificate has CAA record, it means only the CAs listed in the CAA record are allowed to issue a certificate for the domain. If there is no CAA Record, it means any CA can issue certificate for the domain.
Certificate authority (CA)	CA is an entity that verifies the identities of entities such as websites, email addresses, companies, or individuals and links them to cryptographic keys using digital certificates.
Certificate Authority (CA)	A certificate authority or certification authority is an entity that issues digital certificates. It certifies the ownership of the key pair belongs to the subject within the certificate.
Certificate enrollment	This is the process by which a user requests a digital certificate from a Certificate Authority (CA).
Certificate revocation	It is the way in which a certificate is invalidated or revoked before its expiration date. Revoked certificates are listed in the Certificate Revocation List (CRL) maintained by each certificate authority.
Certificate Revocation List (CRL)	Contains a list of digital certificates that have been revoked by the issuing certificate authority before their scheduled expiration date and should no longer be trusted.
Certificate Signing Request (CSR)	It is a message sent to a certificate authority to request a digital identity certificate.
EST	The **Enrollment over Secure Transport** or **EST** is a cryptographic protocol that describes an X. 509 certificate management protocol targeting public key infrastructure (PKI) clients that need to acquire client certificates and associated certificate authority (CA) certificates. **EST** is described in RFC 7030

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Terms	Definition
Heart bleed	**Heartbleed** is a serious vulnerability in the OpenSSL cryptographic library (versions 1.0.1 to 1.0.1f) that allows attackers to access a server's or client's memory, potentially exposing sensitive data such as private keys, passwords, or session cookies. The flaw lies in OpenSSL's implementation of the TLS heartbeat extension, which an attacker can exploit to trick the server into returning chunks of memory that may contain confidential information.
Identity	The digital certificate can also be called a Digital ID or Identity for the subject to whom it is certified.
KMIP	The Key Management Interoperability Protocol is a communication standard protocol that defines message formats for the management of cryptographic keys on a key management server.
MDM	Mobile Device Management (MDM) is the administration of mobile devices, such as smart phones, tablet computers, and laptops.
PKI	A public key infrastructure (PKI) is a technology containing a set of roles, policies, and procedures needed to create, distribute, store and revoke digital certificates and manage public-key encryption.
POODLE	**Padding Oracle on Downgraded Legacy Encryption (POODLE)** is a vulnerability in the outdated SSL 3.0 protocol that allows a man-in-the-middle attacker to decrypt encrypted data, especially in browsers that fallback to SSL 3.0 for compatibility.
Private key	A private key is a secret key that is used to decrypt data and create digital signatures. It must be kept secret and never shared with anyone. The private key is used to authenticate the user and establish a secure connection with the server.
RA (Registration Authority)	It is an entity that verifies the identity of individuals or organizations requesting digital certificates from a CA to ensure only legitimate entities receive them.
ROCA	**Return of Coppersmith's Attack (ROCA)** is a vulnerability in the RSA key generation algorithm that allows an attacker to recover the private key

	from a public key, potentially compromising systems relying on the affected keys.
SCEP	Simple Certificate Enrollment Protocol (SCEP) is an IETF RFC. This enables network user to request their digital certificate electronically and as simply as possible. Supported by most of the network devices.
SSL/TLS Certificates	SSL refers to Secure Sockets Layer whereas TLS refers to Transport Layer Security. Both are cryptographic protocols providing secure data communication in a network.
URI	**URIs** uniquely identify a resource and can take the form of either a URL or a URN. A **URL** is a resolvable address that specifies where a resource is located on the internet. It typically starts with **http://** or **https://** (for example., https://example.com). URLs are commonly used to identify web services or endpoints in certificates. The same is also applicable for SFTP. A **URN** is a persistent, non-resolvable identifier that names a resource without indicating its location. It typically follows the format urn:<namespace>:<resource> (for example, urn:oid:1.2.3.4). URNs are used in environments where stable identifiers are needed, such as IoT or standards-based systems. To add multiple URIs, separate them with commas. Each entry will be added as a distinct SAN value in the certificate.
X.509 Digital Certificate	X.509 is a standard defining the format of public key certificates. An X.509 certificate is using the widely accepted public key infrastructure (PKI) standard to verify that a public key belongs to the user, computer or service identity contained within the certificate.
