Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	Note: Here, instanceNr refers to the last two numeric characters in the Instance ID. If the instance ID is D00, then the -nr should be '-nr 00'.	

Discovery

- SAP uses its cryptographic tool called *sapgenpse*. Using this tool, we can create a .PSE file and export the certificate from the PSE file. (Personal Security Environment).
- **Types of PSE file supported:**
  1. Server Standard PSE (SAPSSLS.pse)
  2. Client PSE
     a. Anonymous (SAPSSLA.pse)
     b. Standard (SAPSSLC.pse)
  3. Web Service PSE (SAPWSSE.pse)

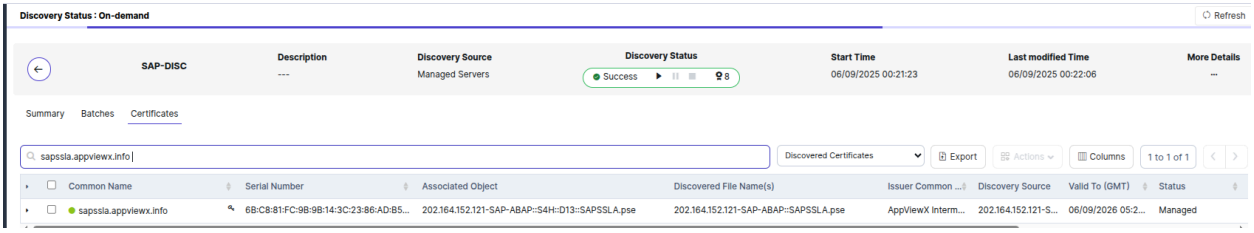
Command	**Description**	Are the commands executed with `sudo` or `dzdo` when access elevation is enabled in the UI?
`su - {sid}adm -c "cd /usr/sap/{SID}/{Instance}; find /usr/sap/{SID}/{Instance} -name SAPSSLS.pse -o -name SAPSSLA.pse -o -name SAPSSLC.pse -o -name SAPWSSE.pse"`	This command checks for the presence of **specific SAP PSE (Personal Security Environment) certificate files** within a given SAP Web Dispatcher instance directory, using the `{sid}adm` user.	Yes
`su - {sid}adm -c "mkdir -p / fileUploadTempPath/{transactionalFolder} "`	This command creates a transactional temp directory inside the `/{fileUploadTempPath}` given in the UI.	Yes
`su - {sid}adm -c "chmod 777 / {fileUploadTempPath}/{transactionalFolder}"`	This command changes the **permissions** of the transactionalFolder to be **rwx by all users** (`777`)	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

su - {sid}adm -c "sapgenpse export_p12 -z \"\" -p /usr/sap/{SID}/{Instance}/sec/{pse} / {fileUploadTempPath}/{transactionalFolder}/SAPSSLA.p12"	This command **exports the SAP PSE (Personal Security Environment) certificate** in **PKCS#12 (.p12) format to the temp directory**.	Yes
su - {sid}adm -c "openssl pkcs12 -in / fileUploadTempPath/{transactionalFolder}/SAPSSLA.p12 -out / fileUploadTempPath/{transactionalFolder}/SAPSSLA.txt -nodes -passin pass:"	To convert the `.p12` certificate bundle into a **plaintext PEM format** containing the certificate and private key,	Yes
su - {sid}adm -c "cat / fileUploadTempPath/{transactionalFolder}/SAPSSLA.txt"	To **view the contents** of the extracted SAP SSL certificate and key file	Yes

Discovery cert-profile association:

For each instance and its supported PSE files, AppViewX will discover the certificates and generate a profile named in the following format:



Profile Naming Convention: deviceName::sid::instance::pse

202.164.152.121-SAP-ABAP::S4H::ASCS14::SAPSSLC.pse
202.164.152.121-SAP-ABAP::S4H::ASCS14::SAPSSLS.pse

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CSR Generation at Endpoint

The **Replace PSE File** checkbox enables users to generate the new CSR and private key in the Server. This checkbox is displayed only in the case described below:

1. Select the **CSR Generation** option as **Endpoint**.
2. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names.
3. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated.

The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.

Command	**Description**	Are the commands executed with `sudo` or `dzdo` when access elevation is enabled in the UI?
`su - {sid}adm -c "test -f <file_path> && echo exist || echo not exist"`	Check if the PSE file **exists**and is a regular file.	Yes
`su - {sid}adm -c "cp /usr/sap/S4H/D13/sec/SAPSSLA.pse / usr/sap/S4H/D13/sec/backup/SAPSSLA.pse_bkp_1721623695188"`	This creates a backup of the existing PSE file	Yes
`su - {sid}adm -c "chmod 755 / usr/sap/S4H/D13/sec/backup/SAPSSLA.pse_bkp_1721623695188"`	This command changes the permissions of the backup file.	Yes
`su - {sid}adm -c "rm /usr/sap/S4H/D13/sec/SAPSSLA.pse"`	When Replace PSE Enabled → Then remove the original pse file	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

su - {sid}adm -c "sapgenpse gen_pse -p /usr/sap/S4H/D13/sec/SAPSSLA.pse -r /tmp/S4HD13SAPSSLA-csr-1721623774652.p10 -x \"\" -a RSA:2048:SHA256 -k GN-dNSName:appviewx123.test.com 'CN=appviewx123.test.com'"	When Replace PSE Enabled → Generates a new SAP SSL PSE file.	**Yes**
su - {sid}adm -c "sapgenpse gen_pse -p /usr/sap/WDP/W00/sec/SAPSSLS.pse -onlyreq -r /tmp/incorrectprofile.p10 -x "" -a RSA:2048:SHA256 -k GN-dNSName:incorrectprofile "CN=incorrectprofile""	When Replace PSE Not Enabled → this command would create the Certificate Signing Request (CSR), not the full PSE file	**Yes**
su - {sid}adm -c "cat /tmp/S4HD13SAPSSLA-csr-1721623774652.p10"	Read the CSR content	**Yes**
su - s4hadm -c "rm -f /tmp/S4HD13SAPSSLA-csr-1721623774652.p10"	Remove this transactional file created to hold the CSR content.	**Yes**

Push Support

- Only the certificate enrolled at the endpoint can be pushed to the end device.
- [WebDispatcher] The certificate in P12 format will be uploaded to the SAP temporary directory using SFTP.
- Pushing Root and Intermediate Certificates is enabled by default and cannot be disabled.
- [WebDispatcher] Based on the profile selection, select the **PSE Type**.
- Select the same profile that is used to enroll a certificate at the endpoint.

Bind Support

WebDispatcher

Command	**Description**	Are the commands executed with `sudo` or `dzdo` when access elevation is enabled in the UI?

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

su - {sid}adm -c "sapgenpse import_own_cert -p /usr/sap/WDP/W00/sec/SAPSSLS.pse -c /tmp/SAPSSLS_W00_temp_20250530084259.txt"	Import the pushed certificate from the temp directory to the selected profile PSE file.	Yes
su - <SID>adm -c "sapgenpse get_my_name -p /usr/sap/WDP/W00/sec/SAPSSLS.pse	Check if the bind is successful.	
su - {sid}adm -c "rm -f /tmp/SAPSSLS_W00_temp_20250530084259.txt	Remove the temp transactional file	Yes
The below commands will be executed based on the Service restart request		
su - <SID>adm -c "sapcontrol -nr <instance_number> -function Stop"	Stops the SAP instance	Yes
su - <SID>adm -c "sapcontrol -nr <instance_number> -function GetProcessList"	To check if the instance is stopped fully.	Yes
su - <SID>adm -c "cleanipc <instance_number> remove"	This command cleans up IPC resources like shared memory and semaphores that may not have been properly released, usually after an unclean SAP shutdown.	Yes
su - <SID>adm -c "sapcontrol -nr <instance_number> -function Start"	To start the SAP instance	Yes

ABAP

```
curl -kv -X POST "https://{ip}}:44313/sap/bc/srt/rfc/sap/zws_update_ssl/300/zws_update_ssl/zbind_update_ssl" \
 -H "Content-Type: text/xml;charset=UTF-8" \
 -H "SOAPAction: urn:sap-com:document:sap:soap:functions:mc-style:ZUpdSslCert" \
 -u <Web Service User ID>:<Web Service Password> \
 --data '<?xml version="1.0" encoding="utf-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
                  xmlns:urn="urn:sap-com:document:sap:soap:functions:mc-style">
 <soapenv:Header/>
 <soapenv:Body>
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  <urn:ZUpdSslCert>
    <ImOwncert>X</ImOwncert>
    <ImCert>
      ...root, Intermediate and signed certificate.
    </ImCert>
    <ImPsename>{PSE_FILE_NAME.pse}</ImPsename>
    <ImHost>{HOSTNAME}</ImHost>
    <ImInstanceno>{INSTANCE_ID}</ImInstanceno>
  </urn:ZUpdSslCert>
 </soapenv:Body>
</soapenv:Envelope>'
```

The response XML will be as follows:

```
<soap-env:Envelope xmlns:soap-env="http://schemas.xmlsoap.org/soap/envelope/">
  <soap-env:Header/>
  <soap-env:Body>
  <n0:ZUpdSslCertResponse xmlns:n0="urn:sap-com:document:sap:soap:functions:mc-style">
    <ExError/>
  </n0:ZUpdSslCertResponse>
  </soap-env:Body>
</soap-env:Envelope>
```

If the ExError tag is empty, it means the certificate updation is successful. If there are any errors, the ExError tag will have ‘X’ in it and another tag ExText will contain the error details.

Note: In the event of a failure during the bind operation, an automatic rollback will be performed by restoring the backup PSE file.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.

4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Limitations

WebDispatcher

SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. So if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.

ABAP

Service Restart functionality has been disabled for SAP ABAP. Use the postscript execution.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Tomcat (Linux)

Refer to Automating CLM for Tomcat (Linux).

Tomcat (Windows)

Prerequisites

- The Tomcat server must be in the running state. This can be validated by checking services in Windows Task Manager.
- Ensure that the target Hostname is accessible from the Windows Gateway Agent.
- The user must have the necessary permissions to access, download, and upload the **server.xml** and the certificate files associated with the configured settings. (Read and Download permissions should be granted to the user as configured.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The directory path containing the **server.xml** file must be specified as the **Installation Directory** during device onboarding.
- Users can manage the Tomcat installed on any drive; however, the account used to manage Tomcat in AppViewX must be configured as a **local administrator** and must have access to both the **Installation Directory** and the **server**.
- Tomcat must be present in the specified directory path, where at least one folder name should include Tomcat.
- To perform certificate discovery, SSL must be enabled on the connector for the respective service. `SSLEnabled="true"` ensures that the connector supports SSL, which is required for certificate discovery.
- Certificates located in paths without the required user permissions cannot be identified. Ensure that the certificates are either configured in the configuration files using accessible paths or update the file permissions to allow the user to access them.
- The system supports **Tomcat**, **ADManager**, and **AD Self Service Plus**. Profiles are automatically created based on the respective installation paths. During the push operation, use the **Device Selection** dropdown to choose the service and view the profiles created for it.

Onboarding Tomcat (Windows) Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Microsoft** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server Details - Field Description Table

Field	Description
***Server Type**	Select the **Tomcat** radio button.
***Server name**	Enter the name of the designated Apache Tomcat server.
***Hostname**	Enter the hostname of the Apache Server.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Apache server. Gateway is the preferred communication mode.
Cert Sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache (Tomcat) server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Field	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Field	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount (when the communication mode is SSM) • All supported external vaults **Note:** • Credential Type does not suppot ssh based authentication for Microsoft devices. • If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Example: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

7. Enter the **Windows gateway details**.

> **Note:** This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Field	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following features: • Server addition using the **import** feature • Endpoint CSR generation

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI. **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • **Remote** **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

8. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Field	Description
Server path	Enter the directory/path where the application is installed. Tomcat ADManager & Self Service Plus has to be integrated under Windows Tomcat, so the paths can be defined as follows: • C:\<parent_folder> e.g. C:\ProgramFiles - Certificates will be discovered from Tomcat, ADManager & Self Service. • C:\ProgramFiles\Apache-Tomcat-8.5.35 - Certificates will be discovered only from Tomcat. • C:\ProgramFiles\ManageEngine\ADManager - here the certificates will be discovered only from ADManager. • C:\ProgramFiles\ManageEngine\ADSelfService - here the certificates will be discovered only from ADSelfService
**: Mandatory fields*	

9. Click **Add.**

   Once the server is added successfully, the path will be listed in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. *[Optional]* Click the (**Delete**) icon, if you want to delete the server path from the list.
11. Click **Save**.
    The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the **Status** column, click Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

VMware

Prerequisites for vCenter

1. Make sure the vCenter device is reachable from the cloud connector.
2. Support is only for **vCenter 7.0.3 or later** (REST API-based).
3. Minimum permissions required to run the CLM operation in AppViewX for the vCenter User is:
   - Role > Certificate Management > Create/Delete (Admins priv)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding VMware

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **VMware** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select server type as **VMWare NSX** or **VMWare vCenter** from the dropdown list.
***Server name**	Enter the name of the designated VMware server.
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) for device communication and integration with the VMware.
Data center	Select the datacenter for routing communications to this vendor.
HTTPS Port	Enter the port number used for HTTPS communication with the server. By default, it is 443.
Proxy required	Select the checkbox to enable the secure proxy service.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - AppViewX* **Note:** If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication. (This field displayed only for manual entry.)
***Password**	Enter the secure password. (This field displayed only for manual entry.)
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, enter details as mentioned below.

Note: This section is displayed only for **VMWare NSX** device.

Vendor Specific Details - Field Description Table

Fields	Description
***Base URL**	Enter the base URL that is to be appended with the API. *Example*: /policy/api/v1
**: Mandatory fields*	

8. Click **Save**.
   The VMware device is added successfully.
9. On onboarding VMWare vCenter, run two REST APIs: `GET Session` (to fetch the session ID to authorize and to confirm communication with the vCenter device) and `GET Version` (to fetch the vCenter version).

Note: REST API is used for vCenter version 7.0.3 and later.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The VMWare vCenter device can also be onboarded by the import functionality using the standard .xlsx and .csv templates available.

To onboard the VMWare vCenter device to the AppViewX inventory using the import functionality:

1. Go to **(Menu) > CERT+ > ADMINISTRATION > Device Management.**
2. Click the **Server** tab.
3. Click the (**Import**) icon on top of the page. The Import details page is displayed.
4. Click the CSV or XLSX icons in the **Uploader Info** section.

   The sample templates are downloaded and saved at the default file location.
5. Open the CSV or XLSX templates, enter the relevant information for onboarding the VMWare vCenter device, and save the file.

   Note: Ensure all the mandatory and relevant fields are entered in the .csv or .xlsx template.
6. Click the **Upload** icon in the Import section, and select the .csv or .xlsx file from the file dialog box.

   The status of the uploaded file is displayed in the File Histories section.

Discovering Certificates

Note: This section is application only for VMWare vCenter.

- Discovery (on-demand and scheduled) of certificates via REST API includes:
  - Machine SSL
  - STS Signing (`active_cert_chain`)
  - Trusted Root certificates
- The system creates the following certificate profiles with the correct naming convention:

Certificate Profile	Naming Convention
Machine SSL	`{deviceName}:machineSSL`
STS Signing (`active_cert_chain`)	`{deviceName}:stsSigning`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Profile	Naming Convention
Trusted Root certificates	{deviceName}:trustedRoot

Note:

- To enable push operations from the root and intermediate inventory, a trustedRoot profile has been created. To add a connector for VMWare NSX, select VMWare from Vendor.
- **Limitation:** As the private key is never exposed via API, discovered certificates do not include the private key.

Pushing Certificates to the Device

- Admin can select Machine SSL or STS Signing as the target certificate type.
- The system validates the certificate chain in the following order: Server Certificate → Intermediate CA → Root CA
- Users can select both Machine SSL and STS Signing profiles for a single push operation.
- **Machine SSL supported scenarios:**
  - CSR was previously generated and the private key is securely stored.
  - The root CA of the signed certificate is:
    - Already trusted by vCenter → No additional trust configuration required.
    - Not trusted by vCenter → The root CA certificate must be added during the operation.
- **STS Signing supported scenarios:**
  - The certificate must include the private key and the trust (root/intermediate) certificate(s).
  - If either the private key or trust certificates are missing, the operation will fail in the backend.
- **Trust Store Handling**
  - If the root CA is already trusted, the system installs only the certificate and the private key (if required).
  - If the root CA is not trusted, the system installs the certificate, the private key, and the root CA certificate, and updates the trust store.
  - The operation will succeed only if the trust chain is complete and valid.
- **Logging & Audit**

  All certificate push attempts are logged with user, timestamp, certificate type, and result.

- **Error Handling**

  The system displays user-friendly error messages for invalid input, trust chain failures, or installation errors.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

1. If VMware Appliance Management Interface does not display the new certificate after replacing the MACHINE_SSL_CERT on vCenter Server Appliance, refer to https://knowledge.broadcom.com/external/article?legacyId=2136693
2. For stopping, starting, or restarting VMware vCenter Server Appliance services, refer to https://knowledge.broadcom.com/external/article/344633/stopping-starting-or-restarting-vmware-v.html

Backing Up and Rolling Back Certificates

- **Backup**: The existing vCenter certificate is backed up before replacement.
- **Private Key Limitation**:

  The private key cannot be backed up. Rollback is possibleonly if the private key is already stored in AppViewX for the corresponding backup certificate UUID.

- **Rollback Support**:
  - Rollback option is available only if the push is successful and the backup certificate's private key is present in AppViewX.
  - Not applicable for certificates enrolled directly at the endpoint.

  Once a certificate is pushed for an enrolled private key, further pushes are not allowed for that key.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The **Server Inventory** page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Device Status Log pop-up is displayed.

5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Gigamon

Prerequisite

- Enable API access on GigaVUE-FM to facilitate integration.
- Configure role-based access control (RBAC) to allow users to manage certificates securely.
- Ensure proper network connectivity between GigaVUE-FM and AppViewX/CC for seamless communication.
- Verify that all necessary communication ports are open and accessible.
- For Inbound and Outbound Inline-SSL deployments, configure the keychain password before installing certificates and private keys into the keystore.

Onboarding Gigamon

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select the **Gigamon** logo from the Vendors list.
5. In the **Server details** section, select/enter the details as follows

Server Details - Field Description Table

Fields	Description
***Server Type**	The value is set to GigaVueFM.
***Server name**	Enter the name of the designated Gigamon server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***IP address/FQDN**	Enter the IP address or the fully qualified domain name (FQDN) of the GigaVue Appliance that is to be onboarded.
HTTPS Port	Enter the HTTPS port number used for secure communication.
Data center	Choose the desired data center.
Proxy Required	Enable this field if GigaVue communication needs to occur via a Proxy. The proxy details configured in general settings will be used for communication.
Cert Sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback, and so on.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx • *All other external Vault*.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the **Credentials** will be displayed in the dropdown.
***Username**	Enter the designated username for authentication. **Note:** Field displayed for manual entry only
***Password**	Enter the secure password. **Note:** Field displayed for manual entry only
**: Mandatory fields*	

7. Click **Save**.

Note: Multiple devices can be configured for the same vendor.

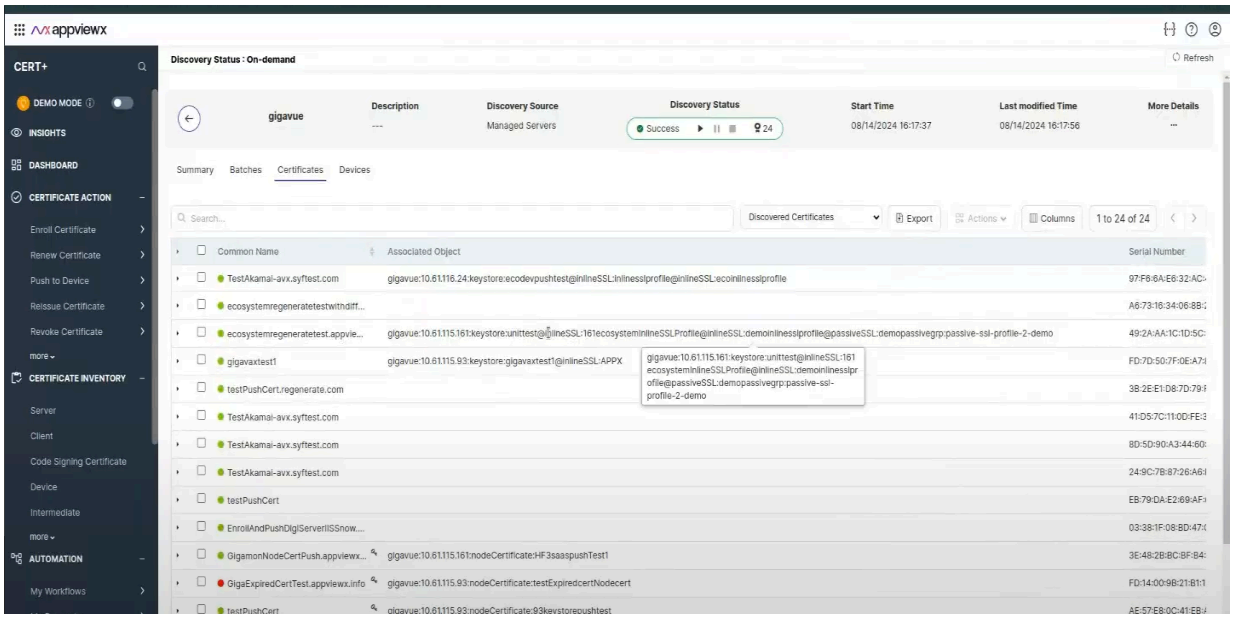
The device is onboarded successfully.

Discovery

- AppViewX automatically detects all clusters and nodes within the Gigamon appliance, enabling comprehensive discovery, push, and bind operations across all nodes.
- For each identified node, AppViewX discovers both the node certificate and any certificates in the keystore, offering detailed visibility into their associations with inline and passive profiles.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Discovery cannot retrieve the private key from GigaVUE-FM.



Profile Naming Convention

- Naming convention for profile

Profile	Format
Default Connector: This profile is used for all cluster nodes and is designed to push the certificate to the specified cluster's keystore.	deviceName:clusterId:keystore
Passive: Used to push the certificate to the keystore and bind it to a specific Passive SSL profile.	deviceName:clusterId:passiveSSL:groupName:sslProfileName:certA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Profile	Format
Inline: Used to push the certificate to the keystore and bind it to a specific Inline SSL profile.	deviceName:clusterId:inlineSSL:sslProfileName:certAliasName 
Push Support

- AppViewX enables certificate deployment to the following two destinations:
  - Node Certificate
  - Keystore.
- CERT Type: <.pem> format is supported
- Bit length: Upto 4096
- HASH Type: SHA516
- The Overwrite option is enabled on the App Connector screen to manage push operations for the profile connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- By default, the overwrite option is dissabled.
- If **Overwrite** is enabled, the existing certificate will be deleted and replaced with the new one during the push operation.
- After renewal or regeneration, it is recommended to use a different alias name. This approach avoids deleting the old certificate; instead, its association is removed, and the newly pushed certificate is assigned to the profile.

Note:
- The keystore certificate is shared by both inline SSL and passive SSL.
- During the push operation, the certificate is pushed into the keystore.
- Within a cluster, the alias name or certificate name must be unique.
- The same certificate cannot be imported to a GigaVUE-FM node using a different alias name.
- Certificate and alias names are unique within a cluster.
- The same certificate with the same name can be pushed to a different cluster.
- To push a certificate into GigaVUE, the private key is mandatory.
- The same certificate can be mapped to multiple profiles.

Bind Support

- AppViewX allows the binding of certificates to the following profile types:
  - Inline Profile
  - Passive Profile.

Note:
- Depending on the selected profile (default or device profile), the certificate is bound to that profile.
- Both inline and passive profiles share the same keystore. For example, a certificate pushed to the keystore becomes available to both passive and inline SSL profiles.
- AppViewX supports SSL operations only for existing profiles in the Gigamon environment.
- Profile creation must be performed outside of AppViewX.
- During device onboarding, AppViewX automatically discovers all available nodes in the Gigamon environment.
- Backup functionality is not supported; as a result, rollback operations cannot be performed.
- Private key export is not supported due to security restrictions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Limitations

The following limitations apply:

- **Private Key Retrieval**: Discovery cannot fetch the private key from Gigavue-FM.
- **Certificate Deployment**: Pushing a certificate to Gigavue requires the private key to be available.
- **Discovered Certificates**: Discovered certificates cannot be pushed to Gigavue unless they are regenerated or renewed within AppViewX.
- **Backup and Rollback**: These features are not supported, as the system cannot back up the private key.
- **Endpoint Enrollment**: Enrollment at the endpoint is not supported because Gigamon has confirmed that the API is not fully functional.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

PingFederate

Onboarding PingFederate

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Ping Identity** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select Server type has default value **PingFederate**.
***Server name**	Enter the name of the designated PingFederate server.
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) of the device being onboarded. It is used for device communication and integration with the server.
***HTTPS Port**	Enter the valid HTTPs port number that is required to remotely access iDRAC through firewall.
Data center	Select the datacenter from where communication needs to be routed to the PingFederate instance.
Proxy Required	Select the checkbox if proxy is required.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication with the PingFederate server.
***Password**	Enter the secure password.
*: Mandatory fields	

7. In the **Vendor Specific Details** section, enter details as mentioned below.

Vendor Specific Details - Field Description Table

Fields	Description
***Base URL**	Enter the base URL to communicate with PingFederate API. For example, **/pf-admin-api/v1/**.
*: Mandatory fields	

8. Click **Save**.
   The PingFederate device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Deleting a Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the checkbox beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the **Delete** icon in the command bar.
   The **Delete** confirmation pop-up window is displayed.
5. Click **Yes** on the confirmation pop-up.
   The server will be removed from the inventory

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Importing a Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the checkbox beside the device name.

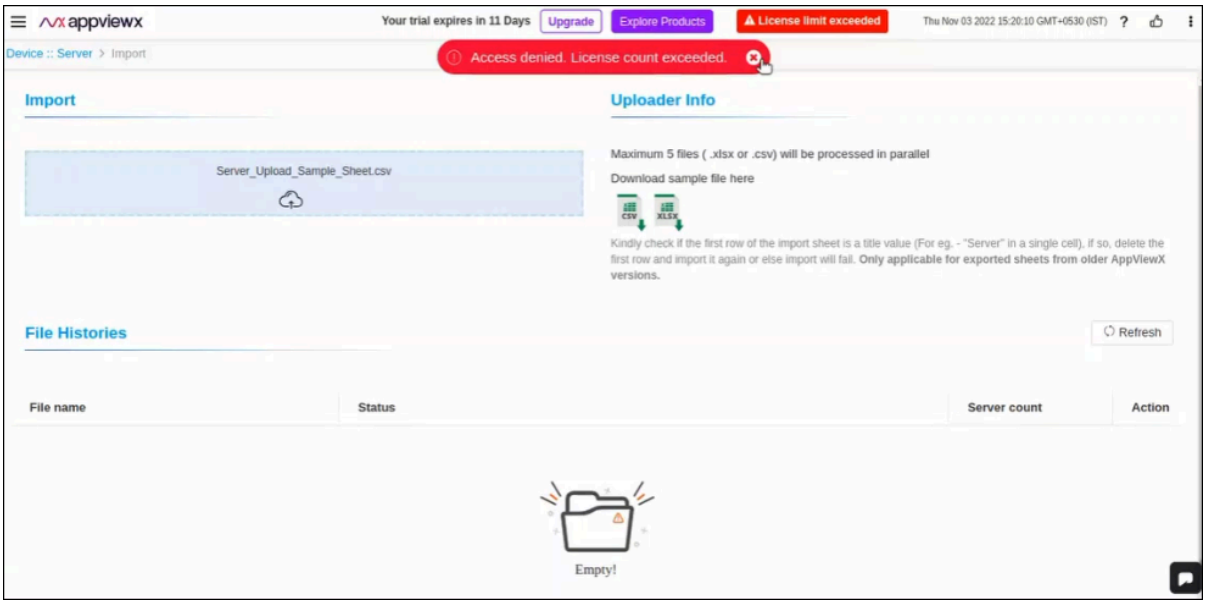
> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Import**) icon in the command bar.
   You will be redirected to the import server page.
5. Download the sample <.csv> or <.xlsx> file.
   a. The **XLSX** option enables you to download a vendor-specific file with ease:
      i. Click the **XLSX** file icon.
      ii. From the **Vendors** field, select the desired **vendor** from the dropdown list.
      iii. Click **Download** to get the file.
6. Update the details.
7. Click the **Browse** and **Upload** button.
8. Upload the files.
   Sever details provided in the sheet will be added to the server inventory.

License Enforcement

AppViewX has enabled a feature to set a limit for the licensed certificates. If the number of certs exceeds this limit then the additional certs added into the inventory will be moved into the **Monitored** status.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- A red indicator labelled **License Limit Exceed** is displayed on the title bar of the page, if the limit has exceeded.
- A pop-up message **Access denied. License count exceeded** is displayed on the click of the **Save** button while adding a new server device.

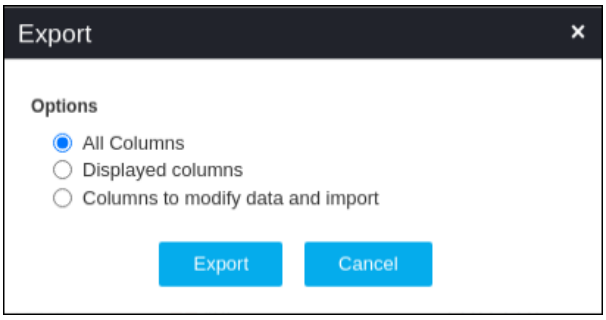
Exporting a Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the check-box beside the device name. If you are exporting details of multiple servers of the same kind, select the check-boxes for each one.

   Note: If the desired server device is not listed on the screen, run a search.

4. Click the (**Export**) icon in the command bar at the upper right of the screen.
5. On the Export pop-up, select the type of information you want to export and click the **Export** button.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



a. **All Columns** - Select this option if you want to export all information about the server.
b. **Displayed columns** - Select this option if you want to export only the information that is visible on the server screen. This is useful if you need to compare values or settings for different servers and do not have any need to see the less important data.
c. **Columns to modify data and import** - Select this option if you are exporting device details to make modifications and then re-import the data into the Device Inventory.

6. On the screen that opens, select the location where you want the device details file to go, then click **Save**.
   Server details will be downloaded as an Excel `<.xls>` file.

Managing a Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the checkbox beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. To start managing the device, click the (**Manage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation pop-up message that is displayed.
   • The "Config fetch" will be triggered and the server will get managed.
   • The server status is changed to Manage.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Unmanaging a Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the checkbox beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Unmanage**) icon in the Command bar at the top of the screen.
5. Click the **Yes** button from the confirmation popup message that is displayed.
   Server device status is changed to UnManaged in Server inventory.

Executing Fetch Config for Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the checkbox beside the device name.

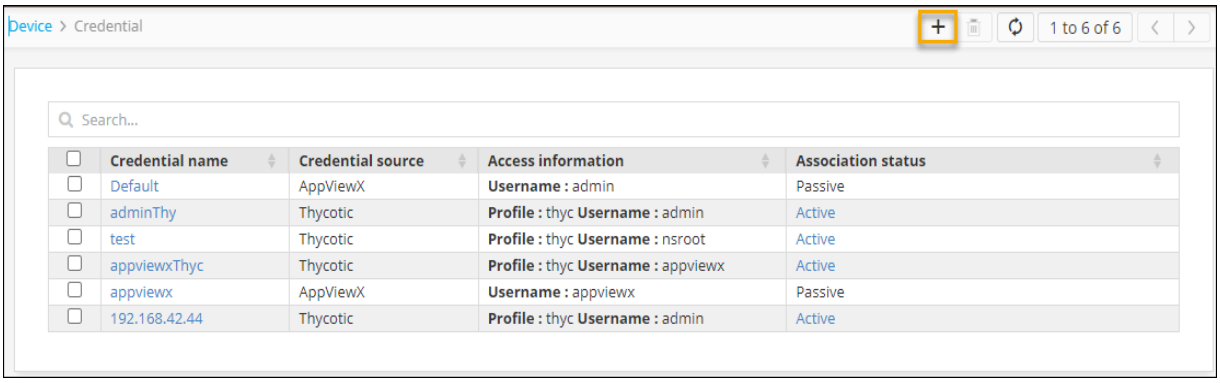
> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Fetch Config**) icon in the command bar.
   A popup notification message is displayed as **Fetch config has been triggered for the server.** The configuration will be fetched from the server.

Adding Device Credentials

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Credentials**) icon in the command bar.
   The Credentials page is displayed. If credentials have been set up, a list of credential names with details will be displayed in a table as shown below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. To add a new credential, click the plus or + (**Add**) icon in the command bar of the Credentials page.
   The Add Credential page is displayed with default credentials fields for AppViewX.

> **Note:** For details of fields in AppViewX and other vaults refer to the sections below.

AppViewX

AppViewX is shipped with a built-in integration with HashiCorp Vault for software level security to secure the private keys and device credentials onboarded to the product.

To configure credential details for the AppViewX enter the fields described in the table below.

Field Description for AppViewX Credentials

Fields	Description
***Credential name**	Name for the credential for the users to identify it.
***User name**	User name used for device onboarding.
Credential type	Select the type of authentication from one of the following: • Password • Identity key
***Password**	Password configured at the time of device onboarding.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for AppViewX Credentials (continued)

Fields	Description
	Note: This field is displayed only when the **Credential type** is selected as **Password**.
Secondary password	Additional password enabled by vendors for specific operations. **Note:** This field is displayed only when the **Credential type** is selected as **Password**.
***Identity key**	Credentials (private key in the **.pem** or **.txt** format) for enabling device communication via SSH. **Note:** This field is displayed only when the **Credential type** is selected as **Identity key**.
Passphrase	Key to protect the private key files. **Note:** This field is displayed only when the **Credential type** is selected as **Identity key**.
All * marked fields are mandatory.	

Cyberark

To configure credential details for the CyberArk vault enter the fields described in the table below.

Field Description for Cyberark Credentials

Fields	Description
***Credential name**	Name for the credential for the users to identify it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Cyberark Credentials (continued)

Fields	Description
Type	To retrieve a credential from the CyberArk vault, select one of the following options: • Device (default) • Amazon (AWS/ELB)
***User name**	User name that has been added in CyberArk. **Note:** This field is displayed when the **Device** type is selected.
***App ID**	App ID that has been authorized to provide access to CyberArk and retrieve credentials. **Note:** This field is displayed when the **Device** type is selected.
User type	From the dropdown list menu, select one of the following: • Internal (user created directly in the device) • External (user created in the Active Directory) **Note: *Server IP Address** field is displayed when the **User type** is selected **External**.
***Server IP Address**	Server IP Address has to be entered if the user has created external active directory. **Note:** This field is displayed when the User type is selected as **External**.
***AWS IAM username**	User name that has been added in CyberArk.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Cyberark Credentials (continued)

Fields	Description
	Note: This field is displayed when the **Amazon** (AWS/ELB) type is selected.
***App ID**	Reference ID provided by CyberArk for the corresponding application. **Note:** This field is displayed when the **Amazon** (AWS/ELB) type is selected.
***AWS access key ID**	Access key ID generated from the AWS management console. **Note:** This field is displayed when the **Amazon** (AWS/ELB) type is selected.
Note: The asterisk (*) symbol indicates a mandatory field.	

To configure credential details for the CyberArk vault, from the top right corner of the page, click **CyberArk API Settings**.

Field Description for Cyberark API Settings

Fields	Description
***IIS-Server IP/Hostname**	Hostname or IP address of the CyberArk application.
***Port**	Port number on which CyberArk is running.
***Client certificate**	Upload the Client Certificate needed to authenticate the CyberArk API service.
***Passkey**	Enter the passkey for Client Certificates uploaded in the .pfx format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Cyberark API Settings (continued)

Fields	Description
Note: The asterisk (*) symbol indicates a mandatory field.	

HashiCorp

To add credentials for HashiCorp Vault enter the fields described in the table below.

Field Description for HashiCorp Credentials

Fields	Description
***Credential name**	Unique name for the credential for the users to identify it.
***API Profile**	Select the API profile from the dropdown list which is configured in HashiCorp API settings.
***Secret Engine**	Type path and click enter. It will suggest a list of secrets and the desired secret can be selected.
Note: The asterisk (*) symbol indicates a mandatory field.	

To set API Credentials: From the top right corner of the page, click **HashiCorp API Settings**.

Field Description for HashiCorp API Settings

Field	Description
***API Profile Name**	Enter a unique API profile name.
***IP/Hostname**	Enter the HashiCorp vault hosted IP address or hostname.
***Port**	Enter the port in which the HashiCorp vault is running.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for HashiCorp API Settings (continued)

Field	Description

***Auth Method**	From the dropdown list list, select either **Token/AppRole.**
	
	• If **Token** is selected, enter the **Vault Token** for the authentication.
	• If **AppRole** is selected, enter the following:
	  • Enter the **RoleID**
	  • Enter the **SecretID**

Namespace	Enter a namespace.
Note: The asterisk (*) symbol indicates a mandatory field.	

Thycotic

To add credentials for Thycotic secret enter the fields described in the table below.

Field Description for Thycotic Credentials

Fields	Description
***Credential name**	Reference name for Thycotic in AppViewX.
***API Profile**	If you have more than one Thycotic Server added as profiles, select the respective profile while adding credentials.
Account Type	Select the account type linked with the secret key. The available options are: • **Device** • **Amazon (AWS/ELB)** • **User/Service Account**.
***Credential Type**	Select the type of credential. The available options are: • **Pasword** • **Private Key**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Thycotic Credentials (continued)

Fields	Description
***User Name**	Enter the username of the secret if you selected the account type as **Device** or **User/Service Account**.
AWS IAM Username	Enter the AWS IAM username if you selected the account type as A**mazon (AWS/ELB)**.
Secret Name	Select secret type as Device or Amazon (AWS/ELB) or User/Service Account.

Note: The asterisk (*) symbol indicates a mandatory field.

To set API Credentials: From the top right corner of the page, click **Thycotic API Settings**.

Field Description for Thycotic API Settings

Fields	Description
***API Profile Name**	Reference name for the vault in AppViewX.
***Hostname/Domain Name**	Enter the Hostname of the Thycotic Secret Server if it is hosted in an on-prem environment or the Domain name of the Thycotc Secret Server if it is the cloud version.
***Port**	Port number of the Thycotic Secret Server.
***Type**	Select if Thycotic Secret Server is hosted in an On prem or Cloud environment.
***Username**	Username of Thycotic Secret Server.
***Password**	Password of Thycotic Secret Server.

Note: The asterisk (*) symbol indicates a mandatory field.

Note: You can add multiple Thycotic Secret Servers as different Profiles. Each Thycotic Secret Sever will be added to the Thycotic API settings page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

BeyondTrust

To add credentials for BeyondTrust Vault enter the fields described in the table below.

Field Description for Beyond Trust Credentials

Fields	Description
***Credential name**	Reference name for BeyondTrust in AppViewX.
***API Profile**	If you have more than one BeyondTrust Server added as profiles, select the respective profile while adding credentials.
***Secret Type**	Select the secret type as Device. Only secrets associated with any device can be added with this secret type. i.e., Secret should contain the device name.
Username	Enter the username of the secret if you selected the Secret Type as Device. When this secret is used in any device, respective device name will be automatically send as one of the argument when AppViewX fetches credential from Vault.
Note: The asterisk (*) symbol indicates a mandatory field.	

To set API Credentials: From the top right corner of the page, click **BeyondTrust API Settings**.

Field Description for Beyond Trust API Settings

Fields	Description
***API Profile Name**	Reference name for the vault in AppViewX.
***Hostname/Domain Name**	Enter the Hostname of the BeyondTrust Secret Server if it is hosted in an on-prem environment or the Domain name of the BeyondTrust Secret Server if it is the cloud version.
***Port**	Port number of the BeyondTrust Secret Server.
***Username**	Username of BeyondTrust Secret Server.
Password	Password of BeyondTrust Secret Server.
***API Key**	It is the security key provided for authentication.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Beyond Trust API Settings (continued)

Fields	Description
Note: The asterisk (*) symbol indicates a mandatory field.	

Note: You can add multiple BeyondTrust Secret Servers as different Profiles. Each BeyondTrust Secret Server will be added to the BeyondTrust API settings page.

Enabling Vault as a Service

Vault as a service refers to the provision of Vault, a popular tool for securely storing and accessing sensitive information. It implies that all the vaults and credentials from the platform can be in all the applicable places. For example, if a new credential type feature is supported in the platform, then those credentials will be available to all the vendors in the Server addition page. You do not have to manually make changes for supporting the same in the respective module. The following credentials are now made available to all vendors on the Server device addition page:

- CyberArk
- Thycotic
- HashiCorp
- BeyondTrust

Vault as a service enables the following capabilities:

- Fetches all available credential store from platform.
- Removes the Static Credential type drop down List maintained from Web.
- Consumes the retrieved vaults from platform at required places.
- Vaults are automatically listed in consumption places (e.g. Server device addition)when added in Platform.
- Sets the access list based on user-selected credential type from the available vaults.
- Supports all the vault services of the imported vendors servers.

Configuring Device Setting

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Linux

The **Certificate Details** and **Vendor Specific Details** settings can be configured globally under Device Settings. These configurations will automatically apply to all connectors created and associated with certificates in the inventory. This minimizes redundant configuration tasks when a customer needs to add hundreds of connectors with the same settings.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Device Settings**) icon.
4. Select **Linux** logo from the Vendors list.
   The Linux Vendor Specific Details configuration screen is displayed.
5. In the **Certificate Details** section, select/update the following fields.

Description of fields on the Certificate Details section.

Fields	Description
***Certificate Directory**	Provide the directory where the certificate must be discovered. **Note:** By default, system will scan for certificates from all the directories.
***Operation**	Select the required option from the dropdown list. Available options are, • Include • Exclude.
Scan Type	Select the type of scan. Available options are, • Default • Aggressive.
* (asterisk): *Mandatory fields*	

6. In the **Vendor Specific Details** section, select/update the following fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Description of fields on the Vendor Specific Details section.

Fields	Description
Enable Network Scan	Select the checkbox to enable the network scan.
Certificate Ownership & Permission	Click the radio button to enable the **Certificate Ownership & Permission** option. **Note:** By default, this option is disabled.
Update System TrustStore	Click the radio button to enable the **Update System TrustStore** option for root and intermediate certificates. **Note:** By default, this option is disabled.
* (asterisk): *Mandatory fields*	

7. Click **Update**.
   The vendor details are saved successfully.

AKAMAI CPS

During enrollment using server device as endpoint, Akamai has a long list of details that are mandatorily required for the enrollment request. Adding these fields along with the CSR parameters will make the enrollment form too big with many details to be filled out. Since these are fixed values and only have to be filled once, the other mandatory fields are made available in the global device settings page. The details saved on the global setting page are based on the combination of the fields **Validation Type**, **Secure Network**, and **Vendor Certificate Type** that are available on the enrollment page.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Device Settings**) icon.
4. Select **Akamai** logo from the Vendors list.
   The Akamai Vendor Specific Details configuration screen is displayed.
5. Enter the fields in the respective sections described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Description of fields on the Vendor Specific Details page.

Fields	Description
General Information	
***Validation Type**	Select a validation type from the dropdown list for the endpoint. The default value is **Third-party**.
***Secure Network**	Select the secure network from the dropdown list for the endpoint. The default value is **Standard TLS**.
***Vendor Certificate Type**	Select a vendor certificate type from the dropdown list for the endpoint. The default value is **Third-party**.
Organization Information	
***Name**	Enter the organization's name.
***Address**	Enter the organization's address.
***Country**	Enter the organization's country code.
***City/Municipality**	Enter the organization's city or municipality.
***State/Province**	Enter the organization's state or province.
***Zip/Postal Code**	Enter the organization's zip or postal code.
***Phone Number**	Enter the organization's phone number.
Admin Contact Information	
***First name**	Enter the administrator's first name
***Last name**	Enter the administrator's last name
***Phone number**	Enter the administrator's phone number
***Email**	Enter the administrator's email
Tech Contact Information	
***First name**	Enter the technical contact's first name
***Last name**	Enter the technical contact's last name
***Phone number**	Enter the technical contact's phone number
***Email**	Enter the technical contact's email

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
* (asterisk): *Mandatory fields*	

6. Click **Update**.
   The vendor details are saved successfully.

Microsoft SQL

The **Force Encryption** and **Registry Restart** settings can be configured globally under Device Settings. These configurations will automatically apply to all connectors created and associated with certificates in the inventory. This minimizes redundant configuration tasks when a customer needs to add hundreds of connectors with the same settings.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Device Settings**) icon.
4. Select **Microsoft SQL** logo from the Vendors list.
   The Microsoft SQL Vendor Specific Details configuration screen is displayed.
5. Enable the radio button if required.

Description of fields on the Vendor Specific Details page.

Fields	Description
Service Restart	Enabling this option applies configuration changes that require you to restart the SQL Server service.
Force Encryption	Enabling this option enforces encryption for all SQL server connections.

6. Click **Update**.

APACHE Linux

The **Enable Certificate Details** and **Suppress Heartbeat Alerts During Service Restart** settings can be configured globally under Device Settings. These configurations will automatically apply to all connectors created and associated with certificates in the inventory. This minimizes redundant configuration tasks when a customer needs to add hundreds of connectors with the same settings.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Device Settings**) icon.
4. Select **APACHE Linux** logo from the Vendors list.
   The APACHE Linux Vendor Specific Details configuration screen is displayed.
5. Enable the radio button if required.

Description of fields on the Vendor Specific Details page.

Fields	Description
Enable Certificate Details	Enabling this option will display the deprecated certificate details section in the Add/Modify device from the Apche Linux.
Suppress Heartbeat Alerts During Service Restart	Enabling this option to disable or prevent false alert triggered during Apache service.

6. Click **Update**.

Configuring and Managing Firewalls

Proper configuration ensures firewalls can handle certificate requests, policy enforcement, and threat protection efficiently. This is critical to maintaining network security, as it ensures certificates are correctly managed and firewalls function seamlessly within the overall security infrastructure.

To set up firewalls to manage certificates securely, this section covers instructions for:

- Adding a Firewall
- Deleting a Firewall
- Importing a Firewall
- Exporting a Firewall
- Managing a Firewall
- Unmanaging a Firewall
- Executing a Fetch Config for Firewall

Adding a Firewall

This section covers instructions for:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Adding CheckPoint Firewall Device
- Adding Cisco Firewall Device
- Adding F5 Firewall Device
- Adding Fortinet Firewall Device
- Adding Juniper Firewall Device
- Adding Palo Alto Firewall Device

Adding CheckPoint Firewall Device

Refer to Automating CLM for CheckPoint.

Adding Cisco Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - AppViewX needs an internet or proxy connection to communicate with the firewall via the REST API.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
  - The API must have elevated (admin) permissions to read and modify SSL certificates.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:
  - Username/Password
  - Credential List AppViewX/CyberArk
- **Enable Password**: Required
- **License Check**: Not required
- **Services and Port for AppViewX Communication**: Port numbers 22 (SSH)
- **Internet Access/Proxy**: Not required
- **Location from which the certificates are discovered if Certificate Managed**: Certificates are fetched by issuing a direct command to the device through SSH.

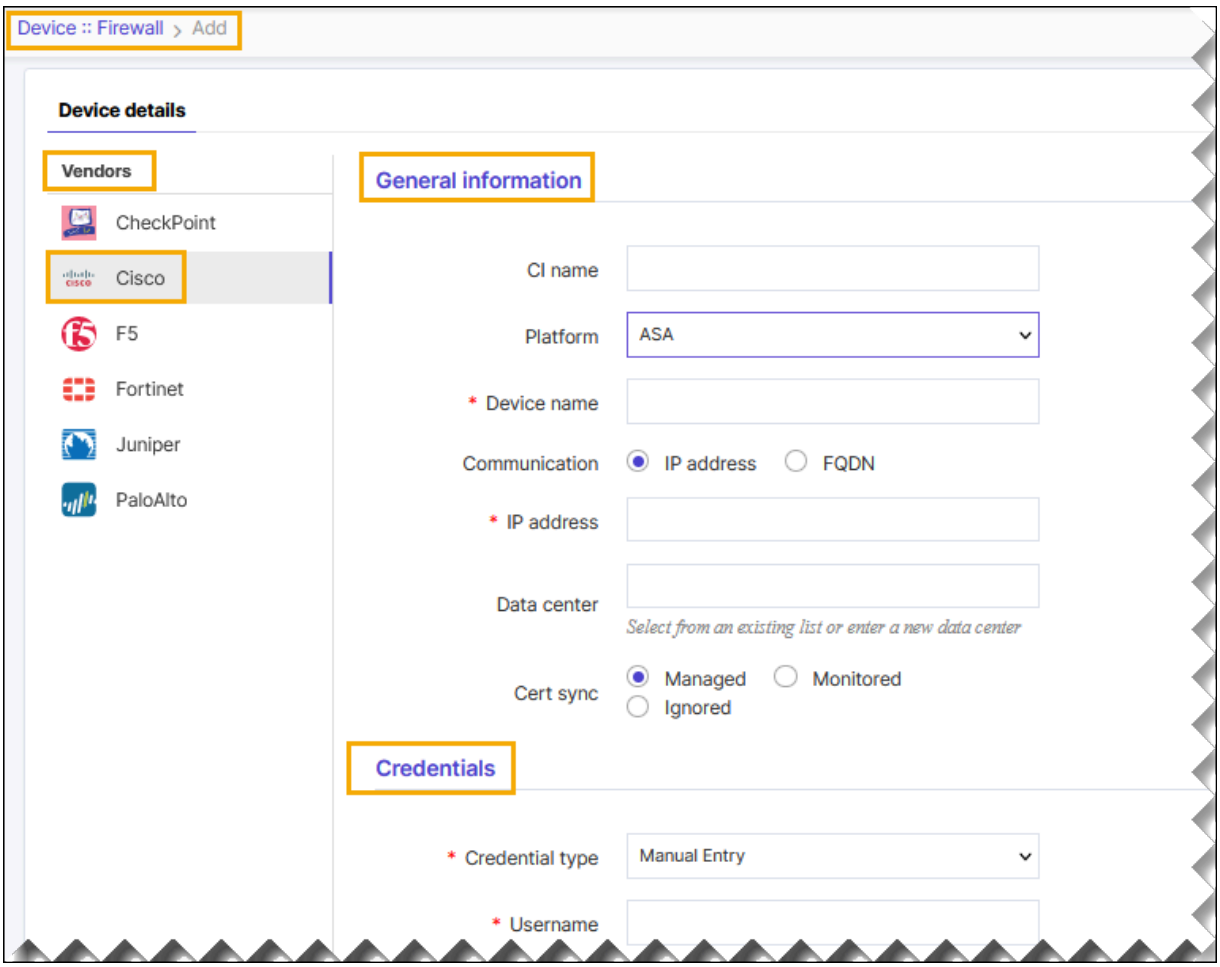
Note: For Visual Workflow action items, you will require credentials with write privilege.

Configuring a Cisco Firewall Device

To add a Cisco device:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
3. On the **Device :: Firewall** page, click (**Add**).
   The **Device :: Firewall > Add** page is displayed.
4. Select the **Cisco** vendor from the left side bar



5. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the dropdown list. The available option is ASA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

6. Enter the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the dropdown list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the privilege password.
**: Mandatory fields*	

7. Enter the field information in the **Secondary device information** section as follows:
   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

8. Click the **Save** button to add an Firewall device.

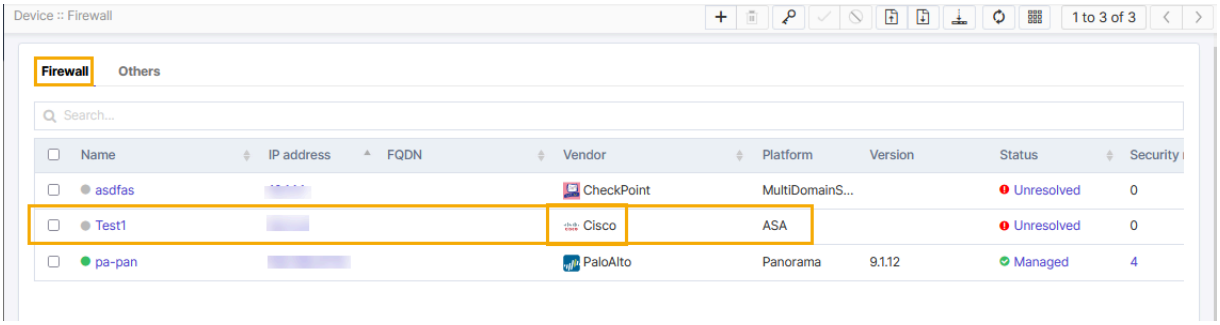
Note:

- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating a Ciso Firewall Device Addition

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
   The **Device :: Firewall** page is displayed. This page is an inventory of all the existing firewall devices.
3. Search the device name and validate whether the device is added successfully.



What's Next

Once you configured the Cisco firewall, you are ready to proceed with the following action to enable the auto enrollment:

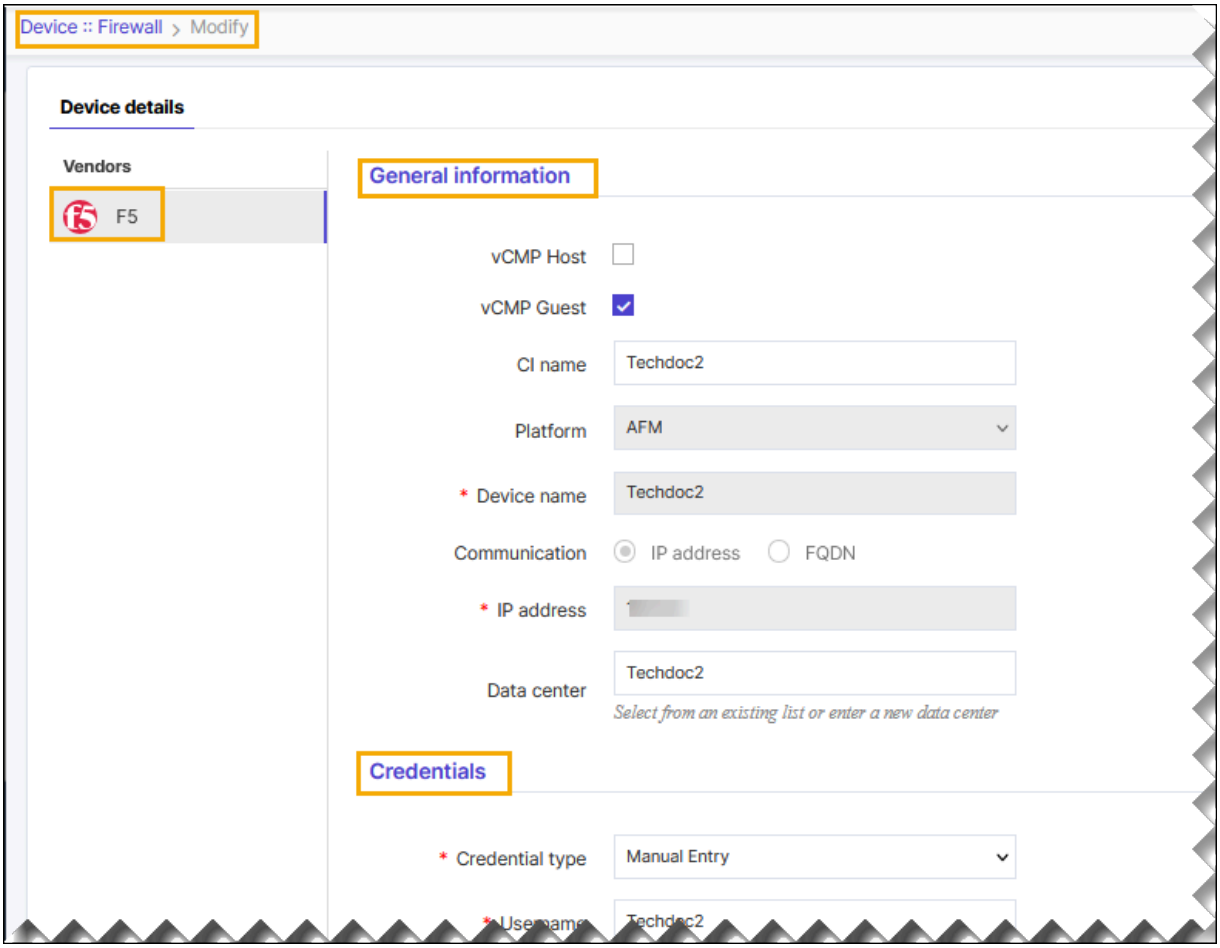
- Automating Certificates for Firewall Devices in AppViewX

Adding F5 Firewall Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring F5 Firewall Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
3. On the **Device :: Firewall** page, click (**Add**).
   The **Device :: Firewall > Add** page is displayed.
4. Select the **F5** vendor from the left side bar.



5. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
vCMP Host	Select the check box to add host based device if required.
vCMP Guest	Select the check box to add device as guest if required..

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the dropdown list. The available option is AFM.
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

6. Enter or select the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the privilege password.
**: Mandatory fields*	

7. **Note:** This step is applicable only if you have selected **vCMP Host** check box in the **General Information** section.

Enter or select the field information in the **Secondary device information** section as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
- **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
- **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

8. Click the **Save** button to add an Firewall device.

Note:

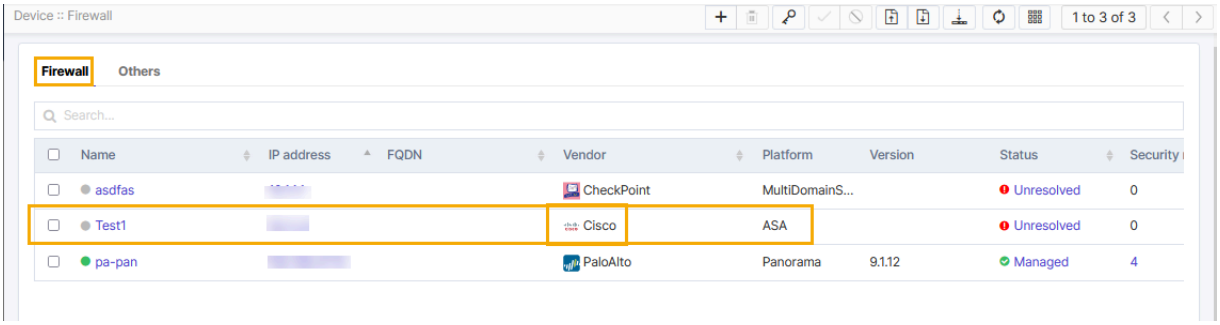
- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating F5 Firewall Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
   The **Device :: Firewall** page is displayed. This page is an inventory of all the existing firewall devices.
3. Search the device name and validate whether the device is added successfully.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

Once you configured the F5 firewall, you are ready to proceed with the following action to enable the auto enrollment:

- Automating Certificates for Firewall Devices in AppViewX

Adding Fortinet Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**: Username/Password
- **Services and Port for AppViewX Communication**: Port number 22 (SSH)

> **Note:** For Visual Workflow action items, you will require credentials with write privilege.

Configuring FortiGate Firewall Device

To add a FortiGate device:

1. Go to (**Menu**) > **CERT+** > **Device Management**.
   By default, the **ADC** tab opens.
2. Select the **Firewall** tab.
3. Click the + (**Add**) icon located on the top right corner.
   The **Add** page appears.
4. Select the **Fortinet** vendor from the left side bar.
5. Enter the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select **Fortigate**.
***Device name**	Unique custom identifier of your device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	The data center on which the device has been hosted. Select a datacenter from the dropdown list or enter a data center name.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
***SSH Port**	By default, it is 22.
**: Mandatory fields*	

6. Enter the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential Type from the dropdown list. If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your password can be of any length with a combination of alpha-numerical, symbols, and special characters.
Api token	Enter the API token.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

7. Enter the field information in the **Certificate specific details** section.

Field and Description Table

Field	Description
Discover Private Keys	Select the check box to discover certificates along with private keys. If the device has many certificates, this may take a bit longer.
Private Key Default Password	Enter the default password.

8. Enter the field information in the **Secondary device information** section as follows:
   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

> **Note:**
> - By clicking the **Add** button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
> - By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

9. Click the **Save** button to add a Firewall device.

> **Note:** To discard the changes, click the **Cancel** button.

A pop-up message is displayed as **Device added successfully**.

CLI Commands

Minimum required permissions

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Version of device:** 6.x or above
- **License type:** Cert+ Only 16
- **Device management**

  Network > Configuration > Read Only (Communication and version check)

- **Certificate discovery**
  - System > Configuration > Read/Write (System Local Certificates, System Setting)
  - VPN > Read (VPN Profiles)
  - Firewall > Others > Read (SSL/SSH Inspection Profile)
  - User & Device > Read (User Authentication Setting Profile)
- **Certificate Push and Bind**
  - System > Configuration > Read/Write (Push to System Local Certificates, Bind System Server Certificate)
  - VPN > Read/Write (Bind to VPN Setting Profile, VPN Ipsec profile)
  - Firewall > Others > Read/Write (Bind to SSL/SSH Inspection Profile)
  - User & Device > Read/Write (Bind to User Authentication Setting Profile)

Operation	Command	Description
System Status	`get system status`	Displays system information such as firmware version, VDOM status, and system mode.
Configure VDOM	`config vdom`	Enters VDOM configuration mode to manage Virtual Domains.
Edit configurations	`edit ?`	Enters edit mode for a specific configuration object (e.g., VDOM, interface, etc.).
End	`end`	Ends the current configuration mode and applies changes.
Switch to global	`config global`	Switches to the global configuration context.
Configure System's console	`config system console`	Used to configure console settings; often used with set output standard for terminal output.
Set output to standard	`set output standard`	Sets the console output format to standard (non-JSON or non-table).
Show full CA certs (VPN)	`show full-configuration vpn certificate ca`	Displays full configuration of CA certificates used in VPN.
Show full CA certs	`show full-configuration certificate ca`	Displays full configuration of CA certificates in the system.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description
Show full local certs (VPN)	`show full-configuration vpn certificate local`	Displays full configuration of local VPN certificates.
Show full local certs	`show full-configuration certificate local`	Displays full configuration of local certificates in the system.
Show IPSec VPN config	`show vpn ipsec {CONFIGURATIONS}`	Displays IPsec VPN configurations.
Show SSL VPN settings	`show vpn ssl settings`	Displays current SSL VPN settings.
Show user settings	`show user setting`	Displays user authentication settings.
Show SSL/SSH profiles	`show firewall ssl-ssh-profile`	Displays SSL/SSH inspection profiles used in firewall policies.
List CA cert names (VPN)	`show full-configuration vpn certificate ca ?`	Lists available CA certificate names in VPN configuration.
List CA cert names	`show full-configuration certificate ca ?`	Lists available CA certificate names in the system configuration.
List local cert names (VPN)	`show full-configuration vpn certificate local ?`	Lists available local certificate names for VPN.
List local cert names	`show full-configuration certificate local ?`	Lists available local certificate names configured on the device (non-VPN).
Set CA certificate	`set ca \"{CERT_CONETNT}\"`	Sets the CA certificate content during certificate configuration.
Set private key	`set private-key \"{PVT_KEY_CONETNT}\"`	Sets the private key content for a certificate.
Set certificate content	`set certificate \"{CERT_CONETNT}\"`	Sets the actual certificate content.
Set password	`set password`	Sets a password (often used when importing password-protected keys/certs).
Unset password	`unset password`	Removes a previously set password from the configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description
Configure SSL VPN settings	`config vpn ssl settings`	Enters configuration mode for SSL VPN settings.
Unset SSL VPN cert	`unset servercert`	Removes the currently configured SSL VPN server certificate.
Set SSL VPN cert	`set servercert {CERT_NAME}`	Sets the server certificate for SSL VPN.
Configure SSL/ SSH profile	`config firewall ssl-ssh-profile`	Enters configuration mode for SSL/SSH inspection profiles.
Unset SSL/SSH cert	`unset server-cert`	Removes the configured certificate from the SSL/SSH profile.
Set SSL/SSH cert	`set server-cert {CERT_NAME}`	Sets the server certificate for SSL/SSH inspection.
Configure global settings	`config system global`	Enters system-wide global configuration mode.
Set admin portal cert	`set admin-server-cert {CERT_NAME}`	Sets the certificate used for the FortiGate admin GUI (HTTPS portal).
Configure user settings	`config user setting`	Enters configuration mode for user authentication settings.
Set user auth cert	`set auth-cert {CERT_NAME}`	Sets the certificate used for user authentication.
Configure IPsec VPN	`config vpn ipsec`	Enters IPsec VPN configuration mode.
Append cert to IPsec VPN	`append certificate {CERT_NAME}`	Appends a certificate to the IPsec VPN configuration.
Generate certificate	`execute vpn certificate local generate`	Generate a local certificate on the device.

Pushing Server Certificates to the Device

The certificate can be pushed to the device in only PEM format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Starting from FortiOS version 5.4 and above, when pushing a certificate to FortiGate, if a certificate with the intended name is already present, a timestamp is automatically appended to the certificate name. This ensures the new certificate is successfully imported without conflict, while retaining the original.

Warning:

FortiGate does not allow importing a certificate that has already been imported earlier—even if you attempt to import it again under a different name or context. FortiOS maintains a checksum or fingerprint of certificates.

If a certificate with the same cryptographic material already exists in the system (for example, with the same subject, serial number, and public key), it will reject duplicates to prevent redundancy or configuration conflicts.

Profiles will be discovered irrespective of the cert sync option selected during device addition or during an on-demand discovery. The following profiles will be discovered currently in AppViewX:

- **Shared location:** Denotes a push-only operation which pushes a certificate to the end device.

  Profile convention : {DeviceName}::System/Vdom name

- **SSL VPN Settings:** SSL VPN allows remote users to securely connect to the corporate network using an encrypted SSL tunnel via a web portal or FortiClient. Apushed certificate can be associated to SSL-VPN setting if it is enabled.

  Profile convention : {DeviceName}::System/Vdom name::SSL VPN Setting:SSL VPN Setting

- **SSL/SSH Inspection Profile:** SSL/SSH inspection profiles inspect encrypted traffic (HTTPS/SSH) for threats or policy enforcement. Apushed certificate can be associated to any inspection profile if it is configured with Protecting SSL Server option.

  Profile convention : {DeviceName}::System/Vdom name::SSL/SSH Inspection Profile:{Inspection profile name}

- **System Setting Https Server Certificate:** This controls which certificate is used to secure access to the FortiGate administrative web interface. Apushed certificate can be associated to the System administration setting server certificate.

  Profile convention : {DeviceName}::System::System Setting Https Server Certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **User Authentication settings:** Defines how users authenticate to FortiGate (e.g., captive portal, VPN, web portal). Ensures only clients with valid certificates can authenticate, enhancing security. Apushed certificate can be associated to the User authentication setting server certificate.

  Profile convention : {DeviceName}::System:User Authentication settings:User Authentication settings

- **IPSec VPN Profile:** IPSec VPN allows site-to-site or remote client VPN connections using the IPSec protocol suite. Apushed certificate can be associated to the IpSec tunnel configured in the device.

  Profile convention : {DeviceName}::System:IPSec VPN Profile:{TUNNEL_NAME}

Backing Up Certificates

Before a bind operation, a backup will be taken for the currently associated certificate so that a rollback can be performed once the new certificate is associated.

Binding Certificates

Certificates can be bound for profile connectors. These connectors include all the connectors other than the shared location connector.

The selected selected certificate will be pushed to the shared location first and then the certificate will be associated to the selected profile.

Rolling Back Certificates

In the event of a rollback, the system restores the previous state by unbinding the current certificate, pushing and binding the backed-up certificates to the selected profile.

CSR Generation

Note: Generation of CSR can be performed for a FortiGate device during certificate enrollment. The Partition name, CSR File Name, and Key File Name have to be provided.

Minimum Privileges required in FortiManager

JSON API Access

Required for JSON API operations, it enables AppViewX to communicate with FortiManager through REST API calls. (`System Settings -> Administrator -> Edit Administrator`).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Required access: Read/Write

System Settings Access

Required to manage system certificates and configurations. (System Settings > Admin Profiles > Edit Administrator)

Required access: Read/Write

Configuring FortiManager Firewall Device

To add a FortiManager device:

1. Go to (**Menu**) > **CERT+** > **Device Management**.
   By default, the **ADC** tab opens.
2. Select the **Firewall** tab.
3. Click the + (**Add**) icon located on the top right corner.
   The **Add** page appears.
4. Select the **Fortinet** vendor from the left side bar.
5. Enter the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select **FortiManager**.
***Device name**	Unique custom identifier of your device.
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Data center	The data center on which the device has been hosted. Select a datacenter from the dropdown list or enter a data center name.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
***SSH Port**	By default, it is 22.
***HTTPS Port**	By default, it is 443. **Note:** Any change in port configuration is captured in audit logs.
**: Mandatory fields*	

6. Enter the field information in the **Credentials** section:

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **Credential List - AppViewX** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential Type from the dropdown list. If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your password can be of any length with a combination of alpha-numerical, symbols, and special characters.
**: Mandatory fields*	

7. Enter the field information in the **Secondary device information** section as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
- **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
- **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Note:
- By clicking the **Add** button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing, and management can be seamlessly handled in AppViewX.

8. Click the **Save** button to add a Firewall device.

Note: To discard the changes, click the **Cancel** button.

A pop-up message is displayed as **Device added successfully**.

Discovering Certificates

- Discovery (on-demand and scheduled) of certificates from the FortiManager certificate repository including:
  - Local certificates
  - Local CA certificates
- The system creates the following certificate profiles with correct naming conventions:

Certificate Profile	Naming Convention
System Local	`deviceName::FortiManager::System`
HTTPS & Web Service	`deviceName::FortiManager::System::AdminServerCertificate`
SAML SSO IdP (when enabled)	`deviceName::FortiManager::System::SamlIdp`
HA Cluster	`deviceName::FortiManager::System::HA`

- When config sync is triggered and cert sync is enabled, the system automatically:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Initiates certificate discovery
- Creates/updates corresponding profiles
- Maintains the association between certificates and profiles

> **Note:** Certificates from FortiGate devices managed by FortiManager are currently not supported in this integration.

- Frame application connectors for the server certificates based on the profile it was discovered from. (Default connector is overridden by Profile connectors.)

Pushing Server Certificates to the Device

> **Note:** The certificates can be pushed to the FortiManager device only in **PEM** format.

Parameters

- **Certificate File Name**: Mandatory parameter specifying the name for the certificate file on the device

Push Root and Intermediate Certificates

- **Functionality**: Root and intermediate certificates can be included with the server certificate during push operation
- **Import Behaviour**:
  - Server certificate imported to **local cert** store
  - Trust certificates (root/intermediate) imported to **local ca cert** store

File Naming Requirements

- File name is **mandatory** for all certificates in the chain.
- Each certificate in the chain requires a unique file name.
- If any of the specified names already exists on the device, the push operation will **fail**
- **Overwrite Option**: Can be resolved by checking the **overwrite** option to replace existing certificates
- **Private Key In Device option**: Used to map certificate to a CSR file in FortiManager. When selected, the CSR file in the device will be updated with the certificate content.

Trust Certificate Push

All trust certificates will be imported to the local ca certificate store on the FortiManager device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Naming and Override Behavior

- Same file naming requirements apply as server certificate push.
- Mandatory file names for all trust certificates being pushed.
- Push operation fails if certificate names already exist on device.
- **Overwrite Option:** Available to replace existing trust certificates with the same names.

Binding Certificates

Certificates can be bound to profile connectors in FortiManager. Certificate binding is supported for the following profiles:

- Admin Server Certificate
- SAML Identity Provider
- High Availability (HA)

After the push operation, the certificate will be referenced using the pushed certificate name in the FortiManager configuration. This ensures proper association between the certificate and the specific profile functionality.

Backing Up and Rolling Back Certificates

Backup and rollback operations are not supported because FortiManager does not expose the private key content of the server certificates. Therefore, it is not possible to backup or restore the previous state of the certificates in case of a rollback.

CSR Generation

The FortiManager CSR generation feature allows users to create Certificate Signing Requests (CSR) directly on FortiManager devices through SSH connectivity.

Note: Command Format: execute certificate local generate [filename] [bitlength] [commonname] [country] [state] [locality] [organization] [organizationunit] [email]

Parameters

- **CSR File Name**: Mandatory parameter specifying the name for the CSR file on the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once CSR generation is successful and signed certificate is received from CA, the certificate has to be pushed back to the device with the same CSR file name with PrivateKeyInDevice option selected to map the certificate correctly.

Note:

- Implementation supports only RSA key generation; no support for EC/DSA or any other key type.
- Supported bit lengths for RSA key type: 512, 1024, 1536, 2048, 3072, 4096

CLI Commands

CSR generation

1. Generate CSR in the device:

```
execute certificate local generate <name> <key_size> <CN> <C> <ST> <L> <O> <OU>
    <email>
```

2. Get CSR file content : `show system certificate local <csr_file_name>`

APIs

`POST https://$HOST:$HTTPS_PORT/jsonrpc`: This is the standard format of the API URLs triggered in FortiManager for all the use cases.

Standard payload format:

```
{
 "id": <id>,
 "method": "<method, could be exec, add, update>",
 "params": [
    {
       "url": "URL for the request",
       "data": {
          <Data required for the request>
       }
    }
 ],
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
 "session": <session_id>
}
```

Operation	Method	URL	Data	Description
Login using json rpc	exec	/sys/login/user	{ "user": {USER_NAME}, "passwd": {PASSWORD} }	A login operation is required in order to get a session ID.
System Status	get	/cli/global/system/status	{ }	Displays system information such as firmware version and system mode.
Show local certs	get	/cli/global/system/certificate/local	{ }	Displays full configuration of local server certificates. (Private key of the certificates are masked in the response).
Show local CA certs	get	/cli/global/system/certificate/ca	{ }	Displays full configuration of local CA certificates in the system.
Show system	get	/cli/global/system/admin/setting	{ }	Displays the system

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Method	URL	Data	Description
admin settings				admin setting details.
Show HA settings	get	/cli/global/system/ha	{ }	Displays the HA setting details.
Show SAML Idp settings	get	/cli/global/system/saml	{ }	Displays the SAML Idp setting details.
Add/Update local server certificate	add/update	/cli/global/system/certificate/local	{ "certificate": "{CERTIFICATE_CONTENT}", "name": "{CERTIFICATE_FILE_NAME}", "private-key": "{PRIVATE_KEY_CONTENT}" }	To import a server certificate with a private key to local store.
Add/Update local CA certificate	add/set	/cli/global/system/certificate/local/ca	{ "certificate": "{CERTIFICATE_CONTENT}", "name": "{CERTIFICATE_FILE_NAME}" }	To import a trusted CA certificate to local ca store.
Modify system admin server certificate	update	/cli/global/system/admin/setting	{ "admin_server_cert": "{CERTIFICATE_FILE_NAME}" }	To modify the admin server certificate mapped to the FortiManager UI portal.
Modify HA certificate	update	/cli/global/system/ha	{ "local-cert": "{CERTIFICATE_FILE_NAME}" }	To modify certificate mapped to the HA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Method	URL	Data	Description
Modify SAML Idp certificate	update	/cli/global/system/saml	`{ "cert": "{CERTIFICATE_FILE_NAME}" }`	To modify certificate mapped to the SAML Idp setting.

Troubleshooting

Device goes to unresolved state after onboarding

The device might enter an unresolved state due to connectivity issues from the AppViewX installed node or CC node. In such cases, follow these steps:

- Attempt to establish an SSH connection from the AppViewX installed node or CC node to the FortiManager server.
- Verify if there is proper connectivity between the nodes and the FortiManager server. Check for the JSON API access provided for the user onboarded in AppViewX.

Device addition with FQDN fails when using external vault

When adding a firewall device with FQDN in AppViewX, the credentials are fetched from the external vaults via device FQDN. A dot (.) is automatically added at the end of the FQDN for firewalls in AppViewX during the credential lookup process.

Note:

- The credentials configured in the external vault must have a dot (.) at the end of the FQDN to match the lookup pattern used by AppViewX.
- If the FQDN of the device is `test.avx.com`, then the credential entry in external vault should be configured as: `test.avx.com.`

Validating the Device

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **CERT+** > **Device Management**.
   By default, the **ADC** tab opens.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click the **Firewall** tab.
3. Search the device name and validate whether the device is added successfully.

Adding Juniper Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - AppViewX needs an internet or proxy connection to communicate with the firewall via the REST API.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
  - The API must have elevated (admin) permissions to read and modify SSL certificates.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:
  - Username/Password
  - Credential List AppViewX/CyberArk
- **Enable Password**: Required
- **License Check**: Not required
- **Services and Port for AppViewX Communication**: Port number 22 (SSH)
- **Internet Access/Proxy**: Not required
- **Location from which the certificates are discovered if Certificate Managed**: Not supported

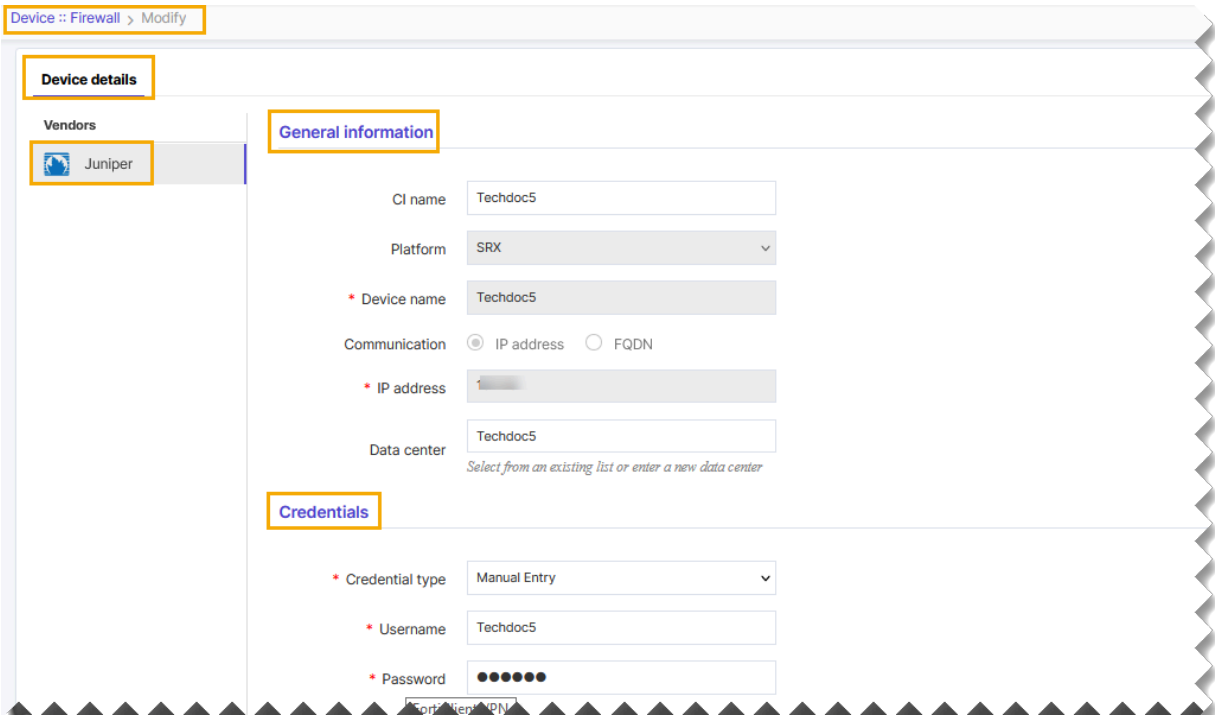
Note: For Visual Workflow action items, you will require credentials with write privilege.

Configuring a Juniper Firewall Device

To add a Juniper device,

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
3. On the **Device :: Firewall** page, click (**Add**).
   The **Device :: Firewall > Add** page is displayed.
4. Select the **Juniper** vendor from the left side bar. bar.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



5. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the drop-down list. The available option is, • SRX.
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***IP address/ FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

6. Enter or select the field information in the **Credentials** section:

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the password.
**: Mandatory fields*	

7. Enter or select the field information in the **Secondary device information** section as follows:

   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

   Note:
   - By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
   - By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

8. Click the **Save** button to add an Firewall device.

   Note:
   - To discard the changes, click the Cancel button.

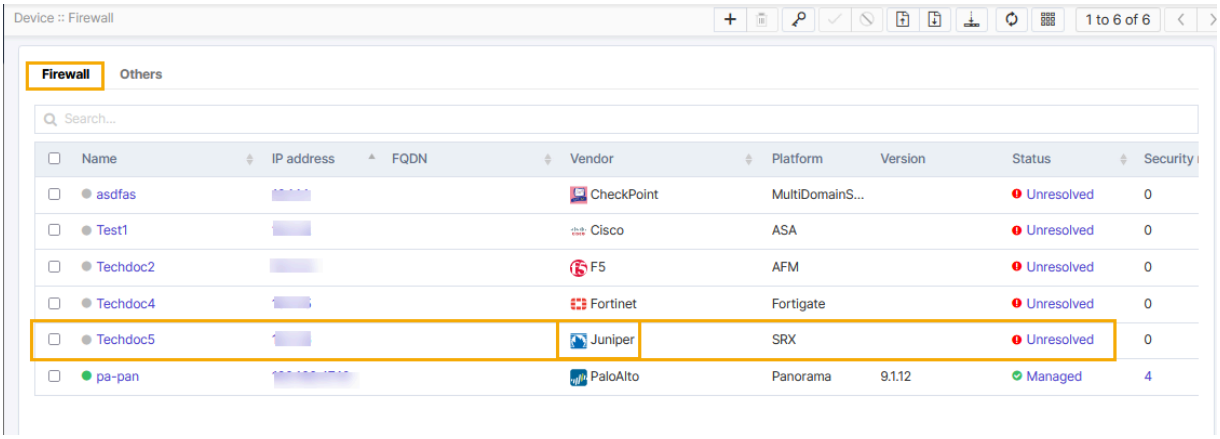
   A pop-up message is displayed as **Device added successfully**.

Validating a Juniper Firewall Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Firewall**.
   The **Device :: Firewall** page is displayed. This page is an inventory of all the existing firewall devices.
3. Search the device name and validate whether the device is added successfully.



What's Next

Once you configured the Juniper firewall, you are ready to proceed with the following action to enable the auto enrollment:

- Automating Certificates for Firewall Devices in AppViewX

Adding Palo Alto Firewall Device

Refer to Automating CLM for Palo Alto.

Deleting a Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Firewall** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Delete**) icon in the command bar.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Delete** confirmation popup window is displayed.

5. Click **Yes**.
   The firewall will be removed from the device inventory.

Importing a Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Firewall** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Import**) icon in the command bar.
   You will be redirected to the import firewall page.
5. Download the sample <.csv> or <.xls> file.
6. Update the details.
7. Click the browse and upload button.
8. Upload the files.
   Firewall details will be updated to the firewall inventory.

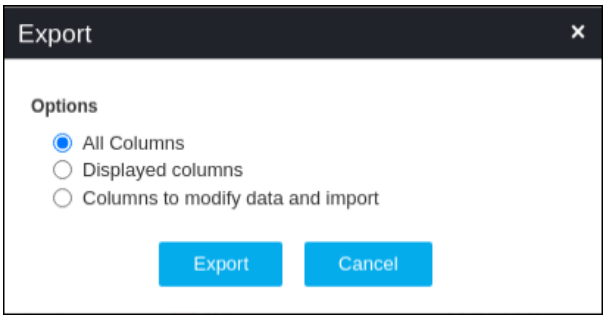
Exporting a Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Firewall** tab.
3. Click the check-box beside the device name. If you are exporting details of multiple firewalls, select the check-boxes for each one.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Export**) icon in the command bar at the upper right of the screen.
5. On the Export pop-up screen that is displayed, select the type of information you want to export and click the **Export** button.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



a. **All Columns** - Select this option if you want to export all information about the firewall.
b. **Displayed columns** - Select this option if you want to export only the information that is visible on the firewall screen.
c. **Columns to modify data and import** - Select this option if you are exporting firewall details to make modifications and then re-import the data into the firewall Inventory.

6. On the screen that opens, select the location where you want the firewall details file to go, then click **Save**.
   Firewall details will be downloaded as an Excel `<.xls>` file.

Managing a Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Firewall** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. To start managing the firewall, click the (**Manage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation pop-up message that is displayed.
   • Config fetch will be triggered and the firewall will get managed.
   • Firewall status is changed to **Manage** in Firewall inventory.

Unmanaging a Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click the **Firewall** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Unmanage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation popup message that is displayed.
   Firewall device status is changed to UnManaged in Firewall inventory.

Executing a Fetch Config for Firewall

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Firewall** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Fetch Config**) icon in the command bar.
   A popup notification message is displayed as **Fetch config has been triggered for the firewall.** The configuration will be fetched from the server.

Configuring Switches

Prerequisites

- Beyond trust PAM must be integrated with AppViewX for managing the device credentials.
- Network devices must be managed in AppViewX for workflow to be executed.

You can configure Arista, Cisco or Juniper switches using these instructions.

To configure a router:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Switch** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the fields in the respective sections as described:

Field Description of Switch

Field	Description
General Information	
***Switch type**	Select between L2 and L3. By default, L2 is selected.
***Device name**	Unique custom identifier of your device.
***IP address**	Enter the IP address based on the selected communication mode.
***Port**	Enter the port details. By default, it is 22.
Model	Enter the switch model.
Device description	Provide a description for the switch.
Data center	Enter a data center.
Credentials	
***Credential type**	Select the credential type from the dropdown: • **Manual entry (default):** The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **Credential List - AppViewX:** The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication.
Secondary device information	
Peer device	By default, **Manual Entry** is not selected. Select this checkbox if you want to add another switch.
The following fields appear if the **Manual Entry** checkbox is selected.	
***Switch type**	Select between L2 and L3. By default, L2 is selected.
***Device name**	Unique custom identifier of your secondary device.
***IP address**	Enter the IP address of the secondary device.
***Port**	Enter the port details. By default, it is 22.
Model	Enter the switch model.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Device description	Provide a description for the switch.
Data center	Enter a data center.
Secondary device credentials	
***Credential type**	Select the credential type from the dropdown: • **Manual entry (default):** The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **Credential List - AppViewX:** The username and password can be saved to a list and referenced when adding the device. The credential lists are integrated within AppViewX application for the secured authentication.
Enable Password	Enter a password.
*Fields marked with asterisk (*) symbol are mandatory.	

4. Click **Save.**
   A message, *Device is added successfully,* appears.

What to do next

Once the credentials are updated a fetch configuration should be initiated in the AppViewX node to check if the credentials are working and if whether all the devices are in managed state. See Manually Fetch the Configuration for a Device.

For other device-related actions, see Inventory Actions.

Configuring Routers

You can configure Cisco or Juniper routers using these instructions.

To configure a router:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Router** tab.
3. Enter the fields in the respective sections as described:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description of Router

Field	Description
General Information	
***Device name**	Unique custom identifier of your device.
***IP address**	Enter the IP address based on the selected communication mode.
***Port**	Enter the port details. By default, it is 22.
Model	Enter the router model.
Device description	Provide a description for the router.
Data center	Enter a data center.
Credentials	
***Credential type**	Select the credential type from the dropdown: • **Manual entry (default):** The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **Credential List - AppViewX:** The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication.
Secondary device information	
Peer device	By default, **Manual Entry** is not selected. Select this checkbox if you want to add another router.
The following fields appear if the **Manual Entry** checkbox is selected.	
***Device name**	Unique custom identifier of your secondary device.
***IP address**	Enter the IP address of the secondary device.
***Port**	Enter the port details. By default, it is 22.
Model	Enter the router model.
Device description	Provide a description for the router.
Data center	Enter a data center.
Secondary device credentials	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Credential type**	Select the credential type from the dropdown: • **Manual entry (default):** The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **Credential List - AppViewX:** The username and password can be saved to a list and referenced when adding the device. The credential lists are integrated within AppViewX application for the secured authentication.
Enable Password	Enter a password.
*Fields marked with asterisk (*) symbol are mandatory.	

4. Click **Save.**
   A message, *Device is added successfully,* appears.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to (**Menu**) > **CERT+** >**ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Switch** tab.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What to do next

Once the credentials are updated a fetch configuration should be initiated in the AppViewX node to check if the credentials are working and if whether all the devices are in managed state. See Manually Fetch the Configuration for a Device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For other device-related actions, see Inventory Actions.

Configuring and Managing Cloud Devices

- Viewing the Cloud Device Inventory
- Amazon Web Services (AWS)
- Azure
- Google Cloud Platform (GCP)
- Apache SSM integration specification
- Functional Specification
- Generic Linux SSM Integration Specification
- Instances Discovery Specification
- Delete Cloud
- Import Cloud
- Export Cloud
- Manage Cloud
- Unmanage Cloud
- Fetch Config for Cloud

Viewing the Cloud Device Inventory

The cloud device inventory is displayed at two levels:

- Outer inventory: Displays details of all cloud accounts added
- Inner inventory: Displays details of an individual cloud account

To access the outer cloud device inventory:

1. In the AppViewX UI, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.
   The **Device** :: **ADC** page is displayed.
2. From the **Device :: ADC** screen, select **Cloud**.
   The **Device :: Cloud** outer cloud device inventory is displayed.

   The fields displayed in the inventory are explained in the table below:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The order in which these fields are displayed in the inventory can vary depending on the value selected from the **Vendor** dropdown list.

Field	Description
Vendor	From this dropdown list, select a vendor to filter the cloud device inventory as required.
Account Name	Name of the account to which the cloud device belongs
Account Description	Applicable only for a child account, this field displays the following details: • Account type (child) • Master account number • Discovery type: **ROLE_BASED** or **ORGANIZATION_BASED**
Vendor	Cloud device vendor name
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for organizations. For organizations, the resource discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field indicates the status of the resource discovery for the individual entities belonging to a discovered project using the following values: • **Not started**: Resource discovery by AppViewX is yet to begin **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery by AppViewX in the customer's GCP environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**. **Note:** This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's GCP environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX in GCP. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • for ACM and ELB resources • for all existing devices and projects as part of data migration
Cert Discovery Status	**Note:** Cert discovery status is not applicable for organizations. For organizations, the cert discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: The certificate discovery status of accounts in this outer cloud inventory list depends on the corresponding status of all their reporting entities listed in the project level inventory.
	
	Indicates the status of the certificate discovery for the discovered projects using the following values:
	• **Not started**: Certificate discovery for the project is yet to begin
	
	Note: At this point, the resource discovery status of the associated project can be **Not started**, **In-Progress**, or **Completed**.
	
	• **In-Progress**: Certificate discovery by AppViewX in the customer's GCP environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all projects is either **Completed** or **Not Applicable**.
	• **Completed**: Certificate discovery by AppViewX in the customer's GCP environment is complete.
	
	Note: This is possible only when the certificate discovery status for all the entities associated with the project is **Completed**.
	
	• **Not Applicable**: The certificate discovery status is set to **Not Applicable**:
	  • for EC2 when no EC2 instances are discovered
	  • for all existing devices and child projects as part of data migration
	
	Note: The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.

Project ID	**Note:** This field is displayed only when **Vendor** = **GCP Projects**. User-assigned unique identifier of the project
Project Number	System-generated unique identifier of the project assigned by GCP

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Project Name	User-friendly name assigned to the project

Note: Alternate steps to access the cloud device inventory:

a. In the AppViewX UI, go to (**Menu**) > **Platform** > **ASSET MANAGEMENT** > **Device Inventory**.

The **Device :: ADC** page is displayed.

b. From the **Device :: ADC** screen, select **Cloud**.

The **Device :: Cloud** outer cloud device inventory is displayed.

Amazon Web Services (AWS)

AWS (Amazon Web Services) is a comprehensive cloud computing platform provided by Amazon. It offers a wide range of cloud services, including computing power, storage options, networking, machine learning, and database services.

- Onboarding a Standalone Account
- Onboarding a Cross Account in AppViewX
- AWS Standalone Account Onboarding via Cross Account

AWS Services Supported by AppViewX

AppViewX supports the following AWS services:

- **ACM**

  AWS Certificate Manager (ACM) is a service provided by Amazon Web Services that simplifies the process of provisioning, managing, and deploying SSL/TLS certificates for use with AWS services and your internal connected resources.

- **IAM**

  IAM (Identity and Access Management) is a web service that helps you securely control access to AWS resources. IAM enables you to manage users, groups, roles, and their associated permissions to ensure that the right individuals and services have the appropriate access to your AWS resources.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **ELB**

  Elastic Load Balancer, ELB, is a service that automatically distributes incoming application traffic across multiple targets, such as Amazon EC2 instances, containers, and IP addresses, in one or more Availability Zones. ELB helps ensure the availability, scalability, and fault tolerance of your applications.

  AWS provides three types of load balancers:

  - **Application Load Balancer** (**ALB**): Best suited for HTTP and HTTPS traffic, providing advanced request routing features targeted at the delivery of modern application architectures, including microservices and containers.
  - **Network Load Balancer** (**NLB**): Designed to handle millions of requests per second while maintaining ultra-low latencies, best suited for TCP, UDP, and TLS traffic where extreme performance is required.

  Classic Load Balancer (**CLB**): Provides support for basic load balancing of HTTP/HTTPS and TCP/SSL traffic
- **CloudFront**

  CloudFront is a Content Delivery Network (CDN) service. It speeds up the delivery of your web content by caching copies of your content at edge locations around the world.
- **EC2**

  Amazon EC2 (Elastic Compute Cloud) is a web service provided by Amazon Web Services (AWS) that offers resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers by providing a secure, resizable, and flexible

Onboarding a Standalone Account

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The following steps cover only the bare minimum requirements for onboarding a standalone AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Note: If you already have a AWS account set up with the required roles and policies created and mapped, refer the instructions for **Onboarding a Standalone Account in AppViewX**.

Prerequisites for Onboarding a AWS Standalone Account in AppViewX

- An IAM role must be created in your AWS account with the required roles and policies created and mapped. For instructions, refer the documentation here.

  Note: For additional AWS documentation for creation a standalone account, refer to the links in the **References** section.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

    Important: For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important: AWS standalone device migration is supported only from the following versions of CERT+ SaaS: **v2020.1**, **v2020.2**, **v2020.3** - **v2020.3 FP7**. The following prerequisites are also applicable to only these versions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Important: AWS device migration **is not** supported from the following versions of CERT+ SaaS: **v2012.x**, **v2019.x**, and **v2021.x**. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Note: For customers migrating from versions **20.1.x**, **20.2.x**, and **20.3.6**, AppViewX recommends that you delete the following before migration:

- All of their Amazon CA settings
- Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).

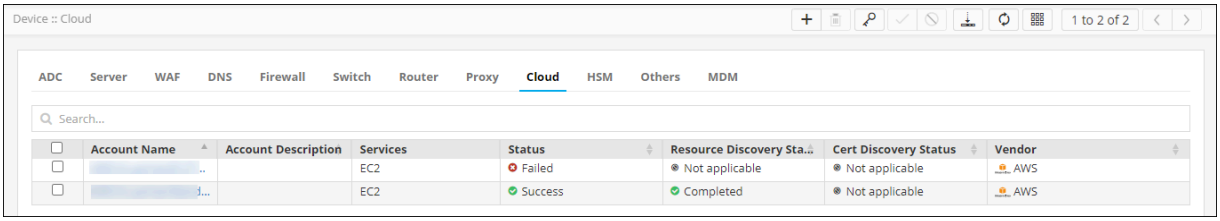
Note: For customers migrating from version **v2020.3.10** (mandatory):

- Delete all of their Amazon CA settings before migration.
- Trigger config fetch for all of their cloud accounts after migration.

The following actions have to be performed for the **standalone AWS cloud accounts** migrated from the above listed versions to version **v2022.1 FP1**:

For standalone accounts where one of the associated services is not EC2

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
   The **Device :: Cloud** page is displayed.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

> **Troubleshooting:** If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.

4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).
   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

> **Note:** For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

Before Migration

Merge permissions from all individual buckets into any one S3 bucket.

After Migration

1. Select a migrated standalone account from the **Device :: Cloud** page.
   The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.
2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
4. Click **Add**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **Save**.
   Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

AWS IAM Prerequisites for Standalone Account Onboarding

For Discovering and Managing SSL Certificates in ACM

```
{

        "Resource": "*"
    }
  ]
}
```

Onboarding a Standalone Account in AppViewX

The following instructions will guide you through the process of onboarding a standalone account in AppViewX for the supported AWS services (listed and explained here):

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, select **Standalone**.
***Account name**	Enter your AWS account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	According to the type of the new cloud device being added, select the corresponding Amazon Cloud Service for the device.
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Service region*	Service regions are regions that are supported by the selected service. From the dropdown list, select the service regions that should be scanned for certificates. **Note:** To be able to fetch and select from the available regions, ensure that the credentials have been provided in the **Credentials** section.
CA Operation Mode*	**Note:** This field is displayed only when the **Amazon Private CA** service is selected. From the following options, select one/both operation mode(s) for discovering all the certificates enrolled by the Private Certificate Authority: • **ACM** • **PCA**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
S3 Bucket*	**Note:** This field is displayed only when the **PCA** CA operation mode is selected. Enter the S3 bucket name.
Discovery Certificate	**Note:** This field is displayed only when one/both of the CA operation modes are selected. To enable instance certificate discovery at the time of device addition, select this checkbox.
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

What's Next?

After you have successfully onboarded a standalone account in AppViewX, the next step is to discover existing certificates for the onboarded account and/or enroll new certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**. **Note:** This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved,** • for ACM and ELB resources, • for all existing devices and child accounts as part of data migration.
Cert Discovery Status	**Note:** Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Certificate discovery for the entity is yet to begin **Note:** At this point, the resource discovery status of the associated account can be **Not started**, **In-Progress**, or **Completed**. • **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

- Using IAM roles for Amazon EC2 instances.
- Define custom IAM permissions for customer managed policies.

Onboarding a Cross Account in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

This section of the documentation will guide you through the process of onboarding an AWS cross account in AppViewX.

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Note: If you already have a AWS account set up with the required roles and policies created and mapped, you can directly start with **Onboarding a Cross Account in AppViewX** .

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Attach policies to the created user.

   For the AWS IAM permissions to be added for the master account, click here.

- In your AWS child account:
  1. Create a role in the child account in AWS.
  2. Attach policies to the created role.

     For the AWS IAM permissions to be added for the child account, click here.

  3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
  4. Attach policies to the EC2 role.

     For the AWS IAM permissions for the EC2 policy, click here.

     For the AWS IAM permissions for the EC2 role, click here.

- If account specific S3 buckets have been deployed for EC2 integration, ensure that the bucket names are suffixed with the corresponding account number.

  For instruction on creating an S3 bucket in your AWS account, see References.

> **Note:** For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

    > **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX

In AWS, cross-account discovery can be set up in two ways:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Onboarding a Cross Account in AppViewX for Organization-based Discovery

The following instructions will guide you through the process of onboarding a standalone account in AppViewX for the supported AWS services (listed and explained here):

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the services required for the CLM operations. **Tip:** To select all services, select the **Select all** check box displayed at the beginning of the list of services. **Note:** • When **ACM (Certificate Authority)** is selected from the **Service** dropdown list, an additional set of fields is displayed under the section **ACM Certificate Authority Service**to configure the ACM services. These fields are explained in the table in Step 10. • When **Amazon Private CA** is selected from the **Service** dropdown list, an additional set of fields is displayed under the section **ACM Private CA**. These fields are explained in the table in Step 11. • When the **EC2(EC2 Instance)** service is selected, an additional set of fields is displayed to configure the EC2 services. These fields are explained in the **EC2 Services** table in Step 7.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **ACM Certificate Authority Service** section.

> **Note:** This section is displayed only when one or both **ACM** services are selected from the **Services** dropdown list.

Field description for the ACM Certificate Authority Service

Field	Description
Role Setting Preference*	**Note:** This field is displayed only when both auto discovery modes (**Organization Based Discovery** and **IAM Policy Based Discovery**) are selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select one of the following options: • **Organization Based Discovery** • **IAM Policy Based Discovery**
Route53 Zone Auto Approval	To support DNS validation as an automatic process, enable this toggle.
**: Mandatory fields*	

9. Enter/Select the required details in the **ACM Private CA** section.

> **Note:** This section is displayed only when the **ACM (Amazon Private CA)** service is selected for a **Cross or Federated** account.

Field description for the ACM Private CA section

Field	Description
CA Operation Mode*	From the following options, select one/both operation mode(s) for discovering all the certificates enrolled by the Private Certificate Authority: • ACM • PCA
S3 Bucket*	**NOTE**: This field is displayed only when the **PCA** operation mode is selected. a. Enter the S3 bucket name. b. Click . The **ARN Advanced Settings** action pane is displayed. c. In the **ARN Advanced Settings** action pane, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	<table><tr><th>Field</th><th>Description</th></tr><tr><td>Role ARN*</td><td>Amazon Resource Name of the role that the caller is assuming</td></tr><tr><td>Role Session name</td><td>Role Session name is an identifier for the assumed role session. Use the Role Session name to uniquely identify a session when the same rule is assumed by different principals or for different reasons.</td></tr><tr><td>Duration Seconds</td><td>Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • Minimum: 900 seconds (15 minutes) • Maximum: 129,600 seconds (36 hours) Default: 3600 seconds (1 hour)</td></tr></table>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	<table><tr><th>Field</th><th>Description</th></tr><tr><td>External Id</td><td>External Id is a unique identifier that might be required when you assume a role in another account.</td></tr><tr><td>Source Identity</td><td>The source identity is specified by the principal that is calling the AssumeRole operation.</td></tr><tr><td>Session Tags</td><td>Session Tags are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: i. In the Enter Key field, enter a key for the key-value pair. ii. In the Enter Value field, enter a value for the key-value pair. iii. Click Add.</td></tr></table>

<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>To create a session tag:
i. In the Enter Key field, enter a key for the key-value pair.
ii. In the Enter Value field, enter a value for the key-value pair.
iii. Click Add.

The added key-value pair is shown in the table below the fields.</td></tr>
</table>
</td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

11. To add the new device to the cloud device inventory, click **Add**.

> **Tip:** To select multiple services for a device, after you click **Add**, go back to the **Services** dropdown list and select the next service you want to enable for the device. Enter/select the rest of the details and click **Add**. Repeat this process for as many services you want to enable for the new device. The table is populated with a separate entry for each service.

- Details of the child accounts for the added master account are displayed in the inner inventory table at the bottom of the page. The details captured in the inner inventory are explained here.
- Details of the master account are listed on the **CERT+** > **Administration** > **Certificate Authority** > **<Selected CA>** page.

> **Note:** For a public Certificate Authority, only the child account details are listed on the **CERT +** > **Administration** > **Certificate Authority** > **Amazon** > **ACM CA** page. There is no inner inventory for a public certificate authority.

12. After enabling all the services for the new device, click **Save**.
    - On saving the device, through SSM, AppViewX will communicate with EC2 instances through SSM.
    - AppViewX will discover the processes from these instances and manage them in the Server device inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once all the details are entered, you can add them to the Apache Linux server.

Note: Apart from the Apache and Tomcat processes vendor, the rest of the processes will be managed in the server inventory only as "Generic Linux".

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section. To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.
   The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:
- If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

The following instructions will guide you through the process of onboarding a standalone account in AppViewX for the supported AWS services (listed and explained here):

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for IAM policy-based discovery: a. Select **Policy Based Discovery**. The **Policy based Discovery** dialog box is displayed. b. Enter/Select the details required to configure IAM policy-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Organization Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the services required for the CLM operations. **Tip:** To select all services, select the **Select all** check box displayed at the beginning of the list of services. **Note:** • When **ACM (Certificate Authority)** is selected from the **Service** dropdown list, an additional set of fields is displayed under the section **ACM Certificate Authority Service**to configure the ACM services. These fields are explained in the table in Step 10. • When **Amazon Private CA** is selected from the **Service** dropdown list, an additional set of fields is displayed under the section **ACM Private CA**. These fields are explained in the table in Step 11. • When the **EC2(EC2 Instance)** service is selected, an additional set of fields is displayed to configure the EC2 services. These fields are explained in the **EC2 Services** table in Step 7.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **ACM Certificate Authority Service** section.

Note: This section is displayed only when one or both **ACM** services are selected from the **Services** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the ACM Certificate Authority Service

Field	Description
Role Setting Preference*	**Note:** This field is displayed only when both auto discovery modes (**Organization Based Discovery** and **IAM Policy Based Discovery**) are selected. From the dropdown list, select one of the following options: • **Organization Based Discovery** • **IAM Policy Based Discovery**
Route53 Zone Auto Approval	To support DNS validation as an automatic process, enable this toggle.
**: Mandatory fields*	

9. Enter/Select the required details in the **ACM Private CA** section.

Note: This section is displayed only when the **ACM (Amazon Private CA)** service is selected for a **Cross or Federated** account.

Field description for the ACM Private CA section

Field	Description
CA Operation Mode*	From the following options, select one/both operation mode(s) for discovering all the certificates enrolled by the Private Certificate Authority: • ACM • PCA
S3 Bucket*	**NOTE**: This field is displayed only when the **PCA** operation mode is selected. a. Enter the S3 bucket name. b. Click .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
The ARN Advanced Settings action pane is displayed.

10. Enter/Select the required details in the **EC2 Services** section.

Field description for the EC2 Services section

Field	Description
Communication mode	By default, the **SSM** communication mode is selected.
Certificate Discovery Mode	By default, the **File System Scanning** certificate discovery mode is selected.
***S3 Deployment Type**	From the dropdown list, from the following options, select the deployment type used for the S3 bucket that will be used for the EC2 integration: • **Centralized**: Select this if the S3 bucket that will be used for the EC2 integration is managed centrally across all accounts. • **Account Specific**: Select this if each account manages individual S3 buckets.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>*S3 Bucket Name</td><td>Enter the name of the S3 bucket that will be used for EC2 integration.

For account specific S3 buckets, enter the bucket name without the account number suffix. AppViewX will automatically append the account number based on the value entered here.

To configure the ARN advanced settings for the specified S3 bucket, follow the instructions given below:

a. Click .

The ARN Advanced Settings dialog box is displayed.

b. In the ARN Advanced Settings dialog box, enter the following details:

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Role ARN*</td><td>Amazon Resource Name of the role that the caller is assuming.</td></tr>
<tr><td>Role Session name*</td><td>Role Session name is an identifier for the assumed role session.

Use the Role Session name to uniquely identify a session when the same rule is assumed by different principals or for different reasons.</td></tr>
<tr><td>Duration Seconds</td><td>Enter the duration, in seconds, for which the credentials should remain valid.

Acceptable durations for IAM user sessions:
• Minimum: 900 seconds (15 minutes)
• Maximum: 129,600 seconds (36 hours)
• Default: 3600 seconds (1 hour)</td></tr>
<tr><td>External Id</td><td>External Id is a unique identifier that might be required when you assume a role in another account.</td></tr>
</table>
</td></tr>
</table>

<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Source Identity</td><td>The source identity is specified by the principal that is calling the AssumeRole operation.</td></tr>
<tr><td>Session Tags</td><td>Session Tags are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

To create a session tag:
i. In the Enter Key field, enter a key for the key-value pair.
ii. In the Enter Value field, enter a value for the key-value pair.
iii. Click Add.

The added key-value pair is shown in the table below the fields.</td></tr>
</table>
</td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

11. To add the new device to the cloud device inventory, click **Add**.

> **Tip:** To select multiple services for a device, after you click **Add**, go back to the **Services** dropdown list and select the next service you want to enable for the device. Enter/select the rest of the details and click **Add**. Repeat this process for as many services you want to enable for the new device. The table is populated with a separate entry for each service.

- Details of the child accounts for the added master account are displayed in the inner inventory table at the bottom of the page. The details captured in the inner inventory are explained here.
- Details of the master account are listed on the **CERT+** > **Administration** > **Certificate Authority** > **<Selected CA>** page.

> **Note:** For a public Certificate Authority, only the child account details are listed on the **CERT +** > **Administration** > **Certificate Authority** > **Amazon** > **ACM CA** page. There is no inner inventory for a public certificate authority.

12. After enabling all the services for the new device, click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- On saving the device, through SSM, AppViewX will communicate with EC2 instances through SSM.
- AppViewX will discover the processes from these instances and manage them in the Server device inventory.

Once all the details are entered, you can add them to the Apache Linux server.

Note: Apart from the Apache and Tomcat processes vendor, the rest of the processes will be managed in the server inventory only as "Generic Linux".

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.

   The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

> **Note:**
> - If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
> - Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.

   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

Note: This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "iam:GetPolicyVersion",
    "iam:GetPolicy",
    "iam:GetUserPolicy",
    "iam:ListGroupsForUser",
    "iam:ListGroupPolicies",
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
      "iam:ListAttachedUserPolicies",
      "iam:ListAttachedGroupPolicies",
      "iam:ListUserPolicies",
      "iam:GetGroupPolicy",
      "iam:GetUser"
    ],
    "Resource": "*"
  }
 ]
}
```

Permissions for Discovering Child Accounts using AWS Organization Services

Note: The permissions mentioned below should be enabled in the account in which organization service is enabled.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "organizations:Describe*",
        "organizations:List*"
      ],
      "Resource": "*"
    }
  ]
}
```

Permissions for Enabling Assume Role Access to all AWS Accounts

Note: This action helps to automatically discover CLM resources in the newly created cloud accounts without manual intervention. This is an optional action, required only if the user prefers to grant access to all the child accounts for the IAM user.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": "sts:AssumeRole",
   "Resource": [
    "arn:aws:iam::<child account 1>:role/<Assume-role>",
    "arn:aws:iam::<child account 2>:role/< Assume-role>",
    "arn:aws:iam::<child account 3>:role/< Assume-role>"
   ]
  }
 ]
}
```

Permissions for Enabling Assume Role Access for a Specific Child Account

Note: If a user prefers not to grant assume role access to all accounts, they can define the RoleARN of a specific child account in the IAM policy, as is shown in the policy below.

Note: This is mandatory when IAM Policy-based account discovery is enabled in AppViewX for child account discovery.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "sts:AssumeRole"
   ],
   "Resource": "arn:aws:iam::<child-account>:role/AppViewX"
  }
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
 ]
}
```

Permissions for Enabling S3 Bucket Access to the AppViewX Platform

Note: The permissions mentioned below are required only if the EC2 service has been added in AppViewX. IAM role should be created in the account with S3 permissions where the S3 bucket resides.

Note: This permission is required when assume role access is granted only to a specific RoleARN.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "VisualEditor0",
         "Effect": "Allow",
         "Action": [
            "sts:AssumeRole"
         ],
         "Resource": "arn:aws:iam::<child-account>:role/AppViewX-S3-Bucket-Access"
      }
   ]
}
```

Permissions for Accessing Organization Services to Discover AWS Accounts

Note: This permission is required when assume role access is granted only to a specific RoleARN.

Note: This permission enables AppViewX to discover the AWS accounts associated to a specific organization.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
{
  "Version": "2012-10-17",

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**. **Note:** This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved,** • for ACM and ELB resources, • for all existing devices and child accounts as part of data migration.
Cert Discovery Status	**Note:** Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Certificate discovery for the entity is yet to begin **Note:** At this point, the resource discovery status of the associated account can be **Not started**, **In-Progress**, or **Completed**. • **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

What's Next?

After you have successfully onboarded a cross account in AppViewX, the next step is to discover existing certificates for the onboarded account and/or enroll new certificates.

AWS Standalone Account Onboarding via Cross Account

The process of onboarding a cross or federated account access involves the following steps:

Step 1: Creating an S3 bucket using the Cloudformation template

1. Login to the AWS account and go to the **CloudFormation service** section.
2. From the navigation pane on the left, select **Stacks**.
3. From the top-right corner of the **CloudFormation** > **Stacks** screen, click **Create stack** > **With new resources (standard)**.

   The **Create stack** page is updated to display the fields for **Step 1 Specify template** of the stack creation process.
4. In the **Prerequisite - Prepare Template** section, select the **Template is ready** option.
5. In the **Specify template** section:
   a. For **Template source**, select **Upload a template file**.
   b. To **Upload a template file**, click **Choose file**.
   c. Navigate to the **CloudFormationTemplates/WithoutCondition** folder.
   d. Select the **S3Bucket.yaml** file and click **Open**.
6. Click **Next**.

   The **Specify Stack Details** page (step 2 of the stack creation process) is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Enter a **Stack name**. For the purpose of this guide, **Stack name** = **avxdemo-S3**.
8. In the **Parameters** section, enter the following details:

    a. **AccountId**: From the top-right corner of the screen, click your username and copy the account ID displayed.

    b. **BucketName**: Enter a name for the S3 bucket that will be created in the backend. Recommended format to name the S3 bucket: **avxdemo-<account ID>**.

    c. **OrganizationID**:
        i. From the top-right corner of the screen, click your username.
        ii. From the menu displayed, right click **Organization** to open it in a new tab.

        The **Dashboard** is displayed.

        iii. From the **Dashboard**, copy the organization ID and paste it into the **OrganizationID** field.

        > **Note:** The organization ID is a mandatory entry for the CloudFormation template.

    d. **RoleName**: Enter a name for the S3 bucket role. For the purpose of this guide, the S3 bucket role will be called **avxdemos3bucketrole**.

    The details entered on the **Specify stack details** page will be used to create a bucket policy for the S3 bucket created for the AWS account. This bucket policy can be customized later based on customer preferences for how they want to secure their infrastructure.

9. Click **Next**.
    The **Configure stack options** page (step 3 of the stack creation process) is displayed.
10. Scroll down to the **Stack failure options** section and select **Preserve successfully provisioned resources**.
11. Click **Next**.
    The **Review <stack name>** page (step 4 of the stack creation process) is displayed
12. On the **Review <stack name>** page, scroll down to **Capabilities** and select the **I acknowledge that AWS CloudFormation might create IAM resources with custom names** checkbox.
13. Click **Create stack**.

    The **<stack name**> page is displayed. This page lists the existing stacks on the left and the following details for each stack on the right:

    - **Stack info**
    - **Events**
    - **Resources**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Outputs**
- **Parameters**
- **Templates**
- **Change sets**

When the stack creation process is complete, **Status** (under the **Events** tab) will be updated to **CREATE_COMPLETE**. This means that, in the backend, an S3 bucket as well as the roles required to provision the bucket have been created. The bucket policy for the S3 bucket has also been updated accordingly.

14. Go to the **Parameters** tab and note the bucket name to use it in the CloudFormation template for the master account.

What to do next: Create a child account using the CloudFormation template.

Step 2: Creating a child account using the CloudFormation template

1. From the top-right corner of the **CloudFormation** > **Stacks** screen, click **Create stack** > **With new resources (standard)**.

   The **Create stack** page is updated to display the fields for **Step 1 Specify template** of the stack creation process.

2. From the navigation pane on the left, click **Step 2 Specify stack details**.
   The **Specify Stack Details** page (step 2 of the stack creation process) is displayed.
3. Enter a **Stack name**. For the purpose of this guide, **Stack name** = **avxdemoc1**.
4. In the **Parameters** section, enter the following details:
   a. **MasterAccountNumber**: From the top-right corner of the screen, click your username and copy the account ID displayed. Paste it in the **MasterAccountNumber** field.
   b. **S3BucketName**: Enter the S3 bucket name copied from the **Parameters** tab of the **avxdemo-S3** stack.
5. Click **Next**.

   The **Configure stack options** page (step 3 of the stack creation process) is displayed.

6. Scroll down to the **Stack failure options** section and select **Preserve successfully provisioned resources**.
7. Click **Next**.

   The **Review <stack name>** page (step 4 of the stack creation process) is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. Scroll down to **Capabilities** and select the **I acknowledge that AWS CloudFormation might create IAM resources with custom names** checkbox.
9. Click **Create stack**.

   The **<stack name**> page is displayed. This page lists the existing stacks on the left and the following details for each stack on the right:

   - **Stack info**
   - **Events**
   - **Resources**
   - **Outputs**
   - **Parameters**
   - **Templates**
   - **Change sets**

   When the stack creation process is complete, **Status** (under the **Events** tab) will be updated to **CREATE_COMPLETE**.
10. Navigate to the **Resources** tab for the **avxdemoc1** stack.
    You will see that a policy called **AppViewXCLM** has been created. This policy will have all the permissions and prerequisites required for AppViewX to discover all the ACM, ELB, and EC2 instances.
11. Navigate to the **Outputs** tab for the **avxdemoc1** stack.
    Note down the **ChildRoleARN** to use it in the CloudFormation template for the master account.

What to do next: Create a master account using the CloudFormation template.

Step 3: Creating a master account using the CloudFormation template

1. Go to the **CloudFormation service** section.
2. From the navigation pane on the left, select **Stacks**.
3. From the top-right corner of the **CloudFormation** > **Stacks** screen, click **Create stack** > **With new resources (standard)**.

   The **Create stack** page is updated to display the fields for **Step 1 Specify template** of the stack creation process.
4. In the **Prerequisite - Prepare Template** section, select the **Template is ready** option.
5. In the **Specify template** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. For **Template source**, select **Upload a template file**.
b. To **Upload a template file**, click **Choose file**.
c. Navigate to the **CloudFormationTemplates/WithoutCondition** folder.
d. Select the **master_account.yaml** file and click **Open**.

6. Click **Next**.

   The **Specify Stack Details** page (step 2 of the stack creation process) is displayed.

7. Enter a **Stack name**. For the purpose of this guide, **Stack name** = **avxdemom1**.
8. In the **Parameters** section, enter the following details:

   a. For **ApplyAssumeRoleForAll**, from the dropdown list, select **False**.

   b. From the **Outputs** tab of the **avxdemoc1** CloudFormation template for the child account, copy the **ChildRoleARN** and paste it in the following fields:
   • **ChildRoleARN**
   • **OrganizationRoleARN**

   c. From the **Outputs** tab of the **avxdemo-S3** CloudFormation template, copy the **S3BucketAssumeRole** and paste it in the following fields:
   • **S3BucketRoleARN**
   • **SQSRoleARN**

   d. In the **UserName** field, enter a username for the IAM account. For the purpose of this guide, the username will be set to **avxdemo-user**.

9. Click **Next**.
   The **Configure stack options** page (step 3 of the stack creation process) is displayed.
10. Scroll down to the **Stack failure options** section and select **Preserve successfully provisioned resources**.
11. Click **Next**.
    The **Review <stack name>** page (step 4 of the stack creation process) is displayed
12. Scroll down to **Capabilities** and select the **I acknowledge that AWS CloudFormation might create IAM resources with custom names** checkbox.
13. Click **Create stack**.

    The **<stack name**> page is displayed. This page lists the existing stacks on the left and the following details for each stack on the right:

    • **Stack info**
    • **Events**
    • **Resources**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Outputs**
- **Parameters**
- **Templates**
- **Change sets**

14. From the **Outputs** tab of the stack, note the access key and the secret key information to use in AppViewX.

What to do next: Map the EC2 roles to the customer's EC2 instances.

Step 4: Mapping EC2 roles to a customer's EC2 instances

The EC2 role created using the CloudFormation template with the naming convention **<Stack_Name>-Ec2RoleForSSM** must be mapped to the EC2 instances. This mapping is required for enabling SSM communication between the instances and AppViewX and for enabling access to the S3 buckets to store the SSM run command response.

What to do next: Test device onboarding the AppViewX environment.

Step 5: Testing Onboarding in the AppViewX Environment

1. Login to AppViewX.
2. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
3. From the **Device :: ADC** page, select **Cloud**.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **AWS**.
5. Enter/select the **Basic information**.

Field description for the Basic information section

Field	Description
Account type*	From the dropdown list, select **Cross or Federated**.
Account name*	Enter the account name, **avxdemo**.
Account number*	Enter the AWS account number.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account Description	Enter a description of the device to be added.
Proxy required	To use a proxy server for the communication, select this checkbox.
Default Region*	From the dropdown list, select a default region for the API communication.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
**: Mandatory fields*	

6. Enter the **Credentials**-related details:

Field descriptions for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: To manually enter the access and secret key for the customer's AWS account) • **Credential List - CyberArk**: To automatically retrieve the customer's AWS key details from CyberArk)
Access key*	Copy the **AccessKey** from the **Outputs** tab of the **avxdemom1** template.
Secret key*	Copy the **Secret Access Key** from the **Outputs** tab of the **avxdemom1** template.
**: Mandatory fields*	

7. Enter the details required to **Discover resources**.

Field descriptions for the Discover resources section

Field	Description
Auto Discover Resources*	By default, the **Auto Discover Resources** toggle key is set to **ON** and is non-editable. Enabling this feature allows discovering all the cross or federated/child accounts for the provided master account details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Advanced Settings*	By default, the **Advanced Settings** toggle key is set to **ON** and is non-editable. This feature allows customizing the auto discovery process.
AutoSync	To enable automatic synchronization, enable this toggle.
Auto Discovery Mode*	Select the **IAM Policy**.
Services*	Select the ACM, ELB, and EC2 services (and their subservices, as required).
Service region*	For the purpose of this solution guide, click **Fetch Region** and select the regions US East (N. Virginia) and US West (N. California).
Route53 Zone Auto Approval*	To support DNS validation as an automatic process, turn on the **Route53 Zone Auto Approval** toggle.
Cert sync	Select one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • Minimum: 900 seconds (15 minutes) • Maximum: 129,600 seconds (36 hours) • Default: 3600 seconds (1 hour)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session name*	**Role Session name** is an identifier for the assumed role session. Use the **Role Session name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons. By default, the **Role Session name** is set to **appviewx**.
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account. For the purpose of this guide, external ID is undefined.
Source Identity	The source identity is specified by the principle that is calling the **AssumeRole** operation. For the purpose of this guide, source identity is undefined.
Session Tags	Enter the key-value attribute pairs required when assuming an IAM role or federating a user in the AWS STS.
**: Mandatory fields*	

8. In the **EC2 Services** section, copy the **S3Bucket Name** from the **Resources** tab of the **avxdemo-S3** template.
9. In the **S3 Bucket Name** field, click .
   The **ARN Advanced Settings** pop-up window is displayed.
10. Copy the **Role ARN** from the **Outputs** tab of the **avxdemo-S3** template and paste it in the **Role ARN** field.
11. Click **Apply**.
12. Click **Save**.

    The discovered account will be displayed in the grid on the **Device :: Cloud** page.

> **Note:** The discovered account will be added one more time as a child account since the use case uses federated access. This behaviour will be altered in the future releases to avoid dual listing of discovered AWS accounts.

Azure

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Important: After migrating to AppViewX v2022.1.0 and beyond, from any of the previous versions, ensure that you have entered the data centre details for each existing Azure account. For instructions to do this, follow steps 1-5 listed here.

This step is not required for migration to v2022.1.0 to any of the later versions.

Important: At the time of migrating to AppViewX v2023.1.0 FP2 and beyond, manually trigger a config fetch for all the Azure accounts already created.

This will ensure that all functionality enhancements are applied correctly.

This documentation highlights the benefits and implementation of integrating supported Azure services with AppViewX to enable comprehensive certificate lifecycle management across Azure environments. The complete list of supported services, along with an overview of each, is provided in the section Azure Subscriptions and Services Supported by AppViewX.

- Azure Subscriptions and Services Supported by AppViewX
- Permissions Required for Onboarding Azure
- Onboarding Microsoft Azure Settings in AppViewX

Azure Subscriptions and Services Supported by AppViewX

Azure Subscriptions

Azure subscriptions are logical containers for providing and managing tenant access to Azure resources and services.

AppViewX supports two Azure subscription types: **single** and **multi**. The **difference between single and multiple subscriptions in Azure implementations** lies in how resources are organized, managed, and accessed.

- **Single Subscription**: Resources are hosted and managed in a single subscription.
- **Multi Subscription**: Resources are divided across subscriptions, allowing for isolated management and granular access control to resources.

Azure Services

AppViewX supports the following Azure services:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Key Vault**

  The Azure Key Vault is a key management solution from Microsoft that offers the following features:

  - Secrets Management: The key vault can be used for securely storing and managing access to tokens, passwords, API keys, and other secrets.
  - Key Management: The key vault simplifies the creation and management of encryption keys used for data encryption.
  - Certificate Management: Azure key vault simplifies the certificate lifecycle management of TLS/SSL certificates

- **Application Gateway**

  The Azure Application Gateway is a web traffic load balancer that helps to optimize and secure web applications traffic. The application gateway operates at the application layer of the OSI model and makes routing decisions based on attributes of an HTTP request, for example the URI path or the host headers.

- **Virtual Machines**

  Azure Virtual Machines (VMs) are scalable and flexible computing resources provided by Microsoft Azure. They enable users to run virtualized Windows or Linux servers in the cloud. Azure VMs allow you to quickly deploy and manage virtualized infrastructure to support various applications, workloads, and services.

  Important: Please note the following **limitations** for Azure virtual machines:
  - Currently, only the Linux-based VMs (and not Windows-based VMs) are discovered.
  - The discovered/onboarded VMs are listed in the server device inventory.
    You are required to manually update the VM credentials in the server inventory to proceed with certificate lifecycle management for the VM.

    To access the server inventory, Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management** and open the **Server** tab.

- **App Service**

  App Services is a fully managed platform for building, deploying, and scaling web apps, mobile app backends, and RESTful APIs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- For all app services in an Azure subscription, AppViewX can discover and manage public and private certificates that have been referenced via a key vault; a single key vault can be used for all app services.
- For app services certificates, can be pushed directly to app services or it can be pushed to key vault and referenced from app services. However, currently, there is no support for certificates directly onboarded to the app services.

- **Enterprise Application**

  The Enterprise Application service in Azure is a key component of Azure Active Directory (Azure AD) used to manage access to applications in a secure and streamlined manner. It allows organizations to integrate both Microsoft and third-party applications with Azure AD for identity and access management.

  Its key features include:
  - Single Sign-On access to multiple applications
  - Secure application management by enabling access policy configuration, access control based on users and groups, and multi-factor authentication.
  - Role-based Access Control (RBAC)
  - Conditional access to applications, including MFA for sensitive applications
  - Monitoring and reporting for application usage, sign-in activities, security risks, and anomalies
  - Identity management by integration with Azure AD
- **API Management**

  The API Management service helps create, manage, secure, and monitor APIs. It provides a centralized platform for API publishers to control their APIs, while enabling developers to consume them in a secure and efficient manner.

  Its key features include:
  - API Gateway that routes all incoming requests to the appropriate backend services
  - Developer Portal that can be customized to help developers discover and access APIs
  - API versioning with revision tracking
  - Authentication and authorization mechanisms for secure access control to APIs
  - Rate limiting and throttling to protect backend services from excessive or abusive traffic
  - Analytics and monitoring
  - Policy Engine to implement additional logic at the API Gateway
- **App Registration**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The App Registration service enbales identity and access management, API security, and integration capabilities. It is used for registering and configuring applications for interactions with Azure services.

App Registration service is essential when you want to allow your application to authenticate users or access resources such as APIs in a secure way.

Its key features include:

- Application Identity Management
- Authentication Support
- Access permissions and scope definition for APIs
- Multi-Tenant and Single-Tenant support
- Enterprise Application Integration
- Roles and Role-Based Access Control
- Token Issuance and Validation for Authentication and Authorization
- Auditing and Monitoring
- Conditional Access and Multi-Factor Authentication

- **Front Door**

Azure Front Door is a modern, high-performance, and secure cloud Content Delivery Network (CDN) that serves as the global entry point for your applications. It optimizes traffic by routing users to the nearest edge location for faster, more reliable access, while built-in caching, acceleration, and a Web Application Firewall (WAF) provide enhanced performance and protection—making it ideal for global websites and SaaS applications.

Permissions Required for Onboarding Azure

Note: For Azure, a custom role has to be created and assigned to the service principal.

Important: In the following sample permissions, the value for **subscriptions** is a placeholder. You are required to replace it with your actual subscription ID.

Permissions for Key Vault

Certificates

```
{
  "properties": {
    "roleName": "AppViewX_KeyVault_Role",
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  "description": "",
  "assignableScopes": [
    "/subscriptions/000-000-000-0000-000"
  ],
  "permissions": [
    {
      "actions": [
        "Microsoft.KeyVault/vaults/read"
      ],
      "notActions": [],
      "dataActions": [
        "Microsoft.KeyVault/vaults/certificates/import/action",
        "Microsoft.KeyVault/vaults/certificates/create/action",
        "Microsoft.KeyVault/vaults/certificates/update/action",
        "Microsoft.KeyVault/vaults/certificates/read"
      ],
      "notDataActions": []
    }
  ]
 }
}
```

Secrets

```
{
 "properties": {
  "roleName": "AppViewX_KeyVault_Secret_Role",
  "description": "",
  "assignableScopes": [
    "/subscriptions/000-000-000-0000-000"
  ],
  "permissions": [
    {
      "actions": [
        "Microsoft.KeyVault/vaults/secrets/read"
      ],
      "notActions": [],
      "dataActions": [

```
  }
}
```

Permissions for Virtual Machine

```
{
 "properties": {
  "roleName": "AppViewX_VirtualMachine_Role",
  "description": "",
  "assignableScopes": [
   "/subscriptions/000-000-000-0000-000"
  ],
  "permissions": [
   {
    "actions": [
     "Microsoft.Compute/virtualMachines/read",
     "Microsoft.Network/networkInterfaces/read"
    ],
    "notActions": [],
    "dataActions": [],
    "notDataActions": []
   }
  ]
 }
}
```

Permissions for App Service

> **Important:** Use the permission `Microsoft.ManagedIdentity/userAssignedIdentities/assign/action` only the application gateway needs integration with the key vault.

```
{
  "properties": {
    "roleName": "AppViewX_App_Service_Permission",
    "description": "",
    "assignableScopes": [
      "/subscriptions/000-000-000-0000-000"
    ],
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
    "permissions": [
      {
        "actions": [
            "Microsoft.Web/sites/Read",
          "Microsoft.Web/sites/Write",
          "microsoft.web/sites/publiccertificates/read",
            "microsoft.web/sites/publiccertificates/write",
            "Microsoft.Web/sites/restart/Action",
            "Microsoft.ManagedIdentity/userAssignedIdentities/assign/action"
        ],

Onboarding Microsoft Azure Settings in AppViewX

Prerequisites for Onboarding Microsoft Azure Settings in AppViewX

- Depending on the service(s) selected for the Azure configuration, ensure that the corresponding service instance is created in your Microsoft Azure account.

  For links to the complete Microsoft Azure documentation for the supported services, refer the References section.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:
  - Ensure that your Microsoft Azure access credentials are saved in your CyberArk account. For instructions on creating Azure access details in the CyberArk account , refer to the documentation here.
  - Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.
- For using the Managed Identity credential type, ensure the following requirements are met:
  - The AppViewX Cloud Connector (CC) is installed on the target Azure VM.
  - A user-assigned or system-assigned Managed Identity is associated with the Azure VM.
  - Strict routing is enabled for the corresponding data center to ensure secure and consistent communication.

    For links to the complete Microsoft Azure documentation on configuring managed identities for Azure VMs, see the **References** section.

Onboarding Microsoft Azure Settings in AppViewX

The following instructions will guide you through the process of onboarding a Microsoft Azure account in AppViewX for the supported Microsoft Azure services (listed and explained here):

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On the **Device :: Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of **Vendors**, select **Azure**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Configure Government Cloud	To configure Azure Government Cloud for this Microsoft Azure, turn on the **Configure Government Cloud** toggle. Azure Government Cloud is a specialized cloud computing platform provided by Microsoft, designed specifically for U.S. government agencies and their partners. While it offers the same core services as the commercial Microsoft Azure cloud, it offers additional complaince, security, and regulatory controls configured to meet the stringent security requirements of its primary use cases.
***Country**	From the dropdown list, select the country for which the Azure Government Cloud is being configured. **Important:** In the current implementation, the Azure Government Cloud configuration is supported **only** for the United States, to serve the U.S. government agencies and their partners with data residency, operations, and complaince as per the U.S. regulations.
***Account Type**	From the dropdown list, select one of the following values: • **Single Subscription** • **Multi Subscription** To understand the subscription types and the difference between them, click here.
***Account Name**	Enter the customer's unique account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for the communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credential Details**.

Field description for the Credential Details section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating Microsoft Azure with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **Managed Identity**: [Read the Managed Identity prerequisites given above.] An Azure-assigned Managed Identity is used for Azure Active Directory (Azure AD) authentication, fetching tokens automatically without storing credentials in AppViewX. Managed Identity is an Azure-generated identity that allows resources to authenticate to Azure AD-protected services without storing credentials. At this time, the **Managed Identity** credential is not supported for an Azure Government Cloud environment.
***Tenant ID**	Enter the unique identifier (GUID) of your Azure Active Directory Tenant.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Managed Identity Type	This field is displayed only when **Credential type** = **Managed Identity**. From the dropdown list, from the following options, select how Managed Identity is provisioned and managed for the resource to be onboarded: • **User Managed**: Use when you need a standalone identity that can be assigned to one or more Azure resources and managed independently. • **System Managed**: Use when you want Azure to automatically create and manage an identity that is tied to a single resource's lifecycle.
***Client ID**	Enter your Azure client ID (application ID). For **Credential type** = **Managed Identity**, this field is displayed only when **Managed Identity Type** = **User Managed**. In this case, enter the Client ID of the user-assigned managed identity linked to your Azure resource.
***Client secret**	Enter your Azure client secret key.
***Credential name**	This field is displayed only when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the Microsoft Azure credentials that will be used for onboarding the Azure account in AppViewX. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. To validate the credential details entered above, click **Validate Credential**.

> **Note:** The option to **Validate Credential** is displayed only for a multi subscription account type.

Access to the **Discover Resources** section is enabled only after the credentials have been validated.

8. Enter/Select the details needed to **Discover Resources**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Discover Resources section

Field	Description
***Services**	From the following options in the dropdown list, select the service(s) that will be mapped to this setting (for an overview of each supported service, see Azure Subscriptions and Services Supported by AppViewX): • Api Management • App Registration **Note:** Currently, this service is not supported for multi subscription accounts. • App Service • Application Gateway • Enterprise Application [For instructions on managing Enterprise Application certificates, click here.] **Note:** Currently, this service is not supported for multi subscription accounts. • Front Door • Key Vault • Virtual Machines Starting v2024.1.0.0, Linux-based as well as Windows-based VMs can be discovered. For instructions on managing the Linux-based/Windows-based server devices onboarded as VMs, click here.
***Subscription ID**	**Note:** This field is displayed only when **Account Type** = **Single Subscription**. This is an **optional** field for the following Azure servcies: • App Registration • Enterprise Application

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the unique identified (GUID) of your Azure subscription.
Subscription Onboarding State	Subscription onboarding refers to integrating an Azure subscription with AppViewX. You can choose to onboard all subscriptions at once or onboard only selected ones. From the following options, select a state for onboarding subscriptions discovered from the Azure organization: • **Managed**: Enables subscription onboarding, allowing Azure cloud resource and certificate discovery instantly • **Unmanaged**: Disables subscription onboarding, preventing resource and certificate discovery for these projects. After you have fetched all subscriptions belonging to these projects, you can select individual subscriptions for onboarding, as explained here.
Auto Sync	To enable/disable automatic synchronization of the AppViewX inventory with your Azure cloud infrastructure , use the **Auto Sync** key. On enabling auto sync, the **Schedule Based** checkbox is displayed
Schedule Based	To specify a schedule for the auto sync: a. Click the icon. The **Schedule Based Sync** window is displayed. b. In the **General Information** section, enter the details of the sync schedule. Field descriptions for the **General Information** section
**: Mandatory fields*	

Field descriptions for the General Information section

Field	Description
***Frequency of Sync**	Set the sync frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Advance Settings	To set the sync frequency for a specific service: a. Enable the **Advance Settings** key. The **Auto Sync Services** section is displayed. The services selected for this setting (in the **Services** field under **Discover Resources**) are listed in this section. b. To set the frequency for a specific service(s), select the corresponding checkbox. The **Service Specific Parameters** section is displayed with the **Frequency of Sync** field displayed for each selected service. c. Enter the details of the sync schedule and click **Apply**. The sync frequency is applied to the selected services. **Note:** If a service is not selected, the **Frequency of Sync** set in the **General Information** section is applied to all services in a setting.

9. For a multi subscription account, after specifying the details for resource discovery, click **Fetch Subscriptions**.
   a. From the subscriptions table, select the checkbox corresponding to the subscription(s) you want to manage.
   b. From the **Actions** dropdown menu, select **Manage**.
10. In the **Additional attributes** section for the selected services, select the user permission for **Cert sync** from the following options:

    a. For the selected services, select the user permission for **Cert sync** from the following options:
    - **Managed**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.
    - **Monitored**: AppViewX will connect with the customer's Azure account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates.
    - **Ignored**: AppViewX will connect with the customer's Azure account but certificate discovery will be disabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

b. For **Enterpise Application**, enter/select the following additional details:

Field descriptions for the additional Enterprise Application attributes

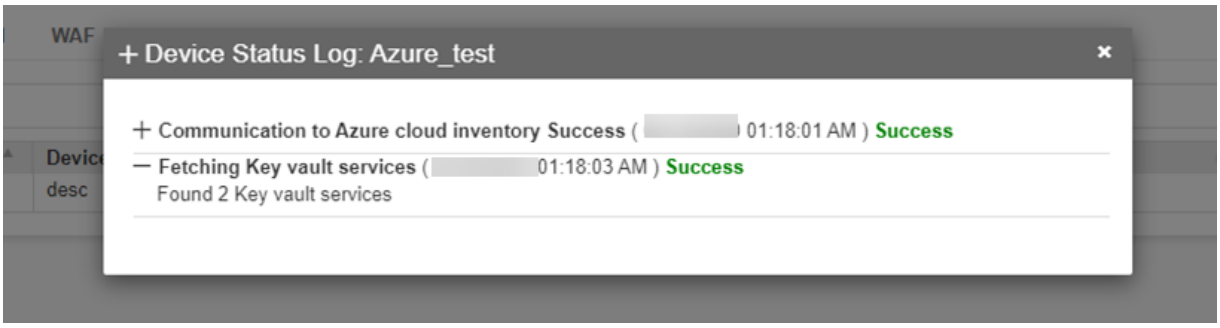
Field	Description
Discover Inactive Certificates	The Enterprise Application service has an active certificate associated with it, which is the default certificate used for securing communication, authentication, and encryption. The rest of the certificates associated with this service are categorized as inactive certificates. To enable discovery of inactive certificates along with the active certificate associated with the selected service(s), enable the **Discover Inacrive Certificates** toggle button.
Notify For	You can choose to receive email notifications every time: • a certificate is pushed to the Enterprise Application service • a certificate is made active certificate while being pushed to the Enterprise Application service To receive email notifications: i. Enable the **Notify For** toggle button. ii. To receive notifications when a certificate is pushed, select **Push**. To receive notifications when a certificate is made active certificate while being pushed, select **Make Certificate Active**.
***Email Alert Template**	**Note:** This field is displayed only when **Notify For** is enabled. From the list of predefined email templates in the dropdown list, select the email template that will be used to send the alert. **Note:** To view the predefined templates, go to **Platform** > **System Administration** > **Themes & Personalization** > **Email attachment customization**. The predefined templates are listed in the **Email Template** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Email Subject**	**Note:** This field is displayed only when **Notify For** is enabled. Enter a custom email subject for the notification email.
Attach Certificates to Email Body	**Note:** This field is displayed only when **Notify For** is enabled. If you need the relevant certificate(s) attached to the notification email, from the following options, select the format in which the certificate will be shared: • **Include as Content** The email body includes the contents of the certificate. If the certificate being pushed is an inactive certificate, the email will also include instructions for manually making it the active certificate. • **Include as Downloadable Link** (to include The email body includes a link for downloading the certificate. Clicking the link will redirect you to the holistic view of the certificate, from where you can download the certificate.
**: Mandatory fields*	

11. Click **Save**.
12. Return to the **Device :: Cloud** page.
13. From the table of added devices displayed on the **Device :: Cloud** page, from the **Status** column, click **Check**.
    The status of the added device is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



14. To view the certificates, go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the required certificate type.

Managing Enterprise Application Certificates

Starting v2024.0.1.0, self-signed certificates discovered from the Enterprise Application service can be:

- Renewed
- Made active

Renewing an Enterprise Application Self-Signed Certificate

To renew an Enterprise Application Self-Signed Certificate,

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the Enterprise Application Self-Signed Certificate that you want to renew.
   The holistic view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Renew**.
4. In the **Renew** dialog box:
   a. Enter the new **Validity** for the renewed certificate.
   b. To make the certificate active, select the **Make Certificate Active** checkbox.
5. Click **Renew**.
   A request ID, which is the work order ID, is generated automatically, and work order status is displayed adjacent to the certificate in the holistic view. If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
6. In the holistic view, click **Approve** to proceed.
   The **Approve** dialog box is displayed.
7. Enter your comments in the text field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

8. Click **Yes**.
   Once the approval process is complete, the **Implement** option is displayed in the holistic view.
9. Click **Implement**.
   The **Implement** dialog box is displayed.
10. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
11. Click **Yes**.
    The renewal process is triggered. After renewal is completed:
    • Workflow status is updated to **Completed**.
    • A notification email is sent.
12. To see if the certificate has been made active (if you selected the checkbox), hover over the application connector for the certificate.
    If the certificate is active, the **Is Active** field in the tooltip text is set to **Yes**.

Making an Enterprise Application Self-Signed Certificate Active

There are two ways in which you can make an Enterprise Application self-signed certificate active.

- By selecting the **Make Certificate Active** checkbox from the **Renew** dialog box for the self-signed certificate

  The instructions for this are given here.

- By selecting the **Make Certificate Active** option from the **More** menu in the holistic view

  The instructions for this are given below.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the Enterprise Application Self-Signed Certificate that you want to make active.
   The holistic view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Make Certificate Active**.
4. To see if the certificate has been made active, hover over the application connector for the certificate.
   If the certificate is active, the **Is Active** field in the tooltip text is set to **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Managing Server Devices Onboarded as Azure Virtual Machines

The discovered/onboarded VMs are listed in the server device inventory.

To access the server device inventory, Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management** and open the **Server** tab.

Once the server device is onboarded, you are required to manually update the VM credentials in the server inventory to proceed with certificate lifecycle management for the VM.

To do this:

1. Go to the server device inventory.
2. On the **Device :: Server** page, click the device **Name** to modify the device details.
   You will be redirected to the **Device details** page.
3. In the **Credentials** section, update the device credentials.
   For field descriptions and other details, refer from the following links:
   - Configuring Linux Server
   - Configuring Microsoft Server

References

- Create an Azure Key Vault using the Azure Portal.
- Create an Azure Application Gateway using the Azure Portal.
- Create a Linux Virtual Machine using the Azure Portal.

- Add an Enterprise Application.
- Create a new Azure API Management Instance by using the Azure Portal.
- Create an Azure Front Door Profile using the Azure Portal.
- Configure managed identities on Azure virtual machines.

What's Next?

After you have successfully onboarded a Microsoft Azure account in AppViewX, the next step is to discover existing certificates for the onboarded account and/or enroll new certificates.

Google Cloud Platform (GCP)

Google Cloud Platform (GCP) is a suite of computing services provided by Google, that can be integrated with an organization’s multicloud setup to meet specific business requirements.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Using GCP in a multicloud setup offers the following advantages:

- Diversity of services (especially in the areas of big data, machine learning, and data analytics) to enhance the overall capabilities of your organization's infrastructure
- Access to advanced analytics and process automation tools
- Support for data analytics and big data capabilities
- Global network infrastructure known for its speed and reliability
- Security expertise
- Data storage and management capabilities

- GCP Services Supported by AppViewX
- Onboarding a Single GCP Project
- Onboarding GCP Projects within an Organization
- Project-level/Inner Inventory
- Limitations

GCP Services Supported by AppViewX

AppViewX supports the following GCP services:

- **Certificate Manager**

  Certificate Manager is a managed GCP service that automates the process of obtaining, issuing, and renewing certificates, and then seamlessly integrating to provision your certificates for the load balancer.

- **Load Balancer**

  GCP comes with a set of load balancers that distribute incoming network traffic evenly across multiple instances or services. Load balancers ensure that your multicloud setup conforms to the requirements of high availability, fault tolerance, and scalability.

  Types of load balancers in GCP:
  - Google Cloud Load Balancer
  - Network Load Balancer
  - SSL Proxy Load Balancer
  - TCP Proxy Load Balancer
  - UDP Load Balancer
  - Internal TCP/UDP Load Balancer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Classic Certificates**

  Classic certificates is a GCP service that lets you create and manage Google-managed SSL certificates.

Onboarding a Single GCP Project

Prerequisites for Onboarding a Single GCP Project

To onboard a single GCP project in AppViewX, you are first required to create and associate roles with the project to be onboarded. For references to the GCP documentation for instructions, click **here**.

Onboarding a Single GCP Project in AppViewX

1. In the AppViewX UI, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.
   The **Device** :: **ADC** page is displayed.
2. On the **Device** :: **Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
3. Under **Device details**, from the list of **Vendors**, select **GCP**.
4. Enter/Select the **Basic Information** for onboarding a single GCP project.

Field description for the basic information

Field	Description
***Onboarding Method**	From the dropdown list, select **Onboard a Single GCP Project**.
***Account Name**	Enter your unique GCP account name. **Note:** • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and the period (**.**) characters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account Description	Enter a description of the GCP account to be added.
Proxy Required	To use a proxy server for this communication, select this checkbox.
***Data Center**	From the dropdown list, select the data center through which communication with the certificate authority will be established.

5. Enter/Select the **Project & Credential Details**.

Field descriptions for the project and credential details

Field	Description
Service Account Key	To access the GCP services using AppViewX, the credentials are supplied either in a JSON or in the form of a certificate file. After you have created the GCP service account, you can download the JSON file or the certificate file with the credential details. Depending on the artifact download, from the **Service Account Key** field, select the **JSON File** or the **Certificate Upload** option.
***Upload JSON**	**Note:** This field is displayed only when **Service Account Key** = **JSON File**. Click **Upload** and navigate to the location of the JSON file.
***Certificate and Key**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Click **Upload** and navigate to the location of the certificate file.
***Email**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**. Enter your email ID registered with GCP.
***Project Id**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**. Enter your GCP project ID.
Validate Credential	To validate the credentials uploaded using JSON/ certificate file, click validate credential.

6. Enter/Select the details required to **Discover Resources**.

Note: The fields in this section are enabled only after the credentials entered in the **Project & Credential Details** section have been validated.

Field descriptions for discovering resources

Field	Description
***Service Type**	From the dropdown list, select the services required for CLM operations.
Cert Sync	Select from one of the following options: • **Managed**: AppViewX will connect with your GCP account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Monitored**: AppViewX will connect with your GCP account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with your GCP account but certificate discovery will be disabled.
Auto Sync	To enable (default)/disable automatic synchronization, use the **Auto Sync** key. Currently the GCP implementation in AppViewX only supports schedule-based synchronization.
Schedule Based Discovery	**Note:** This field is displayed when **Auto Sync** is enabled. To schedule a discovery, set the frequency using the two dropdown lists for this field. For example, to set the frequency to 10 days: a. From the first dropdown list, select **10**. b. From the second dropdown list, select **Days**.

7. Click **Save**.
   Details of the added GCP account are displayed in the outer inventory (explained here).

Onboarding GCP Projects within an Organization

Prererequisites for Onboarding GCP Projects within an Organization

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To onboard GCP projects within an organization in AppViewX, at the organizational level, you are first required to create and associate roles with the projects to be onboarded. For references to the GCP documentation for instructions, click **here**.

Onboarding GCP Projects within an Organization in AppViewX

1. In the AppViewX UI, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.
   The **Device** :: **ADC** page is displayed.
2. On the **Device** :: **Cloud** page, click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
3. Under **Device details**, from the list of **Vendors**, select **GCP**.
4. Enter/Select the **Basic Information** for onboarding a single GCP project.

Field description for the basic information

Field	Description
***Onboarding Method**	From the dropdown list, select **Onboard GCP Projects within Organization**.
***Account Name**	Enter your unique GCP account name. **Note:** • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and the period (**.**) characters.
Account Description	Enter a description of the GCP account to be added.
Proxy Required	To use a proxy server for this communication, select this checkbox.
***Data Center**	From the dropdown list, select the data center through which communication with the certificate authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Enter/Select the **Project & Credential Details**.

Field descriptions for the project and credential details

Field	Description
***Organization ID**	To discover and onboard the GCP projects within the organization, enter your unique GCP organization resource ID.
Service Account Key	To access the GCP services using AppViewX, the credentials are supplied either in a JSON or in the form of a certificate file. After you have created the GCP service account, you can download the JSON file or the certificate file with the credential details. Depending on the artifact download, from the **Service Account Key** field, select the **JSON File** or the **Certificate Upload** option.
***Upload JSON**	**Note:** This field is displayed only when **Service Account Key** = **JSON File**. Click **Upload** and navigate to the location of the JSON file.
***Certificate and Key**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**. Click **Upload** and navigate to the location of the certificate file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Email**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**. Enter your email ID registered with GCP.
***Project Id**	**Note:** This field is displayed only when **Service Account Key** = **Certificate Upload**. Enter your GCP project ID.
Validate Credential	To validate the credentials uploaded using JSON/ certificate file, click validate credential.

6. Enter/Select the details required to **Discover Resources**.

Note: The fields in this section are enabled only after the credentials entered in the **Project & Credential Details** section have been validated.

Field descriptions for discovering resources

Field	Description
***Project Onboarding State**	From the following values, select the state for onboarding the projects discovered from the GCP organization: • **Managed**: Enables project onboarding and allows instant GCP cloud resource and certificate discovery • **Unmanaged**: Disables project onboarding, preventing resource and certificate discovery for these projects.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Service Type**	From the dropdown list, select the services required for CLM operations.
Cert Sync	Select from one of the following options: • **Managed**: AppViewX will connect with your GCP account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with your GCP account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with your GCP account but certificate discovery will be disabled.
Auto Sync	To enable (default)/disable automatic synchronization, use the **Auto Sync** key. Currently the GCP implementation in AppViewX only supports schedule-based synchronization.
Schedule Based Discovery	**Note:** This field is displayed when **Auto Sync** is enabled. To schedule a discovery, set the frequency using the two dropdown lists for this field. For example, to set the frequency to 10 days: a. From the first dropdown list, select **10**. b. From the second dropdown list, select **Days**.

Project-level/Inner Inventory

Field	Description
Account Name	Name of the account to which the cloud device belongs
Project ID	GCP project ID
Project Number	GCP project number
Service Type	GCP service selected for CLM operations
Service Status	**Success** or **Failure**, depending on whether the account has permission to accessthe service
Resource Discovery Status	**Note:** Resource discovery status is not applicable for organizations. For organizations, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered project using the following values: • **Not started**: Resource discovery by AppViewX is yet to begin **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery by AppViewX in the customer's GCP environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's GCP environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX in GCP. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • for ACM and ELB resources • for all existing devices and projects as part of data migration
State	Outcome of the device addition (**Success**, **Failed**)

Limitations

- Pushing certificates to the Certificate Manager and binding to the Classic Loadbalancers in the standard tier is currently not supported.

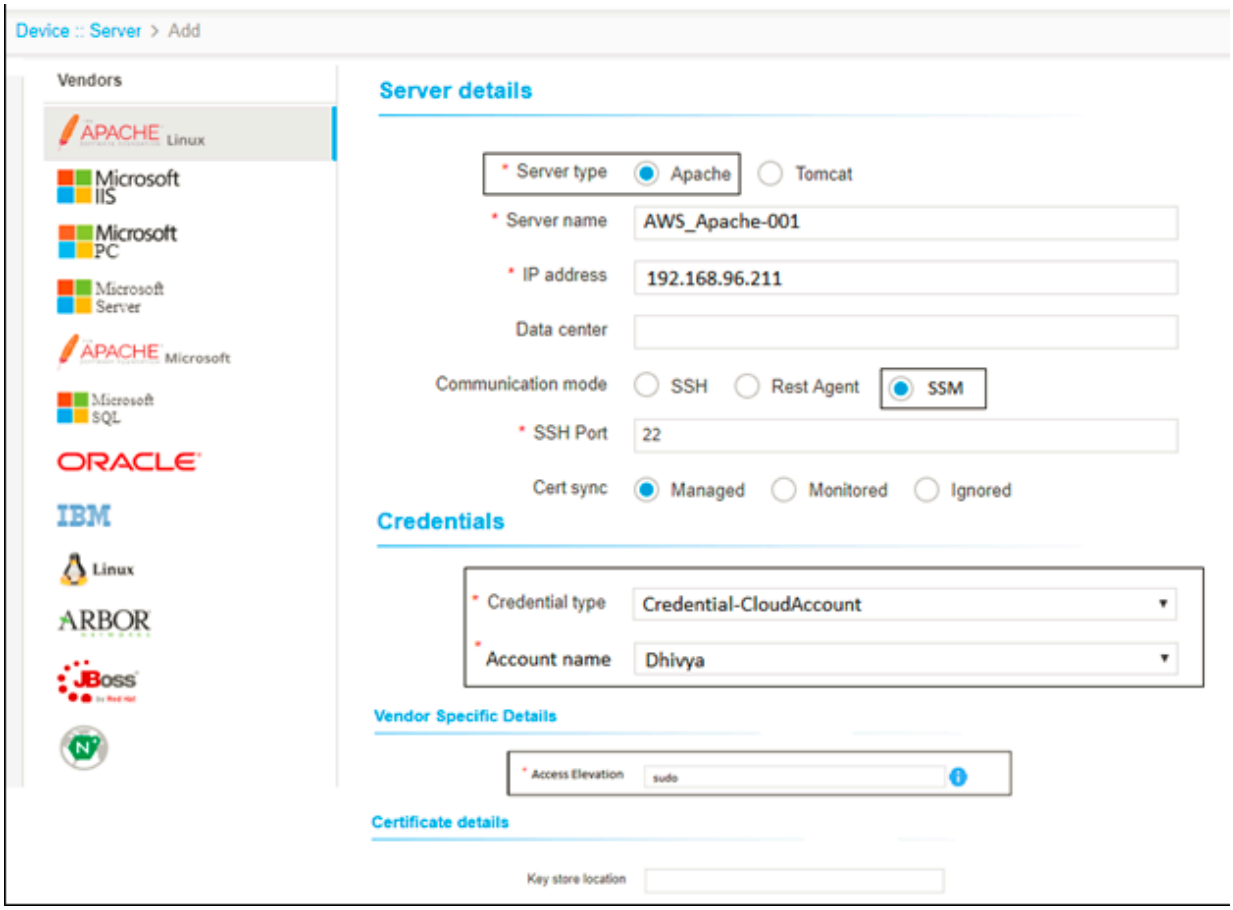
Apache SSM integration specification

Device Addition

- **Apache (Linux)** serversdiscovered from Amazon EC2 instances should be added under the Server tab in AppViewX.
- All the mandatory fields should be pre-fill in the Apache (Linux) device addition page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The server name should be appended with AWS as shown below.
- By default, the communication mode should be selected as **SSM.**
- Credential provided in cloud inventory should be used in server inventory as well.
- By default, access elevation should be selected as **Sudo.**



Credential management

- Credential Type is a mandatory field.
- When a device is added from a could account, **Credential-Cloud Account must** be displayed corresponding to the credential type label. And the cloud account name should be displayed in a dropdown corresponding to the Account name label.
- While modifying the mandatory details in the Apache form, the user should be able to select a different cloud account credential that is added to the cloud inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Similarly, while modifying the mandatory details in the Apache form, the user should be able to provide credentials manually in the Apache device addition form.

> **Note:** Once the Apache instance is identified and successfully added, the user should be able to perform all the actions (device level as well as certificate level).

Functional Specification

Basic information specifications

- Users should be able to provide basic information such as Account name, Device description, and Account number.
- The account name should be maintained as a unique factor; the user should not be allowed to add the same account name more than once.
- When the user tries to submit the same Account name, a pop-up error message displays as **Account name already available in the inventory**.

Account name

- The account name is a mandatory field. Users should provide a valid name in this column.
- The account name field should be an alphanumeric field. Users should be able to provide alphabets and numbers.
- Users should not be able to provide any special characters in this field, except period (.)
- Users should not be able to provide [space] in this field.
- The account name field should support only 25 characters. Block users to enter more than 25 characters.
- Add an information icon next to the account name text box and displays a message as **Account name should be unique**. The account name already in the cloud inventory cannot be added again. Only alphanumeric and period (.) can be entered in this field.

Description

- Users can provide the description in this paragraph box.
- Allow a maximum of 250 characters in the description field.
- Allow numbers, alphabets, all the special characters, and [space] in the description field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Account number

- The account number is an optional field. Users should provide a valid account number in this column.
- Users should be able to enter only numbers in the account number.
- Users should not be able to provide any special characters or empty spaces in this field.
- Users should be able to provide a maximum of 25 numbers. Users should not be able to provide more than 25 entries.

Proxy required

- Proxy required is an optional field, when the user selects this checkbox, AppViewX will try to communicate via Proxy in case of network failure/absence.
- If the user does not select this checkbox, then AppViewX will connect/communicate only via the internet/network, if there is network failure/absence, AppViewX will not try to communicate via provided Proxy.

Credentials Specifications

- Only when the master credential is selected in the above section, the **Credential** section will be displayed in this form. When the user lands on this page to add a new cloud device, by default, the master credential will be selected, hence the **Credential** section will be displayed as well.
- Users should be able to provide the credentials in this section; if the master credential is selected against the credential type. It should be used to access all the services that are selected in the services section.

Credential input type

- The credential input type is a mandatory field. It is a single select dropdown. By default, **Manual Entry** will be displayed.
- Credential input type should list three options, they are
  - Manual entry
  - Credential list – CyberArk
  - Credential list – AppViewX
- When **Manual Entry** is selected, **Access Key** and **Secret key fields** should bedisplayed below Credential input type fields.
  - The access key and secret key are mandatory fields and Password encrypted fields.
  - Users should provide both access key and secret key corresponding to the account added.
  - These keys will be used to access all the services that are selected in the services section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- When **Credential List – CyberArk** is selected, the **Credential list dropdown** should be displayed below the **Credential type** field.
  - Users should be able to select a credential that is saved in CyberArk. This credential will be used to access all the services that are selected in the services section.
- When the **Credential list – AppViewX** is selected, the **Credential list dropdown** should be displayed below the **Credential type** field.
  - Users should be able to select a credential that is saved in AppViewX vault. This credential will be used to access all the services that are selected in the services section.

Access key

- When the user lands on this page to add a new cloud device, by default, Manual Entry will be displayed under the Credential input type. Hence, the Access Key field will be displayed as well.
- The access key is a mandatory, password-encrypted, and alphanumeric field. Users should be able to provide alphabets as well as numbers in this field.
- All the special characters should be supported in this field.
- Users should not be able to enter empty spaces in this field.
- The minimum and maximum length of the access key is 16 and 128 characters respectively.

Secret key

- When the user lands on this page to add a new cloud device, the manual entry will be displayed under the credential input type. Hence, the secret key field will be displayed as well.
- The secret key is a mandatory, password-encrypted, and alphanumeric field. Users should be able to provide alphabets as well as numbers in this field.
- All the special characters should be supported in this field.
- Users should not be able to enter empty spaces in this field.
- The maximum length of the secret key is 256 characters.

Key information specifications

- Users should be able to provide the key information such as the **datacenter**, **region**, **credential type**, and **account number**.
- Users have to provide a data center, region, and service. If any of these fields are empty, while submitting the form, the X mark will be displayed against the field that is not filled. A message will be displayed when the user mouse over the X mark, “Value is missing in <*fieldName*> field”.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Data Center

- **Data center** is a mandatory field, the **Select a data center** message must be displayed as a play holder when the user lands on this page to add a new cloud device.

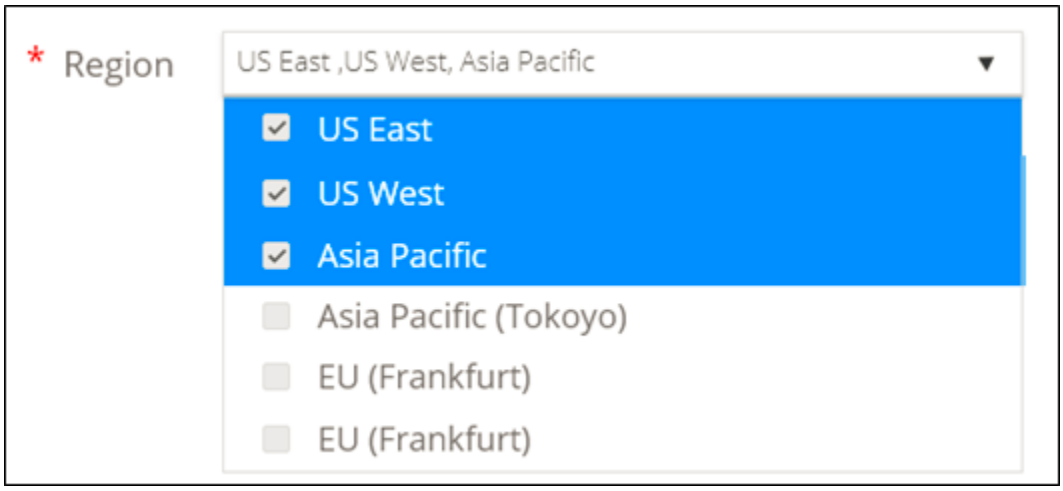
- Users can select a data center for the dropdown (single select dropdown).

- Based on the data center selected, the region corresponding to the selected data center will be listed below the field region field.
- Users should be restricted to submit this form, without filling a data center. If the user does not select a data center, while submitting the form, X mark will be displayed against the data center field. A message will be displayed when the user mouse over X mark, “Value is missing in datacenter field”.

Region

- Region is a mandatory field.
- Fetch region(s) button will be enabled only when the credentials are given. The user should provide the credentials to enable the fetch region(s)
- Once credentials are provided, the fetch region(s) will be enabled. Users should be able to click the fetch region(s) button.
- Once the user click fetch region(s) by providing valid credentials, a list of all the regions corresponding to the credential provided will be displayed in the drop-down,
- If provided credentials do not have any region (or) if the provided credential is invalid, then None will be displayed in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- The **Select the region(s)** message must be displayed as a play holder when the user lands on this page to add a new cloud device.
- Users can select single or multiple regions from this dropdown (multi-select dropdown).
- Users should be able to select all / unselect all the regions from this field.
- Users should be able to free-text search the region in the dropdown.
- Users should be restricted to submit this form, without selecting at least one region. If the user does not select a region, while submitting the form, the X mark will be displayed against the region field. A message will be displayed when the user mouse over X mark, **Value is missing in region field**.

Service

1. Service is a mandatory field. It is a multi-select text box. By default, **ACM** and **IAM** will be selected.

2. Users can select single or multiple service(s) from this dropdown (multi-select text box).
3. ACM, IAM, ELB, and EC2 are the services that should be listed in the dropdown.
4. AppViewX should support four Amazon AWS services, they are, ACM, IAM, ELB, and EC2 instances. Users should be able to select any one of these services from this field.
5. Based on the selected service, the user should provide additional details in the below section.
6. Users should be able to select all / unselect all the services from this field.
7. Users should be able to free-text search the service from this field.
8. Users should be restricted to submit this form, without selecting at least one service. If the user does not select a service, while submitting the form, X mark will be displayed against the service field. A message will be displayed when the user mouse over X mark, **Value is missing in-service field**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Additional Attributes Specifications

Service Input Status

- The services that are selected in the services section will be displayed as a tab in this section.
- Each tab will have a different set of fields that are required for accessing each service.
- There are a few mandatory fields corresponding to each service.
- When the user lands on this page to add a new cloud device, by default, **ACM** and **IAM** tabs will be displayed.
- Once mandatory fields are filled, each tab will be indicated with a GREEN tick mark. Only when all the selected services are marked with a GREEN tick, the user will be able to submit the form.
- If the user tries to save without filling in the required detail, an **X** mark should be displayed against each tab that is not completed.
- When the user mouse over **X**mark below message should be displayed, “Mandatory fields are not filled in this tab”

Cert sync

- Cert sync is a mandatory field. When the user lands on this page to add a new cloud device, by default, Managed will be selected.
- Cert sync should be available in all the tab.
- Cert sync have three options,
  - **Managed**: Certificates within the cloud (corresponding to the service selected), & its objects will be discovered and moved to inventory with managed status. Users can perform different AppViewX actions on the certificates that are in managed status. For example, cert sync in the ACM tab is selected as **Managed**, then all the certificates in ACM will be discovered and moved to the inventory with managed status.
  - **Monitored**: Certificates within the cloud (corresponding to the service selected), and their objects will be discovered and moved to inventory with monitored status. Users can only monitor the certificates that are in monitored status, user cannot perform any AppViewX actions on these certificates. For example, cert sync in the ACM tab is selected as **Monitored**, then all the certificates in ACM will be discovered and moved to the inventory with monitored status.
  - **Ignored**: The cloud account will be added and managed in AppViewX. Certificates within the cloud (corresponding to the service selected), & its objects will **not** be discovered; only the profiles will be created.

Collection type

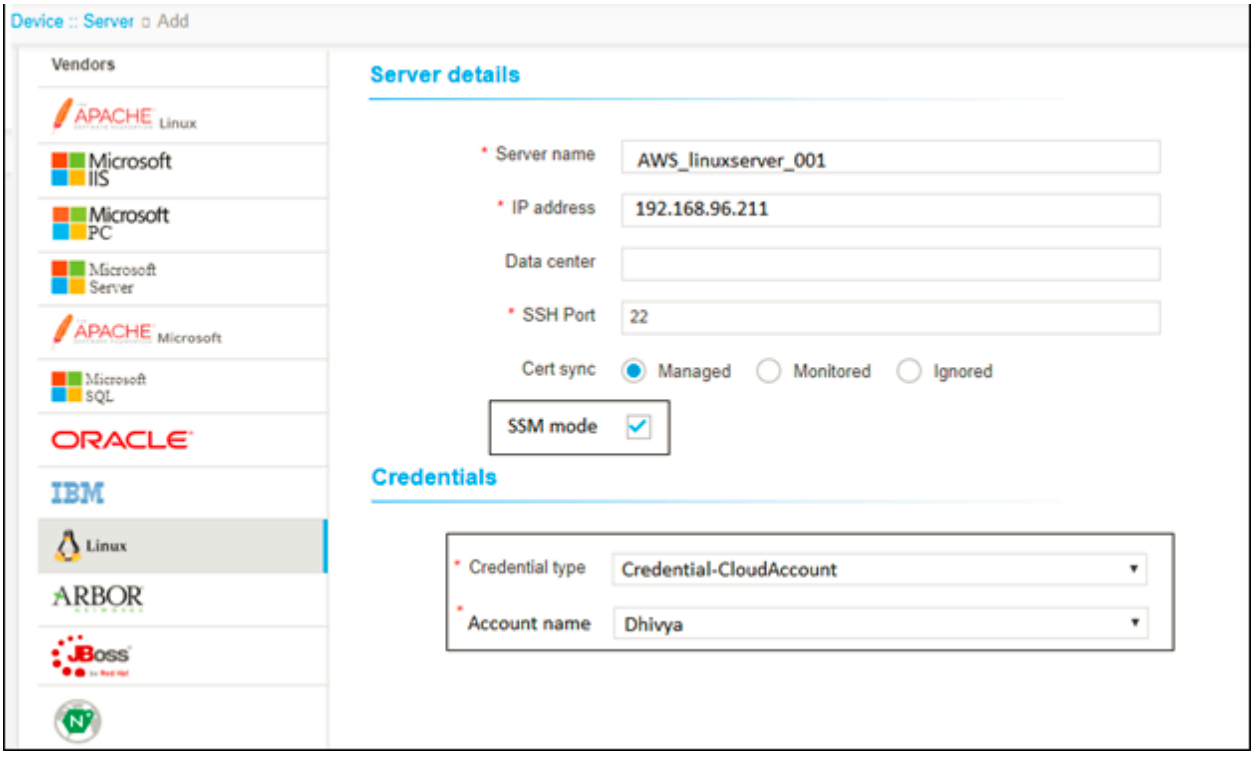
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. The collection type field will be displayed only when the EC2 option is selected under the service section.
2. Collection type is an optional field.
3. All the regions selected by the user should be listed in the collection type section.
4. Users should be able to select a single S3 bucket for all the regions, also users should be able to select an individual S3 bucket for each region.
5. Data stored in S3 must be removed instantly.

Generic Linux SSM Integration Specification

Device Addition

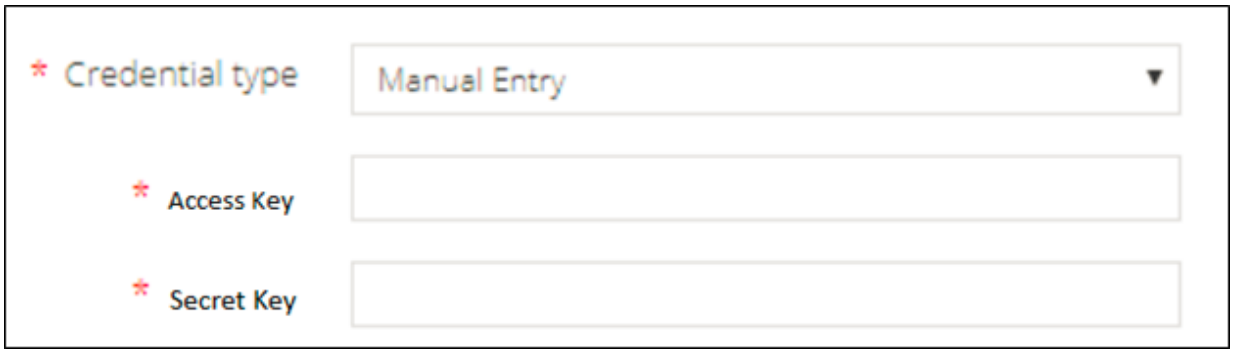
- ApartfromApache, all other instances identifiedfrom Amazon EC2 should be added under Generic Linux under the Server tab in AppViewX.
- All the mandatory fields should be pre-fill on the Generic Linux device addition page.
- The server name should be appended with AWS as shown below.
- By default, the communication mode should be selected as **SSM.**
- Credential provided in cloud inventory should be used in server inventory as well.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credential management

- Credential Type is a mandatory field.
- When a device is added from a Could account, **Credential-CloudAccount must** be displayed corresponding to a credential type label. And the cloud account name should be displayed in a dropdown corresponding to the Account name label.
- While modifying the mandatory details in the Generic Linux form, the user should be able to select a different cloud account credential that is added to the cloud inventory.
- Similarly, while modifying the mandatory details in the Generic Linux form, the user should be able to provide credentials manually in the Generic Linux device addition form.



- Only when the mode of communication is SSM, Access key, and Secret key fields will be displayed under Credential type.

Instances Discovery Specification

Specifications

- It is mandatory for the user to provide credentials and S3 bucket details to identify instances within the Amazon EC2 service.
- With details provided, AppViewX should be able to identify Apache (Linux) server within the Amazon EC2 service and all other instances within the EC2 service will be mapped to Generic Linux in the server tab.
- AppViewX uses the SSM mode of communication to discover certificates within these instances.
- If multiple Apaches run in the same EC2 instance, then only one account will be added under the Apache server tab; if multiple apache running in different EC2 instances; then each instance (apache) will be added as a different account under the Apache server tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- All the certificates within these instances should be discovered by AppViewX, when the **Cert sync** field is selected as **Managed**/ **Monitored**.
- Should not support push certificates including private key via SSM. CSR must be generated in the device itself only a signed public key should be pushed to the device.

Delete Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Delete**) icon in the command bar.
   The **Delete** confirmation popup window is displayed.
5. Click **Yes**.
   The cloud will be removed from the device inventory.

Import Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Import**) icon in the command bar.
   You will be redirected to the import cloud page.
5. Download the sample <.csv> or <.xls> file.
6. Update the details.
7. Click the browse and upload button.
8. Upload the files.
   Cloud details will be updated to the firewall inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Export Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the **Export** icon in the command bar at the upper right of the screen.
5. On the **Export** pop-up screen that is displayed, select the type of information you want to export:

   a. **All Columns** - Select this option if you want to export all information about the cloud.
   b. **Displayed columns** - Select this option if you want to export only the information that is visible on the cloud screen.
   c. **Columns to modify data and import** - Select this option if you are exporting firewall details to make modifications and then re-import the data into the cloud inventory.
6. On the screen that opens, select the location where you want the cloud details file to go, then click **Save**.
   Cloud details will be downloaded as an Excel `<.xls>` file.
7.

Manage Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If the desired server device is not listed on the screen, run a search.

4. To start managing the cloud, click the (**Manage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation pop-up message that is displayed.
   - Config fetch will be triggered and the cloud will get managed.
   - Cloud status is changed to **Manage** in Cloud inventory.

Note: With the introduction of the **Cert License Enforcement**; Server Auto discovery of EC2 instances will be on-boarded with certs status as **Monitored**, even if managed state is configured in the Cloud account configuration.

Unmanage Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

Note: If the desired server device is not listed on the screen, run a search.

4. Click the (**Unmanage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation pop-up message that is displayed.
   Cloud device status is changed to UnManaged in Cloud inventory.

Fetch Config for Cloud

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Cloud** tab.
3. Click the check-box beside the device name.

Note: If the desired server device is not listed on the screen, run a search.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Click the (**Fetch Config**) icon in the command bar.
   A popup notification message is displayed as **Fetch config has been triggered for the cloud.** The configuration will be fetched from the server.

Configuring WAFs

- Adding a WAF Device
- Deleting a WAF Device
- Importing a WAF Device
- Exporting a WAF Device
- Managing a WAF Device
- Unmanaging a WAF Device
- Fetching Config for WAF Devices

Adding a WAF Device

AppViewX supports integration with the following WAF vendors:

- Barracuda
- Cloudflare
- F5
- Imperva SecureSphere

- Adding Barracuda
- Adding Cloudflare
- Adding F5
- Adding Imperva SecureSphere

Adding Barracuda

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. Click the **WAF** tab.
3. Click the **(Add)** icon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Device details** page is displayed.

4. Select **Barracuda** from the Vendors list.
5. In the **General Information** section, select/enter the details as follows.

Fields	Description
Platform	Select the platform from the dropdown field • Azure • AWS • On-Prem
***Device name**	Enter a unique name for the device to be onborded.
Communication	Select from *IP address* and *FQDN*.
***IP Address**	This field is displayed if **Communication = IP Address** Enter the IP address of the device to be onboarded.
***FQDN**	This field is displayed if **Communication = FQDN** Enter the fully qualified domain name of the device to be onboarded.
***Rest port**	Enter the rest port number.
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the WAF device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the Barracuda. API is the default value.
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for Barracuda.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated password to access Barracuda.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
**: Mandatory fields*	

7. In the **Secondary device information** section, select/enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Secondary / Alternate device	Select either *Auto-detect* or *Manual entry*.
***Device name**	Enter a unique name for the secondary device to be onborded.
Communication	Select from *IP address* and *FQDN*.
***IP Address**	This field is displayed if **Communication = IP Address** Enter the IP address of the secondary device to be onboarded.
***FQDN**	This field is displayed if **Communication = FQDN** Enter the fully qualified domain name of the secondary device to be onboarded.
***Rest port**	Enter the rest port number of the secondary device.
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
**: Mandatory fields*	

In the **Secondary device credentials** section (displayed only if **Secondary / Alternate device** = **Manual entry** select/enter the details as follows.

Fields	Description
***Use same credentials**	The *Enable* checkbox is used to fix the credentials type to either *Credential List - Appviewx* or *Credential List - CyberArk* based on its selection.
***Credential type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the secondary device. API is the default value.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for the secondary device.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated password to access the secondary device.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
**: Mandatory fields*	

8. (*Optional step*) Click **Add**. This button is displayed only if **Secondary device information** is **Manual entry**. More than one devices can be configured. (use the **Update** and **Delete** buttons to make changes or remove the devices added.)
9. Click **Save**.
   The device is onboarded successfully.

Adding Cloudflare

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. Click the **WAF** tab.
3. Click the **(Add)** icon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Device details** page is displayed.

4. Select **Cloudflare** from the Vendors list.
5. In the **General Information** section, select/enter the details as follows.

Fields	Description
***Account name**	A user defined unique name to identify the server. No special characters other than '-' , '_' , '.' , '*' , '|' , '!' and spaces are not allowed.
Data center	Enter the data center routing. It holds all the SSL related information that is to be retrieved from the Cloudflare device.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the WAF device.

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the Cloudflare.
***Token based Authentication**	Select the checkbox to enable the token based authentication.
API Token	Enter the API token if the token based authentication is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Username**	This field will be visible if the Credential Type is selected as **Manual entry and token based authentication is disabled** . Enter the designated username for Cloudflare.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry and token based authentication is disabled** . Enter the designated password to access Cloudflare.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
**: Mandatory fields*	

7. Click **Save**.
   The device is onboarded successfully.

Adding F5

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. Click the **WAF** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **f5** from the Vendors list.
5. In the **General Information** section, select/enter the details as follows.

Fields	Description
Platform	Select the platform from the dropdown field. ASM is the default value.
***Device name**	Enter a unique name for the device to be onborded.
Communication	Select from *IP address* and *FQDN*.
***IP Address**	This field is displayed if **Communication = IP Address**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Enter the IP address of the device to be onboarded.
***FQDN**	This field is displayed if **Communication = FQDN** Enter the fully qualified domain name of the device to be onboarded.
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the WAF device.

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the F5 device. API is the default value.
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for Barracuda.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated password to access Barracuda.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
***Token based authentication**	Select the checkbox to enable the token based authentication.
**: Mandatory fields*	

7. In the **Secondary device information** section, select/enter the details as follows.

Fields	Description
Secondary / Alternate device	Select either *Auto-detect* or *Manual entry*.
***Device name**	Enter a unique name for the secondary device to be onborded.
Communication	Select from *IP address* and *FQDN*.
***IP Address**	This field is displayed if **Communication = IP Address** Enter the IP address of the secondary device to be onboarded.
***FQDN**	This field is displayed if **Communication = FQDN**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Enter the fully qualified domain name of the secondary device to be onboarded.
***Rest port**	Enter the rest port number of the secondary device.
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
**: Mandatory fields*	

In the **Secondary device credentials** section (displayed only if **Secondary / Alternate device** = **Manual entry** select/enter the details as follows.

Fields	Description
***Use same credentials**	The *Enable* checkbox is used to fix the credentials type to either *Credential List - Appviewx* or *Credential List - CyberArk* based on its selection.
***Credential type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the secondary device. API is the default value.
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for the secondary device.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated password to access the secondary device.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
**: Mandatory fields*	

8. (*Optional step*) Click **Add**. This button is displayed only if **Secondary device information** is **Manual entry**. More than one devices can be configured. (use the **Update** and **Delete** buttons to make changes or remove the devices added.)
9. Click **Save**.
   The device is onboarded successfully.

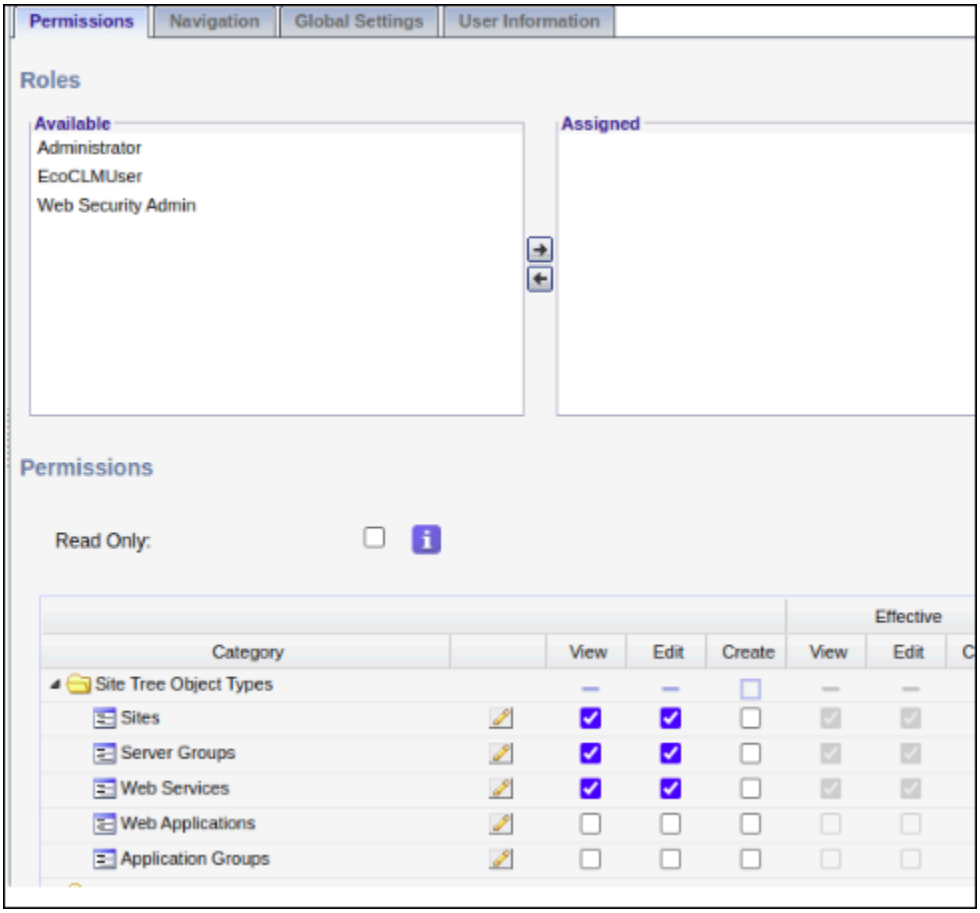
Adding Imperva SecureSphere

Prerequisites

- **AWS**
  - User permissions and navigation settings can be configured either individually or by assigning a predefined role that includes the necessary settings. When a role is assigned, the user automatically inherits all privileges associated with that role. While additional permissions or navigation options can be added, privileges inherited from the role cannot be revoked individually.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Minimum required permissions**



In the **Site Tree Object Types** category, enable:

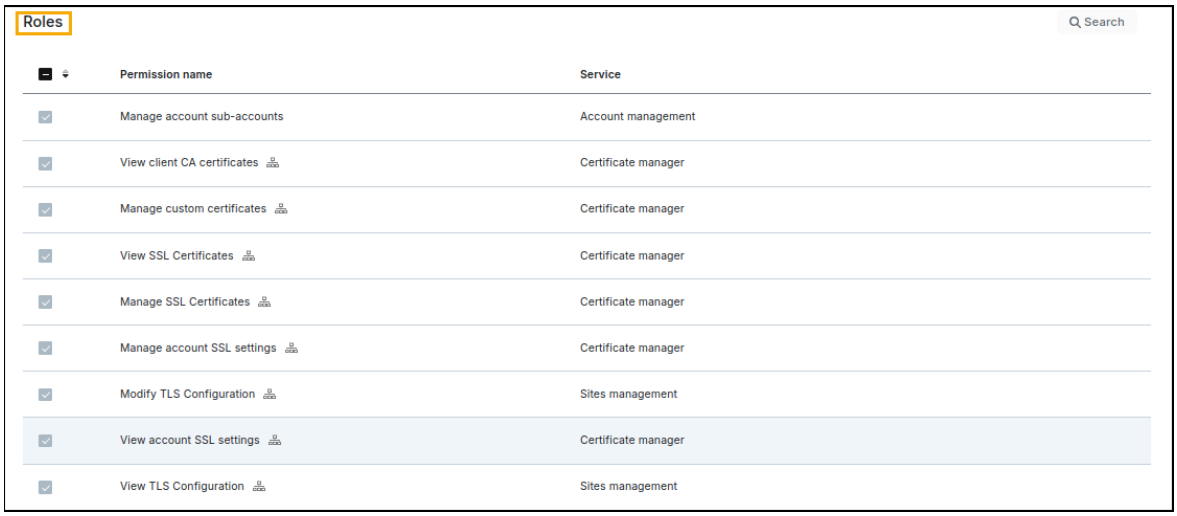
- Sites > Edit
- Server Groups > Edit
- Web Services > Edit

Note: Edit access provides View/Read access implicitly; no need to provide View access separately.

- **SaaS**
  - Configure user account roles and permissions within Imperva SaaS to efficiently perform Certificate Lifecycle Management (CLM) operations. Enable administrator or service account access to the Imperva SaaS portal to create a new User and role.
  - Define and manage roles to assign the appropriate permissions for Imperva SaaS configuration sync, endpoint enrollment, push, and binding from AppViewX to Imperva SaaS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Access the Roles page to create and manage roles. This page is available to the account administrator or users with the **Manage user roles** permission.
  1. On the sidebar, click **User Management** > **Roles** > **New Role**.
  2. Create a new role with the following permissions:



Permissions:

- View client CA certificates
- Manage custom certificates
- Manage account SSL settings
- View account SSL settings
- View TLS Configuration
- View SSL Certificates
- Manage SSL Certificates
- Modify TLS Configuration
- Manage account sub-accounts

Limitations

- **AWS**
  - Due to API limitations, existing certificates from Imperva AWS/On-Prem cannot be discovered. Furthermore, the discovery API metadata does not include the certificate's serial number, which prevents the creation of an AppConnector for the discovered certificate.
  - CSR generation is not supported at the endpoint.
- **SaaS**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Imperva SaaS does not offer an API for exporting certificate content and only provides certificate metadata. Consequently, certificates from Imperva SaaS cannot be directly discovered. However, if a certificate is already present in the AppViewX inventory, a connector will be created using the serial number from the metadata.

API Key Management

To use the API, the client must be authenticated by Imperva.

1. On the sidebar, click **User Management** > **Users**.
2. Click **Add New user** to create a new user, and then enter the details as required.
3. Click the **Add User** button.

> **Note:** When a new user is added to an account, a verification email is sent to their registered address. The user must click the link in the email to verify their address and set a login password.

4. Once the User account is created, select **Edit**, navigate to the **API Keys** category, and generate an API ID and API Key.
5. Click **Create**. It creates an API ID and API Key.

> **Note:** Copy the API key now as it will no longer be accessible once you close this window.

To add the WAF device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Imperva Securesphere** from the Vendors list.
5. In the **General Information** section, enter the details as follows:

Fields	Description
Platform	Select either: • **AWS**: Select **AWS** for Imperva on-prem or AWS Marketplace deployment. • **SaaS**: Select **SaaS** for Imperva SaaS deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: By default, **AWS** platform is selected.
***Device name**	Enter a unique name for the device to be onboarded.
Communication	This field is displayed if **Platform = AWS**. Select *IP address* or *FQDN*.
***IP Address**	This field is displayed if **Platform = AWS** and **Communication = IP Address**. Enter the IP address of the device to be onboarded.
***FQDN**	This field is displayed if **Platform = AWS** and **Communication = FQDN**, or if **Platform = SaaS**. Enter the fully qualified domain name of the device to be onboarded.
***Rest port**	This field is displayed if **Platform = AWS**. Enter the rest port number.
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
Proxy Required	Enable this field if the device communication needs to happen via a proxy. The proxy details configured in general settings will be used for communication.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Note: AppViewX supports certificate enrollment and deployment to the primary Imperva SaaS account and its associated sub-accounts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the WAF device.

Note: This field is displayed if **General Information** = **AWS**.

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - AppVewX* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the Imperva SecureSphere. API is the default value.
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for Imperva Sourcesphere.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated password to access Barracuda.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

Note: This field is displayed if **General Information** = **SaaS**

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box.
***Access type**	Select the method to access the Imperva SecureSphere. API is the default value.
***API ID**	Enter the valid API ID.
***API Key**	Enter the valid API ID.
*: Mandatory fields	

7. In the **Secondary device information** section, enter the details as follows.

Note: This field is displayed if **General Information** = **AWS.**

Fields	Description
Secondary / Failover / Sync group	Select either *Ignore* or *Manual entry*.
***Device name**	Enter a unique name for the secondary device to be onboarded.
Communication	Select from *IP address* and *FQDN*.
***IP Address**	This field is displayed if **Communication = IP Address** Enter the IP address of the secondary device to be onboarded.
***FQDN**	This field is displayed if **Communication = FQDN** Enter the fully qualified domain name of the secondary device to be onboarded.
***Rest port**	Enter the rest port number of the secondary device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Data center	Enter the data center name. It holds all the SSL related information that is to be retrieved from the server.
**: Mandatory fields*	

In the **Secondary device credentials** section (displayed only if **Secondary / Alternate device** = **Manual entry** enter the details as follows.

Fields	Description
***Use same credentials**	The *Enable* checkbox is used to fix the credentials type to either *Credential List - Appviewx* or *Credential List - CyberArk* based on its selection.
***Credential type**	Select the credential type from the dropdown. • *Manual entry* (default) - to directly add the credentials in the username and password text box. • *Credential List - Appviewx* - to use any credentials from the saved AppViewX Credential List. • *Credential List - CyberArk* - to use any credentials from the saved AppViewX CyberArk List.
***Access type**	Select the method to access the secondary device. API is the default value.
***Username**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the username is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed. Enter the designated username for the secondary device.
***Password**	This field will be visible if the Credential Type is selected as **Manual entry**. If the Credential Type is selected as **Credential List - Appviewx**, the password is entered by default and field is read only. If the Credential Type is selected as **Credential List - Cyerark**, this field is not displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Enter the designated password to access the secondary device.
***Credential list**	This field will be visible only if the Credential type is selected as **Credential List - AppViewX** or **Credential List - CyberArk** The dropdown contains a list of credentials stored in AppViewX.
**: Mandatory fields*	

8. [Optional step] Click **Add**. This button is displayed only if **Secondary device information** is **Manual entry**. More than one devices can be configured. (Use the **Update** and **Delete** buttons to make changes or remove the devices added.)
9. Click **Save**.
   The device is onboarded successfully.

Deleting a WAF Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the check-box beside the device name.

> **Note:** If the desired server device is not listed on the screen, run a search.

4. Click the (**Delete**) icon in the command bar.
   The **Delete** confirmation popup window is displayed.
5. Click **Yes**.
   The firewall will be removed from the device inventory.

Importing a WAF Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the check-box beside the device name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If the desired server device is not listed on the screen, run a search.

4. Click the (**Import**) icon in the command bar.
   You will be redirected to the import page.
5. Click **Browse** to navigate to the location of the file to be uploaded.
6. Once the file is selected, click **Upload**.
7. Click **Submit**.

Exporting a WAF Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the check-box beside the device name. If you are exporting details of multiple devices, select the check-boxes for each one.

Note: If the required device is not listed on the screen, run a search.

4. Click the (**Export**) icon in the command bar at the upper right of the screen.
5. On the Export pop-up screen that is displayed, select the type of information you want to export and click the **Export** button.

   a. **All Columns** - Select this option if you want to export all information about the firewall.
   b. **Displayed columns** - Select this option if you want to export only the information that is visible on the firewall screen.
   c. **Columns to modify data and import** - Select this option if you are exporting firewall details to make modifications and then re-import the data into the firewall Inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. On the screen that opens, select the location where you want the firewall details file to go, then click **Save**.
   Device details will be downloaded as a **.xls** file.

Managing a WAF Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the checkbox beside the device name.

> **Note:** If the required device is not listed on the screen, run a search.

4. To start managing the device, click the (**Manage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation pop-up message that is displayed.
   - Config fetch will be triggered and the device will get managed.
   - Device status is changed to **Manage** in the inventory.

Unmanaging a WAF Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the checkbox beside the device name.

> **Note:** If the required device is not listed on the screen, run a search.

4. Click the (**Unmanage**) icon in the command bar at the top of the screen.
5. Click the **Yes** button from the confirmation popup message that is displayed.
   Device status is changed to **UnManaged** in the inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fetching Config for WAF Devices

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **WAF** tab.
3. Click the checkbox beside the device name.

> **Note:** If the required device is not listed on the screen, run a search.

4. Click the (**Fetch Config**) icon in the command bar.
   A popup notification message is displayed as **Fetch config has been triggered for the device(s).**
   The configuration will be fetched from the server.

Certificate Reports

Once the certificates are discovered and managed/monitored in AppViewX, those certificates can be viewed as the reports in dashboards. For some of the reports, email notifications can be enabled as well provided with the other functionality as downloading the report/data.

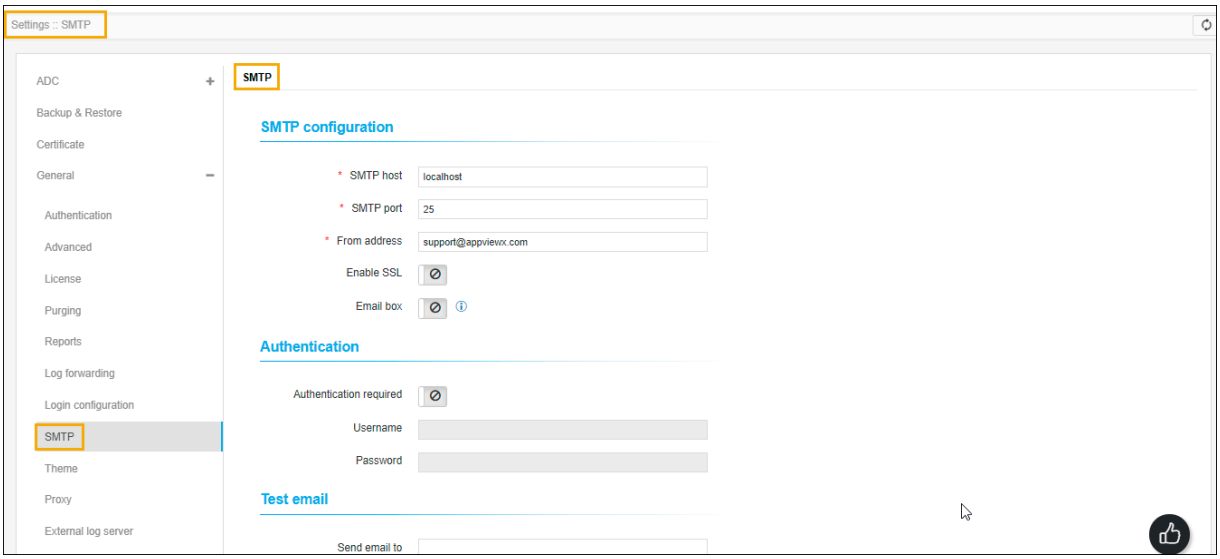
> **Note:** Default reports will contain data only if there is at least one relevant certificate present for that report in the inventory. Otherwise, it displays pop-up message as **No Records Found**.

SMTP Configuration

To get the certificate reports sent as a mail, we will have to first configure SMTP

1. Log in to the AppViewX application with valid credentials.
2. Click on the menu button.
   The left navigation pane is displayed.
3. Click **Settings.**
   The **Settings** page is displayed.
4. Expand the General menu and then click **SMTP.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



5. Refer to the fields in the table below to update the information on the SMTP page.

SMTP Page - Field Description Table

Name	Type	Description	Error Message
* SMTP host	Text	The server that will send the email.	Enter valid Hostname/ IP address <x.x.x.x>.
* SMTP port	Text	Port to connect to the email server.	• Port can contain only numbers. • Enter a port number between 0-65535.
* From address	Text	Mail address from which mail is to be received by the user.	• Please enter a valid email.
Enable SSL	Toggle button	To enable/disable SSL while sending mail.	NA
Email box	Toggle button	Enabling this setting will use IMAP for the mailbox.	NA
* Email	Text	Email for IMAP. Mandatory if Email box is enabled.	• Please enter a valid email.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

SMTP Page - Field Description Table (continued)

Name	Type	Description	Error Message
Password	Text	Password for IMAP. Mandatory if Email box is enabled.	This field is mandatory.
* Hostname	Text	The hostname for IMAP. Mandatory if Email box is enabled.	• Enter valid Hostname/ IP address <x.x.x.x>.
Authentication required	Toggle button	To enable/disable Authentication required.	NA
* Username	Text	The username if authentication required. Mandatory if Authentication required is selected as true.	NA
* Password	Text	Mandatory if Authentication required is selected as true.	NA
* Send email to	Text	Test email to check if able to send mail after configuring the above settings. Mandatory if you want to test.	Enter a valid email.

Note: The asterisk (*) symbol indicates a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

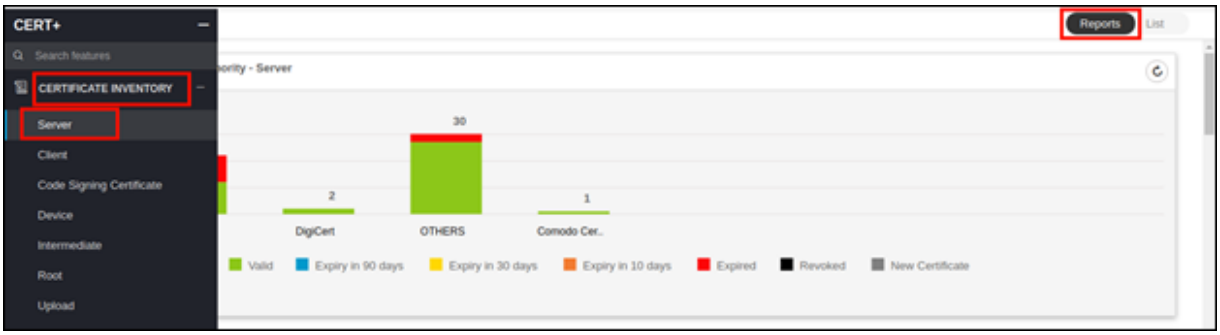
Troubleshooting SMTP

Error Message	Possible Cause	Possible Solution
Please provide a valid value.	Anyone of the mandatory fields is invalid or is missing.	Provide valid values for all mandatory fields.
E-Mail sending was unsuccessful.	• If trying to test, no/valid email is not provided in the 'send email to' field. • Credentials and field values may be incorrect.	• If trying to test, provide a valid email in the 'send email to' field. • All the credentials and fields should be correct.
Service unavailable. Try after some time.	avx_subsystems or avx_platform_gateway is not running.	Restart the plugin.

Fetch All Default Reports

All Reports will be present separately for each certificate category. To view Reports for certain certificate categories, follow the steps given below.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server** or **Client** or **Code Signing Certificate**.
2. In the top right corner, click **Reports** tab.
   The respective report page is displayed.



Working with the Job Scheduler

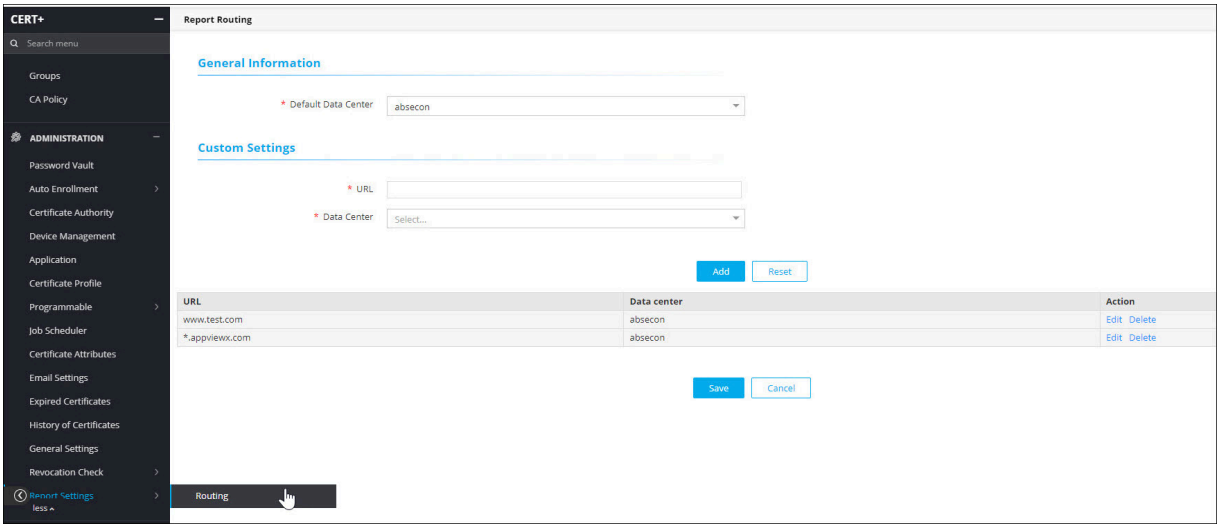
Report Routing

This functionality is applicable only to the following reports:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Validation report
- Vulnerability report
- CAA report

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Report Settings** > **Routing** or **Code Signing**. The **Report Routing** page is displayed.



2. Enter the following fields:

Revocation Routing Page - Fields Description

Fields	Description
General Information	
Default Data Center	This is the default data center through which all validation requests are routed.
Custom Settings	
URL	Type the URL of the certificate for which you want to perform the revocation check.
Data Center	Select the data center of the URL from the dropdown list. Selecting this value will overwrite the default data center.

Note: The asterisk (*) symbol indicates a mandatory field.

3. Click **Add.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The table is refreshed with a row entry of the newly added URL and the data center.

4. Click **Save.**
   - A message that certificate report settings routing is saved successfully is displayed.
   - On saving, any report validation such as validation checks or CAA record check is routed through the data center configured on this page.

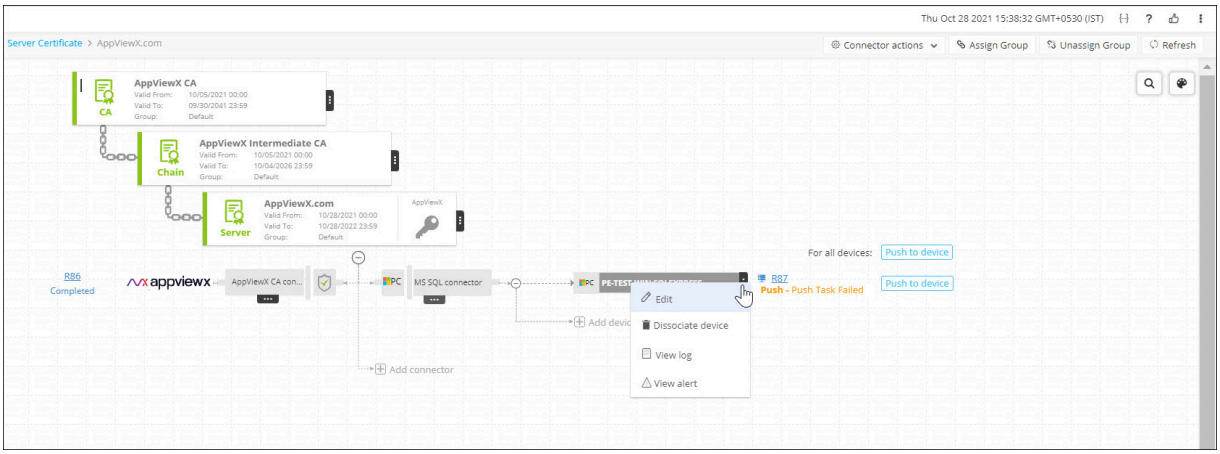
> **Note:** To perform a bulk operation on certificate URLs, you can specify a wild card character with their domain name, for example, if you want to specify a data center to all the AppViewX certificates at one go, then use wild card character as in *.appviewx.com and select the data center from the dropdown list.

5. Click **Add**.
6. To edit the certificates, then use the **Edit** option.

Validation Settings

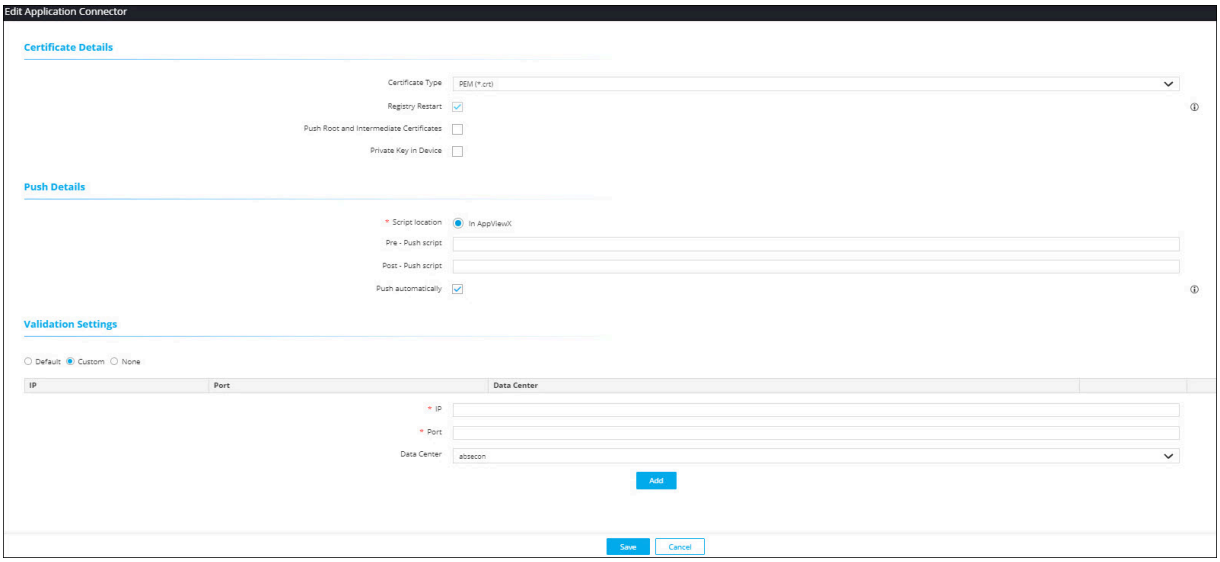
This is an extended feature of Report Routing.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server** or **Client** or **Code Signing**.
2. Click the **Common Name** link to view the certificate in the holistic view.
3. Hover the mouse over the (**More**) icon of the application connector and click **Edit.**



The **Edit Application Connector** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



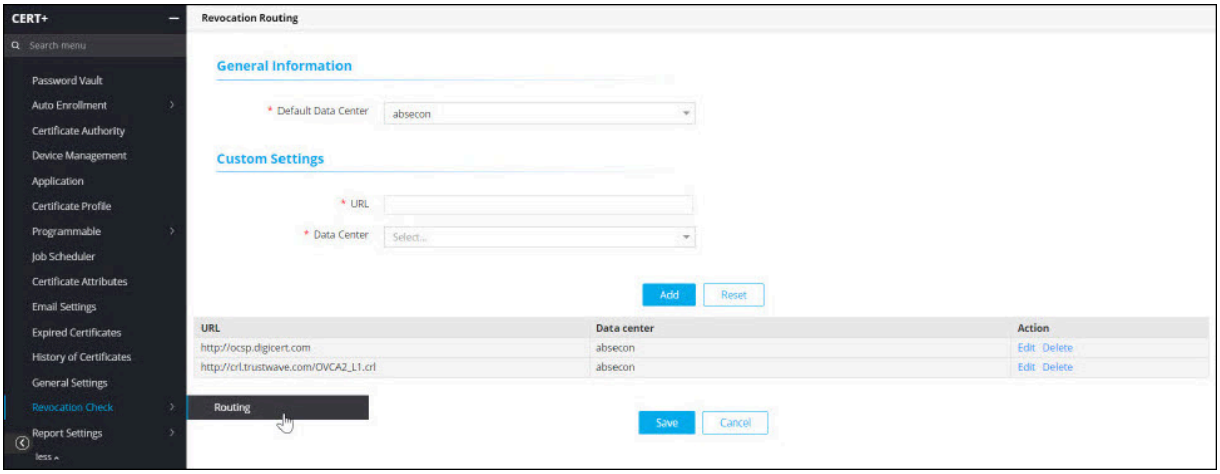
4. Select **Custom** option.
5. In the **Validation Settings** section, select the data center from the dropdown list.
   This ensures that for any validation check, this is treated as high priority.

Revocation Check Routing

This functionality is applicable to:

- Revocation check job
- On demand revocation check

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Revocation Check** > **Routing** .
   The **Revocation Routing** page is displayed.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Enter the following fields:

Revocation Routing Page - Fields Description

Fields	Description
General Information	
***Default Data Center**	This is the default data center through which all validation requests are routed.
Custom Settings	
***URL**	Specify the URL for which you want to run the revocation check job or the on-demand revocation check by selecting the certificate from the holistic view. To run the revocation check job, copy and paste the URL from the **CRL distribution points** field of the **Certificate details** window. To run the on demand revocation check, copy and paste the URL with ocsp extension from the **Authority information access** field of the **Certificate details** window. **Note:** For on demand revocation checks, if you have configured two URLs with .crl and .ocsp extensions and for any reason the job fails on .ocsp, then the revocation check is triggered on the URL with .crl extension. If the job is successful and the certificate is revoked, then the certificate is displayed on the **Certificate Inventory** page with a black icon against it. If the job failed, then go to **Administration > Logging > Certificate** and check the log message.
***Data Center**	Select the data center of the URL from the dropdown list. Selecting this value will overwrite the default data center.
Note: The asterisk (*) symbol indicates a mandatory field.	

3. Click **Add**.

   The table is refreshed with the added URL and the data center.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Click **Save**.
   - A message that certificate revocation check routing is saved successfully is displayed.
   - The table is refreshed with a row entry of the newly added URL and the data center.

Securing CERT+

CERT+ Certificate Lifecycle Management (CLM) offers capabilities to discover and manage certificates on devices and self-service certificate enrollment for users. CERT+ also acts as a Key Escrow for keys discovered and enrolled.

Typically, the private keys are stored by the devices handling SSL termination, and an SSL management tool retrieves them during certificate renewal. The tools and devices store them in their storage in the original format, which can be reused. If there is an attack on the device or tool storage, the private keys will be given away, which can be used to host an array of attacks.

AppViewX stores the private keys discovered in a secure part of the database, which is encrypted using the AES-256 algorithm. It encrypts each private key with independent keys and stores the encrypted independent keys in the database with a randomly generated key.

Thus, even if the hackers get the database, they will not be able to get the private keys. Only a maze of jumbled up characters will be visible to them, which does not make any sense and hence, rendering the attack useless.

Auto-Enrollment Protocols

AppViewX CERT+ enables certificate auto-enrollment by automating all the steps involved, including CSR generation, domain ownership verification, certificate download, and provisioning, making the process efficient, scalable, and secure. AppViewX CERT+ supports all major auto-enrollment protocols including – ACME, EST, SCEP, Native Windows Auto-enrollment, and Microsoft Intune. Automating certificate enrollment reduces human error, outages, and security compromises, while improving productivity.

Auto-enrollment protocols are standardized enrollment mechanisms accepted across a wide range of enterprise systems for device and application certificate enrollment. Systems leveraging auto-enrollment protocols typically expect minimum to no admin intervention. Network devices such as routers-switches, DevOps tools, and Enterprise Mobility Management platforms are typical examples of such systems. If the deployment mode is:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- SaaS or Managed Kubernetes, deploying a cloud connector enables auto-enrollment.
- SaaS deployments where cloud connectors are unavailable, users should provide the AppViewX host information, which includes the IP address and port of the URL or endpoint. If their devices support auto-enrollment to a public URL, auto-enrollment is available as part of the tenant, and configuration details are provided in the documentation.

The cloud connector is advised for DMZ-based deployments or for enrollment through your cloud connector. This is especially useful in scenarios where endpoints cannot communicate with a public URL for auto-enrollment through a private channel, necessitating the use of the cloud connector.

- EST
- ACME
- SCEP
- MS Intune
- CMP
- WAEP
- Actions
- Direct Requests

EST

EST stands for Enrollment over Secure Transport. It is a certificate management protocol targeting Public Key Infrastructure (PKI) clients which require digital certificates to prove their authenticity. EST also helps the clients in acquiring associated CA certificates. Some prerequisites and features are as follows:

- There should be an agent (avx_vendor_cert_est_agent) up and running for EST in AppViewX.
- This EST plugin can either be in HTTPS or HTTP, but it needs a gateway which supports client certificate authentication running to communicate with the client.
- It is highly recommended to keep the 'Approval Required' flag OFF in the **Menu > Inventory > Certificate > Policy** page.
- The valid agent setting should be available in **Menu > Inventory > Certificate > Settings**.

The Enrollment over Secure Transport protocol or EST is a certificate management protocol that automates the issuance and provisioning of X.509 certificates. The protocol has been defined in RFC 7030 (ratified in 2013) and developed for clients that use public key infrastructure (PKI), such as web servers, applications, and endpoint devices.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The protocol helps configure PKI clients to request for certificates from trusted certificate authorities (CAs) and receive them over secure HTTPS without any human intervention.

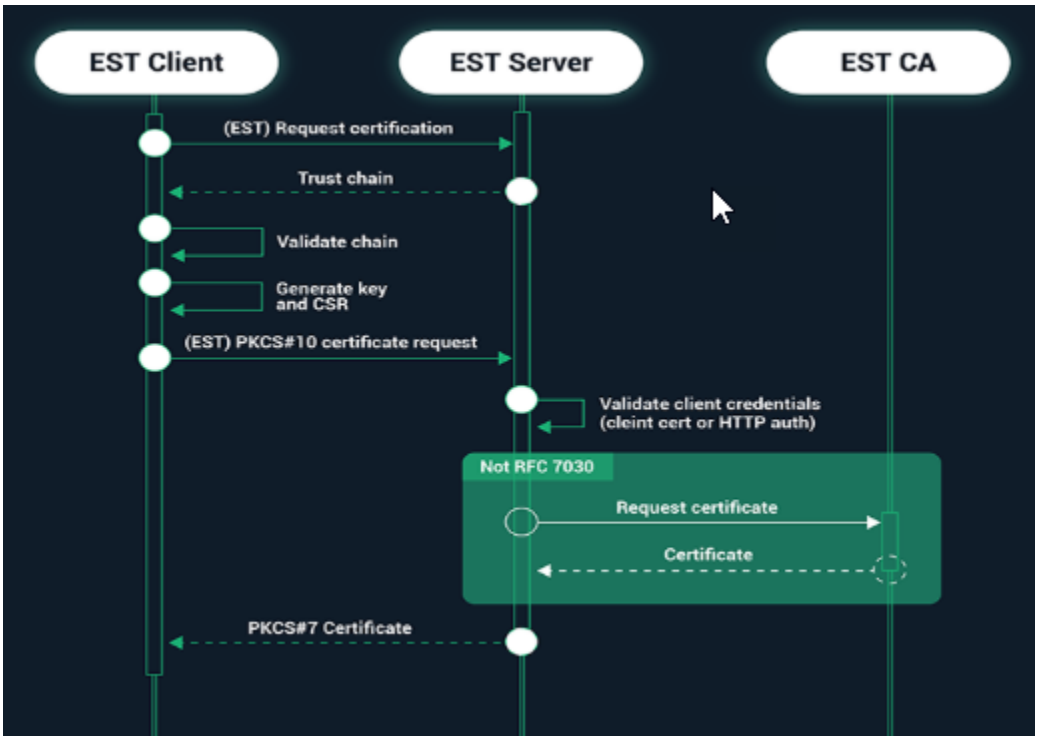
- Configuring AppViewX EST Server
- Configuring AppViewX EST Client
- EST Micro CA (Standalone Server)

What is the Purpose of EST?

The main goal of EST is to simplify and secure certificate enrollment. EST helps ensure certificates are correctly configured and deployed at scale by automating the process. Removing human intervention naturally reduces the risk of misconfigurations, and, in turn, the reduces the possibility of outages and security compromises. Automating enrollment also helps free up time for PKI personnel who are otherwise caught up in the perpetuity of getting certificates issued and provisioning them.

How does EST work?

In an enterprise PKI setup, the EST server sits between a client and a certificate authority (CA) and plays the role of a traditional Registration Authority (RA) – receive a certificate signing request (CSR) from a client, validate the client, forward the request to the corresponding CA, get the certificate issued, and finally provision it to the client.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The EST communication between a client and a certificate authority happens as follows:

1. The client hits the server with a request to communicate over TLS. The server responds to the request by presenting its TLS certificate.
2. The client checks the certificate to verify the legitimacy of the server. Next, it requests the chain of trust from the server and verifies it, including any intermediate certificates that lie between the root and the EST CA, and stores the root certificate.
3. The client generates a key and a CSR and sends the CSR to the server.
4. The EST server forwards the CSR to the CA and receives a new certificate. It then sends the newly signed certificate back to the client.

Advantages of using EST

EST is an auto-enrollment protocol that offers various functionalities such as enrollment, re-enrollment, and server-side key generation. This protocol serves as the foundation for the client and ensures interoperability with other EST-compliant servers.

What's Next?

Configuring AppViewX EST Server

Prerequisites

On-prem

- Make sure that the following pods are running in the cluster by using the command:

```
kubectl get pods -A | grep est
```

```
ppviewx@pm-saas-node33:~$ kubectl get pods -A | grep est
bsecon                avx-vendor-cert-est-agent-549985fbfc-kwzjm                3/3     Running     0               8d
ppviewx@pm-saas-node33:~$
```

- Make sure that <avx-platform-gateway-est> and <avx-vendor-cert-est-agent> services are running in the cluster by running:

```
kubectl get svc -A | grep est
```

```
appviewx@pm-saas-node33:~$ kubectl get svc -A | grep est
absecon               avx-vendor-cert-est-agent             ClusterIP   10.102.47.223   <none>        5306/TCP
external-system       avx-platform-gateway-est              NodePort    10.97.224.10    <none>        5301:3002
```

SaaS

Ensure the https gateway is enabled on the cloud connector while installing it. To do this:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Navigate to the installation directory of the cloud connector software.
2. Run

```
cd deps/tools
```

3. Run

```
./k3s kubectl get svc -A | grep mtls
```

Note: It should have the avx-mid-server-gateway-mtls under namespace cc.

```
[appviewx@pe-qa-cc-n8 tools]$ ./k3s kubectl get svc -A | grep mtls
cc            avx-mid-server-gateway-mtls    NodePort    10.43.0.141   <none>        5301:30021/TCP          22h
[appviewx@pe-qa-cc-n8 tools]$
```

Enabling EST Services

For On-prem

1. Log onto the AppViewX installer node.
2. Go to </installation_folder/appviewx_kubernetes/scripts> folder.
3. Add the avx-vendor-cert-est-agent and avx_platform_gateway_external in ENABLED_PLUGINS in the appviewx.conf file.
4. Specify the datacenter (DC) where the gateway must be deployed:
   - avx_vendor_cert_est_agent=<dc name>
   - avx_platform_gateway_external=<dc name>

```
ENABLED_PLUGINS=appviewx_dependencies,avx_commons,avx_crontab,avx_config_server,avx_platform_core,avx_platform_amc,avx_platform_q
ueue,avx_platform_gateway,avx_platform_gateway_external,avx_platform_web,avx_subsystems,avx_vendors,avx_subsystems_sync,avx_visua
l_page_builder,avx_vendor_cert_network_discovery,avx_vendor_cert_scep_agent,avx_vendor_cert_intune_agent,avx_vendor_cert_est_agen
t,avx_vendor_cert_acme_agent
SSH_OTHER_USER=appviewx

avx_commons=absecon
avx_config_server=absecon
avx_platform_core=absecon
avx_platform_queue=absecon
avx_subsystems=absecon
avx_subsystems_sync=absecon
avx_vendors=absecon
avx_platform_gateway=absecon
avx_platform_web=absecon
avx_platform_amc=absecon
avx_platform_gateway_external=absecon
avx_visual_page_builder=absecon
avx_vendor_cert_network_discovery=absecon
avx_vendor_cert_scep_agent=absecon
avx_vendor_cert_intune_agent=absecon
avx_vendor_cert_est_agent=absecon
avx_vendor_cert_acme_agent=absecon
```

5. Run <plugins_install.sh>
6. Verify if EST is enabled by running kubectl get pods -A | grep est

```
ppviewx@pm-saas-node33:~$ kubectl get pods -A | grep est
bsecon          avx-vendor-cert-est-agent-549985fbfc-kwzjm              3/3     Running     0              8d
ppviewx@pm-saas-node33:~$
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Verify the plugin status and port number:
   a. Make sure that avx-vendor-cert-est-agent and avx-vendor-cert-est-agent are running by using the command:

```
kubectl get services -A | grep est
```

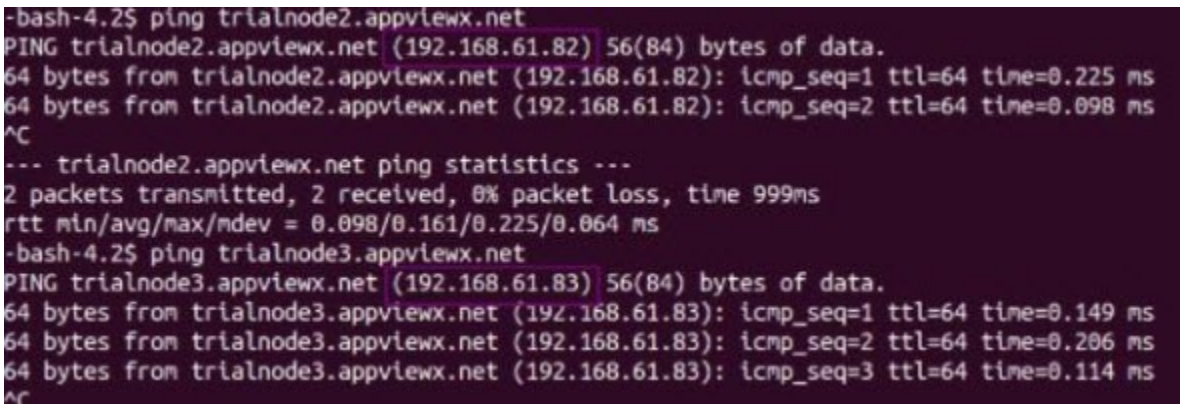
   b. Make sure that the port number is 5301:30021 in avx-platform-gateway-est.

> **Note:** The number 30021 must be used in the UI configuration.

   c. Identify the nodes running the EST service. EST is available on all the nodes where the external system runs by running:

```
<kubectl get pods -n external-system -o wide>
```

   d. Ping to the node names to fetch the IP addresses.



For SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

1. Log onto the cloud connector installed node.
2. Go to cc_installed_path/deps/properties.
3. Open appviewx.properties and set the following fields as *true:*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. AUTO_ENROLL_ENABLED=true
b. ENABLE_MTLS_PROFILE=true
c. ENABLE_HTTP_PROFILE=true
d. ENABLE_HTTPS_PROFILE=true

4. Scale down the avx-mid-server-platform pod.
5. Restart the avx-mid-server-starter pod.

> **Note:** Ensure that avx-mid-server-gateway-https is present under namespace cc.

Configuring EST Server

1. Go to **(Menu)** > **CERT+** .
   The left navigation pane appears.
2. Select **Administration** > **Auto Enrollment** > **EST**.
3. Click **+ Add** icon on the top-right.
   The **Auto Enrollment : EST** page is displayed.
4. Enter the following details:

Endpoint Details - Field Description Table

Fields	Description
Endpoint Details	
***Name**	A unique name (alphanumeric string) to identify the agent setting. Name should not start with special characters. Acceptable characters: A-Z, a-z, 0-9, '.', '_', '-'
***IP/FQDN**	**For On-prem** • **Without load balancer:** Must contain the FQDN of the node where the external gateway is running. To get the details, run `kubectl get pods -n external-system -o wide`. If the external gateway is running on multiple nodes, you can specify any one of those nodes. • **With load balancer:** Must be the FQDN of the load balancer. **For SaaS:**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Using On-premises CC: • **Without load balancer:** Must be the FQDN of the cloud connector where the auto-enrollment gateway is running. • **With load balancer:** Must be the FQDN of the load balancer. **Using Direct Gateway** In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, the FQDN/IP address will be the tenant URL with "-aep" before the domain name. The format is as follows: <tenant>-aep.<domainname>.
***Port**	**For On-prem** • **Without load balancer:** By default, it is port 30021. Leave it as is. • **With load balancer:** Port must be the listening port of the load balancer. **Note:** • It is recommended to set the listening port as 30021, which is the same as AppViewX. • If the load balancer's listening port is different from 30021, then update the respective port. **For SaaS:** **Using On-premises CC:** • **Without load balancer:** By default, it is port 30021. Leave it as is. • **With load balancer:** Port must be the listening port of the load balancer. **Note:** • It is recommended to set the listening port as 30021, which is the same as AppViewX. • If the load balancer's listening port is different from 30021, then update the respective port. **Using Direct Gateway**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, use only port 443.
Client Authentication	
Authentication Mode	Select any one authentication method to be carried out during communication with clients: • **Only Certificate TLS:** During client authentication, only certificate TLS based authentication will be performed. • **Certificate TLS with HTTPS fallback:** During client authentication, when the certificate TLS fails, HTTPs based authentication is performed as fallback. • **Both Certificate TLS and HTTPs:** During client authentication, both certificate TLS and HTTPs authentication are performed one after the successful completion of the other. **Using Direct Gateway** In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, use only **Certificate TLS with HTTPS fallback** as the Authentication mode.
***Issuer Certificate**	Select one or more issuer certificates that need to be checked for the client certificate authentication.
***Client Certificate Revocation Check**	By default, the value is set to **No Revocation Check.** Choose from any of these values: • **No Revocation Check:** Client certificates will not be checked for revocation. • **Perform Revocation Check:** Certificates will be validated against revocation mechanisms using CRL or OCSP. • **Check Inventory for Revocation:** Certificates will be checked against the certificate inventory for revocation status.
***HTTP Authentication Mode**	This field appears when Authentication Mode = Certificate TLS with HTTPS fallback or Both Certificate TLS and HTTPs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Select the type of HTTP auth mode either Basic/Digest. • **Basic:** During client authentication, only the username and password values are considered for HTTPs based authentication. • **Digest:** During client authentication, nonce and realm values are also supported along with username and password.
***Fallback Credentials**	This field appears when Authentication Mode = Certificate TLS with HTTPS fallback or Both Certificate TLS and HTTPs. Select Manual/Logged on user credentials - based on the selection users can configure the credentials manually or save as credentials equivalent to the logged in user. • **Manual:** The Username and Password fields will be displayed to enter values. • **Logged on user credentials:** The Username and Password fields will not be displayed.
***Username**	Enter username for HTTP authentication.
***Password**	This field appears when Authentication Mode = Certificate TLS with HTTPS fallback or Both Certificate TLS and HTTPs. Enter password for HTTP authentication.
CA Accounts	
***Certificate Group**	Select a specific group under which certificate needs to be enrolled.
***Certificate Category**	Select a specific certificate type (Server / Client / Intermediate) to be enrolled. **Note:** The intermediate radio button, filters templates to show only SUB-CA templates suitable for intermediate CA issuance designed for the microCA functionality.
***Select CA**	Select the required CA from the available options. The certificate is enrolled under the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The CAs associated with the Default certificate group are: • AppViewX • AppViewX PKIaaS • AppViewX PKIaaS Native • Amazon Private CA • DigiCert • DigiCert One • EJBCA • Entrust • Entrust MPKI • GlobalSign Atlas • GlobalSign MSSL • Google • HydrantID • IDnomic • Microsoft Enterprise • Microsoft Standalone • Nexus • OpenTrust • Sectigo (Comodo Certificate Manager) • SwissSign
***: Mandatory fields	

Load Balancer Configuration

It is recommended to set the listening port as 30021, which is the same as AppViewX.

Health check URL for load balancer:

a. **HTTP method:** GET
b. **Healthcheck API:** https://<hostname>:30021/
   i. **FQDN:** FQDN of cloud connector enabled with the MTLS gateway.
   ii. **Expected response code:** 401. As the load balancer is accessing the URL without any parameters, it will receive a 401 response.

The load balancer needs to be configured to forward client certificates (used for MTLS authentication) to AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA configuration

When **AppViewX** is selected as CA, the fields for AppViewX CA are as follows:

Details for AppViewX CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with SCEP client machine.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
*: Mandatory fields	

When **AppViewX PKIaaS Native** is selected as CA, the fields for AppViewX PKIaaS Native CA are as follows:

Details for AppViewX PKIaaS Native - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Template Name	Select a template name from the dropdown list.
***Issuer Name**	Select an issuer name to issue the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
*: Mandatory fields	

When **Amazon Private CA** is selected as CA. The fields for Amazon Private CA are as follows:

Details for Amazon Private CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Region**	Select a valid region associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Issuer**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Signature Algorithm**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value from the group's associated policy. Select an appropriate value as required.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Order Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

When **AppViewX PKIaaS** is selected as CA. The fields for AppViewX PKIaaS CA are as follows:

Details for AppViewX PKIaaS CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with SCEP client machine.
***Issuer Location**	Select the issuer location associated with the CA account.
***Issuer Name**	Select a valid issuer associated with the CA account.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

When **DigiCert** is selected as CA. The fields for DigiCert CA are as follows:

Details for DigiCert CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Division**	Select a division associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Type**	Select a valid certificate type associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Order Validity**	Validity of the certificate to be enrolled.
*****: Mandatory fields	

If the **Select CA = DigiCert**, then a separate section **Vendor Specific Details** is displayed after the CA Accounts section with two fields described below.

Vendor Specific Details for Digicert CA - Field Description Table

Fields	Description
***Server Type**	Select a server type. The dropdown is populated with the first available value. Select an appropriate value as required.
***Payment Method**	Select a payment method. The possible options are: • **Bill To Account Balance** - Pay with the account balance. Returns an error if this option is disabled for the account or if the account has an insufficient fund. • **Bill To Default Credit Card** - Pay with the account's default credit card. Returns an error if no default credit card is configured for the account
*****: Mandatory fields	

When **DigiCert One** is selected as CA. The fields for DigiCert One CA are as follows:

Details for DigiCert One CA - Field Description Table

Fields	Description
***CA Account Name**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server or Client.
Proxy Required	Enable this field if the CA communication needs to happen via proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center for CA communication, with the CC node being the recommended option. The selected node will handle the communication through the chosen CC node.
CA Configuration	
***Base URL**	This URL will contain the hostname of the DigiCert CA instance and used for constructing the API requests.
***Authentication method**	By default, API Token is selected.
***API Token**	Enter the API token to authorize the communication between AppViewX and DigiCert One.
Allow Seat ID during enrollment	Enabling this field displays a Seat ID field in the Auto enrollment settings that you can use instead of the CA settings.
***Seat ID**	Unique value assigned to identify an entity in the DigiCert One account.You can provide multiple ID separated by a comma. They can be used for enrollment, renewal, and regeneration.
Use DigiCert One to switch certificates from DigiCert MPKI	Enable this field to automatically switch your DigiCert MPKI certificates to DigiCert One with auto-enrollment/auto-regenerate.
*: Mandatory fields	

When **EJBCA** is selected as CA. The fields for EJBCA CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for EJBCA CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
*: Mandatory fields	

If the selected CA is **EJBCA**, a separate section **Vendor specific details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for EJBCA CA - Field Description Table

Fields	Description
***End Entity Profile Name**	Select a profile of an end entity.
End entity user name	Enter the user name for the end entity.
***Issuer Common Name**	Select a common name of an issuer.
***Certificate Profile Name**	Select a profile name of certificate.
*: Mandatory fields	

When **Entrust** is selected as CA. The fields for Entrust CA are as follows:

Details for Entrust CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Type**	Select a valid certificate type associated with the CA account. • If the **Certificate Category** radio button is selected to *Server*, the dropdown list is populated with the first available value. Select an appropriate value as required. • If the **Certificate Category** radio button is selected to *Client*, the dropdown list is populated with 'None' as the default value.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: Mandatory fields	

If the selected CA is **Entrust**, a separate section displaying **Vendor specific details** and **Custom Attributes** is displayed after the **CA Accounts** section.

Note: Based on the Entrust ECS account configuration **Custom Attributes section** may also be displayed.

Vendor Specific Details for Entrust CA - Field Description Table

Fields	Description
Additional Emails	Enter the valid email address in the field.
Requester Name	Enter the requester name.
Requester Email	Enter a valid email ID.
Requester Phone	Enter the 10-digit phone number.
*: Mandatory fields	

When **Entrust MPKI** is selected as CA. The fields for Entrust MPKI CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: Mandatory fields	

If the selected CA is Entrust MPKI, a separate section **Vendor Specific Details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Name**	Select a CA name from the dropdown list.
***Certificate Profile**	Select a certificate profile from the dropdown list.
*: Mandatory fields	

When **GlobalSign Atlas** is selected as CA. The fields for GlobalSign Atlas CA are as follows:

Details for GlobalSign Atlas CA - Field Description Table

Fields	Description
***Select CA**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***API Credential Friendly name**	Select a CA Account to communicate with during the certificate enrollment actions.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
***: Mandatory fields	

A **Generic Fields** section is also displayed below the CA Accounts section. It contains the fields related to the CSR parameters based on the profile (API Credential Friendly name) selected. Only the Organization field is mandatory and is fetched from the selected profile. Rest of the fields are optional.

When **GlobalSignMSSL** is selected as CA. The fields for GlobalSign MSSL CA are as follows:

Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Product Type**	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
CA Connector Name	Name of the CA connector after the certificate is enrolled.
Certificate Validity	Validity of the certificate to be enrolled (in days/months/years).
***: Mandatory fields	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***Profile name**	Select the Profile based on the configurations made in the Certificate Authority setting.
***: Mandatory fields	

The following field is displayed in the **Point of Contact** section as per the selected CA. The CA mandates the point of contact information for traceability. All auto-enrollment requests via this endpoint will be registered with the point of contact information entered here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Point of Contact Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***First Name**	Enter the first name.
***Email Address**	Enter the valid email address.
***Phone Number**	Enter the valid phone number.
*: Mandatory fields	

When **Google** is selected as CA. The fields for Google CA are as follows:

Details for Google CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate profile type.
***Issuer Location**	Select an issuer location that is associated with the CA account.
***Pool Name**	Select a pool name to issue the certificate.
Template Name	Select the appropriate template name.
***Issuer Name**	Select an issuer name to issue the certificate.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

When **HydrantID** is selected as CA. The fields for HydrantID CA are as follows:

Details for HydrantID CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***HydrantID Policy**	Select the policy associated with the CA Account to be used for certificate operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

When **IDnomic** is selected as CA. The fields for IDnomic CA are as follows:

Details for IDnomic CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate profile from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: Mandatory fields	

When **Microsoft Enterprise** is selected as CA. The fields for Microsoft Enterprise CA are as follows:

Details for Microsoft Enterprise CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: Mandatory fields	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the selected CA is Microsoft Enterprise, a separate section **Vendor specific details** is displayed with a **Template Name** dropdown after the CA Accounts section.

When **Microsoft Standalone** is selected as CA. The fields for Microsoft Standalone CA are as follows:

Details for Microsoft Standalone CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: Mandatory fields	

When **Nexus** is selected as CA. The fields for Nexus CA are as follows:

Details for Nexus CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: Mandatory fields	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details - Field Description Table

Fields	Description
***Procedure**	Select the procedure based on the configurations made in the Certificate Authority Setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

When **OpenTrust** is selected as CA. The fields for OpenTrust CA are as follows:

Details for OpenTrust CA - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Certificate Management Profile**	Select the certificate issuance policy defined in OpenTrust CA.
Zone	The AppViewX configuration wrapper that maps to a CA + profile, and is used by end-users or automation to request certificates consistently.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: Mandatory fields	

A **Profile Parameters** section is also displayed below the CA Accounts section. It contains the fields such as **Common Name*, *Organizational Unit*, **Organization*, **Email*, **Password*. or as configure in the Certificate Authority settings page.

When **Sectigo (Comodo Certificate Manager)** is selected as CA. The fields for Sectigo (Comodo Certificate Manager) CA are as follows:

Details for Sectigo (Comodo Certificate Manager) CA - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Certificate Type**	Certificate Type for which CLM actions will be enabled.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: Mandatory fields	

When **SwissSign** is selected as CA. The fields for SwissSign CA are as follows:

Details for SwissSign CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate creation operations.
***Client Name**	Select the specific client.
***Product**	Select the specific product.
***CA Certificate**	Select the specific issuer certificate that will be used for signing CSR by the certificate authority. Certificates available in the root or intermediate certificate inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

5. Configure the **Advanced Settings** details as follows:

   The following table provides the field description for Advanced Settings:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Advanced Settings - Field Description Table

Fields	Description
***Switch to Enroll**	Select *Yes* or *No*. Selecting the radio button as *Yes* will convert the re-enrollment requests to enrollment requests.
***Fetch Certificate Parameters**	Select *Yes* or *No*. Setting the radio button to *Yes* will enable the system to automatically fetch certificate parameters from a Suggestive Policy, and append them to the client CSRs.
***Include Truststore Certificates**	Select whether the issuer certificate needs to be sent to client machines after enrollment.
***High Speed Transactions**	Based on the selection of this field, the endpoint will be configured with or without High Performance transaction times. Request information pertaining to High-Performance can be viewed on the Direct Requests page.
***Return Existing Certificate**	If this option is enabled (**Yes**) then for request with AppViewX should check and return the existing valid certificate for the same CSR & public key from inventory if available otherwise it should proceed with enrollment and return the certificate. • If it is set to **Yes**, the Certificate Threshold field is displayed. • If the option is disabled (**No**), then AppViewX will do the default behavior of enrolling a new certificate for each request.
Certificate Threshold	This field is enabled only if **Return Existing Certificate = Yes.** Enter the number of days in this field. This value is used to Initiate a new certificate request if the certificate is nearing the expiry date i.e., if existing certificate validity is less than the entered value.
***Retry Count**	Values accepted between 5 - 99.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Based on this value, the EST agent will trigger the number of calls to collect the certificate from AppViewX until it is received.
***Retry Frequency**	Values accepted between 10 - 99. The value specified in this field determines the duration taken between the trigger calls by the EST agent.
*: Mandatory fields	

Iptables and Pod Scaling in Worker Nodes

As part of the **CIS benchmark compliance** for AppViewX on-prem servers, only the **default ports** are whitelisted by default. Any additional ports—such as **30021** or **30022** required for **Auto Enrollment Protocol** operations—must be explicitly allowed in the **iptables** configuration.

In this case, **port 30021 (EST)** is an additional plugin port that must be permitted in the iptables rules to enable external communication.

Follow these steps to add the required rule to the iptables configuration:

1. Connect to the worker nodes:

   `vi /etc/iptables/rules.v4`

2. Add lines to the IPtables to ACCEPT traffic30021, 30022:

   `iptables-restore < /etc/iptables/rules.v4`

3. To scale the pods on a worker node:

   `kubectl scale --replicas=2 deploy/avx-platform-gateway -n external-system`

To include the iptables rules:

1. Open the rules.v4 file:

   `sudo -i`

   `vi /etc/iptables/rules.v4`

2. Append the following lines to allow the required ports:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
-A INPUT -p tcp -m tcp --dport <port> -j ACCEPT
```

```
*filter
:INPUT DROP [0:0]
:FORWARD DROP [0:0]
:OUTPUT DROP [0:0]
-A INPUT -i lo -j ACCEPT
-A INPUT -s 127.0.0.0/8 -j DROP
-A INPUT -p tcp -m state --state ESTABLISHED -j ACCEPT
-A INPUT -p udp -m state --state ESTABLISHED -j ACCEPT
-A INPUT -p icmp -m state --state NEW -j ACCEPT
-A INPUT -p tcp -m tcp --dport 22 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
-A INPUT -m conntrack --ctstate ESTABLISHED -j ACCEPT
-A INPUT -p tcp -m tcp --dport 31443 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 30021 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 30022 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 30190 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 179 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 6443 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 10250 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 2379 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 2380 -j ACCEPT
-A INPUT -p tcp -m tcp --dport 9100 -j ACCEPT
-A INPUT -p udp -m udp --dport 4789 -j ACCEPT
-A OUTPUT -o lo -j ACCEPT
-A OUTPUT -p tcp -m state --state NEW,ESTABLISHED -j ACCEPT
-A OUTPUT -p udp -m state --state NEW,ESTABLISHED -j ACCEPT
-A OUTPUT -p icmp -m state --state NEW -j ACCEPT
-A INPUT -p icmp --icmp-type timestamp-request -j DROP
-A OUTPUT -p tcp -m tcp --sport 22 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
COMMIT
```

Here, we have added 30021 and 30022 ports.

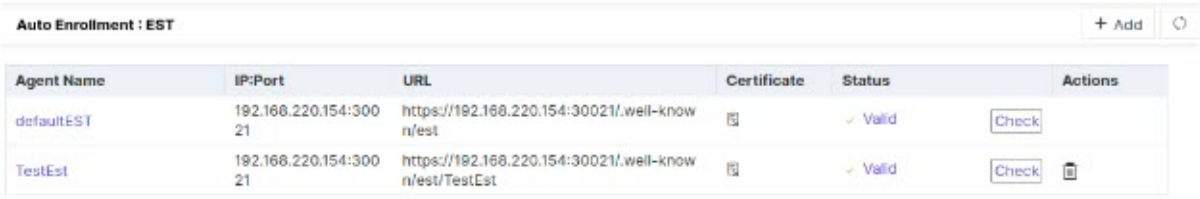
3. Save and apply the rules:

```
iptables-restore < /etc/iptables/rules.v4
```

Verifying EST Server

To validate the AppViewX configuration:

1. The agent configuration must be in **valid** status.



2. If the configuration is completed and agent status is valid, refresh the EST URL from the web browser. The expected response must be:

```
{"appStatusCode":"AVX_GW_021","message":"Client certificate authentication failed"}
```

As no client certificate is provided when entering this URL, there will be a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Supported Operations

The AppViewX EST agent supports these operations:

Supported Operation	Operation Path
Distribution of CA certificates	/cacerts
Enrollment of clients	/simpleenroll
Re-enrollment of clients	/simplereenroll

Actions using EST Server

You will be prompted with the question, *Do you want to bind a SSL certificate to gateway? (y/n)*:

a. To bind a certificate to the gateway, enter **y**.

b. You will then be asked for the *certificate path* and the *key path*. Provide the relative path of the files as indicated:

If the certificate and key file is copied into <cc_installation_folder>/deps/properties/ folder, then the path should be:

- *Please enter the certificate file path:* /properties/test.crt
- *Please enter the key file path:* /properties/test.key

c. If this step is not required, enter **n**.

Enrolling Server Certificate

If you do not have a client-authentication AppViewX CA certificate, you can use AppViewX CA.

Note: When the database flag CERT_AUTO_ENROLLMENT_ENABLE_REENROLL is enabled, AppViewX can detect previously enrolled certificates. If it finds certificates with the same Common Name (CN) from the same device, it will treat them as re-enrollment and preserve their history. Otherwise, it will proceed with the standard enrollment process. This ensures that certificate history is maintained, even after the EST client is reinstalled.

To use a client-authentication AppViewX CA certificate:

1. Log on to the AppViewX application with valid credentials.
2. Go to **(Menu)** > **CERT+** .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Select **Certificate Action > Enroll Certificate > Server**.
   The **Enroll Server Certificate** page appears.
4. In the **General Information** section of the **Enroll Server Certificate** page, select the desired **Assign Group** from the dropdown list. By default, the **Default** option is selected.
5. Enter the **CA Details**.

Field descriptions for the CA Details section

Fields	Description
***Certificate Authority**	From the dropdown list, select the CA.
***Renew Automatically**	**Note:** Changing the group inherited renew period overwrites the renewal period for this certificate. Select the toggle button to On or Off. • When the toggle is enabled, the Start Renewing option is enabled. • Enter the number of days to renew the certificate automatically.
***Regenerate Automatically**	Select the toggle button to On or Off. • When the toggle is enabled, the Start Regenerating option is enabled. • Enter the number of days to renew the certificate automatically.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request is submitted.
Certificate Profile	From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	This field is displayed when **Certificate Authority** = **IDnomic** and a CA+RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that is used for certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Connector Name**	Enter the friendly name for the CA connector. On saving this form, the name entered here is displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

</table>
</td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

6. For the certificate being enrolled, enter the **CSR Parameters**.

Field descriptions for the CSR Parameters

Field	Description
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note:** No special characters allowed except underscore (_) and hyphen (-).
Subject Alternative Name	Enter/From the dropdown list, select the Subject Alternative Name for the certificate being enrolled. You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Multiple values must be separated by a comma. • The cumulative count of SANs is displayed in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field is auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field is auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field is auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field is auto-filled and editable based on the configuration in the selected group's policy.
Country	Country name is one of the CSR parameters to be present in the certificate. This field is auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	Enter a valid email address of the person responsible for maintaining the certificate.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password from the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field is auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	The key type is used while creating a private and public key pair. This field is auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field is auto-filled and editable based on the configuration in the selected group's policy.
***: Mandatory fields	

7. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used only for reference.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
***: Mandatory fields	

8. In the **testAttributelabelTest** field of the **Certificate Attributes** section, enter the organization-specific values that need to be mentioned along with the CSR.
   These values are not part of the certificate but are available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

9. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow.
First name	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. First name (as a metadata) associated with the certificate to be enrolled.
Last name	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Last name (as a metadata) associated with the certificate to be enrolled.
Organization	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Organization name (as a metadata) associated with the certificate to be enrolled.
Comment	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Additional information (as a metadata) associated with the certificate to be enrolled.
UUID	This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled.

10. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters for their operational purposes.
    - By default, the **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section).
    - The **Certificate ID** can be modified by the user.
    - If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**.
    - If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.
11. Click **Add**.
    Once the details are added, you are redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
12. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
13. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
14. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
15. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

16. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
17. Click **Implement**.
    The **Implement** dialog box is displayed.
18. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
19. Click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CSR Submission to CA is in progress. Once the CSR submission is successful, the request state changes to **Submit** certificate - retrieval in progress state.

If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate is fetched in a few seconds.

If auto-approval disabled in the targeted CA, you have to be logged into the CA and approve the request.

Once the certificate is issued successfully, the certificate is retrieved into AppViewX.

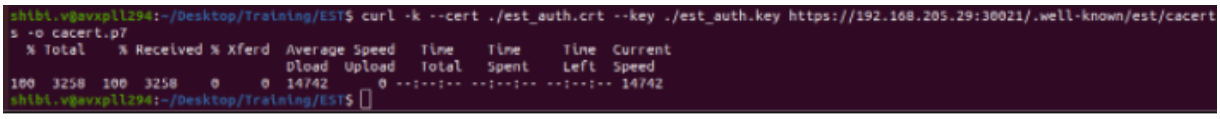
Testing EST Enrollment

To test the EST enrollment:

1. After successful verification, create a test folder in the Linux client machine.
2. Download the client authentication certificate (est_auth.crt) and the key (est_auth.key).

> **Note:** The common name of the client authentication certificate can be any value, but the file name of the client certificate to be used in EST client must be est_auth.crt and est_auth.key.

3. Trigger the GetCA certificates request using the curl command.
4. Make sure that the authentication certificate and the key are present in the same location: <curl -k --cert ./est_auth.crt --key ./est_auth.key<EST Endpoint URL from AppViewx GUI>/cacerts -o cacert.p7>.



You will get the <cacert.p7> file with the enrolled CA certificate in Step 9.

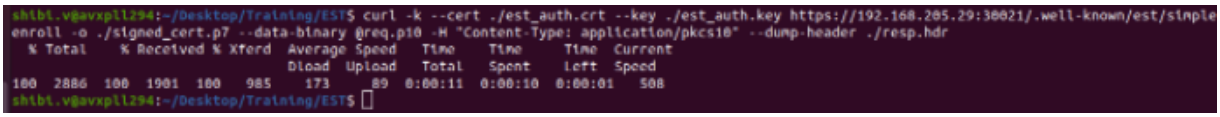
5. Convert the received CA certificate to pem:

```
openssl base64 -d -in cacert.p7 | openssl pkcs7 -inform DER -outform PEM -print_certs -out cacert.pem>
```

6. Trigger the enrollment request by using the curl command. Make sure that the authentication certificate, key, and CSR are present in the same location.

```
curl -kv --cert ./est_auth.crt --key ./est_auth.key <EST Endpoint URL from AppViewx GUI>/simpleenroll -o ./signed_cert.p7 --data-binary @req.p10 -H

"Content-Type: application/pkcs10" --dump-header ./resp.hdr
```



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Verify the content of <signed_cert.p7>.

8. Convert the enrolled p7 certificate into pem:

```
<openssl base64 -d -in signed_cert.p7 | openssl pkcs7 -inform DER -outform PEM -print_certs -out signed_cert.pem>
```

9. Make sure that you received the <cacert.p7> file with the enrolled CA certificate.

[Optional] Adding External CA Trust Certificate for EST Client Authentication

On-prem

1. By default, the AppViewX intermediate and the AppViewX root certificates are available in the location with filenames default_inter.crt and default_root.crt.
2. Run:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
[appviewx@pesrv07-arch-94-20 ~]$ kubectl describe secret client-cacerts-est -n external-system
Name:         client-cacerts-est
Namespace:    external-system
Labels:       <none>
Annotations:
Type:         Opaque

Data
====
default_inter.crt:  1505 bytes
default_root.crt:   1281 bytes
[appviewx@pesrv07-arch-94-20 ~]$
```

3. Download the required issuer certificates in .crt format and move them to the AppViewX installer node.
4. Open appviewx.conf file in appviewx_kubernetes/scripts folder.
5. Add the absolute path of the issuer certificates as key separated value in EST_TRUSTED_CA_CERTS.

```
# Comma seperated values of absolute paths of certs
EST_TRUSTED_CA_CERTS=/home/appviewx/certs/digicert_issuer.crt
```

6. Add these plugins in the ENABLED_PLUGINS list:
   ENABLED_PLUGINS=appviewx_dependencies,avx_platform_gateway_external,avx_platform_gateway
7. Run `./plugins_install.sh`

SaaS

EST Client Authentication in Cloud Connectors

This section describes the steps to replace the Default TLS Certificate with Signed Certificate and to add a CA issuer certificate for EST client authentication in CC (Cloud Connector).

By default, AppViewX provides a default certificate in the gateway. To enable TLS validation youvalidationFor ACME you must bind a valid certificate (Certificate with CC hostname) with the gateway.

[Optional for EST] To bind a TLS certificate to gateway:

- The certificate's common name must be the hostname of the CC.
- Download the certificate with .crt format and key file.

Note: By default, AppViewX cloud connector allows only the AppViewX CA issued certificates for client authentication. To add other CA issuer certificates for EST client authentication, download the required issuer certificates in .crt format.

To update the certificate:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Copy the certificate and the key file to <cc_installation_folder>/deps/properties/ directory.
2. Go to the cc_installation_folder and run:

```
./avxctl upgrade gateway-cert
```

3. You will be prompted with the question, *Do you want to bind a SSL certificate to gateway? (y/n)*:
   a. To bind a certificate to the gateway, enter **y**.
   b. You will then be asked for the *certificate path* and the *key path*. Provide the relative path of the files as indicated:

      If the certificate and key file is copied into <cc_installation_folder>/deps/properties/ folder, then the path should be:

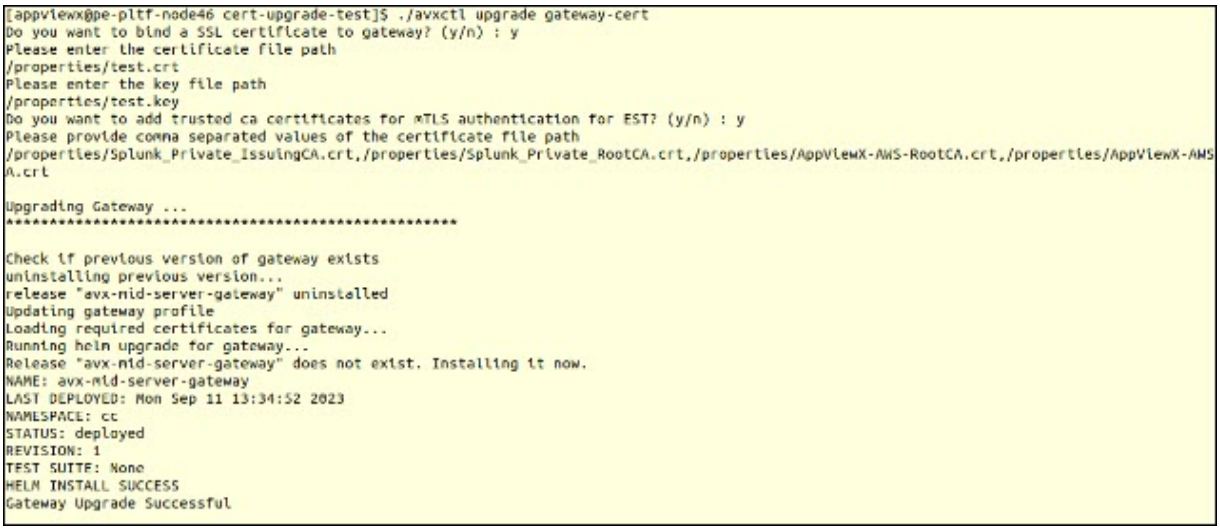
      • *Please enter the certificate file path:* /properties/test.crt
      • *Please enter the key file path:* /properties/test.key

   c. If this step is not required, enter **n**.
4. You will now be prompted with, *Do you want to add trusted CA certificates for mTLS authentication for EST? (y/n):*
   a. To give the issuer certificate list of the client certificate used in EST enter **y**.
   b. You will then be asked for the *certificate path*. You may give more than one certificate path using a comma (,).

      If the issuer certificates are copied to <cc_installation_folder>/deps/properties/ folder, then the path should be:

      Please provide comma separated values of the certificate file path: /properties/test.crt

   c. If this step is not required, enter **n**.
5. Wait for the script to complete and the gateway will be upgraded.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

[Optional] Changing SSL Certificate for EST-HTTPS Communication

Note: This section is applicable only for on-premise installation.

- By default, there is a self-signed certificate available in the location.
- Add the following plugins in the ENABLED_PLUGINS list:

ENABLED_PLUGINS=appviewx_dependencies,avx_platform_gateway_external,avx_platform_gateway

```
# Please specify the absolute paths of files for the labels below
# EST_SERVER_ACCESS_CERT=
# EST_SERVER_ACCESS_KEY=
# Comma seperated values of absolute paths of certs
#EST_TRUSTED_CA_CERTS=/home/appviewx/appviewx_kubernetes/scripts/digicert.crt
```

- Run `./plugins_install.sh`

```
[appviewx@pesrv07-arch-94-20 ~]$ kubectl describe secret server-tls-est -n external-system
Name:         server-tls-est
Namespace:    external-system
Labels:       <none>
Annotations:
Type:         kubernetes.io/tls

Data
====
tls.crt:  1046 bytes
tls.key:  1704 bytes
```

Best Practices

- **Certificate Group and CA Policy Setup:**
  - Create a dedicated certificate group and CA policy specifically for auto-enrollment in AppViewX.
  - While configuring the policy, ensure only the required key bit-length is selected (minimum: **2048-bit**).
- **Machine Enrollment Controls:** Define an expected domain pattern (e.g., *.appviewx.com) in the CA policy to restrict certificate issuance to authorized machine domains.
- **Security Recommendations:**
  - **TLS Authentication** is strongly recommended for all EST client communications with AppViewX.
  - Use only **private/internal CAs** as trusted issuers for client certificate authentication.
  - If client certificates from non-AppViewX CAs are used, ensure the **Intermediate and Root CA certificates** are properly bound to:
    - The AppViewX **external gateway** (for on-prem deployments)
    - The AppViewX **mid-server gateway** (in Cloud Connector for SaaS deployments)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Certificate Type Selection:** Choose the correct certificate category: **Server** category for server certificates only, and **Client** category for machine and user certificates
- **High Availability and Load Balancing:** When multiple external gateways (on-prem) or Cloud Connectors (SaaS) are in use, it is recommended to deploy a **Load Balancer with mTLS**. This ensures secure and reliable EST client authentication using the certificate and key-based requests.

Example of URLs

- For default: `<https://est.appviewx.com:<port_number>/.well-known/est>`
- For AppViewX enrollment: `<https://est.appviewx.com:<port_number/.well-known/est/appviewx/simpleenroll>`
- For AppViewX re-enrollment:

```
<https://est.appviewx.com:<port_number/.well-
known/est/appviewx/simplereenroll>
```

Configuring AppViewX EST Client

- EST Client v1.5.4

Prerequisites

- Configure EST server in AppViewX.
- Administrator access is required to run AppViewX EST client 1.5.0.
- Ensure that the firewall configuration permits communication from the EST client. (Port 30021 for both on-prem and SaaS setup.)
- If a load balancer is part of the network infrastructure for the endpoint to communicate with the EST agent, make sure the load balancer does not terminate the client authentication certificate. If it does terminate, then configure the EST authentication mode as **Certificate TLS with HTTP as a fallback** in the EST endpoint configuration in AppViewX.

System Requirements

Linux

Operating System: The supported operating system and their versions are mentioned as follows:

Operating System	Version
Red Hat	v8.6 and later
Ubuntu	v20.04 and later

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operating System	Version
CentOS	v7.9 and later
Debian	v11.0 and later
Mint	v18.2 and later
openSUSE	v15.0 and later

Mac

Operating System	Version
Sonoma	v14.0 and later
Ventura	v13.0 and later

Windows

Operating System: Windows v7.0 and later

Installing EST Client

This section provides instructions on how to install and configure the AppViewX EST client agent on Linux, Windows, and Mac machines. The installation and configuration process follow these steps:

1. Downloading and extracting the EST client on Linux and Mac machines and Windows machine.
2. Configuring the EST client.
3. Running Generator and Installer EST client on Linux and Mac machines and Windows machine.

On Linux and Mac

1. Log on to the AppViewX release portal.
2. Download:
   - **For Linux:** est-client-linux-1.X.0.zip
   - **For Mac:** est-client-mac-1.X.0.zip
3. Extract the above zip file to the desired file location.

   The extracted file contains two subfolders:
   - appviewx_est_client_installer
   - appviewx_est_client_installer_generator

   In the appviewx_est_client_installer folder are:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- input
  - **Linux:** contains appviewx_client, config.json, DATA
  - **Mac:** contains appviewx_client, appviewx_client.app, config.json
- • **Linux:** appviewx_est_client_installer
  - **Mac:** appviewx_est_client_installer.app
- current_crontab.txt (present only for Linux)
- README.md
- uninstall.sh

In the appviewx_est_client_installer_generator folder are:

- input (contains credentials, est_auth.crt, est_auth.key, secure_config.json)
- • **Linux:** appviewx_est_client_installer_generator
  - **Mac:** appviewx_est_client_installer_generator.app
- appviewx_est_client_installer_generator.app
- README.md

Configuring EST Client

1. Navigate to the following extracted folder:
   - **For Linux and Mac:** appviewx_est_client_installer_generator > input
   - **For Windows:** AppViewX_EST_Windows_Client > Generator > input
2. Replace the following files from the input folder with your authentication key and certificate with the same names. Ensure that the key file is not encrypted and the certificate file is in .crt format. (This certificate must be trusted by the EST server. The issuer certificate must be configured in the EST server setting under **Client Authentication > Issuer Certificate**):
   - est_auth.crt
   - est_auth.key
3. Open the credentials file in the Notepad editor and add the following details in two separate lines:

```
<username>

<password>
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- The username and password are the values that are configured in the agent setting under Client Authentication in the EST Agent Server Settings.
- This step is not required when the **Authentication Mode** is set to *Only Certificate TLS* in AppViewX EST agent setting.
- When the Fallback credentials under Client Authentication is set to *Logged on user credentials* on the server side, enter the AppViewX web username and password (used to login into the AppViewX web page/UI) in the credentials file. (This feature is only available from AppViewX server version Ganga - 2022.1.0 and later)

4. Open the secure_config.json file and edit the configuration file.
   The details of the parameters are as described:

   Structure of the secure_config.json file:

   - **General parameters**: Comprises the general configuration parameters such as allowed domain names and the option for silent uninstallation.
   - **EST server parameters**: In this section, you can provide the configuration details of EST server such as hostname, port number, and agent name (which represents the agent name in the server settings) specific to the certificate type.
   - **Certificate parameters**: For the mentioned certificate_type in the EST server parameters, you can provide certificate-specific details in this section. These details include CSR parameters, SAN details, and the configuration related to re-enrollment.

   For more details regarding the parameters, see the following tables:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Figure 3. Sample secure_config.json file

```
{
  "is_sso_required": false,
  "override_secure_config_certificate_section": false,
  "silent_uninstallation": true,
  "allow_manual_enrollment": true,
  "est_servers": [
    {
      "certificate_type": "machine",
      "host_name": "192.168.73.193",
      "port": 30021,
      "agent_name": "est"
    },
    {
      "certificate_type": "user",
      "host_name": "192.168.73.193",

Field descriptions for the General Section parameters

Parameter	Type	Mandatory	Description
silent_uninstallation	Boolean	No	This field is accessed by secure_config.json during the installation process. • By default, this value is *false*. You will be prompted to uninstall the previous client. • If the value is *true*, then you will be prompted to uninstall the previously installed versions.
allow_manual_enrollment	Boolean	No	• By default, this value is *true* allowing you to enroll and re-enroll the certificates using the commands. • If the value is *false*, then the certificates are allowed to enroll and re-enroll the certificates using the commands.

install_for_all_users	Boolean	No (applicable only for Windows)	Accessed by secure_config.json. This field is used to avoid multiple installations of AppViewX client in multiple places.
			• By default, this value is *false*, then
			  • no admin access is required and the client is installed in HKEY_LOCAL_MACHINE registry
			  • EST task schedulers are not created as this task creation requires admin privileges. This option is mainly used for non C:\ folder installation and manual EST auto commands.
			• If the value is *true*, then you must have admin privileges to install. AppViewX client is installed in the HKEY_CURRENT_USER registry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameter	Type	Mandatory	Description
			• If the client is reinstalled, the installed path is retrieved from the Windows registry based on this flag, and the client is uninstalled before being reinstalled.
override_user	Boolean	No	The Boolean value determines the certificate parameters to be considered during installation. • By default, this value is *false*. • If the value is *true*, then you can override the config.json's certificate parameters value over the secure_config.json's value. This is applicable only for the certificate section field values. Precedence table based on this field is as given below.

Precedence table for Certificate Section based on the *override_user* Flag

override_user flag	Values in secure_config.json	Values in config.json	Result - Values taken from
FALSE	Present	Absent	secure_config.json
	Absent	Present	config.json
	Absent	Absent	Do nothing
	Present	Present	secure_config.json
TRUE	Present	Absent	secure_config.json
	Absent	Present	config.json
	Absent	Absent	Do nothing
	Present	Present	config.json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EST Server section parameters

Parameter	Type	Mandatory	Description
certificate_type	String	Yes	This parameter is **case-insensitive**. It can have the following values: • auth • user • machine • others Duplicate values are not allowed.
host_name	String	Yes	A valid IP/FQDN provided in EST endpoint configuration. For SAAS, use Cloud Connector IP/FQDN as provided in the endpoint configuration.
port_number	Integer	Yes	Can have a value between 1 and 65535. Make sure it matches the port number specified in the EST endpoint configuration on the AppViewX GUI (Default port is 30021).
path_seg	String	Yes	This is the EST endpoint setting name from the AppViewX GUI. It must not include any spaces. If the agent name is not present in either the secure_config.json or config.json, the defaultEST agent name is used.

After configuring the **server** and the **general** parameters, the **certificate** section must be configured. The following image provides the example of the certificate section. The certificate section must be configured for the certificate_types mentioned in the EST server section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
{
  "certificate_id": 2,
  "certificate_type": "others",
  "common_name": "others.appviewx.com",
  "reenrollment_trigger_before_no_of_days_of_expiry": 365,
  "certificate_country": "AU",
  "certificate_province": "TN",
  "certificate_locality": "City",
  "certificate_organization": "Limited",
  "certificate_organization_unit": "IT",
  "certificate_email_address": "test@appviewx.com"
},
```

Field descriptions for the Certificate Section parameters

Parameter	Type	Mandatory	Description
certificate_type • **Linux and Mac:** appviewx_est_client_installer_generator • **Windows:** Generator	String	Yes	This parameter is **case-insensitive**. It can have the following values: • *auth*: Generates the common name based on the est_auth.crt auth file present in the input subfolder within the folder mentioned: • *user*: Generates Logged in Username as CN for the CSR. • *machine*: Generates logged in machine name as CN for the CSR. • *others*: Generates configured common_name as CN for the CSR and installs the certificate in the key_store.
certificate_id	Integer	Yes	Contains the certificate ID. Duplicate values are not allowed.
certificate_country	String	No	The country code must be in ISO standards (2-letter code).
certificate_province	String	No	The province name; it can be up to 128 characters.
certificate_locality	String	No	The locality name; it can be up to 128 characters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameter	Type	Mandatory	Description
certificate_organization	String	No	The organization name; it can be up to 64 characters.
certificate_organizationUnit	String	No	The organization unit; it can be up to 64 characters.
reenrollment_trigger_before_no_of_days_of_expiry	Integer	Yes	The number of days before re-enrollment can be triggered. The value can be up to 36500.
common_name	String	Yes (only for **others** certificate type)	Cannot have more than 64 characters.
allowed_san_domains	List [string]	No	This field can only be used in secure_config.json and will not be considered even if it is provided in config.json. Must contain proper domain names. For example, if the **allowed_san_domains** contain ["a.com","b.com","c.com"] and the **san_dns_names** contains ["test.a.com","test.b.com","test.c.com", "test.d.com"], then only the first three domain names from **san_dns_names** are considered and used. If **allowed_san_domains** parameter is absent in the file, then all the SAN restrictions are removed.
san_dns_names	List [string]	No	Cannot have more than 255 characters - Must be a proper FQDN
san_ip_addresses	List [string]	No	Must be valid IP addresses.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameter	Type	Mandatory	Description
store_name *[Applicable for Windows ONLY]*	String	No	If the certificate type is *others*, then the store name must be either *user* or *machine*.
certificate_email_address	String	No	Cannot have more than 255 characters - Must be a valid email address
custom_values	Custom values provided are framed during EST client run time to frame the field values that trigger the enrollment. They can be accessed by both config.json and secure_config.json. The custom values are defined below: Example to use custom_values is "custom_values":[{"field_name":"common_name", "base_value":"$MACHINE", "additional_value": ".appviewx.com", "operation":"prepend"}] Here the common will be changed to machinename.appviewx.com		
field_name	N/A	Yes	Common_name or san_rfc822 name to which the values must be added.
base_value	N/A	Yes	Value can be $MACHINE or $USER or any other value. • If value is $MACHINE, then the machine name is considered. • If value is $USER, then it will be the machine logged in user name.
additional_value	N/A	Yes	Any specific value.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameter	Type	Mandatory	Description
operation	N/A	Yes	Values can be *append* or *prepend*. • If the value is *append*, then the final value is fieldvalue = base_value + additional_value. • If the value is *prepend*, then the final value is fieldvalue = additional_value +base_value. If the field name is san_rfc822name, then the final value is added in CSR's SAN value.

Note: The above parameters are accessed by config.json and secure_config.json files unless specified.

Note:

- Having all types in the config.json file is not mandatory. You can retain only the necessary type and remove the rest. For example, if you want to enroll only User CERT, then you can delete *machine* and *other* types from the list.
- If there are any absent fields or parameters in the secure_config.json, they are disregarded and not enforced as mandatory. This is because you can set up the missing fields in the config.json file located in the installer folder.

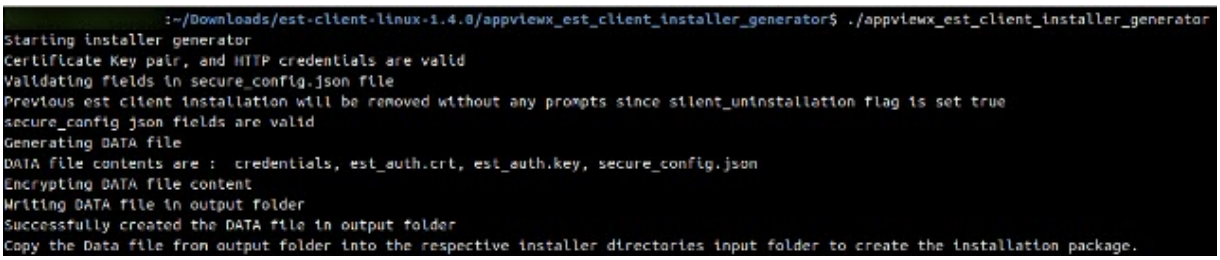
Running Generator and Installer on Linux

Running EST Installer Generator

1. Go to the appviewx_est_client_installer_generator folder.
2. Right-click and select **Open in terminal**.
3. Run:

```
./appviewx_est_client_installer_generator
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Troubleshooting: If the output has errors, correct the values or parameters in the secure_config.json file and re-run the command until it successfully creates the DATA file. The DATA file is created in the output subfolder within the appviewx_est_client_installer_generator folder.

4. To create the installation package, go to appviewx_est_client_installer_generator > output and copy the DATA file present there and paste it into the appviewx_est_client_installer > input folder.
5. In the same input folder, verify the config.json file.

Note: Repeat the steps for the secure_config.json file as mentioned in the Section Configuring EST Client . If you want to modify the values set by the admin in secure_config.json, you can do so in config.json provided the **override_user_flag** is set to *true*. (See Precedence table for Certificate Section based on the *override_user* Flag.)

The EST client folder (AppViewX_EST_Installer) can be distributed to the client machines for installing the AppViewX EST client. The admin only needs to generate the installer once, which can then be shared with other users. The DATA file within the AppViewX_EST_Installer folder contains all the configuration details from the generation of the AppViewX EST client installer.

Installing EST Client

This task must be completed on each machine where the EST client installation is required, while the generation of the installer is a one-time process carried out by the admin.

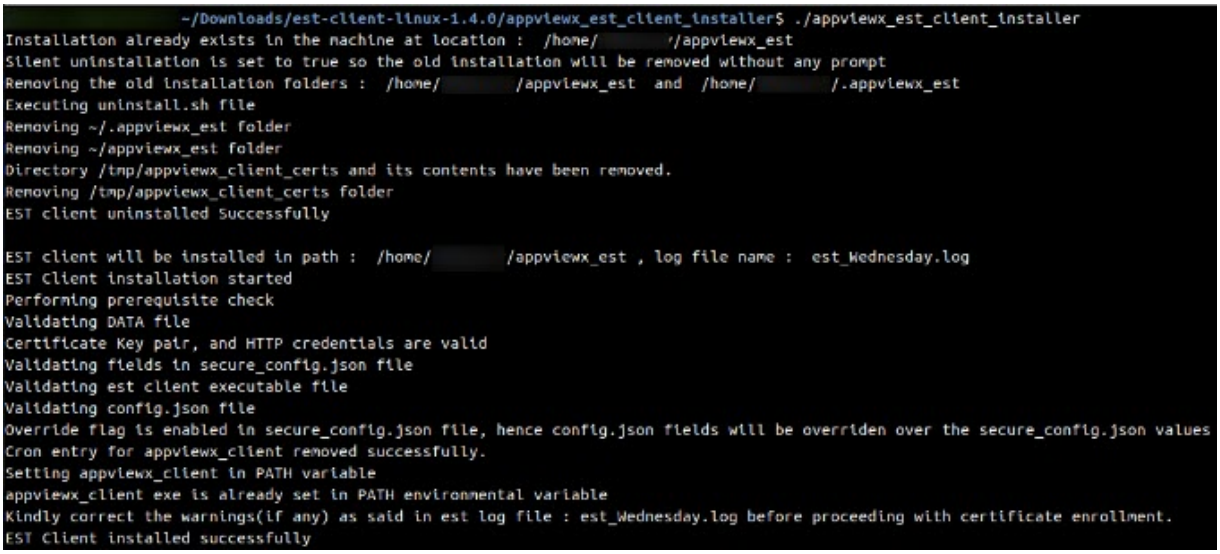
Only if the **override_user** flag is set to *true* when generating the EST agent can you modify the **certificate** section in the config.json file located within the appviewx_est_client_installer > input folder.

To install EST client:

1. Go to the appviewx_est_client_installer folder, right-click and select **Open in terminal**.
2. Run:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
./appviewx_est_client_installer
```



- If there are errors in the config.json file, then correct the errors and run the installer again. (The log files for the installation are saved in the appviewx_est_client_installer > appviewx_est_client_installer.log file.)
- During the installation process, all fields in the secure_config.json and config.json files are verified and compared according to the **override_user** flag outlined in the table below. If any mandatory fields are found to be missing or invalid, all errors are gathered and presented to you for correction before proceeding with enrollment and installation.
- If there is an existing client installation in the home folder and the **silent_uninstallation** flag is enabled, you will not receive a prompt for uninstallation. However, if the flag is disabled, you will be prompted to uninstall the previous installation.

  If you enter Y and continue, you will be asked to remove the old installation folders. If you confirm by entering Y, the old installation is deleted thus allowing the new installation to proceed; otherwise, the program will exit.

- The EST client is automatically installed in your Home folder. The following folders are created in the Home folder after installation is complete:
  - appviewx_est
  - .appviewx_est
- Certificates are stored in the keystore folder under /Home/<username>/.appviewx_est/key_store/key_store. This can only be found after fetching the required certificates from the server.
- If you accidentally deleted the appviewx_est and .appviewx_est home folders, then the installation is considered as a new installation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- You can run the appviewx_client command from any location on the machine as this executable is part of the environment PATH variable. To enable this functionality, make sure to reload the .bashrc file, which is required only during the initial installation. You can do this by running the source ~/.bashrc command or by closing and reopening the terminal.
- The most recent log file for the AppViewX EST client is named est_<CurrentDayName>.log (for example, est_Friday.log), while older files are stored based on their days. These logs are located within the appviewx_est directory in the Home folder.

3. To install with cron expression, run:

```
./appviewx_est_client_installer -cron "* * * * *"
```

- This command installs the EST client and sets up a crontab on the Linux/Mac machine using the specified cron expression. The Linux/Mac crontab daemon then automatically runs the appviewx_client est auto command at the designated time interval.
- The above cron expression is a sample command to trigger the EST auto after every minute.
- To verify the cron jobs, run:

```
crontab -l
```

The generated installation logs are captured in appviewx_est_client_installer.log located in the same folder where the installer file is located.

Verifying EST Client Installation

1. To list the commands to be run for verification, run:

```
appviewx_client -h
```

```
                    :~/Downloads$ appviewx_client -h
Log limit 100000 number of lines hasn't reached so updating in same log file
Usage:
  appviewx_client [command]

Available Commands:
  est                   est protocol based certificate enrollment and reenrollment
  help                  Help about any command
  keystore              keystore
  updateAuthCertificate Update the Authentication Certificate and key
  updateAuthCredentials Update the Authentication Credentials - username and password
  version               version

Flags:
  -h, --help   help for appviewx_client

Use "appviewx_client [command] --help" for more information about a command.
                    :~/Downloads$
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. For more information about a command, run:

```
appviewx_client --help
```

If the command does not work for any reason, then go to the ~/appviewx_est folder and run one from the following commands:

- To list the commands, run:

```
./appviewx_client -h
```

- For more information about a command, run:

```
./appviewx_client --help
```

Triggering Enrollment Request

1. Go to the Home/appviewx_est folder, right-click and select **Open in Terminal**.
2. Run:

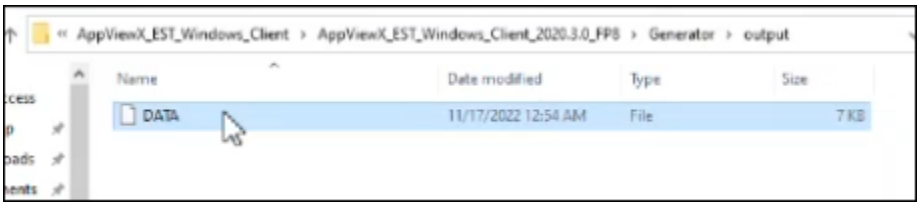
```
appviewx_client est auto
```

Running Generator and Installer on Windows

Running EST Installer Generator

1. Go to the AppViewX_EST_Windows_Client > Generator > input extracted folder.
2. Run appviewx_est_client_installer_generator.exe (right-click the file and select **Run as administrator**).
   A folder named output is generated in the same directory. If the output folder is not created, review the secure_config.json file for potential errors and repeat the step.
3. Go to the AppViewX_EST_Windows_Client > Generator > output folder.
   A file named DATA is created as a result of the execution of the above installer file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Copy this DATA file and place it in the AppViewX_EST_Installer > input folder.
5. In the same input folder, verify the config.json file.

> **Note:** Repeat the steps for the secure_config.json file as mentioned in the Configuring the EST Client section. If you want to modify the values set by the admin in secure_config.json, you can do so in config.json provided the **override_user** flag is set to *true*. See the Precedence table for Certificate Section based on the *override_user* Flag).

6. Go to the Scheduler folder (AppViewX_EST_Installer > Scheduler) and verify the files as shown:

It contains the following details:

- triggerJobSystem.ps1: PowerShell Script for creating machine enrollment schedule task. The default trigger is at User LogOn.
- triggerJobUsers.ps1: PowerShell Script for creating user enrollment schedule task. The default trigger is at User LogOn.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attention: By default, the triggers will be in LogOn. You can customize it by following the following steps to change this to trigger at a particular time daily:

a. Open the triggerJobSystem.ps1 that is responsible for scheduling the task for *auth* and *machine* certificate. Replace the following line that triggers a task by log-on (shown in the following image) to *$trigger = New-ScheduledTaskTrigger -Daily -At HH:MM.* This triggers the task everyday at the specified time HH:MM.

b. Make the similar changes in the triggerJobUsers.ps1 file. Ensure that both tasks are scheduled with sufficient time difference between them.

```
# if ($userPolicy -eq $null) {
#     $taskDescription = read-host -Prompt "Please enter a valid user policy ("users" or "system"): "
# }

$task = Get-ScheduledTask -TaskName $taskName -ErrorAction SilentlyContinue
if ($null -ne $task) {
    Unregister-ScheduledTask -TaskName $taskName -Confirm:$false
}
if ("null" -eq $arguments) {
    $action = New-ScheduledTaskAction -Execute $executablePath
}
else {
    $action = New-ScheduledTaskAction -Execute $executablePath -Argument $arguments
}
$trigger = New-ScheduledTaskTrigger -AtLogOn
$trigger.Delay = 'PT3M'
$settings = New-ScheduledTaskSettingsSet -Compatibility Win8 -AllowStartIfOnBatteries -DontStopIfGoingOnBatteries
$currentUser = [System.Security.Principal.WindowsIdentity]::GetCurrent().Name
# $userGroup = "users"
if ($userPolicy -eq "users") {
    $principal = New-ScheduledTaskPrincipal -GroupId "BUILTIN\Users"  -RunLevel Highest
}

#if ($userPolicy -eq "system") {
#    $principal = New-ScheduledTaskPrincipal -UserId $YSTEM  -RunLevel Highest
#}
if ($userPolicy -eq "system") {
    $principal = New-ScheduledTaskPrincipal -GroupID "SYSTEM" -RunLevel Highest
}

$definition = New-ScheduledTask -Action $action -Principal $principal -Trigger $trigger -Settings $settings -Description $taskDescription

Register-ScheduledTask -TaskName $taskName -InputObject $definition
```

The EST client folder (AppViewX_EST_Installer) can be distributed to the client machines for installing the AppViewX EST client. The admin only needs to generate the installer once, which can then be shared with other users. The DATA file within the AppViewX_EST_Installer folder contains all the configuration details from the generation of the AppViewX EST client installer.

Installing EST Client

This task must be completed on each machine where the EST client installation is required, while the generation of the installer is a one-time process carried out by the admin.

Only if the **override_user** flag is set to *true* when generating the EST agent can you modify the **certificate** section in the config.json file located within the appviewx_est_client_installer > input folder.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To install EST client:

   a. Open the AppViewX_EST_Installer folder and select the installer.bat file.

   b. Right-click and select **Run as administrator**.
   - It creates **Machine** and **User Enrollment** tasks in the Windows Task Scheduler.
   - It encrypts the software with machine-unique parameters and copies to C: drive.

2. After the installation:

   a. Create **Machine** and **User enrollment** tasks in the task scheduler.

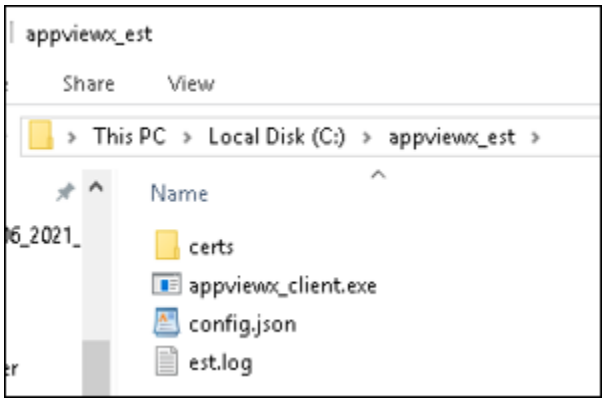
   b. Copy the files to the C: drive

   .

> **Note:** Check if appviewx_est and .appviewx_est have all the permissions to write, read, and modify. If not, provide the necessary permissions.

   c. Validate whether the config.json file is present in C:/appviewx_est/config.json.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

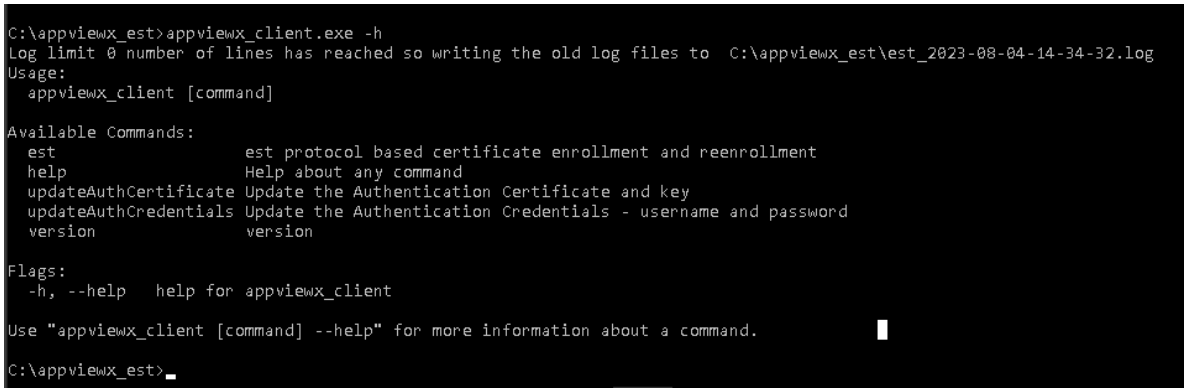


d. Open the command prompt with administrator privileges and navigate to C:/appviewx_est.

e. Run:

```
appviewx_client.exe -h
```

A list of commands is displayed to help users with different processes as shown:



3. **Note:** This agent can either be triggered automatically when you log in or can be triggered manually from the Task Scheduler.

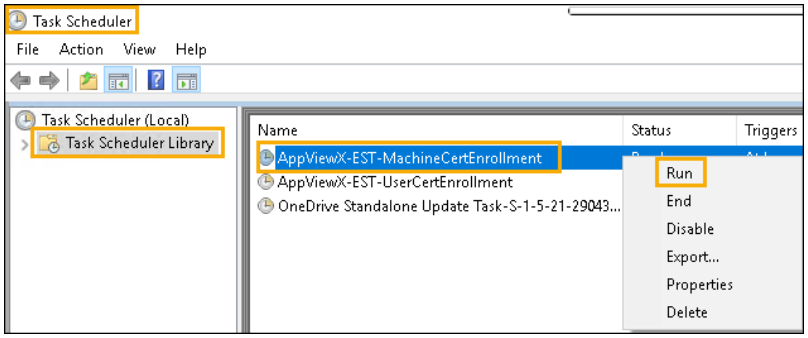
To trigger the enrollment task:

a. Open the task scheduler library, and select the AppViewX-EST-MachineCertEnrollment file. Once you log out of the system and log back in, the enrollment/re-enrollment is triggered automatically.

b. Right-click and select **Run** to run the tasks.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Only User scheduler works this way as Machine scheduler requires system user permission to run it. The certificates are installed in the store within 30 seconds.



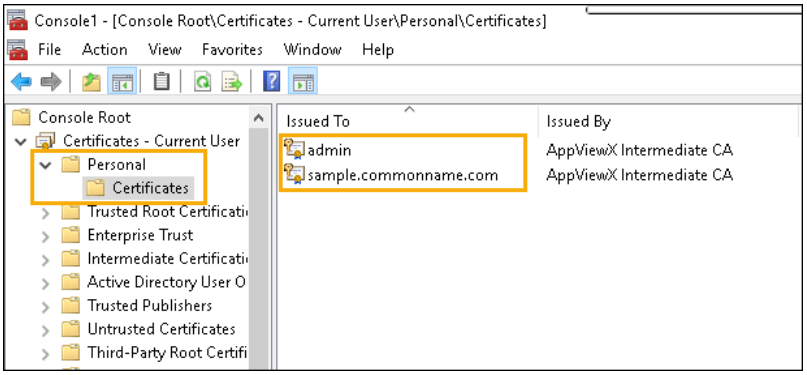
Enrollment request can be triggered by running the task from the task scheduler or can be triggered by the following steps:

1. Open the command prompt with administrator privileges, and go to C:/appviewx_est.
2. Run:

```
appviewx_client.exe est auto
```

The latest log file for the AppViewX EST client can be found in est_<CurrentDayName>.log (for example, est_Friday.log) while the old files are saved based on the day. These logs are found in the appviewx_est folder present in the C:/ drive.

The certificates are created based on the configurations provided. The **machine** type certificate can be found in the Machine certificate store whereas the **user** and the **others** type certificates are present in the User certificate store. The certificates are present in the sections as shown:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Actions using EST Client

Available Commands and their Descriptions

List of Available Commands and their Description

Available Command	Description
est	EST protocol based certificate enrollment and re-enrollment.
help	Help about any command.
keystore	Listing the certificates in the keystore.
updateAuthCertificate	Update the Authentication certificate and key. Example: `appviewx_client updateAuthCertificate --authCert “<certificate path>” --authKey “<keypath>”`
updateAuthCredentials	Update the Authentication Credentials - username and password. You are prompted to enter the username and the password.
version	Version details.

Auto-Enrollment and Re-Enrollment

- To perform auto-enrollment or re-enrollment, run:

```
appviewx_client est auto
```

  This enrolls certificates based on the secure_config and the config files.
- If certificates are already enrolled, then the validity of the certificates are checked against the **reenrollment_trigger_before_no_of_days_of_expiry** value present in the configuration files. If the certificate's expiry in number of days from today is less than **reenrollment_trigger_before_no_of_days_of_expiry** value, then re-enrollment will be triggered. Example: If the **reenrollment_trigger_before_no_of_days_of_expiry** value is 30 and if the certificate is going to expire in the next 20 days, then the re-enrollment will be triggered.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Manual Enrollment and Re-Enrollment

Note:

- Manual enrollment and re-enrollment are possible only if **allow_manual_enrollment** is set to *true* in the secure_config.json file.
- Before running the manual enrollment and re-enrollment commands, Linux and Mac users must navigate to appviewx_est in their home directory, while Windows users must navigate to appviewx_est in the C: drive.

- Manual enrollment and re-enrollment do not come under any certificate type mentioned in the configuration files.
- Manual enrollment is accessed through the following command:

Example 1:

```
appviewx_client est manual-enrollment csr-mode --csr-file <csr-file-complete-path> --est-server-url <est-server-url>
```

Example 2:

```
appviewx_client est manual-enrollment csr-mode --csr-file <csr-file-complete-path> --est-server-hostname <est-server-hostname> --est-server-pathseg
<est-server-pathsegment/agent name>
```

The description for every parameter is given in the following table:

Flags	Input Type	Description
--csr-file	string	Input CSR filename. For example: /home/user/test.csr
--est-server-hostname	string	EST server hostname
--est-server-pathseg	string	EST server name present in the EST server setting (default value: defaultEST)
--est-server-port	int	EST server port number configured in the EST server settings (default value: 30021)
--est-server-url	string	EST server URL present in the EST server setting page. (Not required if the hostname, port, and agent name are given.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Manual re-enrollment is triggered using two modes:
  - **csr-mode**

    Ensure that the certificate corresponding to the CSR sent is present in the inventory before triggering re-enrollment.

    Example 1:

    ```
    appviewx_client est manual-reenrollment csr-mode --csr-file <csr-file-complete-path> --est-server-url <est-server-url>
    ```

    Example 2:

    ```
    appviewx_client est manual-reenrollment csr-mode --csr-file <csr-file-complete-path> --est-server-hostname <est-server-hostname> --est-server-pathseg <est-server-pathsegment/agent name>
    ```

    Note: See the table in the manual-enrollment, for the description of these parameters.

  - **cert-mode**

    Similar to the manual re-enrollment using csr-mode, the certificates must be enrolled and must be present in the inventory before triggering re-enrollment.

    Example:

    ```
    appviewx_client est manual-reenrollment cert-mode --cert-file <cert-file-complete-path> --cert-file-type <cert-file/extension-type> --est-server-hostname <est-server-hostname> --est-server-pathseg <est-server-pathsegment/agent name> --output-privatekey-file <path-to-store-private-key> --key-size <Key-length>
    ```

    Descriptions for the flags/parameters for the manual cert-mode are as follows:

    Flags and their description

Flags	Input Type	Description
--cert-file	string	Input Certificate filename. For example: /home/user/test.crt
--cert-file-type	string	Input Certificate file types (cer, crt, pem, p7b)
--key-size	int	Key size of the generated private key. If not given, the key size is taken from the old certificate.
--output-privatekey-file	string	Output private key filename.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Flags	Input Type	Description
		Example: /home/user/output/hostname.key
--est-server-hostname	string	EST server hostname
--est-server-pathseg	string	EST server name present in the server setting (default value: defaultEST)
--est-server-port	int	EST server port number configured in the EST server settings(default value: 30021)
--est-server-url	string	EST server URL present in the EST server setting page. (Not required if hostname, port, and agent name are given)

Keystore

On Linux

- To view the list of certificates created, run:

```
appviewx_client keystore list
```

```
dhivya.v@avxpll771:~/Downloads/20230306-2022.1.0_5-Validations/toDevopsForRelease/AppViewX_EST_Linux_Client_20230306-2022.1.0_5/appviewx_est_client_installer$ appviewx_client keystore list
+-----------------------------------------------------------------------------------------------------------------------------------------------------------------+
|ID   |Common Name             |SerialNumber                                |Download Type  |Created Date                |Expiry Date                 |
+-----------------------------------------------------------------------------------------------------------------------------------------------------------------+
|0    |avxpll771.appviewx.com  |4E0F5A037572E2449160D9B9AD6E8F91             |p12            |Mon Mar 20 15:17:46 2023    |Tue Mar 19 23:59:59 2024    |
|1    |secure.appviewx.com     |1EF5F92BC76CFEDAC96EC24E7A8DF6C             |p12            |Mon Mar 20 15:17:59 2023    |Tue Mar 19 23:59:59 2024    |
+-----------------------------------------------------------------------------------------------------------------------------------------------------------------+
```

- To download the certificates based on **id** specified when using the `list` command above, run:

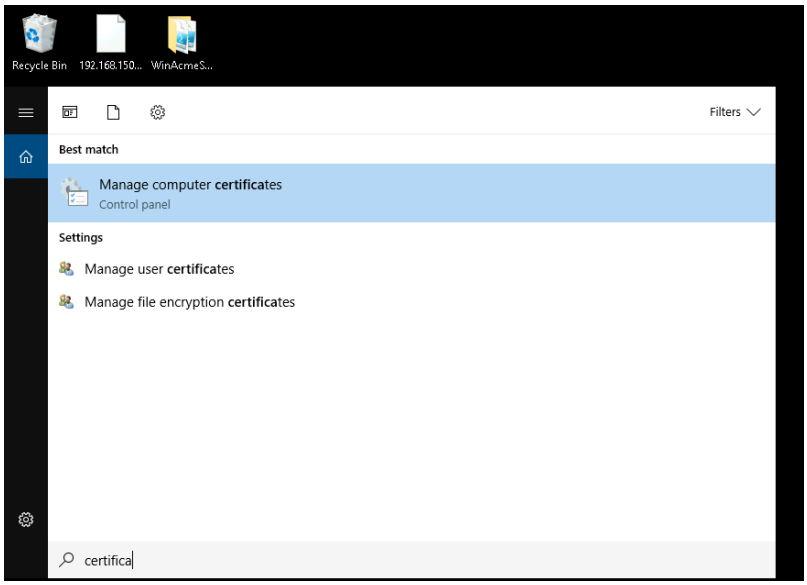
```
appviewx_client keystore download --id <id> --filepath <path to store the cert with file name and extension>
```

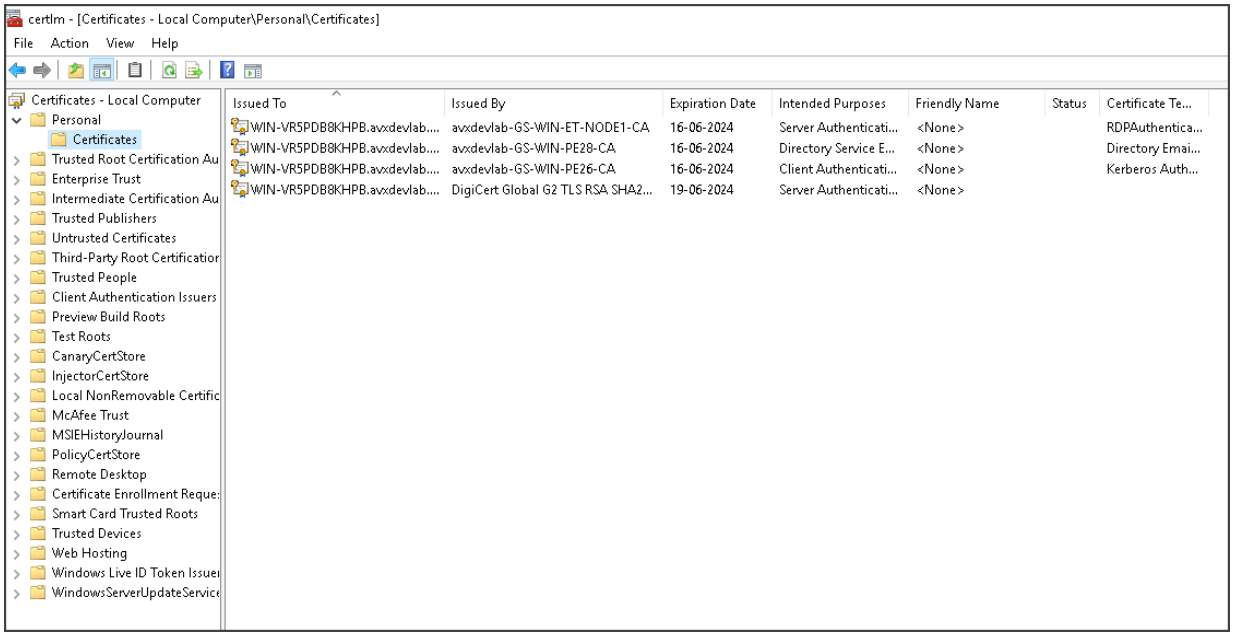
Note: To download PFX file, provide the password with --password field

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On Windows

- To access Machine Certificate Type, go to **Start > Manage Computer Certificates**.
- To access User and Others Certificate Type, go to **Start > Manage User Certificates**.
- To view the certificates, go to **Personal > Certificates**.





Uninstalling the EST Client

The uninstall.sh is present along with the other files you downloaded and extracted as mentioned in instructions for installing the EST client. Run the uninstall.sh script in the command prompt as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
ller$ ./uninstall.sh
Removing ~/.appviewx_est folder
Removing ~/appviewx_est folder
Removing /tmp/appviewx_client_certs folder
EST client uninstalled Successfully
```

The AppViewX EST client is successfully uninstalled.

Best Practices

- **Log Reference for Troubleshooting:** For any issues related to installation, enrollment, or re-enrollment, consult the **installer logs** or **EST client logs** for detailed diagnostic information.
- **Installer Behavior and Cleanup:** The installer places the AppViewX EST Client in the user's **home directory**. It is recommended to delete the installer from the machine after successful installation to maintain security hygiene.
- **Machine Binding and Security Restrictions:** The EST client is bound to the machine on which it is installed. Transferring or using EST client artifacts (e.g., .exe files) on other machines is not permitted due to strict security controls.
- **Windows-Specific Installation Steps:**
  - Always use **installer.bat** for Windows installations to ensure proper creation of Task Scheduler entries.
  - After installation, users must sign out and then sign back in. Upon re-login:
    - **User** and **Others** certificate type enrollment will begin immediately.
    - **Machine** and **Authentication** certificate type enrollment will occur after approximately 3 minutes.
  - This timing and behavior can be customized by:
    - Modifying the Task Scheduler settings post-installation, or
    - Editing the PowerShell (.ps) file before installation.
- **Certificate Store Behavior:** Reinstalling the EST client does not delete the existing certificates from the Windows certificate store or macOS keychain.
- **CSR Parameter Configuration:**
  - To define mandatory CSR fields, update the **secure_config.json** file located in the Installer Generator folder.
  - Use the provided sample **config.json** and **secure_config.json** files as templates. Remove any unused fields based on your requirements.
- **Configuration Best Practices:**
  - Always use the Fully Qualified Domain Name (FQDN) instead of the server IP address in both **config.json**and**secure_config.json**.
  - This ensures proper communication with the EST server during enrollment and re-enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Regenerating Data After Config Updates:**
  - Any change made to the **secure_config.json** file requires the DATA file to be regenerated.
  - The installation process must be re-executed following this update.

Troubleshooting

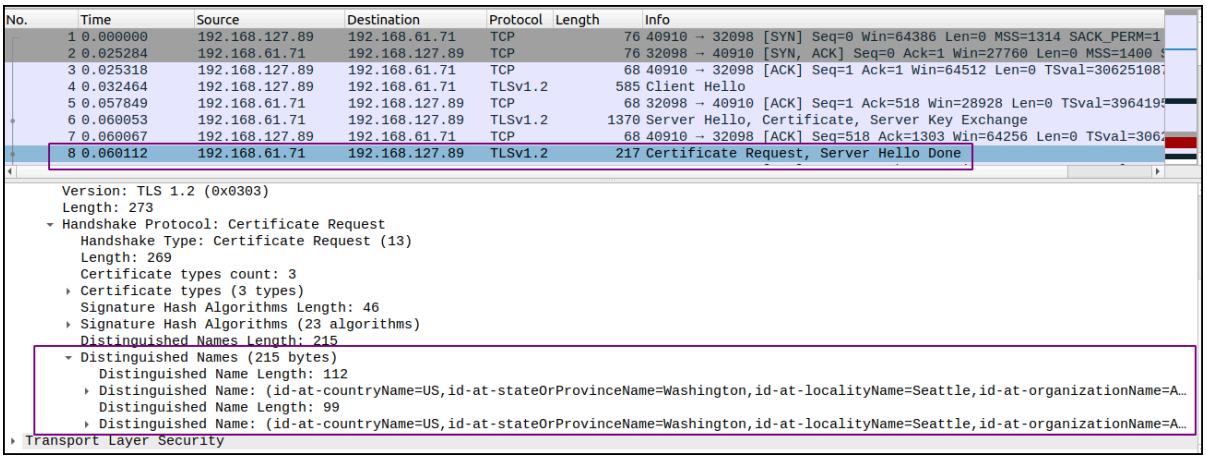
This section covers error scenarios and the troubleshooting steps only for Linux and Windows users.

Connection Errors

1. Check whether the IP address and the port number are correctly configured in the secure_config.json file located in the AppViewX_EST_Windows_Client > Generator > Input folder.
2. Verify if the firewall policies permit the connection between the EST client and the server.

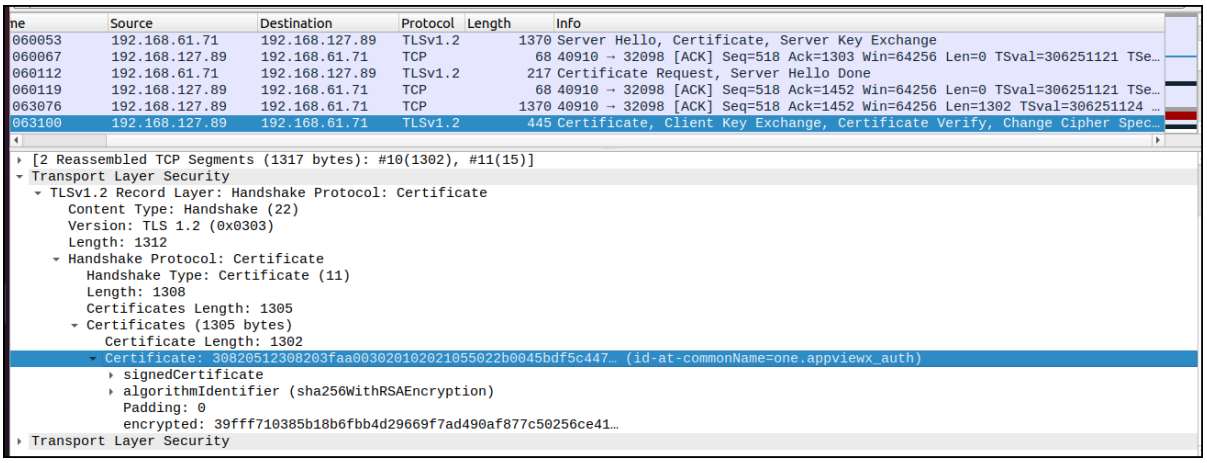
Error Code: 401 Unauthorized

1. Ensure the client sends the authentication certificate (try enrollment request from `curl` using the same client certificates).
2. Check the trusted CA added in the EST agent settings to validate whether the client authentication certificate is signed by the same CA.
3. If the client authentication certificate is signed by a CA other than AppViewX, make sure it is added in the trusted CA list from the CLI.
4. Do a TCP dump and analyze the TLS transactions between server and client to make sure the client receives the Distinguished Name of the Trusted CA.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. In the TCP dump, make sure the client sends the Authentication Certificate in the Certificate Response field.



500-Internal Server Error

1. Make sure EST service is running on the AppViewX server.
2. Check the EST server status. (Refer section: Verify EST Server Status (Enabled/Disabled).)
3. Check the EST enrollment using `curl`. (Refer section: Testing EST Enrollment by using **CURL**.)

Error Codes

Error Codes and their Descriptions

S. No.	Status Code	Error Codes	Error Messages	Description
1	500 - Internal Server Error	CERT-ENROLLMENT-001	Agent settings are not found (or) invalid for this agent	When there is no agent found for EST with the specified name.
2	500 - Internal Server Error	CERT-ENROLLMENT-002	Agent settings are not valid	When EST agent settings are invalid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Codes and their Descriptions (continued)

S. No.	Status Code	Error Codes	Error Messages	Description
3	401 - Unauthorized	CERT-ENROLLMENT-003	Authentication failed for the auto-enrollment protocol	TLS / Basic / Digest authentication failed for the provided authentication parameters.
4	401 - Unauthorized	CERT-ENROLLMENT-006	Provided NONCE is invalid	• When TLS and HTTP auth are selected but the input does not contain any Basic auth value. • When TLS and HTTP auth is selected but the input does not contain any Digest auth value. Here Nonce is sent in the WWW-Authenticate header as per RFC.
5	500 - Internal Server Error	CERT-ENROLLMENT-007	Failure while creating nonce	When creating Nonce to send to the client in case of Digest HTTP authentication.
6	500 - Internal Server Error	CERT-ENROLLMENT-008	Certificate conversion failed	While converting the certificate contents to PKCS7 format which is to be sent as a response to the client.
7	500 - Internal Server Error	CERT-ENROLLMENT-009	Error while converting to JSON	Error during map to JSON conversion.
8	401 - Unauthorized	CERT-ENROLLMENT-010	No client certificate was obtained to perform authentication.	When a client certificate is not found in the request to perform the TLS authentication.
9	500 - Internal Server Error	CERT-EST-001	Unable to get certificates requested by the client device	Could not obtain the certificates which were requested from the agent.
10	500 - Internal Server Error	CERT-EST-003	Certificate cannot be obtained after polling from the agent.	A certificate cannot be obtained even after retrying for the provided amount of time interval.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Codes and their Descriptions (continued)

S. No.	Status Code	Error Codes	Error Messages	Description
11	500 - Internal Server Error		CSR parameters already available for selected CA.	When there is a request already present in the certificate inventory and a similar CSR is obtained for enrollment/re-enrollment.
12	500 - Internal Server Error	CERT-ENROLLMENT-PROTOCOL-1020	Certificate enrollment failed for the provided CSR.	• Check for the request-id of the submitted CSR for further details. • Certificate or certificate creation requests may not be found to retrieve the certificate. • Exception while fetching work order mapping for the transaction ID.
13	404 - Not Found	CERT-ENROLLMENT-PROTOCOL-1019	Certificate enrollment request does not exist. Check the request sent from the AppViewX agent	The request from the EST agent is not found when received in subsystem certificate NB.
14	401 - Unauthorized	CERT-ENROLLMENT-PROTOCOL-1014	Authentication failed for the autoenrollment protocol.	When TLS authentication fails.
15	500 - Internal Server Error	CERT-ENROLLMENT-PROTOCOL-1005	Error while fetching policy settings for an agent	When obtaining group or policy details.
16	400 - Bad Request	CERT-SCEP-1011	Unable to extract CSR in the SCEP request	Occurs when the CSR extraction fails.
17	404 - Not Found	CERT-SCEP-1012	Policy is not associated with the given certificate group	When the certificate policy for the provided agent is not present.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Codes and their Descriptions (continued)

S. No.	Status Code	Error Codes	Error Messages	Description
18	404 - Not Found	CERT-SCEP-1013	Group policy does not have the given certificate authority	All the errors from 18 to 29 are to validate the CSR parameters against policy.
19	404 - Not Found	CERT-SCEP-1014	Group policy does not have the given hash function	-
20	404 - Not Found	CERT-SCEP-1015	Group policy does not have the given key type	-
21	404 - Not Found	CERT-SCEP-1016	Group policy does not have the given key length	
22	400 - Bad Request	CERT-SCEP-1017	Given common name must end with as per the common name defined in group policy	-
23	400 - Bad Request	CERT-SCEP-1018	Given common name can not be same as the common name defined in group policy	-
24	400 - Bad Request	CERT-SCEP-1019	Given organization must match with organization defined in group policy	-
25	400 - Bad Request	CERT-SCEP-1020	Given organization unit must match with organization unit defined in group policy	-
26	400 - Bad Request	CERT-SCEP-1021	Given locality must match with locality defined in group policy	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Codes and their Descriptions (continued)

S. No.	Status Code	Error Codes	Error Messages	Description
27	400 - Bad Request	CERT-SCEP-1022	Given state must match with the state defined in group policy	-
28	400 - Bad Request	CERT-SCEP-1023	Given country must match with country defined in group policy	-
29	404 - Not Found	CERT-SCEP-1024	Group policy does not have the given certificate type	-
30	400 - Bad Request	CERT-CSR-0002	Failed to parse CSR, validate the content.	CSR content is not proper while uploading it for submission
31	404 - Not Found	CERT-CA-0001	CA settings are not available.	CA setting selected in EST settings is not found.
32	404 - Not Found	CERT-KEY-0003	Certificate/private key retrieval failed.	DAO exception while fetching certificate.
33	417 - Expectation Failed	CERT-CSR-0005	Csr submission failed. ${ERROR_MSG}	Custom error message from CA.
34	500 - Internal Server Error		More than one data returned from collection while fetching SAN list from the DB for the given server name.	More than one entry of SAN is present for the same server name.
35	500 - Internal Server Error		Error while processing.	Hookname is not mapped with the EST agent setting. Run the DB query to add the hookname.

EST Client v1.5.4

The AppViewX EST Client automates the enrollment and renewal of SSL certificates for Linux, Windows, and macOS systems. After installation, the client automatically enrolls and renews certificates before

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

expiration according to a custom configuration. Certificates can be installed for a machine, a user, or for a certificate with a user-defined Common Name (CN).

AppViewX EST Client Installation and Usage

Once installed on any Linux or Windows machine, the EST Client allows users to enroll certificates based on the required type—machine, user, or other.

EST Client 1.5.4 Features

Using PowerShell Scripts in the AppViewX EST Client

- Custom PowerShell scripts can be added to the AppViewX_Installer/Resources folder before installing the EST Client. After installation, all files from this package are copied to the C:\appviewx_est folder.
- After certificate enrollment, the specified PowerShell scripts are automatically executed to bind the enrolled certificate to the service defined within each script.
- The `certificate_type` can be **machine**, **user**, or **others**. Based on the `certificate_type`, the corresponding enrolled certificate is used to bind to the appropriate Remote Desktop (RD) service.
- Multiple scripts can be configured to run for a single certificate type.
- To enable post-enrollment script execution, add a **post_certificate_creation** section to the **config.json** file located in C:\appviewx_est. This ensures the designated PowerShell scripts run immediately after certificate creation.

```
"post_certificate_creation": [
{
"certificate_type": "machine",
"script_path": "C:\\appviewx_est\\RDSCertBindWithRestart.ps1",
"script_type": "powershell"
},
{
"certificate_type": "machine",
"script_path": "C:\\appviewx_est\\UploadCAChain.ps1",
"script_type": "powershell"
}
]
```

- The following powershell scripts have been validated from AppViewX:
  - Certificate binding to RD Services
  - Uploading enrolled certificate’ intermediate and root to the client machine's trust store.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enhanced Security

All EST Client executables, Scheduler creation PowerShell scripts, and DLLs are now code-signed.

Improved Windows EST Client Functionality

- **Automated Machine Scheduler:** The Machine scheduler in the EST Windows Client now triggers automatically one minute after installation and subsequently every 12 hours, without requiring a machine logout or login. Refer the script triggerJobSystem.ps1.
- **Windows 11 24H2 Compatibility:** Issues related to deprecated WMIC commands in Windows 11 24H2 have been resolved by removing all instances where these commands were used.
- **Certificate Re-enrollment Logic:** If an enrolled certificate is removed from the Windows Keystore, the EST Client will now enroll the certificate during its next execution.

Validated Windows Versions

The EST Windows Client has been validated on the following Windows versions:

- Windows 10
- Windows 11 23H2
- Windows 11 24H2
- Windows Server 2019 and 2022

Note: The EST Windows Client is now supported on Azure VMs. However, it is not supported on Windows 7 and Windows 8 machines, as these have reached their End of Life (EOL).

Powershell Scripts validated in EST Client 1.5.4:

triggerJobSystem.ps1

Note: The machine scheduler which is triggered automatically once EST Client installation is complete and is triggered regularly every 12 hours.

```

# Import Intermediate Certificate
Write-Output "Importing Intermediate certificate: $IntermediateCertPath"
Import-Certificate -FilePath $IntermediateCertPath -CertStoreLocation Cert:\LocalMachine\CA | Out-Null

Write-Output "Certificates imported successfully."
```

EST Micro CA (Standalone Server)

- Configuring EST Micro CA (Standalone Server)
- Configuring Azure IoT Hub in AppViewX

Overview

Micro CA is a standalone, lightweight Certificate Authority (CA) solution purpose-built for environments where traditional enterprise-grade CAs may be too heavy, complex, or resource-intensive. It is particularly

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

suited for IoT devices, edge computing deployments, and distributed systems that require secure communication and identity verification but operate under resource or connectivity constraints.

Key Features

- **EST Protocol:** Operates entirely on the Enrollment over Secure Transport (EST) protocol for seamless certificate issuance and renewal.
- **Intermediate CA:** Functions as an intermediate CA, deriving its trust from a central Root CA via the AppViewX PKI-as-a-Service (PKIaaS) platform.
- **Offline Capability:** Ability to issue certificates entirely offline.
- **Visibility & Traceability:** Provides comprehensive visibility and traceability of all issued certificates, ensuring compliance and audit readiness.

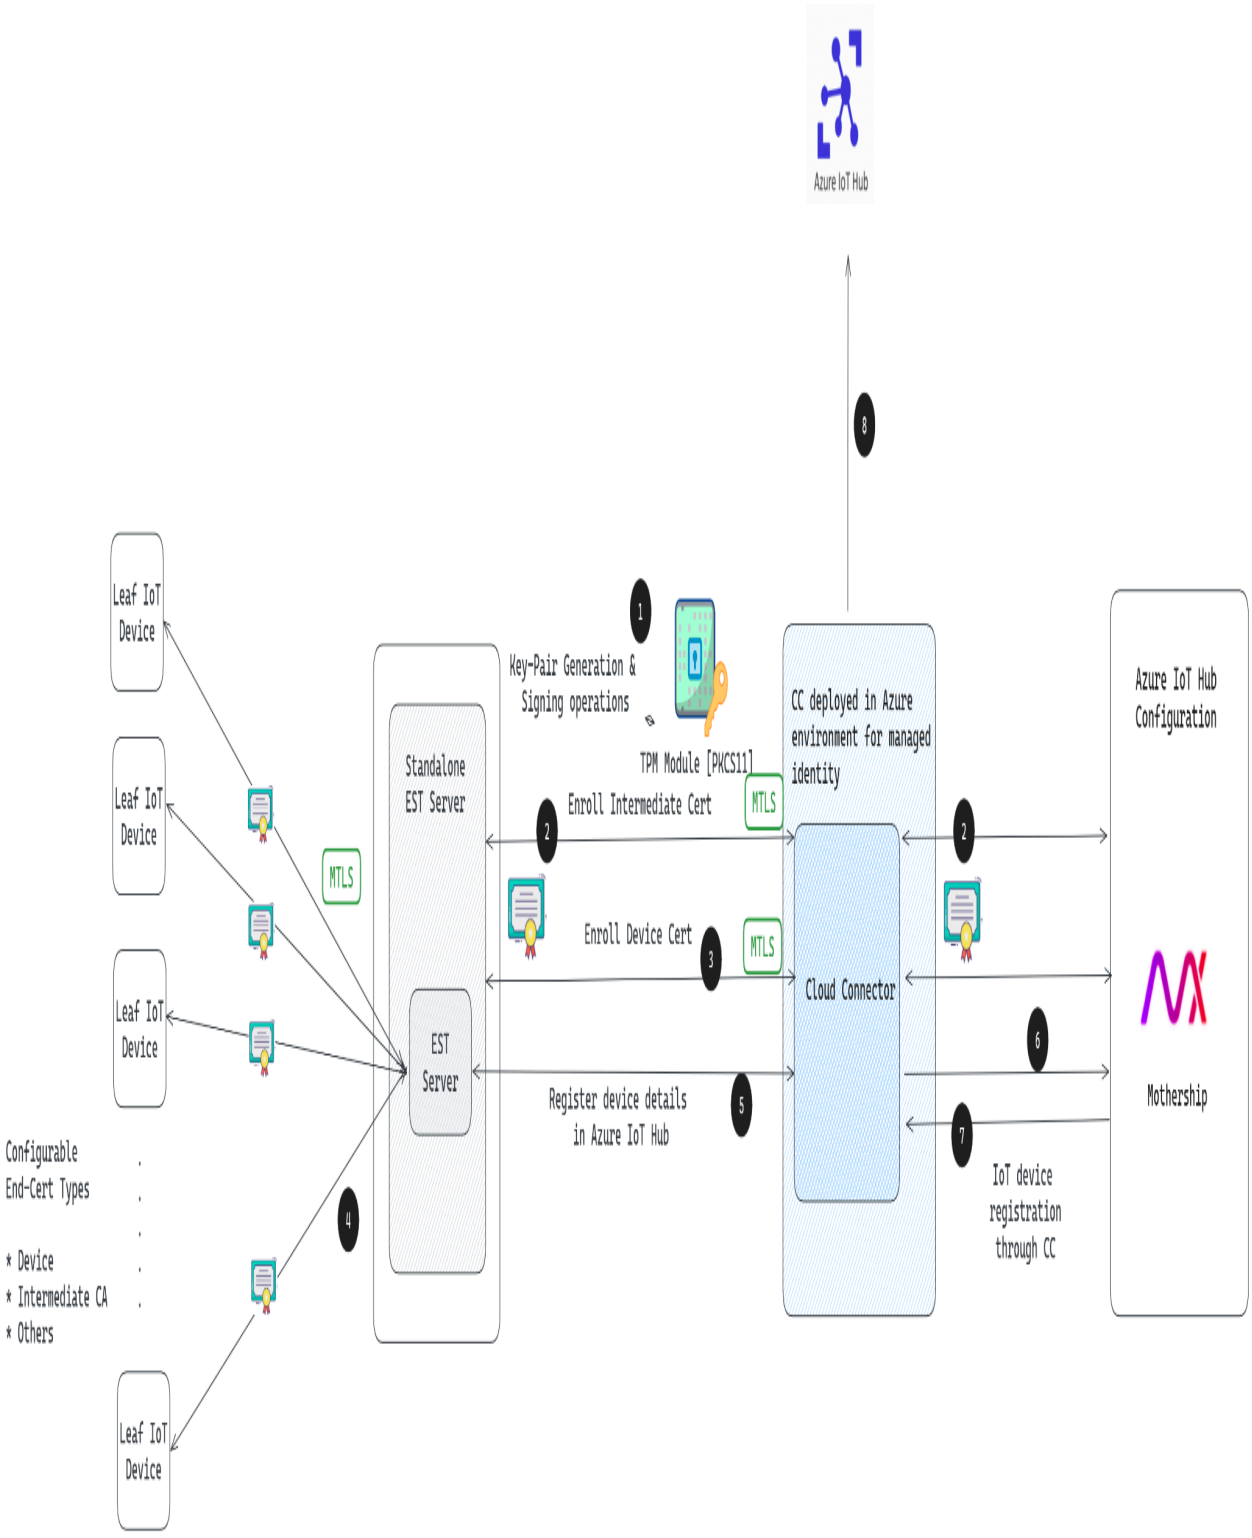
Need for Micro CA

Micro CA is designed for optimal performance in environments with limited resources, offering robust and secure certificate management.

- **Optimized for Constrained Environments:** Operates reliably on systems with 2GB RAM and 32GB storage, with a software footprint under 200MB.
- **Secure Key Management:** Utilizes PKCS#11 for secure key generation and signing through TPM (Trusted Platform Module) or HSM.
- **Offline & Remote Ready:** Supports manual intermediate CA and full certificate issuance, even in offline mode.
- **Azure IoT Integration:** Automatically updates certificate thumbprints and metadata in Azure IoT Hub.
- **Lightweight EST Client:** Features a custom Go-based client that provides full EST functionality with minimal resource consumption.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Micro CA Architecture



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Architecture key points explained

Key Points	Description
1	The EST Standalone server generates a key pair using the TPM module and initiates a certificate enrollment request to the AppViewX EST Server via the EST protocol, utilizing mTLS authentication. The Certificate Signing Request (CSR) is generated based on configurable parameters from the configuration file.
2	AppViewX processes this request and issues an Intermediate CA certificate, leveraging a Sub-CA template configured in the PKIaaS Native CA. Upon reception, the EST Standalone server uses this Intermediate CA certificate to sign CSRs and locally issue certificates for devices or subordinate CAs.
3	Similarly, device certificate CSRs are generated and issued via AppViewX PKIaaS with a template for unlimited validity (31/12/9999) and stored on the device for various device-related use cases.
4	The EST Standalone Server supports three configurable endpoints, each of which can be exposed on a customizable port. Key certificate attributes such as `Extended Key Usage`, `Key Usage`, `Path Length Constraint`, `isCA` flag, and `Azure IoT Hub` settings are defined through two configuration files. When an IoT device initiates a certificate request to the EST Standalone Server (Micro CA), it is authenticated via mTLS. The EST Standalone Server then signs the CSR using its Intermediate CA and issues the device certificate.
5—8	After issuance, the certificate thumbprint and relevant metadata are calculated and forwarded to the Cloud Connector (CC). The CC, using Managed Identity authentication, updates the Azure IoT Hub. The Micro CA also offers the option to directly update Azure IoT without routing through AppViewX.

Configuring EST Micro CA (Standalone Server)

Prerequisites for EST server

- **AppViewX**
  - AppViewX PKIaaS CA configured in AppViewX, with the capability to issue a Sub-CA certificate.
  - Service account configured.
- **Linux end machine with Sudo access.**
  - Connection to AppViewX CC to issue the intermediate certificate and update the Azure IoT Hub.
- Azure credentials and access to the Azure portal from the end machine, if Azure IoT hub needs to be updated directly from the end machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

EST Server Setup and Execution

1. **Configure the API and Server Settings:** Modify the APIconfig and config.json files according to the required configuration. Example settings are provided below.
2. **Start the Server:**

   a. Run the EST server using the following command:

   ```
   sudo ./ESTSERVER
   ```

   b. Print and debug the log files which are stored in the same folder

   To print logs in the terminal:

   ```
   --logToTerminal
   ```

   To add debug logs:

   ```
   --debugMode
   ```

3. **Access the Exposed APIs:**
   - The API endpoints are available based on the `end_certificate` configurations in the **config.json** file.
   - For example, if the `end_point_name` is configured as ***device***, the EST URL will be:

     *https://<hostname>:<port-number>/.well-known/est/**device**/simpleenroll*

   - Each endpoint name exposes a different URL, which lets the user obtain certificates based on its specific configuration.

Once configured, the server listens and issues certificates using the intermediate certificate. The issued certificates are stored in the folder named IssuedCerts within the same server directory.

APIconfig File Configuration

Sample Configuration:

```
{
  "appviewx_hostname": "<AppViewX/CC Hostname>",
  "appviewx_port_number": <HTTPS Port Number - Appviewx/CC>,
  "ca_setting_name": "<AppViewX PKIaaS CA settings name>",
  "template_name": "<AppViewX PKIaaS sub ca template name>",
  "issuer_name": "<AppViewX PKIaaS issuer name>",
  "ca_name": "AppViewX PKIaaS Native",
  "intermediate_cert_validity_in_days": <Intermediate certificate validity>,
  "appviewx_group_name": "<Appviewx group to issue the certificate>",
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  "service_account_client_id": "<Appviewx service account id>",
  "service_account_client_secret": "<Appviewx service account secret>",
  "azure_hub_url": "<Azure IoT hub url>",
  "azure_hub_key": "<Azure IoT hub key>",
  "azure_hub_policy_name": "<Azure IoT hub Policy Name>",
  "azure_token_validity": <Token validity in seconds>,
  "poll_count": <Poll Count>,
  "poll_interval":  <Poll Interval in seconds>,
  "update_azure_iot_hub_from_standalone_server":  <true/false>
}
```

Field Description for the APIconfig File

Field	Description
appviewx_hostname	Hostname or IP address of the AppViewX API endpoint (If using a CC then use the CC's hostname).
appviewx_port_number	Port number where the AppViewX service is running (If using a CC then use the CC's port number—30020).
ca_setting_name	Name of the CA settings configured under CA Configurations in CERT+.
template_name	Name of the AppViewX PKIaaS Sub-CA template to issue intermediate CA certificates.
issuer_name	Name of the AppViewX PKIaaS issuer.
appviewx_group_name	Certificate Group in AppViewX that is used for issuing intermediate CA certificates.
service_account_client_id	Client ID for authentication to AppViewX using a service account.
service_account_client_secret	Client secret for authenticating the service account in AppViewX.
azure_hub_url	URL of the Azure IoT Hub for communication with devices. Ensure to replace the device number with %s before entering the `azurehuburl`.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for the APIconfig File (continued)

Field	Description
	Sample Input URL - "*https://AzureIotHubTrialSample.azure-devices.net/devices/**%s**?api-version=2021-04-12*"
azure_hub_key	Primary or secondary key of the Azure IoT Hub policy.
azure_hub_policy_name	Name of the policy in Azure IoT Hub (e.g., `iothubowner`).
azure_token_validity	Time duration (in seconds) during which the SAS token remains valid.
certFolder	Path to the folder where issued certificates are stored —**IssuedCerts** folder
backupFolder	Path to the folder where backup certificates are stored.
poll_count	Number of times the standalone server polls the Azure IoT hub's update status, when updating through AppViewX. **Default value**: 5
poll_interval	Time interval (in seconds) between each poll attempt made by the standalone server. **Default value**: 5
update_azure_iot_hub_from_standalone_server	Boolean flag to control whether the Azure IoT Hub update is triggered directly from the standalone server. If set to **false**, the update is handled by AppViewX.
Note: To ensure AppViewX manages the Azure update process correctly, see Configuration for Azure IoT hub in AppviewX.

Field Description for Intermediate and Device Certificate Configuration

Field	Description
Intermediate certificate configuration - intermediate_cert_config	
common_name	Common Name (CN) of the Intermediate Certificate.
country	Country associated with the Intermediate Certificate (typically a 2-letter ISO code).
province	Province or state associated with the Intermediate Certificate.
locality	Locality or city associated with the Intermediate Certificate.
organization	Organization name associated with the Intermediate Certificate.
organizational_unit	Organization unit associated with the Intermediate Certificate.
mtls_auth_cert_path	MTLS certificate used for authentication of the Intermediate Certificate issuance. **Note: Intermediate** certificate template must be chosen in the AppViewX EST agent setting.
mtls_auth_key_path	MTLS key used for authentication of the Intermediate Certificate issuance.
est_url	EST Agent URL from AppViewX agent setting for Intermediate Certificate issuance.
use_est	A boolean value (true or false) indicating whether to enroll intermediate certificates using EST protocol or using create certificate API.
Device certificate configuration- device_cert_config	
is_device_cert_required	A boolean value (true or false) to determine if control the configuration of device certificate should be enrolled.
common_name	Common Name (CN) of the Device Certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Intermediate and Device Certificate Configuration (continued)

Field	Description
country	Country associated with the Device Certificate (typically a 2-letter ISO code).
province	Province or state associated with the Device Certificate.
locality	Locality or city associated with the Device Certificate.
organization	Organization name associated with the Device Certificate.
organizational_unit	Organization unit associated with the Device Certificate.
mtls_auth_cert_path	MTLS certificate used for authentication of the Device Certificate issuance.
mtls_auth_key_path	MTLS key used for authentication of the Device Certificate issuance.
est_url	EST Agent URL from AppViewX agent setting for Device Certificate issuance.
new_intermediate_cert: A boolean value (true or false) indicating whether to create a new Intermediate Certificate using AppViewX PKIaas CA.	

Field Description for EST Server Configuration Fields

Field	Description
mtls_ca_cert	Specifies the path to the CA certificate of the client certificate's issuer or root CA, required for establishing a Mutual TLS (mTLS) connection. This may be a single CA certificate or a bundle of intermediate and root certificates associated with the EST client certificate, used to validate the mTLS connection.
mtls_server_cert	Path to the server certificate for spinning up the server in an mTLS environment (**.crt**).
mtls_server_key	Path to the server certificate key for spinning up the server in an mTLS environment (**.key**).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for EST Server Configuration Fields (continued)

Field	Description
pkcs11_library	Path to the PKCS#11 shared library (**.so** file) used for Hardware Security Module (HSM) or Trusted Platform Module (TPM) integration.
pkcs11_library_pin	PIN used to authenticate to the PKCS#11 library (HSM/ TPM).
port	Port number on which the EST (Enrollment over Secure Transport) client listens.
intermediate_private_key_label_in_pkcs11	Label of the private key stored inside the PKCS#11 module (HSM/TPM).
intermediate_cert_path	Path where the intermediate certificate is stored which can be used to issue certificate without fetching a new certificate from AppViewX. **Note:** Pass the `private_key_label` and set the `new_intermediate_cert` field as **false** before proceeding with this option.
Attention: Each **end_certificate_config** block defines the parameters for generating an end certificate, including validity, key usage, and extended key usage (EKU).	

Field Description for Endpoint Configuration

Field	Description
end_point_name	Name of the endpoint receiving the certificate.
validity_in_days	Number of days the certificate will remain valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Endpoint Configuration (continued)

Field	Description
extended_key_usage_list	A list of OID strings representing extended key usages (EKU), such as • `1.3.6.1.5.5.7.3.1` for TLS Web Server Authentication. • `1.3.6.1.5.5.7.3.2` for TLS Web Client Authentication.
key_usage	Boolean flags to specify the certificate's key usages (set true or false for each if required): • **digital_signature**: Allows the certificate to verify digital signatures. • **non_repudiation**: Ensures proof of origin and prevents denial of actions • **key_encipherment**: Enables encryption of keys. • **data_encipherment**: Enables direct encryption of user data. • **key_agreement**: Supports key exchange protocols • **key_cert_sign**: Allows the certificate to sign other certificates. • **crl_sign**: Allows the certificate to sign Certificate Revocation Lists (CRL) • **encipher_only**: Restricts key agreement usage to encryption only. • **decipher_only**: Restricts key agreement usage to decryption only.
is_device_cert	If the value is set to **true** then the device is registered in Azure IoT Hub. Default value is **false**.
is_unlimited_validity	If the flag is set to **true**, the validity is fixed at 31/12/9999, regardless of the `validity_in_days` value. Default value is **false**.
is_ca	If flag is set to **true**, the certificate acts as a Certificate Authority (CA) and the Basic Constraint is set as true.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Endpoint Configuration (continued)

Field	Description
	Default value is **false**.
path_length_constraint	If a value is set, it defines the maximum number of subordinate CAs allowed under this CA. Default value is **Nil** (i.e. unlimited).
encryption_key_file_path	(*Optional*) This parameter specifies the location where a randomly generated encryption key is to be stored. This key is created during the EST server's initial run and is essential for encrypting sensitive information such as the Azure API Key, service account secret, and the PKCS11 pin. The same key is used for both, encryption and decryption operations. **Note:** If this encryption key is deleted, decryption of the previously encrypted data is not possible. Therefore, it is crucial to store this key in a secure location.

Configuring Azure IoT Hub in AppViewX

Creating a Service Account

Service account is required for API authentication with AppViewX.

1. Log in to the AppViewX with valid credentials.
2. Got to (**Menu**) > **Platform** > **IDENTITY** > **Service Account**.
3. Add a new account, by providing the necessary details.
4. Assign the user group to Admin.

Uploading and Enabling the Workflow

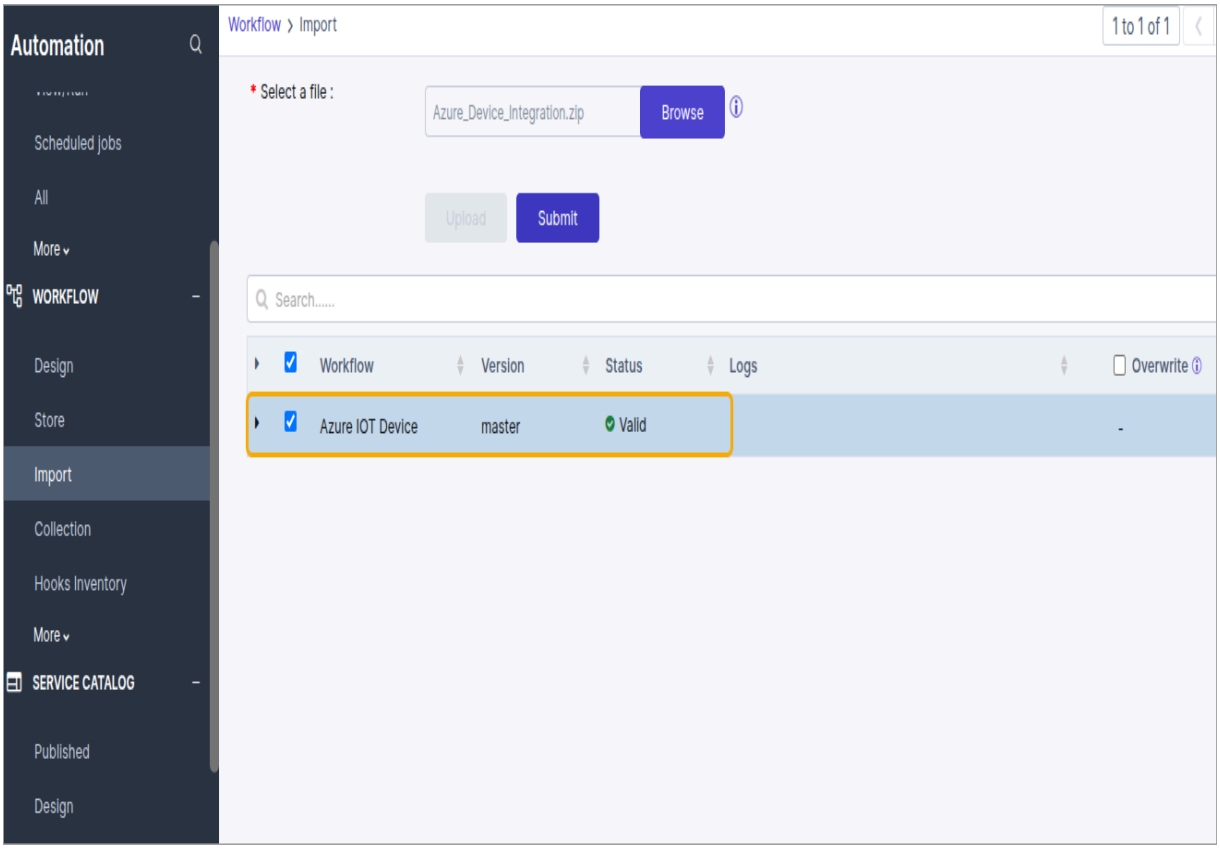
Prerequisites: Download and extract the **EST_STANDALONE_SERVER** file. The extracted file contains the following:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Folders—***Est server*** and ***workflow***
- PDF—***Config Guide***
- text file—***readme***

AppViewX features a workflow that enables registration to the Azure IoT Hub.

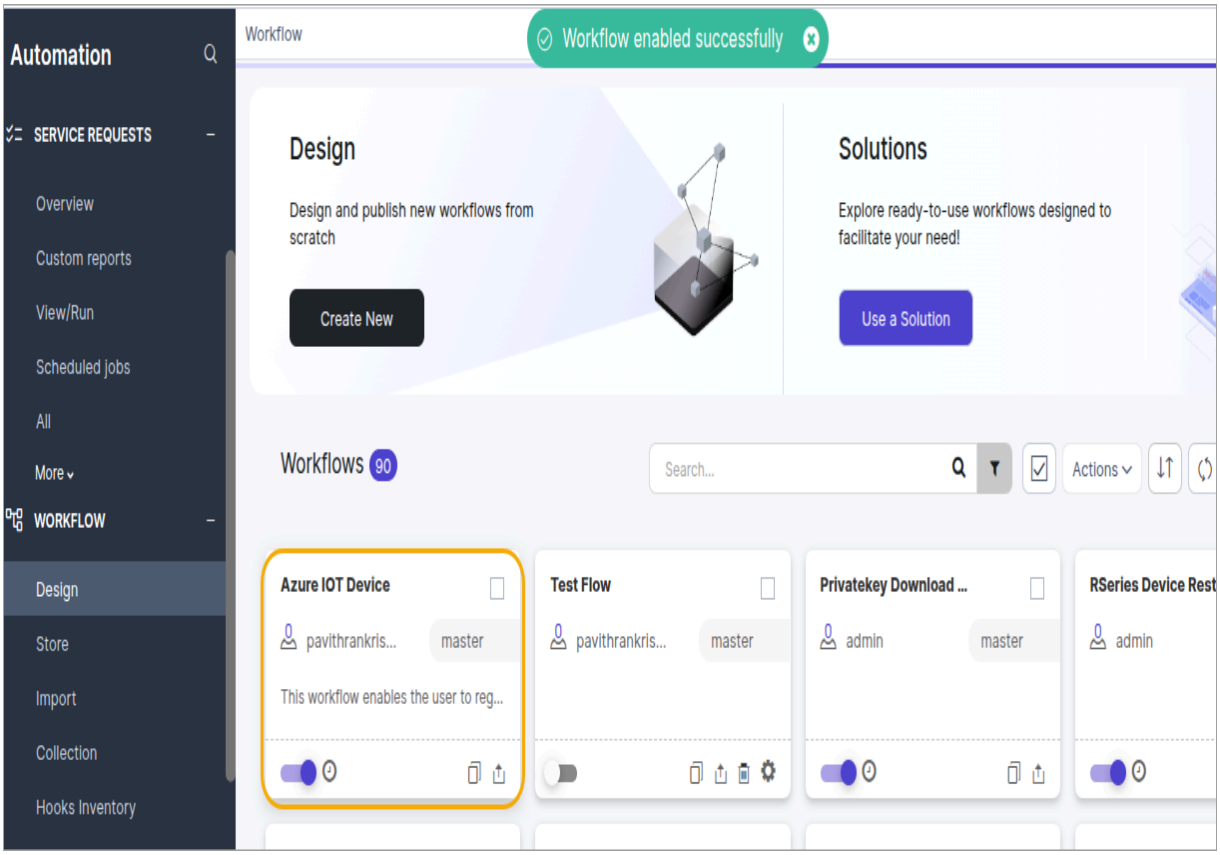
1. Log in to the AppViewX with valid credentials.
2. Got to (**Menu**) > **Automation** > **Workflow** > **Service Account**.
3. Click **Browse**, to upload the provided workflow file [zip file inside the ***workflow*** directory (refer Prerequisites).]
4. Select the uploaded workflow and click **Submit** as shown below.



5. Once submitted, go to the **Workflow** > **Design**, and choose the workflow named **Azure IoT Device**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

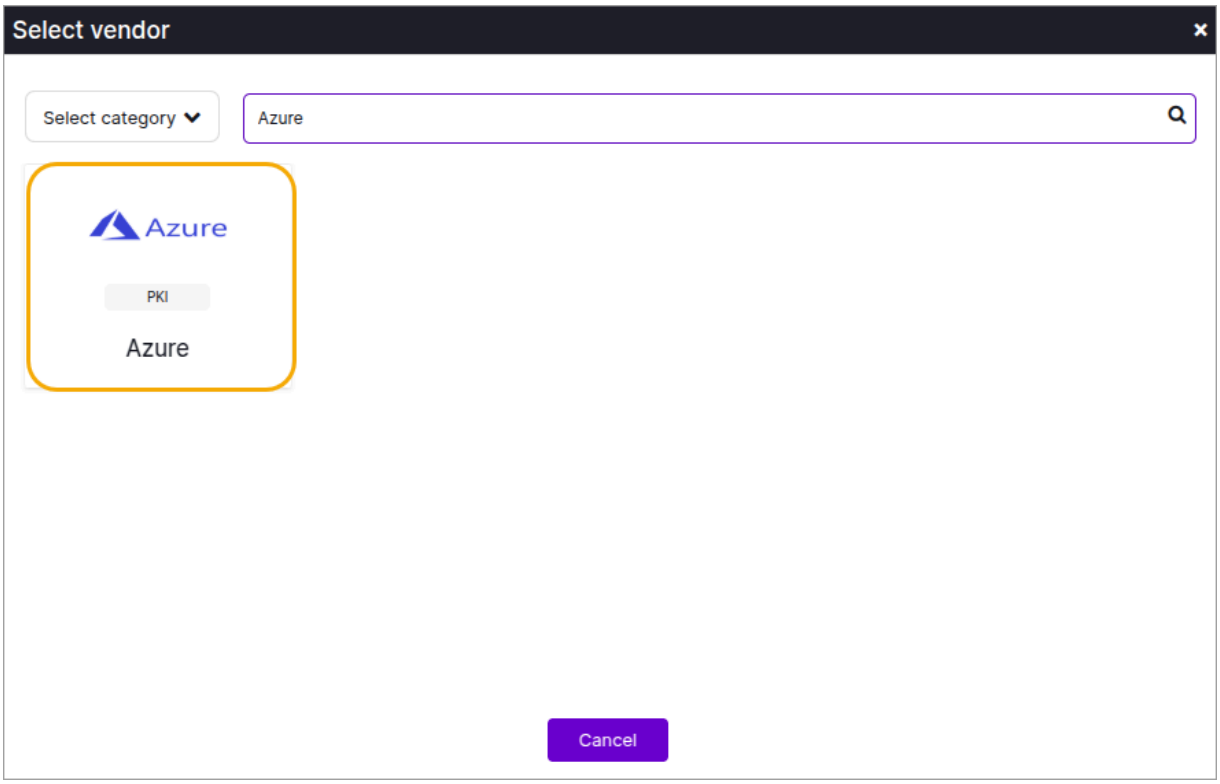
6. Enable the workflow as shown below by clicking on the toggle.



Updating Azure IoT Hub Configuration in AppViewX

1. Log in to the AppViewX with valid credentials.
2. Got to (**Menu**) > **Platform** > **Asset Management** > **Integration Hub**.
3. Click **Add new vendor** icon.
   The **Select vendor** pop-up is displayed.
4. In the **Select vendor** pop-up, enter **Azure** in the search bar.
   The **Azure** vendor icon is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



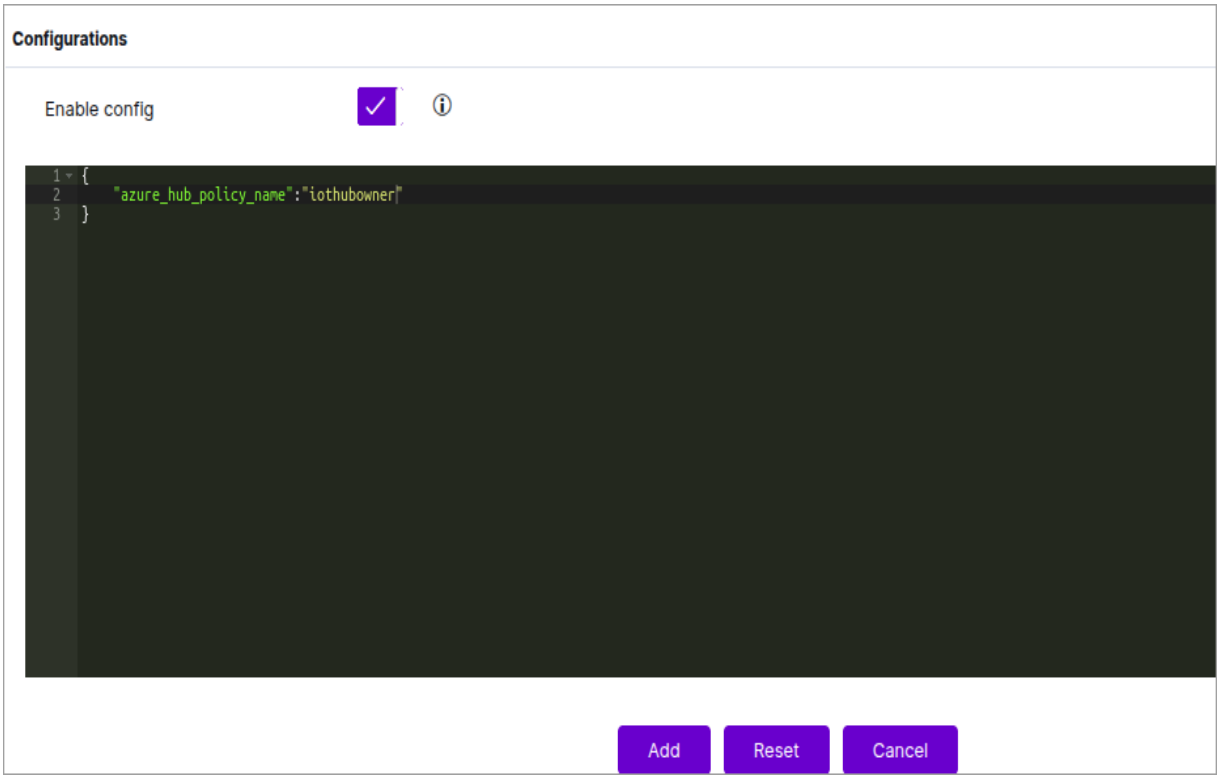
5. Select the **Azure** vendor and enter the following values in the fields specified below:

Field	Value
Name	Enter the value **AzureIoT**.
Datacenter	Select the required value through which the cloud connector device registration/update call should be communicated.
Auth Type	Select **API Key**.
URL	Enter the Azure IOT HUB URL.
Key	Enter the value as **X-Authorization**.
Value	Enter the secret key of Azure IOT Hub.

Enable config	Click the toggle button to enable it and enter the Azure IOT Hub policy name in the config field using the format below:
	`{`
	`"azure_hub_policy_name": "<AZURE_IOT_HUB_POLICY_NAME>"`
	`}`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Value
	Refer figure below.



6. Click **Add** to save the values.

ACME

What is ACME?

ACME, or Automated Certificate Management Environment, is a communications protocol that leverages an agent to automate the process of CSR generation and certificate/key rotation. It is primarily used by the popular public CA, Let's Encrypt, to issue and renew 90-day Domain Validated certificates quickly and efficiently.

The protocol, developed by Internet Security Research Group (ISRG) for Let's Encrypt to issue x.509 (SSL/TLS) certificates, is now supported by other CAs, PKI vendors, and browsers for issuing various types of certificates.

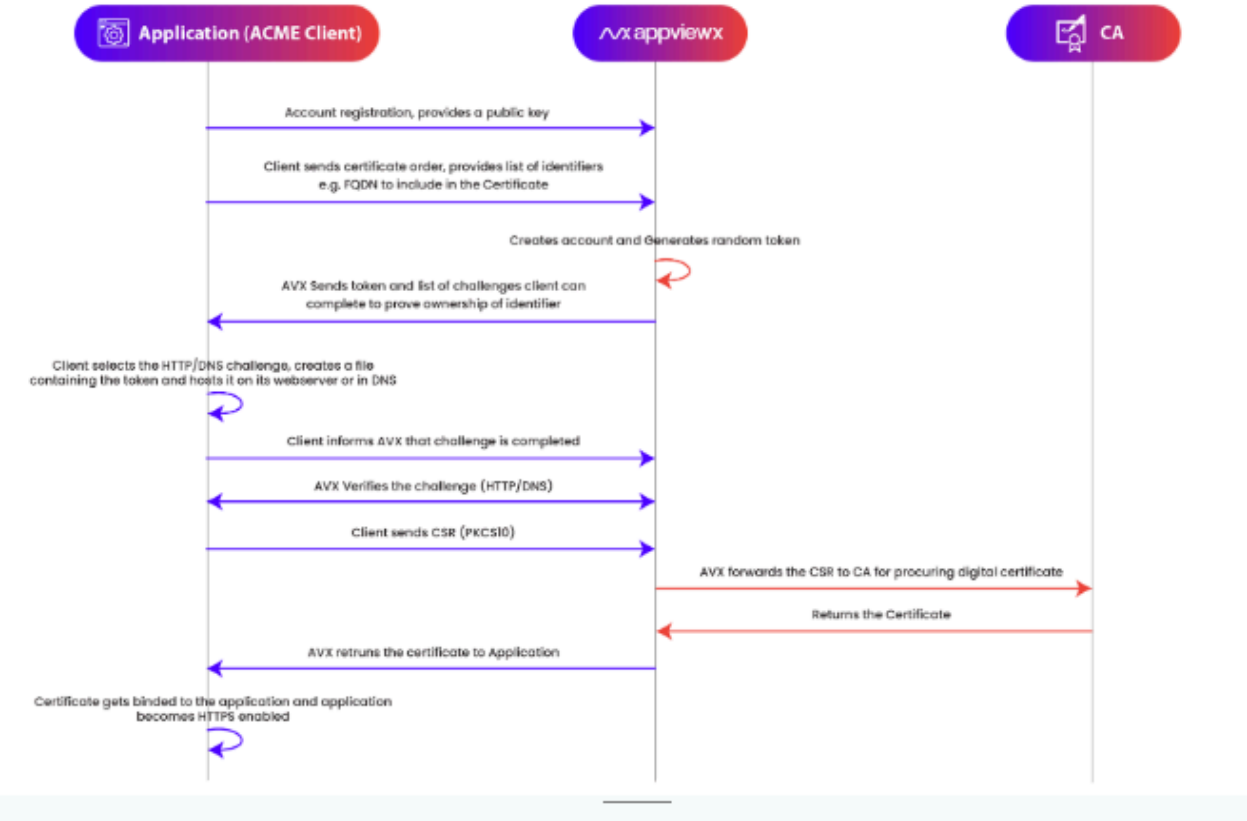
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

ACME is **Automated Certificate Management Environment**, which is a certificate management protocol targeting Public Key Infrastructure (PKI) clients that need to acquire certificates and associated CA certificates. Architecturally, the ACME service (agent) is located between a CA and a client.

- There should be a plugin/pod (avx_vendor_cert_acme_agent) up and running for ACME in AppViewX.
- This ACME plugin works in the HTTPS gateway (The default gateway is used in AppViewX with port 31443)
- It is highly recommended to turn OFF the **Approval Required** flag in **Menu > Inventory > Certificate > Policy** page.
- A valid agent settings should be available in **Menu > Inventory > Certificate > Settings**.

How does ACME work?

This is how ACME works:



1. The application (ACME client) registers an account with AVX and provides a public key.
2. The client sends a request for a certificate, listing the identifiers (e.g., Fully Qualified Domain Names like example.com) to be included in the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. AVX creates the account and generates a random token. It also sends back a list of challenges (like HTTP-01 or DNS-01) to prove the client owns the domain.
4. The client chooses a challenge (e.g., HTTP or DNS), creates a token file and hosts it either on the web server (.well-known/acme-challenge) or in DNS as a TXT record.
5. The client tells AVX that the challenge setup is complete and is ready for verification.
6. AVX accesses the HTTP URL or DNS record to verify the token.
7. The client sends a PKCS#10 CSR (with the public key and requested identifiers) to AVX.
8. AVX forwards the CSR to the CA, which returns a signed digital certificate. AVX sends the certificate back to the application. The application binds the certificate to itself, and HTTPS is enabled.

What's Next?

- Configuring AppViewX Certbot Client
- Configuring AppViewX Posh-ACME Client
- Configuring AppViewX LEGO Client
- Troubleshooting

Configuring AppViewX ACME Server

Prerequisites

On-prem

- Make sure that the following pods are running in the cluster by using the command:

```
kubectl get pods -A | grep acme
```

SaaS

Ensure the https gateway is enabled on the cloud connector while installing it. To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run

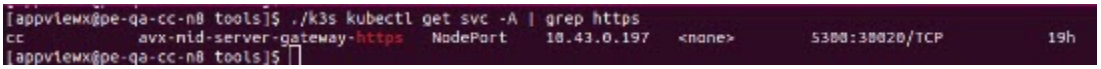
```
cd deps/tools
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Run

```
./k3s kubectl get svc -A | grep https
```

> **Note:** It should have avx-mid-server-gateway-https under namespace cc.



Enabling ACME Services

For On-prem

1. Log onto the AppViewX installer node.
2. Go to </installation_folder/appviewx_kubernetes/scripts> folder.
3. Add the avx-vendor-cert-acme-agent in ENABLED_PLUGINS in the appviewx.conf file.
4. Specify the datacenter (DC) where the gateway must be deployed. avx_vendor_cert_acme_agent=<dc name>

```
ENABLED_PLUGINS=appviewx_dependencies,avx_commons,avx_crontab,avx_config_server,avx_platform_core,avx_platform_amc,avx_platform_q
ueue,avx_platform_gateway,avx_platform_gateway_external,avx_platform_web,avx_subsystems,avx_vendors,avx_subsystems_sync,avx_visua
l_page_builder,avx_vendor_cert_network_discovery,avx_vendor_cert_scep_agent,avx_vendor_cert_intune_agent,avx_vendor_cert_est_agen
t,avx_vendor_cert_acme_agent
SSH_OTHER_USER=appviewx

avx_commons=absecon
avx_config_server=absecon
avx_platform_core=absecon
avx_platform_queue=absecon
avx_subsystems=absecon
avx_subsystems_sync=absecon
avx_vendors=absecon
avx_platform_gateway=absecon
avx_platform_web=absecon
avx_platform_amc=absecon
avx_platform_gateway_external=absecon
avx_visual_page_builder=absecon
avx_vendor_cert_network_discovery=absecon
avx_vendor_cert_scep_agent=absecon
avx_vendor_cert_intune_agent=absecon
avx_vendor_cert_est_agent=absecon
avx_vendor_cert_acme_agent=absecon
```

5. Run the <plugins_install.sh>
6. Verify if ACME is enabled by running kubectl get pods -A | grep acme

For SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). to do this:

1. Log onto the cloud connector installed node.
2. Go to cc_installed_path/deps/properties.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Open appviewx.properties and set the following fields as *true:*
   a. AUTO_ENROLL_ENABLED=true
   b. ENABLE_MTLS_PROFILE=true
   c. ENABLE_HTTP_PROFILE=true
   d. ENABLE_HTTPS_PROFILE=true
4. Scale down the avx-mid-server-platform pod.
5. Restart the avx-mid-server-starter pod.

> **Note:** Ensure that avx-mid-server-gateway-https is present under namespace cc.

Configuring ACME Server

1. Log on to the **AppViewX** application with valid credentials.
2. Click (**Menu**) > **CERT+** > **Administration** > **Auto Enrollment** > **ACME**.
   The **Auto Enrollment : ACME** page appears.
3. Click the **+ Add** button.
4. Enter the following fields:

Field description on Auto Enrollment : ACME page

Field	Description
Endpoint Details	
***Name**	A unique name (alphanumeric string) to identify the agent setting. Name should not start with special characters. Acceptable characters: A-Z, a-z, 0-9, '.', '_', '-'
***IP/FQDN**	**For On-prem** • Enter the FQDN address of the AppViewX ACME gateway. It must be the same as the web URL's hostname. **For SaaS** **Using On-premises CC:** • **Without load balancer:** Must be the FQDN of the cloud connector where the auto-enrollment gateway is running. • **With load balancer:** Must be the FQDN of the load balancer.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Using Direct Gateway • In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, the FQDN/IP address will be the tenant URL with "-aep" before the domain name. The format is **<tenant>-aep.<domainname>**.
***Port**	**For On-prem** • By default, it is port 31443. Leave it as is. **For SaaS** **Using On-premises CC** • **Without load balancer:** By default, it is port 30020. Leave it as is. • **With load balancer:** Port must be the listening port of the load balancer. **Note:** • It is recommended to set the listening port as 30020, which is the same as AppViewX. • If the load balancer's listening port is different from 30020, then update the respective port. **Using Direct Gateway** • In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, use port 443.
***Challenge Type**	**Select any of the following:** • **HTTP:** By default, this is selected. • **DNS**
***HTTP Challenge Port**	Specify the port number used for HTTP challenge validation. By default, it is 80. Specify a different port (1 to 65535), if required. Audit logs are available for this under **Alerts & Logs > Certificate Logs.**
***Challenge Validation Type**	**Note:** Only win-acme and Certbot enrollments and re-enrollments use these fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field appears when Challenge Type = DNS. Select any of the following: • **Default:** Select this option to update the DNS TXT record. Access is required to update the record in the DNS server as part of this process. • **DNS Challenge:** Select this option for AppViewX to update the TXT record on the DNS server. AppViewX will require credentials for the DNS server. **Attention:** On clicking DNS Challenge, make sure to onboard your DNS server in the Integration Hub to update the challenge token and to allow addition/modification/deletion of the TXT record. • **Enterprise secure challenge:** Select this option for validation to happen based on the A record of the domain. **Note:** The options **DNS Challenge** and **Enterprise Secure Challenge** are supported only in appviewx provided ACME clients. For all the open source clients always use the **Default option**
***Validation Method**	This field appears when Challenge Validation Type = Enterprise secure challenge. Select any of the following: • **Secure:** This method performs strict validation of the client's IP address against the existing A record of the domain. • **Any:** The client's IP must be part of one of the available A records for the domain. • **Ignore:** Select this option for domains that have been pre-validated.
Validate HTTP Challenge via Proxy	This field appears when Challenge Type = HTTP. If enabled, the communication with the ACME client to fetch the HTTP challenge token is via the proxy details provided in the **General Settings**.
***Allowed Domain Names**	This is a mandatory field if you have chosen Challenge Validation Type as DNS Challenge or Enterprise secure challenge. You can provide multiple domain names separated by a comma.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

Load Balancer Configuration

It is recommended to set the listening port as 30020, which is the same as AppViewX.

Health check URL for load balancer:

a. **HTTP method:** GET
b. **Healthcheck API:** https://<hostname>:30020/
   i. **Hostname:** Hostname of cloud connector enabled with the MTLS gateway.
   ii. **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

Field description of Add New Vendor page on Integration Hub page

Field	Description
***Category**	This field is pre-populated on selecting **Select Category** as **IOT**.
***Vendor**	This field is pre-populated on selecting **Infoblox**.
***Name**	Enter a name.
Version	Provide a version, if required.
Description	Provide a description, if required.
Upload Image	Upload vendor image.
Tags	Provide tags.
Data center	Select a data center from the dropdown list.
Credentials	
Type	Select between REST or SSH. By default, REST is selected.
Auth Type	Select a value from the dropdown list. By default, Basic Auth is selected.
***URL**	Enter the URL and validate it by clicking **Validate URL.**
***Credential Type**	By default, Manual entry is selected. Keep the selection as is.
***Username**	Enter the assigned username. (This field is displayed for Manual entry only.)
***Password**	Enter the password.

Field	Description
Configurations	
Enable config	By default, this toggle button is disabled. Enable it to add another vendor configurations/attributes in JSON format. Attributes can be referred to as variables in workflow automation.
***:** mandatory fields	

Field description in CA Accounts section

Field	Description
***Certificate Group**	Select a specific group under which certificate needs to be enrolled.
***Select CA**	Select the required CA from the available options. The certificate will be enrolled under the selected CA. The CAs associated with the Default certificate group are: • AppViewX • AppViewX PKIaaS • AppViewX PKIaaS Native • Amazon Private CA • DigiCert • DigiCert One • EJBCA • Entrust • Entrust MPKI • GlobalSign SSL • GlobalSign Atlas • GlobalSign MSSL • Google • HydrantID • IDnomic • LetsEncrypt • Microsoft Enterprise • Microsoft Standalone • Nexus • OpenTrust • Sectigo (Comodo Certificate Manager) • SwissSign

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The Vendor Specific Details and Custom Attributes section are displayed for some of the CAs as follows: • DigiCert • Ejbca • Entrust • Entrust MPKI • GlobalSign MSSL • MS Enterprise • Nexus
*: mandatory fields	

Note: Use the port number that appears when you enable ACME services.

When **AppViewX** is selected as CA, the fields for AppViewX CA are as follows:

Details for AppViewX CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with the ACME client machine.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: Mandatory fields	

When **AppViewX PKIaaS Native** is selected as CA, the fields for AppViewX PKIaaS Native are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for AppViewX PKIaaS Native - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Template Name	Select a template name from the dropdown list.
***Issuer Name**	Select an issuer name to issue the certificate.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
*: mandatory fields	

When **Amazon Private CA** is selected as CA. The fields for Amazon Private CA are as follows:

Details for Amazon Private CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Region**	Select a valid region associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Issuer**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Signature Algorithm**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value from the group's associated policy. Select an appropriate value as required.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields	

When **AppViewX PKIaaS** is selected as CA, the fields for AppViewX PKIaaS CA are as follows:

Details for AppViewX PKIaaS CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with the ACME client machine.
***Issuer Location**	Select the issuer location associated with the CA account.
***Issuer Name**	Select a valid issuer associated with the CA account.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields	

When **DigiCert** is selected as CA. The fields for DigiCert CA are as follows:

Details for DigiCert CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Division**	Select a division associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Certificate Type**	Select a valid certificate type associated with the CA account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The dropdown is populated with the first available value. Select an appropriate value as required.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Order Validity**	Validity of the certificate to be enrolled.
*: mandatory fields	

If the **Select CA =DigiCert**, then a separate section **Vendor Specific Details** is displayed after the CA Accounts section with two fields described below.

Vendor Specific Details for DigiCert CA - Field Description Table

Fields	Description
***Server Type**	Select a server type. The dropdown is populated with the first available value. Select an appropriate value as required.
***Payment Method**	Select a payment method. The possible options are: • **Bill To Account Balance** - Pay with the account balance. Returns an error if this option is disabled for the account or if the account has an insufficient fund. • **Bill To Default Credit Card** - Pay with the account's default credit card. Returns an error if no default credit card is configured for the account
*: mandatory fields	

When **DigiCert One** is selected as CA. The fields for DigiCert CA are as follows:

Details for DigiCert One CA - Field Description Table

Fields	Description
***CA Account Name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server or Client.
Proxy Required	Enable this field if the CA communication needs to happen via proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center for CA communication, with the CC node being the recommended option. The selected node will handle the communication through the chosen CC node.
CA Configuration	
***Base URL**	This URL will contain the hostname of the DigiCert CA instance and used for constructing the API requests.
***Authentication method**	By default, API Token is selected.
***API Token**	Enter the API token to authorize the communication between AppViewX and DigiCert One.
Allow Seat ID during enrollment	Enabling this field displays a Seat ID field in the Auto enrollment settings that you can use instead of the CA settings.
***Seat ID**	Unique value assigned to identify an entity in the DigiCert One account.You can provide multiple ID separated by a comma. They can be used for enrollment, renewal, and regeneration.
Use DigiCert One to switch certificates from DigiCert MPKI	Enable this field to automatically switch your DigiCert MPKI certificates to DigiCert One with auto-enrollment/auto-regenerate.
*****: mandatory fields	

When **EJBCA** is selected as CA. The fields for EJBCA CA are as follows:

Details for EJBCA CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: mandatory fields	

If the selected CA is **EJBCA**, a separate section **Vendor specific details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for EJBCA CA - Field Description Table

Fields	Description
***End Entity Profile Name**	Select a profile of an end entity.
End entity user name	Enter the user name for the end entity.
***Issuer Common Name**	Select a common name of an issuer.
***Certificate Profile Name**	Select a profile name of certificate.
*: mandatory fields	

When **Entrust** is selected as CA. The fields for Entrust CA are as follows:

Details for Entrust CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Type**	Select a valid certificate type associated with the CA account. • If the **Certificate Category** radio button is selected to *Server*, the dropdown list is populated with the first available value. Select an appropriate value as required. • If the **Certificate Category** radio button is selected to *Client*, the dropdown list is populated with 'None' as the default value.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

If the selected CA is **Entrust**, a separate section displaying **Vendor specific details** and **Custom Attributes** is displayed after the **CA Accounts** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Based on the Entrust ECS account configuration **Custom Attributes section** may also be displayed.

Vendor Specific Details for Entrust CA - Field Description Table

Fields	Description
Additional Emails	Enter the valid email address in the field.
Requester Name	Enter the requester name.
Requester Email	Enter a valid email ID.
Requester Phone	Enter the 10-digit phone number.
***: mandatory fields	

When **Entrust MPKI** is selected as CA. The fields for Entrust MPKI CA are as follows:

Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***: mandatory fields	

If the selected CA is Entrust MPKI, a separate section **Vendor Specific Details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Name**	Select a CA name from the dropdown list.
***Certificate Profile**	Select a certificate profile from the dropdown list.
***: mandatory fields	

When **GlobalSign (GlobalSign SSL)** is selected as CA. The fields for GlobalSign (GlobalSign SSL) CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for GlobalSign SSL CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. The name should not start with special characters.
***Certificate Type**	Certificate Type for which CLM actions will be enabled. Select a value from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

If the selected CA is GlobalSign (GlobalSign SSL), a separate section **Vendor Specific Details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for GlobalSign (GlobalSign SSL) CA - Field Description Table

Fields	Description
***Domain Admin CA Name**	Select a CA name from the dropdown list.
*: mandatory fields	

The following field is displayed in the **Point of Contact** section as per the selected CA if the **Select CA =GlobalSign**, and the **Certificate type = Organization SSL**. The CA mandates the point of contact information (**First Name**) for traceability. All auto-enrollment requests via this endpoint are registered with the point of contact information entered here.

When **GlobalSignMSSL** is selected as CA. The fields for GlobalSign MSSL CA are as follows:

Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
CA Account	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Product Type	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
CA Connector Name	Name of the CA connector after the certificate is enrolled.
Certificate Validity	Validity of the certificate to be enrolled (in days/months/years).
***:** mandatory fields	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***Profile**	Select the Profile based on the configurations made in the Certificate Authority setting.
***:** mandatory fields	

The following field is displayed in the **Point of Contact** section as per the selected CA. The CA mandates the point of contact information for traceability. All auto-enrollment requests via this endpoint will be registered with the point of contact information entered here.

Point of Contact Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***First Name**	Enter the first name.
***Email Address**	Enter the valid email address.
***Phone Number**	Enter the valid phone number.
***:** mandatory fields	

When **GlobalSignAtlas** is selected as CA. The fields for GlobalSign MSSL CA are as follows:

Details for GlobalSignAtlas CA - Field Description Table

Fields	Description
***API Credential Friendly name**	select the user-defined label in AppViewX that identifies and maps the API credentials used for authenticating with the GlobalSign Atlas CA.
***Certificate Profile**	Select a certificate profile from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Fields	Description
*: mandatory fields	

Note: The **Generic Fields** section will be displayed for this CA, with fields such as *organization*, *organizational_unit*, *country*, *state*, *locality* etc, as configured in the Certificate Authority settings.

When **Google** is selected as CA. The fields for Google CA are as follows:

Details for Google CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate profile type.
***Issuer Location**	Select an issuer location that is associated with the CA account.
***Pool Name**	Select a pool name to issue the certificate.
Template Name	Select a template name from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields	

When **HydrantID** is selected as CA. The fields for HydrantID CA are as follows:

Details for HydrantID CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***HydrantID Policy**	Select the policy associated with the CA Account to be used for certificate operations.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields

When **IDnomic** is selected as CA. The fields for IDnomic CA are as follows:

Details for IDnomic CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

When **LetsEncrypt** is selected as CA. The fields for Let's Encrypt CA are as follows:

Details for LetsEncrypt CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields	

When **Microsoft Enterprise** is selected as CA. The fields for Microsoft Enterprise CA are as follows:

Details for Microsoft Enterprise CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields	

If the selected CA is Microsoft Enterprise, a separate section **Vendor specific details** is displayed with a **Template Name** dropdown after the CA Accounts section.

When **Microsoft Standalone** is selected as CA. The fields for Microsoft Standalone CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for Microsoft Standalone CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields	

When **Nexus** is selected as CA. The fields for Nexus CA are as follows:

Details for Nexus CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details - Field Description Table

Fields	Description
***Procedure**	Select the procedure based on the configurations made in the Certificate Authority Setting.

When **OpenTrust** is selected as CA. The fields for OpenTrust CA are as follows:

Details for OpenTrust CA - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Management Profile**	Select the certificate issuance policy defined in OpenTrust CA.
Zone	The AppViewX configuration wrapper that maps to a CA + profile, and is used by end-users or automation to request certificates consistently.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields	

When **Sectigo (Comodo Certificate Manager)** is selected as CA. The fields for Sectigo (Comodo Certificate Manager) CA are as follows:

Details for Sectigo (Comodo Certificate Manager) CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Certificate Type**	Select a value from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

When **SwissSign** is selected as CA. The fields for SwissSign CA are as follows:

Details for SwissSign CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate creation operations.
***Client Name**	Select the specific client.
***Product**	Select the specific product.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*****: mandatory fields	

5. Configure the **Advanced Settings** details as follows:
   The following table provides the field description for Advanced Settings:

Advanced Settings - Field Description Table

Fields	Description
***Fetch Certificate Parameters**	Select *Yes* or *No*. Setting the radio button to *Yes* enables the system to automatically fetch certificate parameters from a Suggestive Policy and append them to the client CSRs.
***Restrict Revocation**	This option restricts the revocation of certificates through this endpoint. • If it is set to No, then the certificates are revoked through the ACME endpoint. • If this is set to Yes, then the certificates cannot be revoked through the ACME end point.
***Restrict Wild Card Certificate**	This option restricts the issuance of wildcard certificates through this endpoint. The default value is set to “No”. • If it is set to No, then wildcard certificates are issued through the endpoint. There are no restrictions to certificate enrollment through the ACME endpoint. • If this is set to Yes then wildcard certificates are issued through the ACME endpoint. Choosing this option will not allow Common Name or DNS starting with *.
***High Speed Transactions**	Based on the selection of this field, the endpoint will be configured with or without High Performance transaction times. ACME protocol’s Revocation actions are not supported in High Performance mode. Request information pertaining to High-Performance can be viewed on the Direct Requests page.
***Return Existing Certificate**	If this option is enabled (**Yes**) then for request with AppViewX should check and return the existing valid certificate for the same CSR &

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	public key from inventory if available otherwise it should proceed with enrollment and return the certificate. • If it is set to **Yes**, the Certificate Threshold field is displayed. • If it is set to **No**, then the AppViewX will do the default behavior of enrolling a new certificate for each request.
Block Duplicate Certificates	By default, this option is disabled. Enable this option to prevent users from requesting duplicate certificates for the same common name from the same device within a defined timeframe. On enabling this option, the following fields are displayed: • ***Max duplicate certificate requests:** You can limit duplicate certificates within a set timeframe. By default, up to 3 duplicates are allowed per hour, with a maximum of 100 duplicates in 240 hours. • ***Block Duration:** By default, this is set to 24h. Value can range between 1 and 240h. For example, if 3 duplicate certificates are blocked for 1 hour at 11:40:03, and 3 matching requests (same CN, SAN, device endpoint, and ACME agent) arrive within that hour, those requests will remain blocked for 24 hours—until 12:40:03 the next day—after which they will be automatically unblocked. During this period, any attempt to enroll certificates with the same common name from the same device will result in an error. **Note:** • If IP forwarding is not enabled (for example, in a loadbalanced environment), all requests may appear to originate from the same IP address. This could potentially cause unexpected behavior when block duplicate requests are enabled. • You can manually unblock the duplicate certificates by clicking Unblock Requests on the ACME Auto Enrollment page.
***Certificate Threshold**	This field is enabled only if Return Existing Certificate = Yes. Enter the number of days in this field. This value is used to Initiate a new

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	certificate request if the certificate is nearing the expiry date i.e., if existing certificate validity is less than the entered value.

***External Account Binding**	The Certificate Authority operating the ACME server needs to provide the ACME client with a MAC Key and a Key Identifier using mechanisms outside of ACME (either through Email/SMS/ downloading or copying from the local login account). The key identifier must be an ASCII String. The MAC key will be provided in base64 URL encoded form to maximize the compatibility between non-ACME provision systems and ACME clients.
	• Select Yes to enable the External Account Binding (EAB). The following fields are enabled:
	  • EAB Algorithm
	  • EAB Generation Logic
	  • MAC Value
	  • Key Identifier
	• Select No to disable the EAB.

EAB Algorithm	This dropdown list contains a list of preset algorithms that generate the MAC Value and the key identifier that are used for enrollment. The values are • HS256 • HS384 • HS512
EAB Generation Logic	This field has two options: Generate Static and Generate Dynamic. • **Generate Static**: Application generates the Key Identifier and MAC Value and displays the same in the respective fields. The MAC Value is displayed with an asterisk (*) symbol and the Key Identifier as plain text. Option to copy the values is provided. • **Generate Dynamic**: These credentials are unique for each user and are shared to the respective email IDs. While creating an account, the EAB credentials are validated against the email ID provided.
MAC Value	The MAC value as generated by the EAB Algorithm
Key Identifier	The Key identifier value as generated by the EAB Algorithm.
When **Generate Dynamic** is selected:	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***EAB Algorithm**	This dropdown list contains a list of preset algorithms that generate the MAC Value and the key identifier that are used for enrollment. The values are: • HS256 • HS384 • HS512
***Configuration Type**	Select the type of configuration as below: • User Group - enabled by default. • CSV - currently disabled • LDAP Group - currently disabled
***User Group List**	A dropdown with a list of available user groups with multi-select option. Select one or more user groups.
*: mandatory fields	

The **Generate Dynamic** option also displays a table with the configured values as follows:

Description for configured values of Generate Dynamic selection

Table Options	Description
User Name	Column to display the user name / user group. A checkbox is available next to the user name to perform actions described below.
Mail Address	Column to display the mail address where the EAB details were sent.
EAB Status	Displays the status as follows • Activated • Deactivated • Credentials not sent
Last Updated Time	Column to display the date and time when the configuration was last updated.
Search	Type the user name/group, mail address, status etc to find or display desired values in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Table Options	Description
Actions	The Actions dropdown field has the values below. Select the checkbox next to the user name and then click Actions. • **Activate** - Deactivated EAB credentials and ACME accounts are marked as activated. An activation email is sent to the user. • **Deactivate** - EAB details and ACME accounts are marked as deactivated. A deactivation email is sent to the user. • **Rotate** - New EAB credentials will be generated and shared to the user. The ACME accounts - Dynamic and Static, created with existing credentials are deleted. • **Resend** - Existing EAB details are resent to the users through email.

6. Click **Save**.

Verifying ACME Server

To validate the AppViewX configuration:

1. Configure the ACME endpoint in AppViewX GUI.
2. Ensure that the agent configuration must be in **valid** status.

3. If the configuration is completed and the agent status is valid, refresh the ACME URL from the web browser. The expected response should be:

```
{
  "newAuthz": "https://<ip>:<port>/avxapi/test-acme/acme/new-authz",
  "keyChange": "https://<ip>:<port>/avxapi/test-acme/acme/key-change",
  "revokeCert": "https://<ip>:<port>/avxapi/test-acme/acme/revoke-cert",
  "meta": {   "externalAccountRequired": false  },
  "newNonce": "https://<ip>:<port>/avxapi/test-acme/acme/new-nonce",
  "newAccount": "https://<ip>:<port>/avxapi/test-acme/acme/new-account",
  "newOrder": "https://<ip>:<port>/avxapi/test-acme/acme/new-order"
}
```

Binding Custom Certificate to Gateway in Cloud Connector

This section describes the steps to replace the Default TLS Certificate with Signed Certificate in on-premises CC (Cloud Connector).

By default, AppViewX provides a default certificate in the gateway. For ACME, you must bind a valid certificate (Certificate with CC hostname) with the gateway.

To bind a TLS certificate to gateway :

- The certificate's common name must be the hostname of the CC.
- Download the certificate with .crt format and the key file.

To update the certificate:

1. Copy the certificate and the key file to <cc_installation_folder>/deps/properties/ directory.
2. Go to the cc_installation_folder and run:

   ```
   ./avxctl upgrade gateway-cert
   ```

3. You will be prompted with the question, *Do you want to bind a SSL certificate to gateway? (y/n)*:

   a. To bind a certificate to the gateway, enter **y**.

   b. You will then be asked for the *certificate path* and the *key path*. Provide the relative path of the files as indicated:

   If the certificate and key file is copied into <cc_installation_folder>/deps/properties/ folder, then the path should be:
   - *Please enter the certificate file path:* /properties/test.crt
   - *Please enter the key file path:* /properties/test.key

   c. If this step is not required, enter **n**.

4. You will now be prompted with, *Do you want to add trusted CA certificates for mTLS authentication for EST? (y/n):*

   Enter **n** (This step is applicable only for EST protocol).

5. Wait for the script to complete and the gateway will be upgraded.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When there is a load balancer on top of the cloud connector, then a valid certificate must be bound to the load balancer using the load balancer's hostname.

Best Practices

- **Certificate Group and CA Policy Setup:**
  - Create a dedicated certificate group and CA policy specifically for auto-enrollment in AppViewX.
  - While configuring the policy, ensure only the required key bit-length is selected (minimum: **2048-bit**).
- **Enable SSL Verification:** Always bind a valid SSL certificate on the AppViewX Gateway or Cloud Connector (CC) and enable SSL verification for secure communication.
- **Restrict Domain Issuance:** Use the **Allowed Domain Names** field to limit certificate issuance to specific domains and prevent unintended wildcard certificate issuance by disabling it in the agent setting configuration where necessary.
- **Ensure High Availability:** Deploy a load balancer in front of Cloud Connectors to establish a high-availability setup.
- **Use External Account Binding (EAB):** Implement EAB as an added layer of authentication for enhanced security.

Configuring AppViewX win-acme Client

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Getting Started

Prerequisites

- The AppViewX server/cloud connector (CC) must be bound with a valid certificate. See Section, *Binding Custom Certificate to Gateway in Cloud Connector*.
- The certificate bound to the AppViewX or CC gateway must be trusted by the Windows client machine.
- To trust the certificate, import the root and the issuer certificates to the Windows root and intermediate trust stores.
- A proper DNS entry for the Windows server where winacme is being installed.
- A valid ACME endpoint must be configured on the AppViewX GUI.
- To enable client connections, ensure the following ports are open for inbound communication in AppViewX:
  - 31443 is open for on-premises deployment and port.
  - 30020 in cloud connectors is open for SaaS deployment in AppViewX.
- If the domain validation is set as HTTP, ensure port 80 is accessible on your Windows machine to allow AppViewX to establish a connection.
- If the DNS validation is for DNS challenge, then the DNS server must be up and running and the DNS credentials file should be correctly configured.
- Certificate attributes and custom attributes must be configured to capture the attributes in the AppViewX GUI (if required).

System Requirements

- **Operating System:** Windows Server 2012 R2 SP1 or higher
- **Framework:** .NET Core 5 or higher
- **RAM:** 4GB or higher

Installing win-acme Client

1. Download the latest version from the AppViewX release portal.
2. Unzip files to a non-temporary folder so that the scheduled task can be run.
   We recommend using `%program files%\win-acme`.
   The settings.json file inside the win-acme folder is used for further configurations.

Installing Bluecat Micetro Plug-In

To install Bluecat Micetro plug-in:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to the winacme home directory. Copy the plugin.validation.dns.bluecatmicetro.v25.0.0.0.zip into the winacme home directory.
2. Extract the plugin.validation.dns.bluecatmicetro.v25.0.0.0.zip and ensure that the plugin.validation.dns.bluecatmicetro.v25.0.0.0 folder is available in the winacme home directory.
3. Run the following command:

```
Sample command

./wacs.exe --target manual --validation bluecatmicetro --host  --credentialfilepath --validationmode dns-01 --verbose
```

4. bluecat_credentials_file_format:
   - hostname=
   - username=
   - password=

Configuring win-acme

Configuring URL

1. Go to **Cert+ > Administration > Auto Enrollment > ACME**.
2. Copy the URL from the **Directory URL** field.
3. Update the **DefaultBaseUri** field in the settings.json file.

Enabling Polling

The following configurations are within the **Acme** category in the settings.json file:

- Configure the **RetryCount** parameter to determine the maximum number of times to refresh validation and order status, while waiting for the ACME server to complete its tasks. By default, this value is set to **15**.
- Configure the **RetryInterval** parameter to the amount of time in seconds to wait for each retry. By default, this value is set to **5 seconds**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Example: Let us consider a scenario where the **RetryCount** is set as **15**, and the **RetryInterval** is configured as **5** seconds. In this case, the **total timeout duration (polling time)** is calculated as 15 multiplied by 5 seconds totaling 75 seconds.

Setting Custom and Certificate Attributes

Custom attributes represent fields that are specific to the Certificate Authority (CA). These attributes are transmitted to the CA for processing to serve different purposes in different scenarios.

Certificate attributes are included in the payload sent to AppViewX. They are primarily used internally for categorization and management purposes. These values must be added in the settings.json file.

Both these attributes are optional fields, so they can be left blank.

Example of cert and custom attributes in settings.json file:

"certAttributes" : {"id":"12345678", "manager":"managerName2"},

"customAttributes" : {"email_address":"test@appviewx.com","Director":"Name"}

```
        "organizationUnit" : "IOT",
        "email" : "testavx@appviewx.com"
},
"certAttributes" : {"id":"12345678", "manager":"managerName2"},
"customAttributes" : {"email_address":"test@appviewx.com","Director":"Name"}
}
```

Providing additional CSR Parameters

You can configure the following fields under the existing CSR field in the settings.json file present in the win-acme folder:

- Organization
- Organization unit

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Country
- State
- Locality
- Email-ID

Note: These fields are optional, so they can be left blank. When filled, they are fetched from the settings.json file for certificate renewal and enrollment.

A sample json file is as shown:

Note: You can customize the CSR parameters only in the win-acme provided by AppViewX.

Actions using win-acme

Enrolling Certificates

You can enroll certificates using:

- Interactive terminal -OR-
- PowerShell script

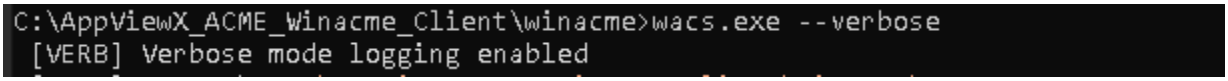
Enrolling Certificates using Interactive Terminal

Prerequisites:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

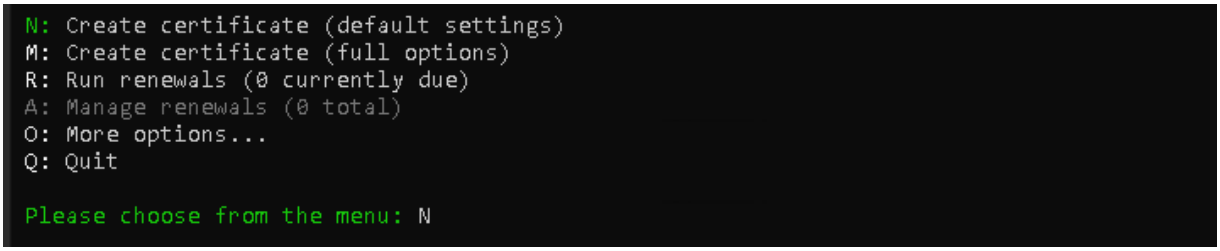
Run the following command with administrator privileges:

```
wacs.exe
```

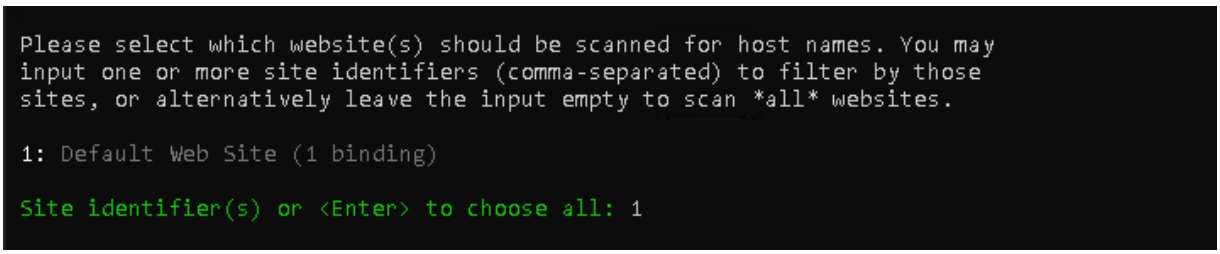


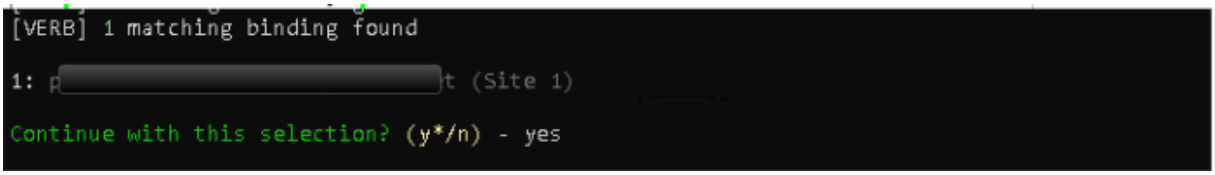
Note: The default settings are for users installing a regular (non-wildcard) certificate on their local IIS instance.

1. To create a new certificate with default settings, choose N from the main menu.



2. Choose how you want to determine the domain name(s) that are to be included in the certificate. This can be derived from the bindings of an IIS site or can be entered manually.





Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If EAB is enabled in the AppViewX ACME configuration settings, win-acme will prompt to enter the key identifier and key (base64 url encoded) [enter the value from MAC value in the place of key (base64 url encoded)]

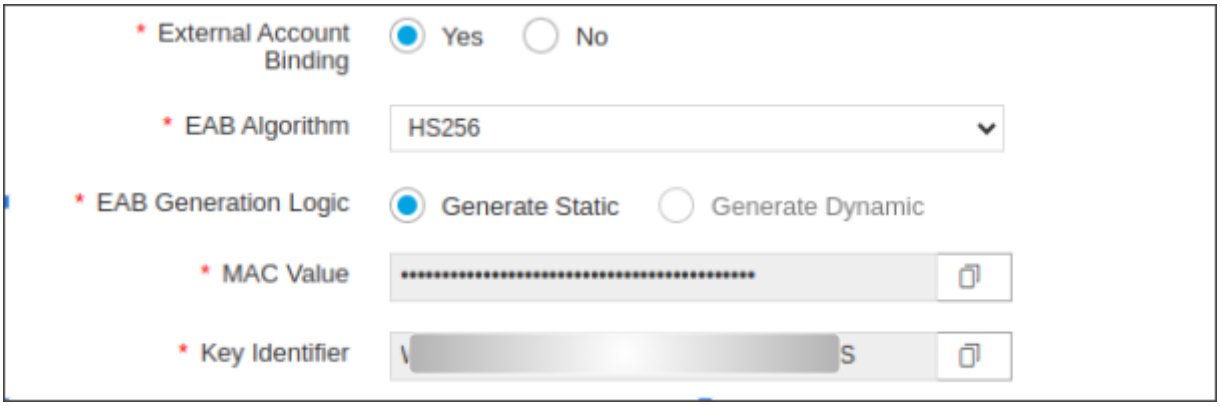
```
Create certificate failed, retry? (y/n*) - yes

This ACME endpoint requires an external account. You will need to provide a
key identifier and a key to proceed. Please refer to the providers
instructions on how to obtain these.

Key identifier: [redacted]

Key (base64url encoded): ****************************************
[testwinacme.appviewx.net] Authorizing...
```

AppViewX ACME configuration:



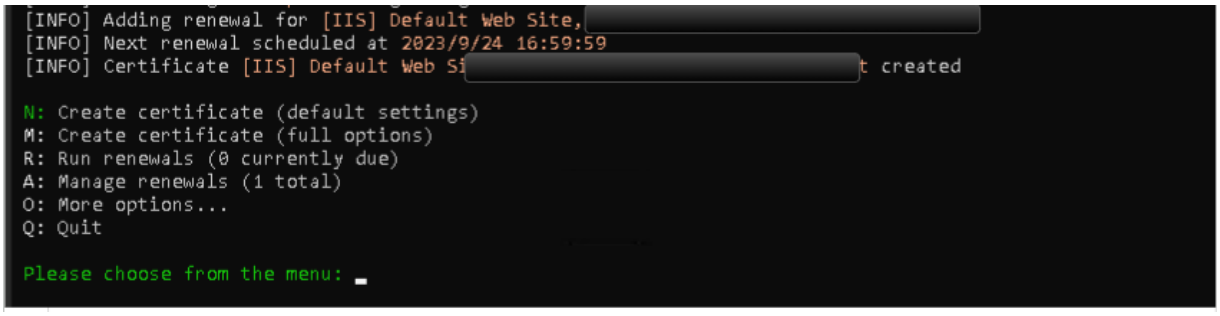
3. A registration is created with the ACME server, if no existing one is found. You will be prompted to agree to its terms of service and to provide an email address that the administrators can use as contact information.

```
[VERB] No account found, creating new one
[VERB] Terms of service downloaded

Enter email(s) for notifications about problems and abuse (comma-separated): <Enter>
```

4. The program communicates with the ACME server to confirm ownership for the certificate you want to create. By default, the http validation mode is used and handled by AppViewX's self-hosting plugin. Getting the validation correct can be the most challenging aspect of obtaining an ACME certificate. If problems persist, refer to the common issues.
5. After the proof has been provided, the program gets a new certificate from the ACME server and creates/updates the IIS bindings as required according to the logic documented here.

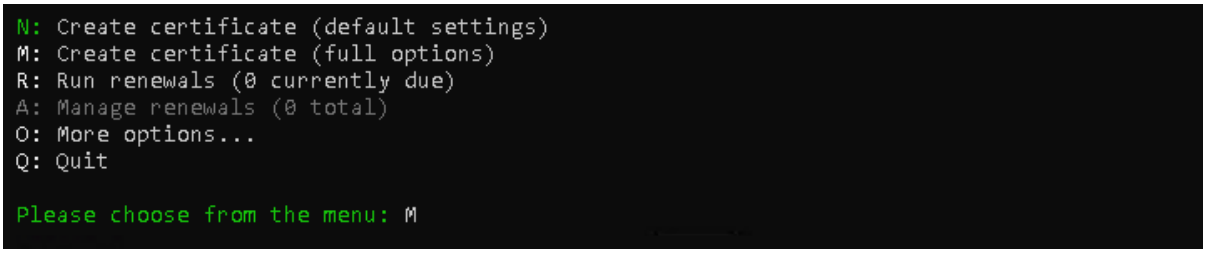
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



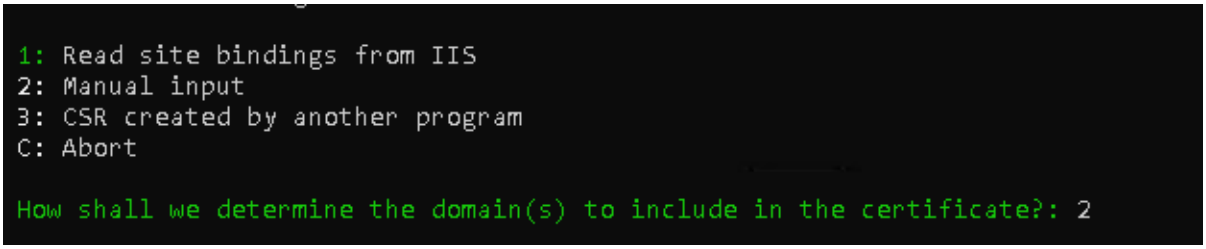
The program stores all choices made while creating the certificate and applies them for each subsequent renewal.

Steps for using *M: create certificates with full option*

1. Choose M to create certificates using full options.



2. Choose 1 to read site bindings from IIS server; else, choose 2 to provide the domain name manually.



3. Continue with the default options for HTTP Challenge validations (The number highlighted in green). HTTP challenge validation is the most common challenge type. ACME server will give a token to the ACME client, and the ACME client puts a file on the web server at http://<YOUR_DOMAIN>/.well-known/acme-challenge/<TOKEN>. Once the token is published in the webserver, AppViewX will send an HTTP request to fetch the token from the client machine.

> **Note:** The common name must be resolving to the client machine IP address and port 80 of the client machine must be accessible by AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
1: [http-01] Save verification files on (network) path
2: [http-01] Serve verification files from memory
3: [http-01] Upload verification files via FTP(S)
4: [http-01] Upload verification files via SSH-FTP
5: [http-01] Upload verification files via WebDav
6: [dns-01] Create verification records manually (auto-renew not possible)
7: [dns-01] Create verification records with acme-dns (https://github.com/joohoi/acme-dns)
8: [dns-01] Create verification records with your own script
9: [tls-alpn-01] Answer TLS verification request from win-acme
C: Abort

How would you like prove ownership for the domain(s)?: 2
```

4. Provide the default option 2 to create the private key for the certificate.

```
1: Elliptic Curve key
2: RSA key
C: Abort

What kind of private key should be used for the certificate?: 2
```

5. To store the certificate in the Windows certificate store, enter 4.

```
1: IIS Central Certificate Store (.pfx per host)
2: PEM encoded files (Apache, nginx, etc.)
3: PFX archive
4: Windows Certificate Store
5: No (additional) store steps

How would you like to store the certificate?: 4
```

6. Choose the WebHosting option/ default option to store the certificates in that particular store. (The certificates can be found in the Windows machine certificate store > Web Hosting > Certificates.)

```
1: [WebHosting] - Dedicated store for IIS
2: [My] - General computer store (for Exchange/RDS)
3: [Default] - Use global default, currently WebHosting

Choose store to use, or type the name of another unlisted store: 3
```

Note: To store the certificate in the personal store use the option **2 instead of 3.**

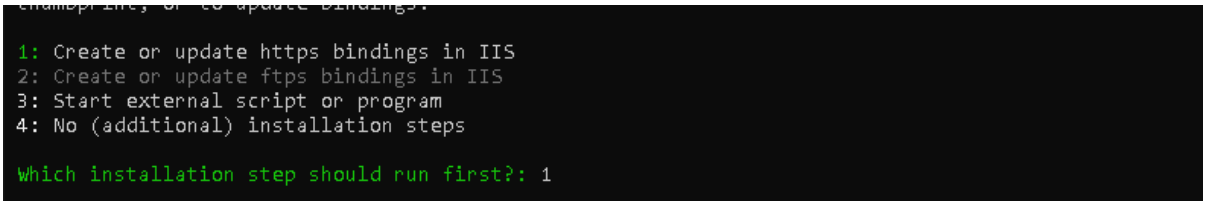
7. Enter the default option 5 and continue.

```
1: IIS Central Certificate Store (.pfx per host)
2: PEM encoded files (Apache, nginx, etc.)
3: PFX archive
4: Windows Certificate Store
5: No (additional) store steps

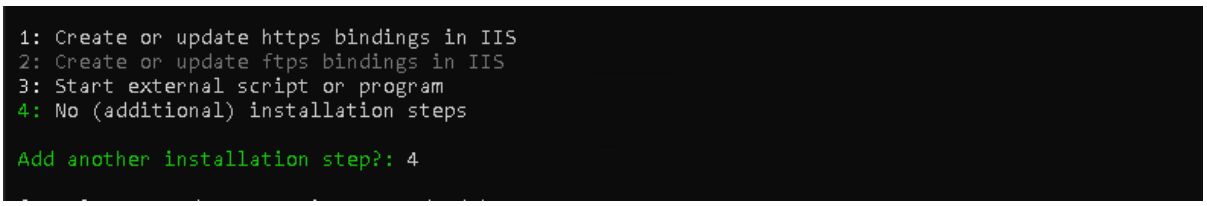
Would you like to store it in another way too?: 5
```

8. To create and update the https bindings in IIS server, choose 1.

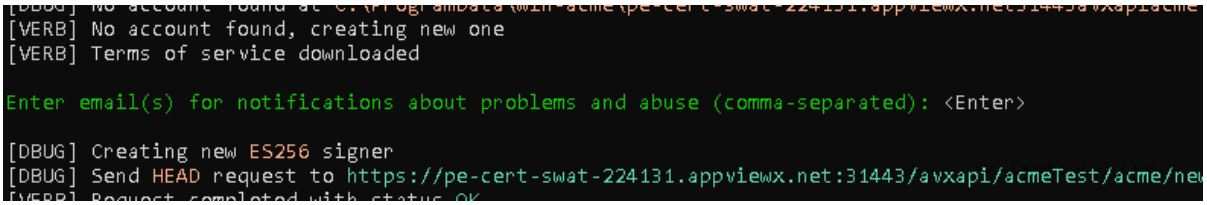
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



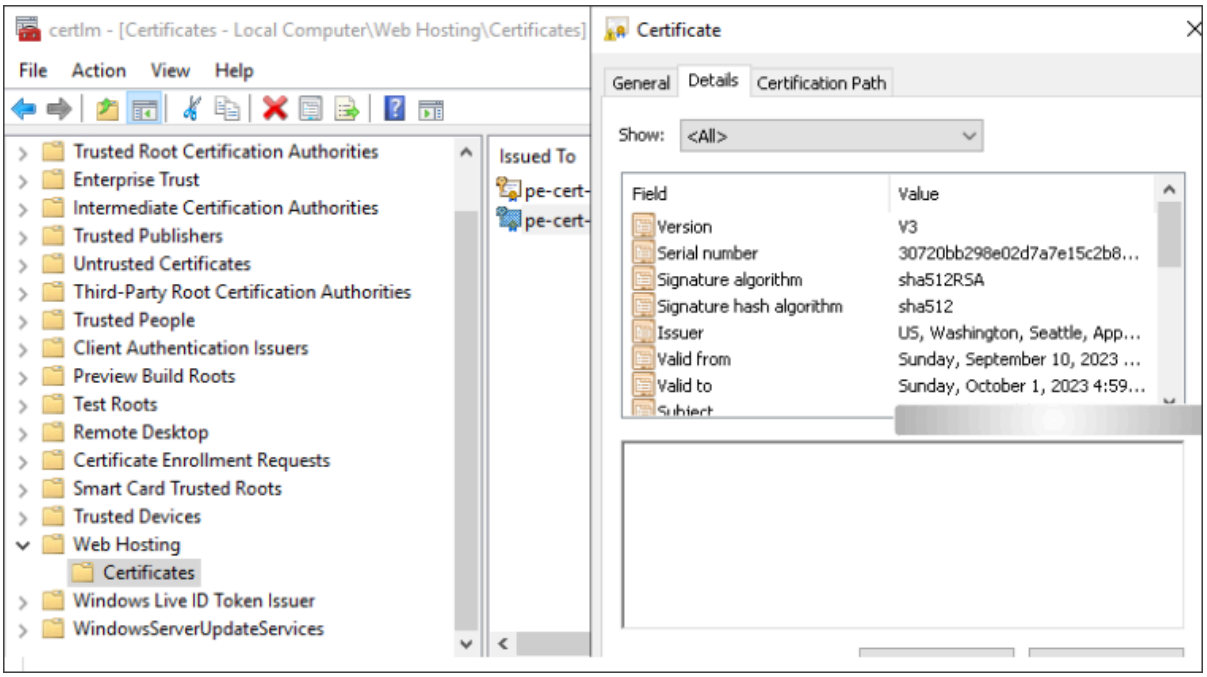
9. Enter 4 to add no other installation steps and continue.



10. Provide an email address or press enter to skip.



11. The certificate will be bound to the chosen IIS server and the certificate will be stored in the Windows certificate store.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Using PowerShell Script

win-acme is initiated as a hidden process using a PowerShell script. When the PowerShell script is run, the terminal opens in the background and remains invisible to the user.

Steps to run the win-acme enrollment process in background:

1. Choose the script as per the requirement and follow these steps:
   - **Run win-acme using manual hostname as input:** The following PowerShell script fetches the certificate for the hostname specified and binds it with the IIS server for the site ID specified.

```
$wacsPath = "<path to the wacs.exe file>"
$arguments = "--validationmode HTTP-01 --source manual --host <host-name> --emailaddress <email id (or) NA> --installation iis --installationsiteid <site id> --verbose --eab-key-identifier <eab-key-identifier> --eab-key <eab-key> --eab-algorithm <eab-algorithm>"
Start-Process -FilePath $wacsPath -ArgumentList $arguments -WindowStyle Hidden
```

> **Note:** The command `--eab-key-identifier -O7R97x8T52ASpwAYZJzJ --eab-key _Pqh5h6yJKThrXiqy6GGsfVIZdgNNw --eab-algorithm HS256` is only applicable when EAB is enabled in the server side.

   - **Run using CSR as input for certificate generation:** The following PowerShell script fetches the certificate using the given CSR file and binds the certificate to the specified site ID.

```
$wacsPath = "<path to the wacs.exe file>"
$arguments = "--validationmode HTTP-01 --source csr --csrfile <Path to the csr file> --pkfile <Path to the key file> --emailaddress <email id (or) NA> --installation iis --installationsiteid <site id>  --verbose"
Start-Process -FilePath $wacsPath -ArgumentList $arguments -WindowStyle Hidden
```

   - **Run using site ID as input for certificate generation**
     - Multiple site IDs can be given in comma separated format in this script (for example, 1,2,3).
     - This PowerShell script fetches the hostnames of the servers mentioned in the <site ID> and creates a single certificate.
     - The hostnames of all the specified IIS servers are present in the SAN DNS of that certificate.
     - All the servers mentioned in the <site ID> are bound with the same certificate.
     - This is not applicable for IP based binding and only works for hostname based bindings.

```
$wacsPath = "<path to the wacs.exe file>"
$arguments = "--validationmode HTTP-01 --source iis --siteid <site id>  --emailaddress <email id (or) NA> --installation iis --verbose"
Start-Process -FilePath $wacsPath -ArgumentList $arguments -WindowStyle Hidden
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The command `--eab-key-identifier -O7zaR976x8T52AGASpwAAAYZJzJ --eab-key _PqhM5h6yJnXKThr7Xiq4y6GGlFsfGVICZdgNNw --eab-algorithm HS256` is only applicable when EAB is enabled in the server side.

Refer to these points to replace placeholder values in the commands:

- `<path to the wacs.exe file>`: The wacs.exe file path (present inside the win-acme installation folder).
- `<host-name>`: The hostname for which the certificate needs to be acquired.
- `<site id>`: This ID can be found in the IIS server manager.
- `<email id (or) NA>`: An email address or NA (should not be empty). This is bound to the win-acme account.
- `<Path to the csr file>`: Path of the CSR file.
- `<Path to the key file>`: Path of the key file associated with the given CSR.

2. Save the required script in .ps1 format (the new ps1 file can be created using Windows PowerShell ISE > File > New).
3. Open PowerShell with admin privileges.
4. Run `.\<shell script file name>`
5. To ensure that the task is being run in the background, open the Windows Task Manager and look for the *wacs* process (This may be found as separate process or under Windows PowerShell process).
6. If the manual approval is enabled in the CA policy settings, this process waits for the certificate to be approved. (The client polls the ACME server for the certificate according to the *RetryCount* and *RetryInterval* values provided in the settings.json file. [Path - C:\AppViewX_ACME_Winacme_Client\winacme\settings.json].
   After receiving the certificate, this process is terminated. The certificate is found in the Windows certificate store (under the Web Hosting/certificates tab).

DNS-based Challenge Validation

DNS-based challenge validation in the ACME protocol involves proving the domain ownership by adding a specific TXT record to the domain's DNS records. When the ACME server issues a certificate for a domain, it provides the ACME client with a unique challenge token. The ACME client then adds this token as a TXT record in the domain's DNS configuration. AppViewX verifies the domain ownership by querying the DNS records for the challenge token. Once the token is found, the validation is considered successful and the certificate is issued.

This method of validation requires access to modify DNS records for the domain typically through the domain registrar or DNS-hosting provider.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Extract the route53 plugin zip file in the win-acme folder.
2. Open a command prompt terminal in the win-acme folder and run the following command:

```
wacs.exe --verbose --validation route53
```

3. Continue with the enrollment process as mentioned in the Section, *Steps for using M: Create Certificates with Full Option* until you reach the step where the challenge method is chosen.
4. Select **Create verification records in AWS route 53** option.

```
1: [http] Save verification files on (network) path
2: [http] Serve verification files from memory
3: [http] Upload verification files via FTP(S)
4: [http] Upload verification files via SSH-FTP
5: [http] Upload verification files via WebDav
6: [dns] Create verification records in AWS Route 53
7: [dns] Create verification records manually (auto-renew not possible)
8: [dns] Create verification records with acme-dns (https://github.com/joohoi/acme-dns)
9: [dns] Create verification records with your own script
10: [tls-alpn] Answer TLS verification request from win-acme
C: Abort

How would you like prove ownership for the domain(s)?: 6
```

5. Enter the Route53 credentials when prompted.
6. Follow the steps as shown:

```
How would you like prove ownership for the domain(s)?: 6

[VERB] No value provided for --route53iamrole

Description:         AWS IAM role for the current EC2 instance to login into
                     Amazon Route 53. Note that you should provide the IAM
                     name instead of the ARN.

IAM role name (leave blank to use access key): <Enter>

[VERB] No value provided for --route53accesskeyid

Description:         Access key ID to login into Amazon Route 53.

Access key ID: [redacted]

[VERB] No value provided for --route53secretaccesskey

Description:         Secret access key to login into Amazon Route 53.

1: Type/paste in console
2: Search in vault

Choose from the menu: 1

Secret access key: ****************************************

Save to vault for future reuse? (y/n*) - no
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On completion, the enrollment process begins and the certificate is issued upon successful validation of the DNS challenge.

Note: This is a sample to use the DNS route 53 plugin for challenge validation. Users can use the other DNS plugins also for validation. Refer to the following link to use the other DNS plugins: https://www.win-acme.com/reference/plugins/validation/dns/

Default Challenge Validation

This challenge requires you to prove control over the DNS for a domain by adding a specific value to a TXT record within that domain. AppViewX then performs a DNS query to verify the presence of the token in the domain's DNS records.

A sample command to do the challenge validation using the AWS route 53 server is as shown:

```
wacs.exe --target manual --host <domain name> --validation route53 --validationmode dns-01 --route53accesskeyid <route53 key id> --route53secretaccesskey <route53 key>  --eab-key-identifier <EAB key identifier> --eab-key <EAB HMAC key> --eab-algorithm <EAB alogrithm>  --verbose  --emailaddress <mail address>
```

DNS Challenge Validation (using AppViewX DNS plugin with Infoblox DNS Server)

This challenge requires you to show how AppViewX manages DNS for the domain by adding a specific value to a TXT record within that domain. AppViewX then performs a DNS query to verify the token's presence in the domain's DNS records. AppViewX, with the support of Platform Integration Hub, will handles all aspects of creating, searching, and deleting TXT records in the DNS server.

A sample command to do the AppViewX DNS Challenge Validation option is as shown:

```
wacs.exe --target manual --validation appviewx --host <domain name> --vendor infoblox --vendoraccountname <Infoblox server name configured in appviewx> --validationmode dns-01 --eab-key-identifier <Key identifier> --eab-key <HMAC key> --eab-algorithm <EAB Algorithm> --verbose --emailaddress <email address>
```

Enterprise Secure Challenge Validation

This challenge requires you to show how AppViewX manages DNS for a domain by querying to verify the presence of the client's IP address in the domain's DNS A record. This verification does not require DNS server credentials as it only involves accessing the DNS A record for the specific domain.

A sample command to do the AppViewX Enterprise Secure Challenge Validation option is as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
wacs.exe --target manual --validation appviewx --host <domain name> --validationmode dns-01 --eab-key-identifier <key identifier> --eab-key <HMAC key>
 --eab-algorithm <EAB Algorithm> --verbose  --emailaddress <email address>
```

DNS Challenge Validation using Azure Plugin

Enrolling Certificates for Public DNS

```
wacs.exe --target manual \
--host <FQDN_NAME_FOR_CERTIFICATE>\
--validation azure \
--azuretenantid xxx-xxx-xxx \
--azureclientid xxxxxxxxx \
--azuresecret xxxxxxxxx \
--azuresubscriptionid xxx-xxx-xxx \
--azureresourcegroupname xxx \
--eab-key-identifier <key_identifier> \
--eab-key <hmac_value> \
--eab-algorithm <eab_algorithm>
--emailaddress <eab_email_address>
```

Enrolling Certificates for Private DNS

```
wacs.exe --target manual \
--host <FQDN_NAME_FOR_CERTIFICATE>\
--validation azure \
--azuretenantid xxx-xxx-xxx \
--azureclientid xxxxxxxxx \
--azuresecret xxxxxxxxx \
--azuresubscriptionid xxx-xxx-xxx \
--azureresourcegroupname xxx \
--eab-key-identifier <key_identifier> \
--eab-key <hmac_value> \
--eab-algorithm <eab_algorithm>
--emailaddress <eab_email_address>
--azurezonetype private
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Renewing Certificates

Scheduling Tasks

A scheduled task renews certificates when necessary, based on the specified threshold in the settings.json file. The program checks certificates daily to see if they are close to expiration. The settings.json file also controls how long cached certificates can be used for renewals.

The following are configuration settings in the settings.json file located within the win-acme directory:

Adjusting settings in the Cache field

- Adjust the value of **ReuseDays** to **0**:

  When renewing or creating a certificate with the same domain names as before, **ReuseDays** decides how long the program will use a cached version. Setting **ReuseDays** to **0** stops using cached files for renewals.

  The default value for **ReuseDays** is set to **1**.

Adjusting settings in the ScheduledTask field

1. Set **RenewalMinimumValidDays** to determine the minimum number of days a certificate should remain valid. If a certificate has fewer days left than this threshold, automatic renewal will be triggered.

   The default value for **RenewalMinimumValidDays** is set to **null**, which is interpreted as 7 days.

   For example: If you set the parameter to 10, certificates with less than 10 days validity will be renewed automatically using the task scheduler. Certificates with 10 days or more remaining will not be renewed.
2. Adjust the **StartBoundary** to specify the start time for the scheduled task.

   The default value for **StartBoundary** is set to **09:00:00**, which is interpreted as 9:00 am (local time).
3. [Optional]: Set **RandomDelay** to **00:00:00** (0 hour), which is the time to wait before starting the scheduled task to spread the load on the servers and thus prevent users from getting TooManyRequests errors.

   The default value for **RandomDelay** is set to **04:00:00**, which is interpreted as 4 hours.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Health Checks

The health of the scheduled task is checked each time the program is run manually. It can also be (re)created from **More options > (Re)create scheduled tasks**.

Monitoring

The renewal process can be monitored from the Windows Event Viewer and log files written to `%programdata%\win-acme\$baseuri$\Log`.

Scheduling Tasks for Auto-Renewal

win-acme schedules task using the configurations from settings.json file. For more information, see Renewing Certificates.

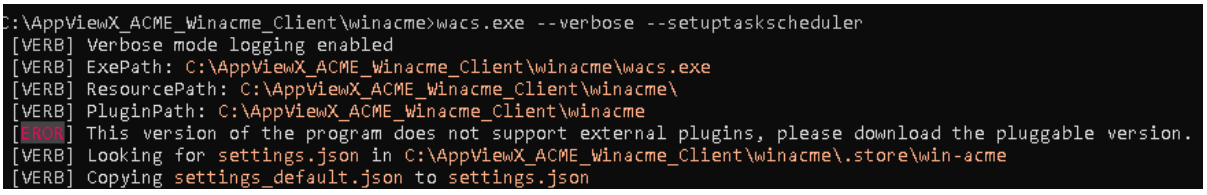
> **Attention:** Ensure that you have removed the .store directory within the win-acme folder. Neglecting this step might result in the creation of a scheduled task using parameters from the previous settings.json configuration disregarding the recent adjustments.

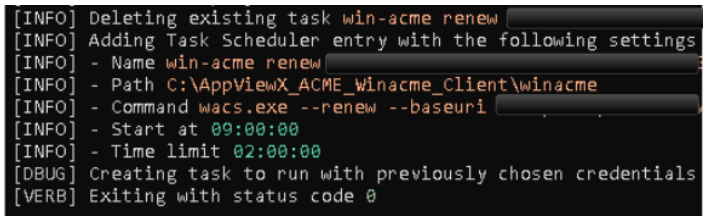
It is possible to create a renewal task for win-acme in Windows using either a command or an interactive terminal session.

Using Command

1. Open command prompt with admin privilege and run:

```
wacs.exe --verbose --setuptaskscheduler
```





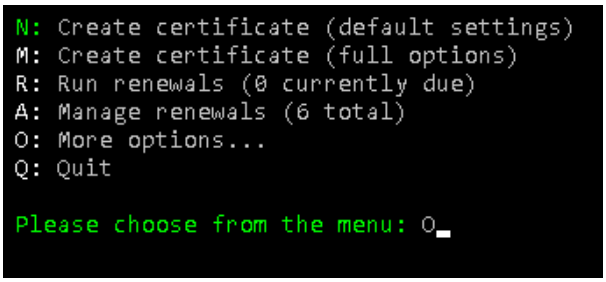
2. Ensure that the **Start at** time in the end of the log matches with the **StartBoundary** time specified in the settings.json file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

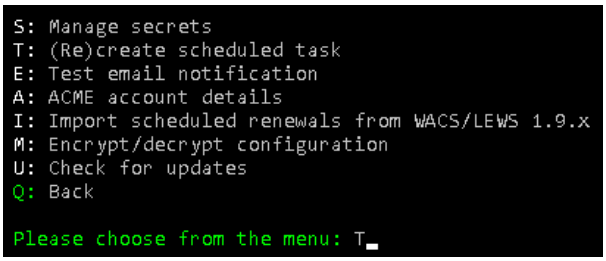
Using Interactive Terminal

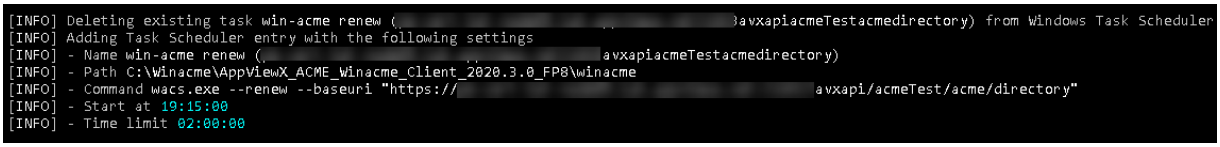
1. Run the following command and choose option O to go into More Options:

```
wacs.exe --verbose
```



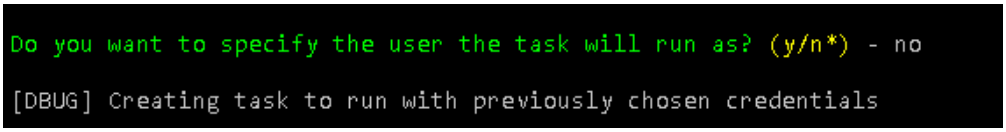
2. Choose option T.





Ensure that the **Start at** time aligns with the **StartBoundary** time specified in the settings.json file.

3. Type n.



This sets up a scheduled task in the Windows Task Scheduler for the renewal of win-acme using the parameters specified in the settings.json file.

> **Note:** You can cross verify by refreshing the Task Scheduler Library to find the **win-acme renew** task. Check if the **Next Run Time** of this task matches the defined **StartBoundary** time.

Points to be noted:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Whenever the scheduled **win-acme renew** task is triggered, the newly generated certificates from the renewal process will take the place of the older certificates in the **Certificates - LocalComputer \Web Hosting\Certificates** section present within the **Manage computer certificates** console.
- Certificates that have a remaining validity period that is equal to or greater than the specified **RenewalMinimumValidDays** will not be subjected to renewal and will remain unaltered in the certificates console.
- After scheduling a win-acme renewal task using the specified settings.json, the task will continue to operate with those configurations until a new win-acme renewal task is generated with altered settings.
- Later on, if you want to (re)create a scheduled task for winacme renewal, simply go through the steps **a** and **b** as described earlier. This will overwrite any existing winacme renewal task in the task scheduler, if there is one.
- Other properties of the scheduled task like **RenewalDays**, **ExecutionTimeLimit** can also be changed in a similar manner. Some of these parameters can be changed from the Task Scheduler itself, as long as the name is not modified.

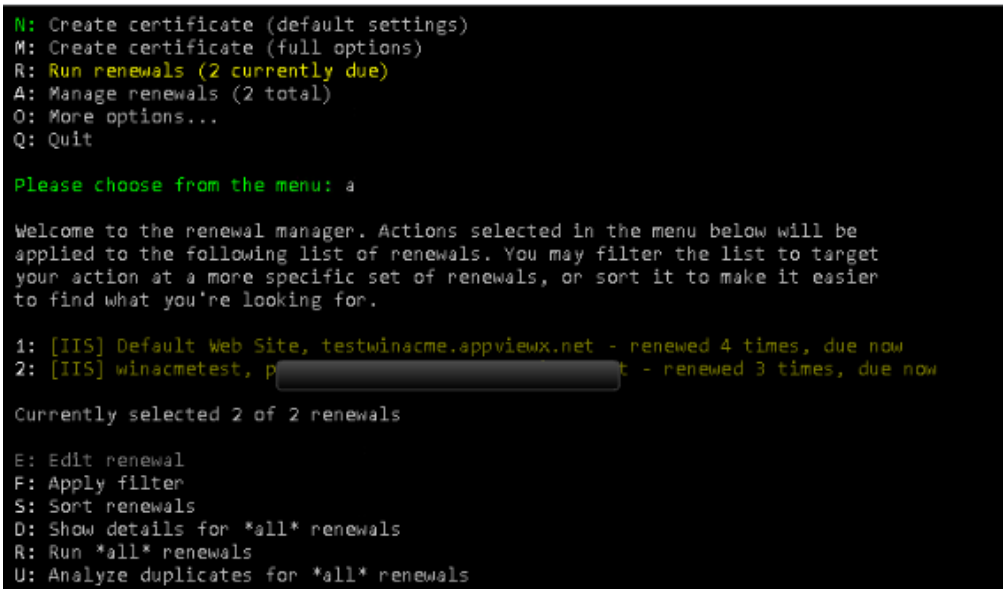
Revoking Certificates

Revoking a certificate must be done only when the private key is believed to have been compromised, and not when simply replacing or canceling the private key. Revocation can be done from **Manage renewals > Revoke certificate**.

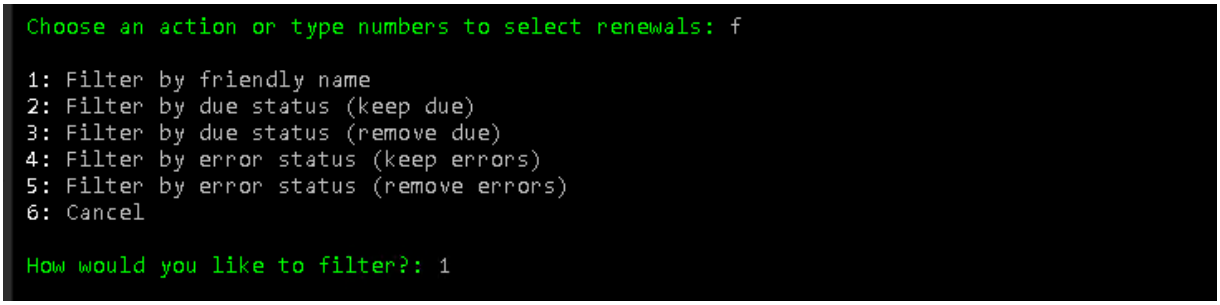
To revoke a certificate in win-acme:

1. Run `wacs.exe`.
2. Enter A to list the certificates. These names can be used to revoke a particular certificate.

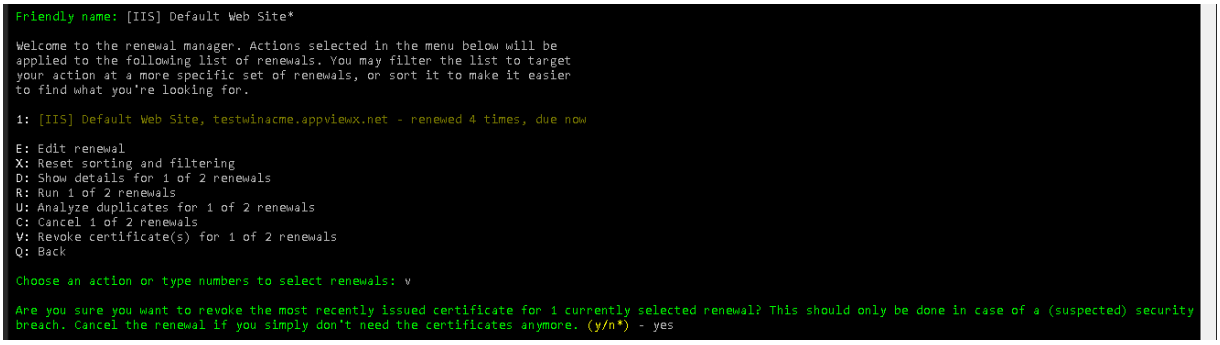
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



3. Enter V to revoke all certificates. If one particular certificate is to be revoked, then use F option to apply filter.



4. If F is chosen, this menu will be prompted. Enter 1 to filter by friendly name.



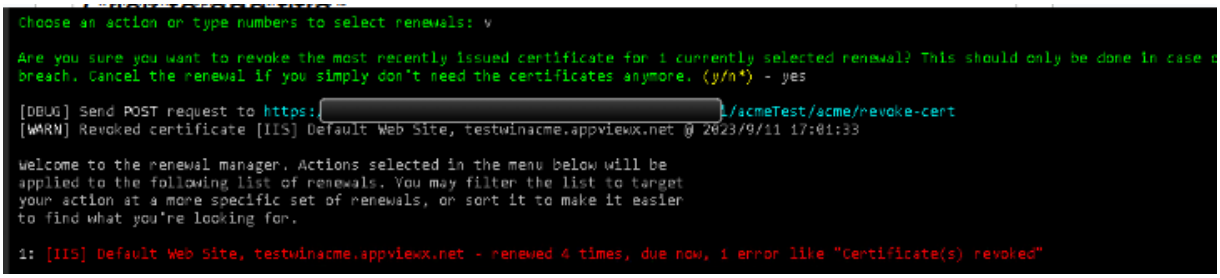
5. Enter the friendly name as shown (Friendly names are displayed in Step 1):

Example 1	If the name displayed in the menu is [IIS] winacme-test, pe-cert-swat-142107.appviewx.net, then enter the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	following in the friendly name filter → `[IIS] winacme-test*`
Example 2	If the name displayed in the menu is `[IIS] Default Web Site, testwinacme.appviewx.net`, then enter the following in the friendly name filter - `[IIS] Default Web Site*`

6. Verify if the intended certificate is filtered.
7. Enter V to revoke the selected certificate and type yes for the revoke prompt as shown:



Issuing Certificates using Tomcat Server

To issue a certificate with win-acme using the Tomcat server for challenge validation, run:

```
wacs.exe --verbose --target manual --validation filesystem --host <server-domain-name> --webroot "<complete-path-of-tomcat-webapps-folder>"
```

Sample command:

```
wacs.exe --verbose --target manual --validation filesystem --host test.appviewx.net --webroot "C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps"
```

Note: --webroot "<complete-path-of-tomcat-webapps-folder>": This should point to the location where Tomcat serves its web applications. The certificate will not bind to the server with this command.

Issuing and Binding Certificates using Tomcat Server

1. While win-acme does not include a native plugin for binding certificates to the Tomcat server, the following command can be used to leverage the installation script option in win-acme:

```
.\wacs.exe --verbose --target manual --validation filesystem --host <server-domain-name> --webroot "<complete-path-of-webapps-folder>" --store pfxfile --pfxfilepath "<pfx-file-folder>" --pfxpassword <pfx-password> --accepttos --pfxfilename <pfx-file-name> --installation script --script "<script.ps1 file>"
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

where:

- <server-domain-name>: The actual domain name for which the certificate is requested (e.g., example.com).
- <complete-path-of-webapps-folder>: This should point to the location where Tomcat serves its web applications.
- <pfx-file-folder>: The directory where the PFX file will be saved (e.g., C:\path\to\output\folder).
- <pfx-password>: The password used to encrypt the PFX file, securing the private key.
- <pfx-file-name>: The desired name for the PFX file to be created (e.g., mycert).
- <script.ps1 file>: The full path to the PowerShell script that will run after certificate issuance (e.g., C:\path\to\your\script.ps1).

Sample command:

```
.\wacs.exe --verbose --target manual --validation filesystem --host test.appviewx.net --webroot "C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps" --store pfxfile --pfxfilepath "C:\Program Files\Apache Software Foundation\Tomcat 9.0\conf" --pfxpassword Test@1234 --accepttos --pfxfilename cert2024.appviewx.com --installation script --script "C:\Users\admin\Desktop\restart_tomcat_9.ps1"
```

2. Sample PowerShell Script to restart the Tomcat service:

```
Restart-Service -Name 'Tomcat9'
```

The following operations are performed when this command is run :

1. Perform challenge validation using Tomcat on port 80 to obtain the certificate.
2. Export the PFX file with the required password and file path.

> **Note:** This file is referenced in Tomcat's server.xml. This allows win-acme to automatically replace the certificate as needed.

3. PowerShell (.ps1) script that restarts the Tomcat server is run after the certificate is issued, ensuring the new certificate is bound to the Tomcat instance.

Support for other .NET Versions

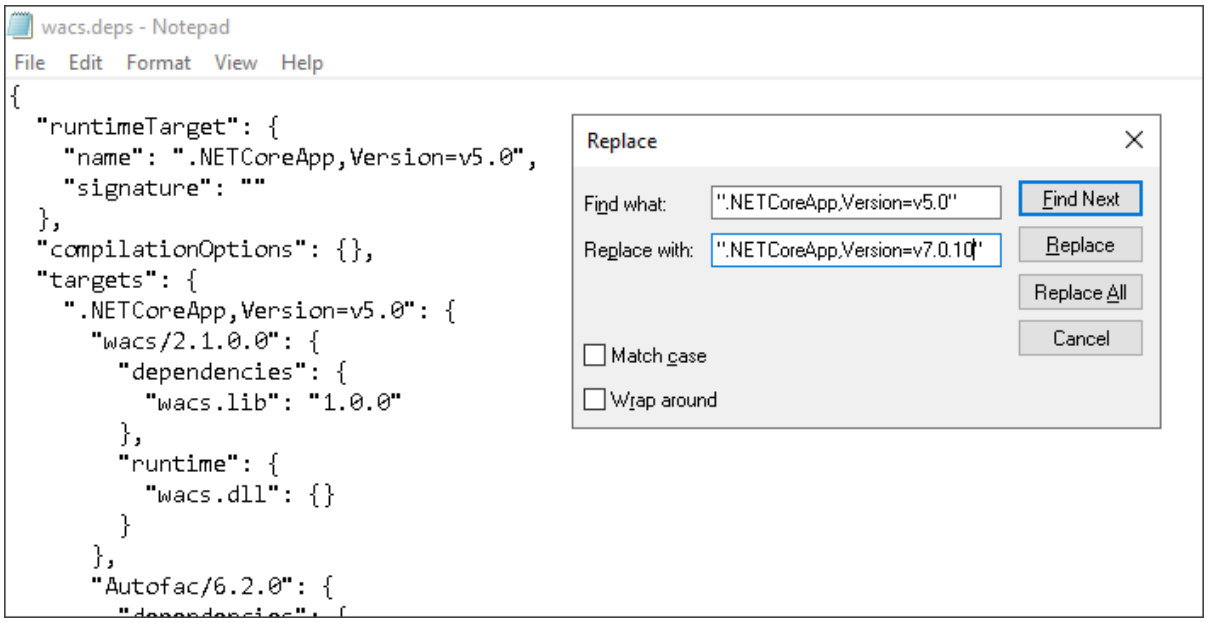
win-acme supports .NET v5. For newer .NET versions, the configurations in `wacs.dep` and `wacs.runtimeconfig` need to be changed. These files are found in the win-acme folder.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Changes in the wacs.dep file

- Use CTRL+H to open the *find and replace* menu to replace `.NETCoreApp,Version=v5.0` with `".NETCoreApp,Version=v<version of .NET in the pc>"`
- Use the complete version number when replacing, such as 7.0.10

  For example: `".NETCoreApp,Version=v5.0"` is replaced with `".NETCoreApp,Version=v7.0.10"`



- Similarly replace (replace all) `"Microsoft.NETCore.Platforms": "5.0.0"` with `"Microsoft.NETCore.Platforms": "<version of .NET in the pc>"`.

Changes in the wacs.runtimeconfig file

- Replace (use replace all) `"tfm": "net5.0"` with `"tfm": "net<version of .NET in the pc>"`
- Replace `"version": "5.0.0"` with `"version": "<version of .NET in the pc>"`.

Best Practices

- **Prefer Stronger Key Sizes:** Use higher key sizes where applicable—consider using RSA 2048 or above for increased cryptographic strength.
- **Distribute Renewal Schedules:** Ensure that certificate renewal cron jobs or schedulers are spread out in time to avoid concentrated load on the ACME server and ensure smooth, uninterrupted renewals.
- **Use External Account Binding (EAB):** Use EAB as an added layer of authentication for enhanced security.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Secure your API credentials:** Store DNS provider API keys securely (e.g., environment variables, encrypted files).
- **Challenge Methods:** Prefer **DNS-01 challenge** when possible using supported DNS APIs. For **HTTP-01**, ensure port 80 is reachable and forwarded correctly if behind a NAT or firewall.
- **Scripting & Hooks:** Use pre- and post-renewal scripts to restart IIS or services and to copy certificates to remote locations or appliances.
- **Storage:** Use --store and --installation parameters wisely to define multiple cert storage and bindings (IIS, file, registry, etc.).
- **Logging:** Enable **verbose logging** and monitor the renewal logs at C:\ProgramData\win-acme\logs.
- **Custom Package Verification:** Make sure the AppViewX DNS plugin is available in Winacme package if the user is using the AppViewX DNS Challenge or the Enterprise Secure DNS Challenge option.

Troubleshooting

Accessing ACME Logs

1. Access the terminal window.
2. Go to <Installed_Path>/logs directory and find the name format with <avxgw-HTTPS-<yyyy-mm-dd>.log>. For example, <avxgw-HTTPS-2021-03-17.log>
   - If the file size exceeds 100MB, it will be rolled over and the latest logs will be available in the latest file named with an incrementing counter starting from 1 such as avxgw-HTTPS-<yyyy-mm-dd>.<incrementing_counter>.log, for example, <avxgw-HTTPS- 2021-03-17.1.log>.
   - ACME plugin logs:

     </home/appviewx/appviewx/logs/avx-vendor-cert-acme-agent-<pod_name>.log>

Common Issues

- You may need to install Microsoft Visual C++ 2015 Redistributable Update 3
- If you run into an error about api-ms-win-crt-runtime-l1-1-0.dll, refer to KB2999226.
- If you run into an error about hostfxr.dll, refer to KB2533623.
- If you run into an error such as Failure processing application bundle, perhaps this thread might provide a solution.
- If the program does not seem to start but you see an error such as Microsoft.Windows.Apprep.ChxApp_cw5n1h2txyewy:App.AppXc99k5qnnsvxj5szemm7fp3g7y08we5vm.mca in the Event Viewer, this thread might provide a solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Scenarios

To troubleshoot the renewal process, renewals can be triggered manually from the menu. When listing the details for renewal, the program displays any errors that have been recorded during the previous runs.

#	Error Message	Description	Troubleshooting
1	Unable to connect to ACME server System.Net.Http.HttpRequestException: An error occurred while sending the request. ---> System.Net.Http.WinHttpException (80072EE7, 12007): Error 12007 calling WINHTTP_CALLBACK_STATUS_REQUEST_ERROR, 'The server name or address could not be resolved'.	The default base uri name is not configured in the settings.json / the configured URL or the port is wrong.	Configure the correct URL in the default base uri section in settings.json file.
2	Initial connection failed	1. Configured Agent settings URL might be incorrect. 2. AppViewX Server / CC might not have a valid certificate. 3. Certificate bound to AppViewX server/CC might not be trusted by the Windows machine.	1. Check the value DefaultBaseUri in the settings.json, it should be the same as ACME URL in AppViewX GUI. Always use the hostname instead of IP while configuring the ACME end point in AppViewX GUI. 2. Bind a valid certificate to the gateway. 3. The certificate that is bound to the AppViewX server / Cloud Connector should be trusted by the windows client machine, that is, the root

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
			and intermediate certificates associated with the bound certificate must be added to the Windows root and intermediate trust stores.
3	Failed to create order: Unable to fetch acme server url. - Agent Settings name given is invalid	The Agent name provided in the URL is incorrect / Agent setting is not configured in the ACME server side configuration.	Check the status of the ACME end point in AppViewX GUI. It should be in Valid status. If it is in failed status, check the reason for the same and fix it. 1. Agent settings failed in ACME services step, then the ACME pod is not enabled in AppViewX. Enable the same 2. Agent settings validation failed in CA Settings Step, then check in the CA settings page check the test connection status of the ACME endpoint configured CA, it might be

#	Error Message	Description	Troubleshooting
			and delete the Registration_v2 file
7	Unable to perform ACME order finalize operation - Either CSR Parameters,CA details or certificate algorithm values are not compliant with the policy name - <Policy Name>	CSR parameters from the client are not matching with parameters configured in AppViewX policy.	Check if the policy is set as strict. • Change the policy type to Suggestive. OR • Configure the CSR parameters as per the policy requirements (Cert policy in AppViewX)
8	Unexpected order status processing (Exception): Unable to complete order	Certificate issuance is still in progress or failed.	Navigate to the holistic view of the certificate in AppViewX and check for the work order status: • **In progress:** CA is taking time to issue the certificate. Increase the retry count and frequency. • **Failed:** Click the work order and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
			check the reason for failure and remediate it.
9	Self DNS Challenge token validation/IP Validation option is selected but EAB details/Allowed domains are not configured for the agent settings.	When AppViewX **DNS Challenge** or **Enterprise Secure Challenge Validations** is selected but **Allowed Domains** or EAB details are not provided from the ACME client, you get this error.	1. Provide valid domains under the **Allowed Domains** field. 2. Enable either **Static EAB** or **Dynamic EAB credentials**.
10	DNS Challenge validation failed. IP Options are not selected for agent settings. Allowed options are STRICT, ANY, NONE.	If Enterprise Secure Challenge type other than **Secure, Any, Ignore** is selected in the ACME Settings.	Select any one of the following under Enterprise Secure Challenge options: **Secure, Any, Ignore.**
11	DNS Challenge validation failed. ACME DNS challenge verification via DNS A record failed. For STRICT Option IP didn't Match.	If the **Secure** option is selected under **Enterprise Secure Challenge** type and the ACME client’s IP address does not match with the available DNS	Make sure that the DNS A record of the requesting domain contains the same IP address as the ACME client's IP address.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
		A record for the particular domain.	
12	DNS Challenge validation failed. ACME DNS challenge verification via DNS A record failed. For STRICT Option there are more IP address entries in DNS A Record.	If the **Secure** option is selected under **Enterprise Secure Challenge** type and the DNS A record for the requesting domain is fetched with more than one IP address.	Make sure that the DNS A record of the requesting domain contains only one IP address, which is the same as the ACME client's IP address.
13	DNS Challenge validation failed. No DNS A records are found to validate ANY type.	If the **ANY** option is selected under **Enterprise Secure Challenge** type and the DNS A records for the requesting domain are fetched in which none of the IP address matches with the ACME client’s IP address.	Make sure that the DNSA records of the requesting domain contains any one IP address, which is the same as the ACME client’s IP address.
14	DNS Challenge validation failed. DNS A record for the domain <domain name> is not available.	When AppViewX is not able to obtain the DNS A records for the requesting domain.	• Check if the DNS Server is reachable from AppViewX to resolve and obtain the DNS A records

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
			of the requesting domain. • Check if the provided DNS server hostname is proper to resolve and obtain the DNS A records.
15	DNS Challenge validation failed. Error while executing Create/Delete record operation.	1. When AppViewX is not able to reach the DNS server for creating DNS TXT for the requesting domain. 2. When there are errors while performing creation or deletion of DNS TXT records in the DNS server.	1. Check if the DNS server is reachable from AppViewX. 2. Check AppViewX logs for detailed errors regarding creation and deletion of errors.
16	[ERR] (WinHttpException): Error 12002 calling WINHTTP_CALLBACK_STATUS_REQUEST_ERROR, 'The operation timed out'.	This issue occurs during the challenge validation process. When validation fails, it is often due to the firewall	Configure the firewall to allow AppViewX server/CC to access port 80 of the win-acme machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
		or Microsoft Defender blocking the AppViewX server or CC from accessing port 80 on the Windows machine.	

Keywords Used in win-acme Commands

Keyword	Expected Input	Comments
-host	<Domain_Name> (Type: String) **domain1.com** (or) **domain1.com, domain2.com, domain3.com**	Comma-separated list of domains to obtain a certificate for.
-baseuri	<Acme Server Endpoint URL fetched from AppViewX GUI> (Type: String)	ACME Directory Resource URI.
-source	csr/iis/manual	Source using which the CSR is generated

Configuring AppViewX Certbot Client

What is Certbot?

Certbot is a popular open-source tool for automating the process of obtaining and managing SSL/TLS certificates. It acts as an ACME (Automated Certificate Management Environment) client, which is a protocol used by certificate authorities (CAs) to issue certificates. The Certbot agent provides a command-line interface (CLI) and automation capabilities to simplify the certificate management process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

It handles the entire certificate lifecycle, including certificate generation, renewal, and installation. Certbot automates the process of obtaining certificates from Let's Encrypt, a free and open certificate authority, which is the default option but can be configured to work with other CAs as well. Certbot is a powerful and user-friendly tool that simplifies the deployment and management of SSL/TLS certificates, promoting the widespread adoption of secure HTTPS communication on the web.

Note:

The inherent challenges of using native Certbot include the issuance of certificates without common names, the absence of support for custom attributes, the need for manual installation of Certbot dependencies and virtual environments, and the lack of a user-friendly terminal experience.

Our solution addresses these limitations comprehensively by providing certificates with common names. It supports custom attributes, automates dependency installation and virtual environment setup required for Certbot to run, and offers a user-friendly terminal. These enhancements improve functionality and user experience significantly.

Advantages of AppViewX Certbot

- Single-click installation and interactive digital certificate CLM operations.
- Support for working with Let’s Encrypt CA through AppViewX (where AppViewX acts like an ACME Proxy to Let’s Encrypt CA).
- Custom attribute and certificate attribute support in Certbot command for enrollment and renewal.
- Addition of CA Certificate in native trust store for the ACME client to work with any CA issued SSL Server certificate.

Getting Started

Prerequisites

- The AppViewX server/cloud connector must be bound with a valid certificate. See Section, *Binding Custom Certificate to Gateway in Cloud Connector*.
- Ensure you have root user permissions.
- A proper DNS entry for the Linux server where Certbot is installed.
- Certificate attributes must be configured to capture custom attributes in the AppViewX GUI (if required).
- A valid ACME endpoint must be configured on the AppViewX GUI.
- To enable client connections, it is essential to have ports 31443 open for on-premises deployment and port 30020 (in cloud connector) open for SaaS deployment in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- If the domain validation is done using **HTTP challenge**, it is essential to have port 80 accessible on your Linux machine to allow AppViewX to establish a connection.
- If the domain validation is done using **DNS challenge**, then the DNS server must be up and running and the DNS credentials must be configured in the Certbot client.
- Internet connectivity is required to successfully install the Certbot client.

System Requirements

- **Environment Details:** Linux
- **Operating System:**
  - Ubuntu 20.4
  - CentOS 7
  - Red Hat 8.6
  - Debian 10
  - Devuan 3
  - OpenSUSE Tumbleweed

- **Python 3.8** (Ubuntu 20.4, CentOS 7, Red Hat 8.6)
- **Python 3** (Debian 10, Devuan 3, OpenSUSE Tumbleweed)
- **OpenSSL**
- **Virtual environment (venv) and required dependencies** for Certbot
- **jq package** is a prerequisite (must) to access Interactive digital certificate CLM operations.
- **REQUESTS_CA_BUNDLE environment variable** (custom CA bundle path in the root user's .bashrc file) which is required to enable SSL verification. The root certificates trusted by Certbot can be overridden by setting the REQUESTS_CA_BUNDLE environment variable.

If any of the above packages are not installed or configured in your system, AppViewX will do it for you without any human intervention.

Installing Certbot

Certbot comes in two versions: open-source and the one provided by AppViewX. When using the open-source Certbot via AppViewX, the Common Name field will not be filled, and features specific to AppViewX such as custom/cert attributes, customizable EAB algorithms, and CSR options, will be unavailable.

If you are using the open-source Certbot, proceed directly to the certificate enrollment section. Keep in mind that a virtual environment may not be required for enrollment, depending on the version of the open-source Certbot installed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Download the Certbot client from the AppViewX release portal.
2. Open your terminal and go to the directory where you downloaded the Certbot zip file.
3. Unzip the file and open the unzipped folder.
4. To proceed with further installation steps, you must have root privileges. Log on as sudo user using the command:

```
sudo -i
```

Installing Certbot via Automated Installation Files

For automated installation, AppViewX provides a simple installation script [install.sh] that streamlines the setup process, including the creation of a virtual environment and automatic downloading of all required dependencies. To install using the install.sh script, follow these steps:

1. Log on as root user using:

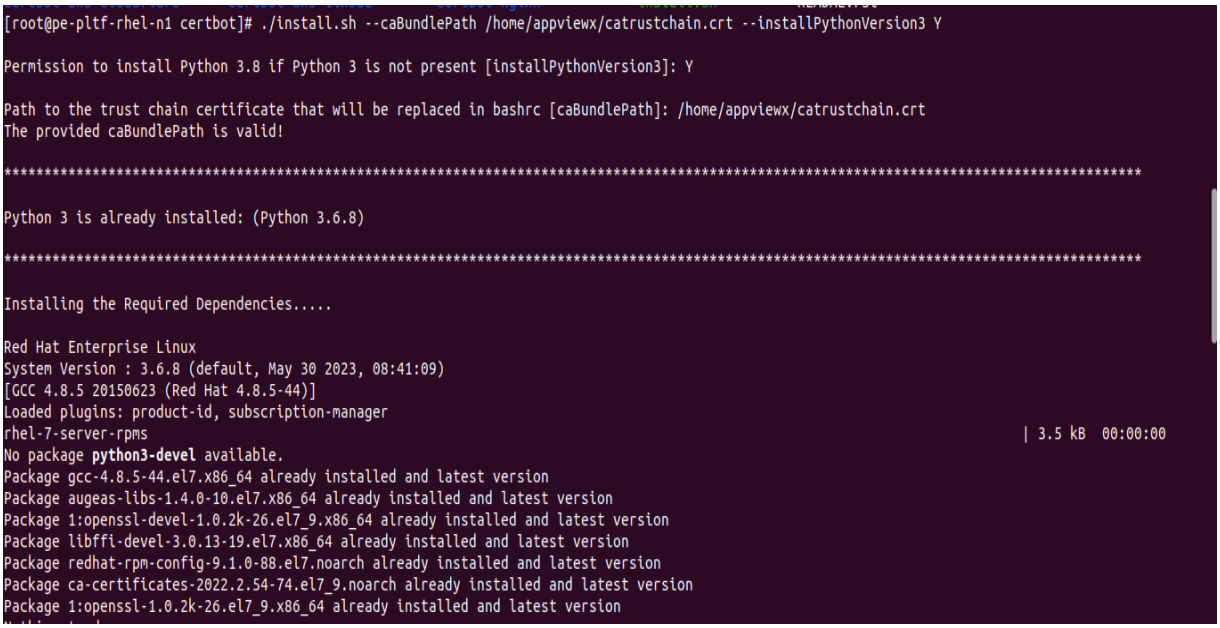
```
sudo -i
```

2. To install dependencies and set up the virtual environment, run:

```
./install.sh
```

You may also pass additional parameters with the install.sh as in the command:

```
./install.sh --caBundlePath /home/appviewx/caCertificate.crt --installPythonVersion3 Y
```



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameter Description

Parameters	Type/ Values	Mandatory	Description
--caBundlePath	Path of the caBundle certificate	No	To strictly enforce SSL verification during the enrollment or renewal of certificates through Certbot, you must provide a custom CA BUNDLE path, indicating the path to your designated trust store file location with the **caBundlePath** parameter. The provided path is used to set the REQUESTS_CA_BUNDLE environment variable in the user's .bashrc file. Alternatively, if you opt to bypass SSL verification during certificate enrollment or renewal via Certbot. Do not provide the **caBundlePath**. In this scenario, the installation process will proceed without having to provide a CA BUNDLE path. However, you will still have the option to activate SSL verification by manually configuring a custom bundle path at a later time. See Section, *Prerequisites*.
--installPythonVersion3	Y (or) N	No (default value : 'N')	The install.sh script examines the Python version present on the client system. If the detected version is below 3, the installation script attempts to install Python 3.8 only if the installPythonVersion3 parameter is configured to Y. If the installPythonVersion3 parameter is set to N, the installation

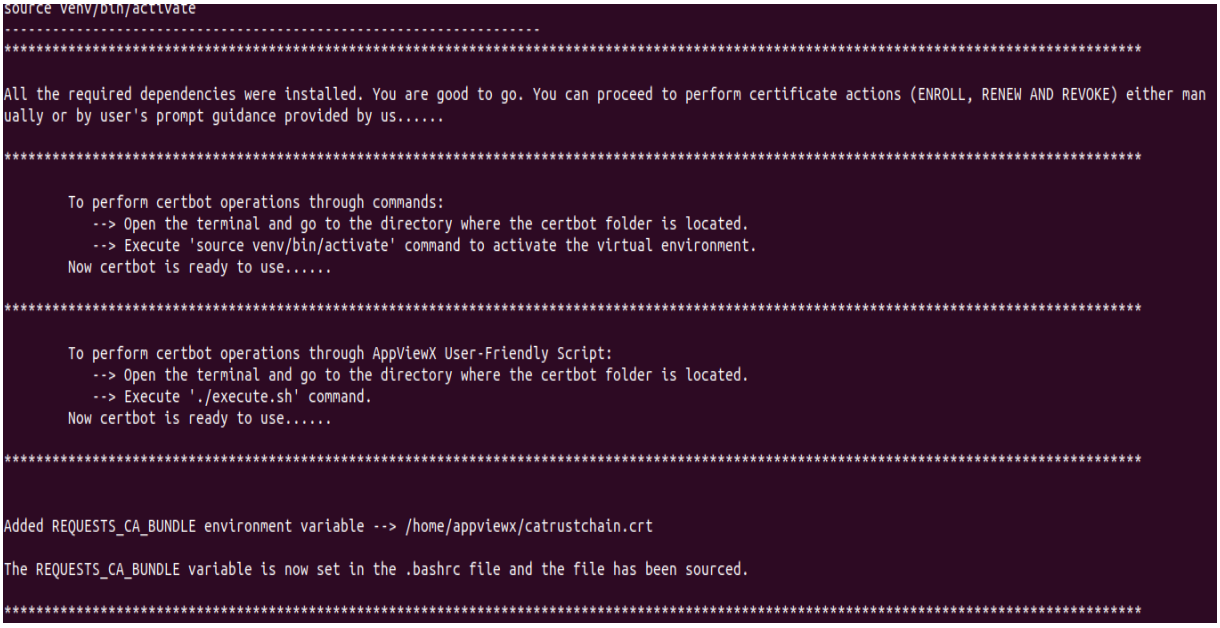
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters	Type/ Values	Mandatory	Description
			process is terminated if Python 3 or a higher version is not found on the client system.

During the installation process:

- The install.sh script verifies the presence of the necessary Python version compatible with the operating system.
- In the event that the required version is absent and the installPythonVersion3 parameter is passed as Y, the script proceeds to install python 3.8.
- The script installs the mandatory Certbot dependencies and establishes the essential virtual environment.

Once the installation is complete, you will see the following details:



Installing Certbot via Commands

To install and to create a Certbot virtual environment manually, follow these steps:

1. Switch to root user using the `sudo -i` command.
2. Install all the required dependencies using:

```
apt install python3-dev gcc libaugeas0 libssl-dev libffi-dev ca-certificates openssl
```

-OR-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
yum install python3-devel gcc augeas-libs openssl-devel libffi-devel redhat-rpm-config ca-certificates openssl
```

3. Open the Certbot folder using:

```
cd certbot_client/certbot
```

4. Setup the virtual environment running:

```
python3 tools/venv.py
```

A virtual environment is activated within the Certbot folder. You can enroll a certificate, re-enroll, or revoke using the commands mentioned in the Section, Enrolling Certificate.

Installing Bluecat Micetro Plug-In

1. Go to the certbot home directory. Copy the certbot-dns-bluecat-micetro.zip into the certbot home directory.
2. Extract the certbot-dns-bluecat-micetro.zip and ensure that the certbot-dns-bluecat-micetro folder is available in the certbot home directory.
3. Run the following command if virtual environment is configured:

```
source venv/bin/activate
```

4. Run the following command to install Bluecat Plugin:

```
pip install -e <path_to_bluecat_plugin>
```

5. Create a Bluecat credential file with the following values, in the format below:
   - dns_bluecat_micetro_hostname="<bluecat_hostname>"
   - dns_bluecat_micetro_username="<username>"
   - dns_bluecat_micetro_password="<password>"
6. To issue certificate run the following command: (sample command below)

```
certbot certonly -d <FQDN> --preferred-challenges dns --authenticator dns-bluecat-micetro --dns-bluecat-micetro-credentials <bluecat_credentials_file_path>
 --server <ACME_SERVER> --no-verify-ssl
```

Adding Custom CA Certificates to Trust Store

In Certbot, the **--no-verify-ssl** option disables the SSL certificate verification when making HTTPS requests to the ACME server.

If SSL verification is not required, skip the following steps and proceed with enrollment using **--no-verify-ssl.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If SSL verification is required, bind the AppViewX server/CC in both on-prem and SaaS environments with a valid server certificate. Ensure that the issuing CA of the server certificate is trusted by the client machine to successfully complete the SSL verification by following these steps:

Note: Ignore this section if the issuer CA certificates are already trusted by the end machines, or if **--no-verify-ssl** is used, or if the trust has been added via the install.sh script in the previous step.

1. To obtain the certificate chain:
   a. If the server certificate is created in AppViewX, download the chain certificates from the AppViewX inventory; else, download the certificate chain files (.pem or .crt) for the Certificate Authority (CA). This chain must include the root certificate as well as any intermediate certificates of the server.
   b. If there are individual certificates for root CA and intermediate CAs, combine these certificate filesinto a single file. This can be done either through a text editor or by using the command:

      ```
      cat intermediateca.crt rootca.crt > acmetrustchain.crt
      ```

      Here, the intermediate *ca.crt* and *rootca.crt* are sample root certificate files, so change them accordingly. *acmetrustchain.crt* is the final concatenated trust chain certificate.

2. To address situations where Certbot does not trust the SSL certificate employed by the ACME server, add the issuer CA certificates to the appropriate Linux trust store:
   a. Determine the appropriate trust store on your Linux system. Common locations for trust stores are /etc/ ssl/certs/ca-certificates.crt and /etc/ssl/certs/ca-bundle.crt.
   b. Log on as sudo user:`sudo -i`
   c. Go to the directory where the acmetrustchain.crt file is located.
   d. Copy the contents of the certificate chain files and append them to the end of the trust store file using the command: cat acmetrustchain.crt >> /etc/ssl/certs/ca-certificates.crt

      Note to change the trust store part accordingly.

Accessing Certbot

Certbot can be accessed either by:

- Certbot command line
- AppViewX Certbot user-friendly script

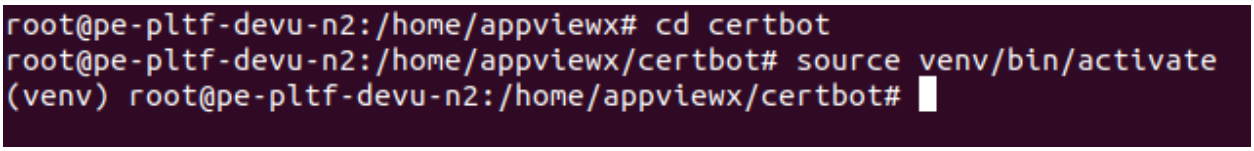
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Method 1: Using Certbot Command Line

Activating Developer Environment

To activate the developer environment, run:

```
source venv/bin/activate
```



Enrolling Certificate

1. **Using HTTP challenge in Standalone Mode**

   HTTP-01 challenge: This is the most common challenge type. The ACME server issues a token to the ACME client, and the ACME client puts a file on the web server at **http://<YOUR_DOMAIN>/.well-known/acme-challenge/<TOKEN>**. Once the token is published on the web server (Linux server), AppViewX sends an HTTP request to fetch the token from the client machine.

   Note: The common name must resolve to the IP address of the client machine, and port 80 on the client machine must be accessible to AppViewX.

   • A sample Certbot certificate enrollment command using HTTP challenge is as shown:

   ```
   certbot -vv certonly --standalone --preferred-challenges http -d <domain_name> --logs-dir /etc/avx-certbot/
   --config-dir /etc/avx-certbot/ --work-dir /etc/avx-certbot/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from
   AppViewX GUI>
   ```

2. **Using HTTP challenge when Apache server is running on Port 80**

   If the Apache server is already running on port 80 but is not available, Certbot's Apache plugin allows it to be used for challenge validation. To enable this functionality, a new folder must be created in the /etc directory. This directory will serve as the configuration, working, and log directory when using the **--apache plugin** option. For example, by creating a folder named **avx-certbot** within /etc and specifying it as a custom directory, this setup can be achieved..

   A sample command is as shown:

   ```
   certbot certonly --apache -d <domain_name> --preferred-challenges http -m <Email> --agree-tos --no-verify-ssl --server <ACME_URL>
   --config-dir /etc/avx-certbot/ --logs-dir /etc/avx-certbot/ --work-dir /etc/avx-certbot/
   ```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. **Using DNS challenge**

DNS-01 challenge: This challenge requires you to demonstrate control over the DNS for the domain name by inserting a specific value into a TXT record within that domain. Subsequently, AppViewX conducts a DNS query to verify the presence of the token in the domain's DNS records.

Refer to the following link to configure and use Certbot with different type of DNS servers: https://eff-certbot.readthedocs.io/

- **Default Challenge Validation (using default plugins)**

  This challenge requires demonstrating control over the DNS for a domain by adding a specific value to a TXT record within that domain. AppViewX then performs a DNS query to verify the presence of the token in the domain's DNS records.

  A sample command to do the challenge validation using the AWS route 53 server is as shown:

  ```
  certbot -vv certonly --preferred-challenges dns --dns-route53 -d <domain_name> --logs-dir /etc/avx-certbot/--config-dir /etc/avx-certbot/
  --work-dir/etc/avx-certbot/ -m <mail_id> --agree-tos --no-verify-ssl --server<ACME server endpoint URL fetched from AppViewX GUI>
  ```

  You must configure the credentials in Certbot to access the DNS servers. Refer to the following link to configure and use Certbot with different type of DNS servers: https://eff-certbot.readthedocs.io/en/stable/

- **DNS Challenge Validation (using AppViewX DNS plugin with Infoblox DNS Server)**

  This challenge requires demonstrating how AppViewX manages DNS for the domain by adding a specific value to a TXT record within it. AppViewX then performs a DNS query to verify the token's presence in the domain's DNS records. With the support of Platform Integration Hub, AppViewX will handle all tasks related to creating, searching for, and deleting TXT records in the DNS server.

  A sample command to do the AppViewX DNS Challenge Validation option is as shown:

  ```
  certbot certonly --dns-appviewx --dns-vendor infoblox --dns-server <Infoblox server name configured in appviewx> -d <Domain name> --logs-dir <logs dir>
  --config-dir <config dir> --work-dir <work dir> -m <mail id> --agree-tos --no-verify-ssl --eab-kid <key identifier> --eab-hmac-key <HMAC value> --server
  <acme url>
  ```

- **Enterprise Secure Challenge Validation**

  This challenge involves demonstrating how AppViewX manages DNS for a domain by querying the DNS A record to verify the presence of the client's IP address. This verification does not require DNS server credentials, as it only entails accessing the DNS A record for the specified domain.

  A sample command to do the AppViewX Enterprise Secure Challenge Validation option is as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
certbot certonly --dns-appviewx -d <Domain name> --logs-dir <logs_dir> --config-dir <config_dir> --work-dir <work_dir> --agree-tos --no-verify-ssl --eab-kid <key identifier> --eab-hmac-key <HMAC value> --server <acme_server_url>
```

Note: DNS Challenge Validation and Enterprise Secure Challenge Validation are only supported through the command-line interface (CLI) and not through the interactive script (execute.sh).

Re-enrolling Certbot using DNS-Based Challenge Validation

- **Default Challenge Validation**

```
certbot renew --no-verify-ssl --no-random-sleep-on-renew --eab-kid <key identifier> --eab-hmac-key <HMAC value> --config-dir <config dir for which renew should be triggered> --force-renewal
```

To automate renewal for Certbot through cron job, run:

```
(crontab -l ; echo "MM HH * * * /usr/bin/env bash -c 'source <certbot_folder/venv/bin/activate> && certbot renew --no-verify-ssl
 --no-random-sleep-on-renew
--config-dir <config_dir>'") | crontab -
```

- **DNS Challenge Validation**

```
certbot renew --dns-appviewx --dns-vendor infoblox --dns-server <Infoblox server name configured in appviewx> --no-verify-ssl
 --no-random-sleep-on-renew
--config-dir <config dir for which renew should be triggered> --eab-kid <key identifier> --eab-hmac-key <HMAC value> --force-renewal
```

To automate renewal for Certbot through cron job, run:

```
(crontab -l ; echo "MM HH * * * /usr/bin/env bash -c 'source <certbot_folder/venv/bin/activate> && certbot renew --dns-appviewx --dns-vendor infoblox
--dns-server <Infoblox server name configured in appviewx> --no-verify-ssl --no-random-sleep-on-renew --config-dir <config dir for which renew should be
 triggered> --eab-kid <key identifier> --eab-hmac-key <HMAC value> --force-renewal'") | crontab -
```

- **Enterprise Secure Challenge Validation**

```
certbot renew --dns-appviewx --no-verify-ssl --no-random-sleep-on-renew --config-dir <config dir for which renew should be triggered> --eab-kid <key identifier> --eab-hmac-key <HMAC value> --force-renewal
```

To automate renewal for Certbot through cron job, run:

```
(crontab -l ; echo "MM HH * * * /usr/bin/env bash -c 'source <certbot_folder/venv/bin/activate> && certbot renew --dns-appviewx --no-verify-ssl
--no-random-sleep-on-renew --config-dir <config dir for which renew should be triggered> --eab-kid <key identifier> --eab-hmac-key <HMAC value>
--force-renewal'") | crontab -
```

4. **Using Polling during Enrollment**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Polling can be activated when manual approval is configured for certificate generation. In this scenario, the client conducts polling for the certificate within a specified time frame, as determined by the configured parameters. If the certificate is approved before the polling duration expires, it is retrieved. To enable polling in the Certbot client, you may pass the parameters as mentioned:

Parameters	Type	Mandatory	Description
--retry-after	Integer	No	The waiting period in seconds, after which the next call in the polling is triggered. [Default value : 10]
--retry-frequency	Integer	No	The number of times for which the certificate is polled from the client side. [Default value : 20]

A sample command with **retry-after** as **5** and **retry-frequency** as **10** is as shown:

```
certbot -vv certonly --standalone --preferred-challenges http -d <domain_name> --logs-dir /etc/avx-certbot/ --config-dir /etc/avx-certbot/
 --work-dir /etc/avx-certbot/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX GUI> --retry-after 5
 --retry-frequency 10
```

In this case, the certificate is polled 10 times with a 5-second interval for each polling attempt. Therefore, the polling process takes a total of 10 x 5 = 50 seconds to complete.

Note: To enable polling during the renewal process, it is important to include these parameters along with the renewal commands.

5. **Providing Custom and Certificate Attributes during Enrollment**

Certbot can be run with **custom attributes** allowing additional command line arguments. These arguments can include multiple name-value pairs, which are then included in the *Finalize Order* call along with the CSR. The values for these fields are provided as a JSON name/value pair, which can then be retrieved and mapped to the custom attributes in our application. This mapping enables including the custom attribute information in the certificate request for reporting.

A sample Certbot certificate enrollment command with custom attributes is as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
certbot -vv certonly --standalone --preferred-challenges http -d <domain_name> --logs-dir /etc/avx-certbot/

--config-dir /etc/avx-certbot/ --work-dir /etc/avx-certbot/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX

GUI> --attributes "cust_id:123,name:appviewx" --attribute-type custom
```

This section covers the **attributes** and **attribute-type** parameters.

a. The **--attributes** field allows users to provide multiple attributes as a string with comma and colon separated values in the Certbot command. **Format:** name:AppViewX,city:Coimbatore

   The attributes field must adhere to the following guidelines:

   - The string must not be empty and must contain at least one name-value pair.
   - Multiple name-value pairs can be provided within the string separated by a comma.
   - Space is only allowed in the value field of the name-value pairs.
   - The attributes, after processing, will be sent as part of the payload in the finalize order call along with the CSR.

b. The **--attributes** field must be accompanied with the **--attribute-type** field that takes in one of the following inputs:

   - cert
   - custom
   - both

   i. When **attribute-type** is passed as **cert** the attributes from the (--attributes) field are taken as certificate attributes. An example of certificate attribute is:

   ```
   --attributes "id:1098,environment:development,Director:director_id" --attribute-type cert
   ```

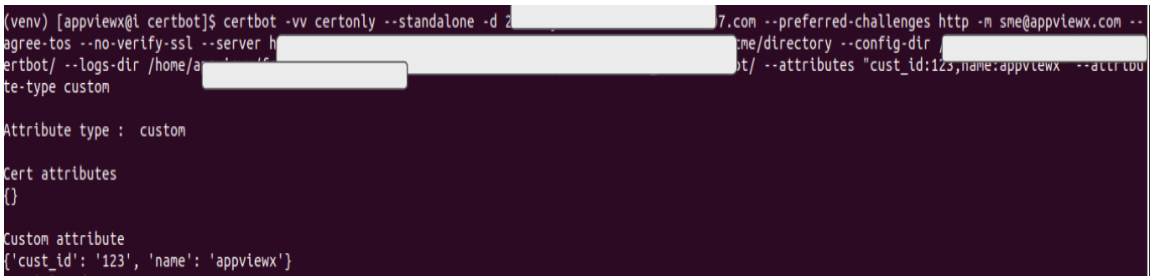
   The following image depicts how certificate attributes are defined in Certbot command:

   ii. When **attribute-type** is passed as **custom** the attributes from the (--attributes) field are taken as custom attributes. An example of certificate attribute is as follows:

   ```
   --attributes "cust_id:123,name:appviewx" --attribute-type custom
   ```

   The image shows how certificate attributes are defined in the Certbot command:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



iii. When **attribute-type** is passed as **both**, a JSON mapping is expected by the AppViewX Certbot. A new JSON file named attributesMapping.json needs to be created inside the Certbot folder. A sample JSON file is as shown:

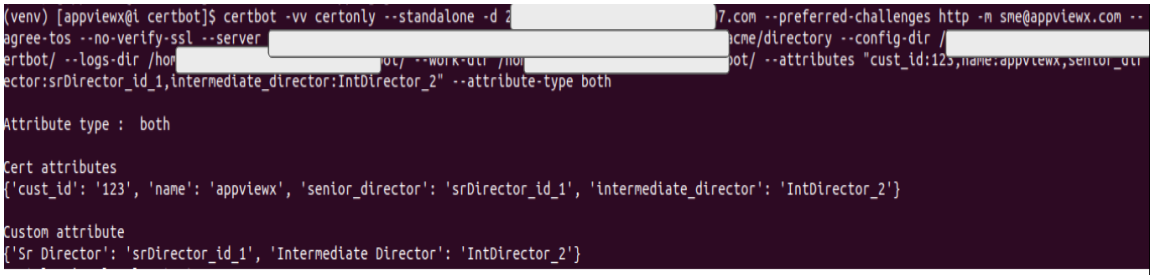
```
{
"senior_director" : "Sr Director",
"intermediate_director" : "Intermediate Director"
}
```

- The *key* [in the *key:value* pair from attributesMapping.json] refers to the certificate attribute key provided in the command, while the *value* corresponds to the custom attribute key where the value of the certificate attribute must be passed.
- The attributes passed as input are sent as certificate attributes. For attributes present in the attributesMapping.json, the mapped value is being used as attribute name and sent as custom attribute.

An example of custom attribute is as follows:

```
--attributes "cust_id:123,name:appviewx,senior_director:srDirector_id_1,intermediate_director:IntDirector_2" --attribute-type both
```

The image shows how certificate attributes are defined in Certbot command:



Note:

- The attributes are applicable only to *Method 1: Using Certbot Command Line*.
- If the attributes and attribute-type field are not specified in the Certbot command, normal flow of Certbot will work fine without any exceptions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. **Using EAB Credentials during Enrollment**

   A sample Certbot certificate enrollment command with external account binding enabled in the ACME server:

```
certbot -vv certonly --standalone --preferred-challenges http -d <domain_name> --logs-dir /etc/avx-certbot/

--config-dir /etc/avx-certbot/ --work-dir /etc/avx-certbot/ -m <mail_id> --agree-to s --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX

GUI> --eab-kid <Key identifier> --eab-hmac-key <MAC value>
```

   Note: This command is applicable only when the EAB algorithm is HS256. For other algorithms, use the cert_config.json file and adjust the configuration accordingly.

7. **Certbot - CSR and EAB Configuration**

   Providing CSR Parameters and EAB Fields

   The file named **cert_config_template.json** located in the Certbot directory is designed to facilitate the configuration of CSR and External Account Binding (EAB) fields. Renaming this file to **cert_config.json** and subsequently populating the required fields will ensure that these configurations are applied.

   CSR fields that can be provided:

   a. Subject fields:
      i. Organization
      ii. Organization unit
      iii. Country
      iv. State
      v. Locality
   b. Hashing algorithm
   c. RSA Key-Size
   d. key type
   e. elliptic curve details

   EAB fields that can be provided:

   a. EAB HMAC
   b. EAB KID
   c. EAB Algorithm

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- EAB details can be provided via Certbot command parameters or a cert_config.json file. The Certbot command only supports HS256. Other EAB algorithms require the cert_config.json file.
- The cert_config.json file contains key-value pairs for all subject fields. If any of these fields are not required, the corresponding key-value pair can be deleted from thecert_config.json.

A sample JSON is as follows:

```
{
"csr_params": {
        "organization" : "AVX",
        "organization_unit" : "AVX_IOT",
        "country" : "IN",
        "state" : "TN",
        "locality" : "CBE",
        "hashing_algorithm":"SHA512",
        "rsa_key_size": "4096",
        "key_type":"rsa",
        "elliptic_curve":""
        },
"eab": {
        "kid":"",
        "mac":"",
        "alg":""
}
```

Json keys	Expected Input	Comments
csr_params:organization **csr_params:organization_unit** **csr_params:country** **csr_params:state**	String	Choose the appropriate subject fields for the CSR.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

csr_params:Locality		
csr_params:hashing_algorithm	<Hashing_Algorithm>	Choose the appropriate hashing algorithm [SHA256,SHA384 & SHA512]
csr_params:rsa_key_size	<RSA_keysize> (String)	Default value : “2048” The size of the private key to use for the certificate. For RSA keys, specify a number between 2048-4096 (divisible by 128) [Provide this field only when key_type is set to “rsa”]
csr_params:key_type	Possible values : [“rsa”, “ecdsa”] (String)	Default value : “rsa” Provide the key type which can be used for private key generation.
csr_params:elliptic_curve	Possible values : [“secp256r1” , “secp384r1”, “secp521r1”] (String)	Default value : “secp256r1” The type of elliptic curve can be specified here. [Provide this field only when key_type is set to “ecdsa”]
eab:kid	<value_of_EAB_KID>	Key Identifier for External Account Binding (Optional).
eab:hmac	<value_of_EAB_HMAC_KEY>	HMAC key for External Account Binding (Optional).
eab:alg	HS256/HS384/HS512	Default value : “HS256”

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

		Signature Algorithm for External Account Binding.

Note: When a certificate is initially created with **key_type** set to rsa and needs to be changed or renewed to ecdsa, you must use the **--key-type ecdsa** option along with **--cert-name** on the command line during the certificate creation or renewal process.

Example: `certbot renew --key-type ecdsa --cert-name example.com --force-renewal`

Enrolling Certificates with DNS Validation using Azure Plugin

Prerequisite

Set up Azure Credentials

1. Create the azure.ini file in any path that Certbot can access, for example, you can use /opt/.secrets/azure.ini as config file for Azure credentials.
2. Add the following template config in /opt/.secrets/azure.ini:
   - dns_azure_sp_client_id = xxx-xxx-xxx-xx
   - dns_azure_sp_client_secret = xxx-xxx-xxx-xx
   - dns_azure_tenant_id = xxxx-xxx-xxx-xx
   - dns_azure_environment = "AzurePublicCloud"
   - dns_azure_zone1 = <zoneName>:/subscriptions/<subscription_id>/resourceGroups/<resouce_group_name>

Note: Multiple DNS zones can be added in the following variable format, **dns_azure_zone(X)**, where X denotes incremental integers.

Enrolling Certificates for Public DNS Zone

```
certbot certonly --authenticator dns-azure --preferred-challenges dns  \
--dns-azure-config /opt/.secrets/azure.ini \
--logs-dir <logs_dir> \
--config-dir <config_dir> \
--work-dir <work_dir> \
-d <FQDN_NAME_FOR_CERTIFICATE> \
-m <email_id> --agree-tos \
--server <ACME_SERVER_URL> \
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
--eab-kid <EAB_KEY> \
--eab-hmac-key <EAB_HMAC_KEY>
```

Enrolling Certificates for Private DNS Zone

```
certbot certonly --authenticator dns-azure --preferred-challenges dns \
--dns-azure-config /opt/.secrets/azure.ini \
--logs-dir <logs_dir> \
--config-dir <config_dir> \
--work-dir <work_dir> \
-d <FQDN_NAME_FOR_CERTIFICATE> \
-m <email_id> --agree-tos \
--server <ACME_SERVER_URL> \
--eab-kid <EAB_KEY> \
--eab-hmac-key <EAB_HMAC_KEY
```

Method 2: Using AppViewX Certbot User-Friendly Script

Activating Virtual Environment

With the AppViewX Certbot user-friendly script, you can run commands to perform enroll, renew, and revoke certificate actions by activating the virtual environment as described in this section.

1. Go to the Certbot folder and open the terminal from that path.

   ```
   cd /path/to/file/AppViewX_ACME_Certbot_Client
   ```

2. Run:

   ```
   ./execute.sh
   ```

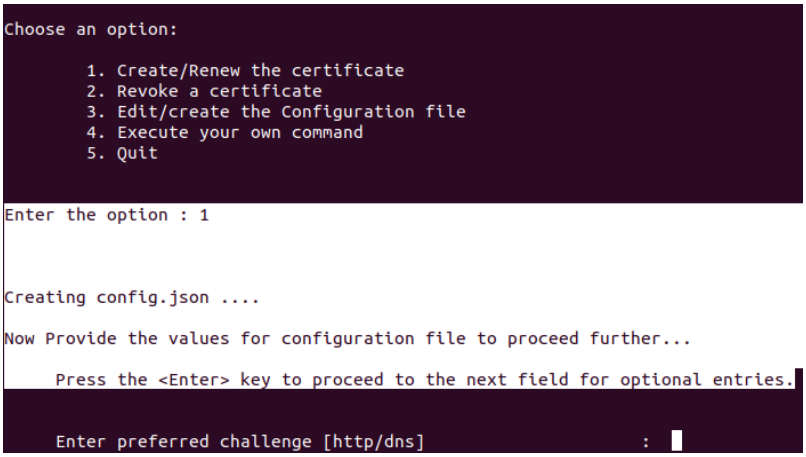
   Note: You must log on as a root user (`sudo -i`) before running the `execute.sh` file.

   Once Certbot is ready to use, it displays the following options:

   - Create/Renew a certificate
   - Revoke a certificate
   - Edit/create the Configuration file
   - Execute your own command
   - Quit

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. When using the user prompt for the first time, you are automatically redirected to option 3 even if you select option 1 or 2. This is to fill all the parameters that are required for the command to be run as shown in the next sections.



All the parameters are stored in a JSON config file (/<filepath>/AppViewX_ACME_Certbot_Client/certbot/config.json) created by AppViewX. A sample of the configuration being updated is as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
Choose an option:

        1. Create/Renew the certificate
        2. Revoke a certificate
        3. Edit/create the Configuration file
        4. Execute your own command
        5. Quit

Enter the option : 1

Creating config.json ....
Now Provide the values for configuration file to proceed further...

     Enter preferred_challenges [http/dns]                :  http
     Enter server specification [standalone/apache]       :  standalone

The EAB HMAC Key provided is                   :

        If you want to change the above configurations, Enter (1)..
        Else press <Enter> to proceed using the currently configured values..

Enter your option :

        Enter the domain names for which the certificate needs to be created     : exampledomain.com

certbot -vv certonly -d exampledomain.com --null --preferred-challenges http --logs-dir /home/appviewx/certbot/certbot_certs/ --config-dir /ho
me/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m example@gmail.com --agree-tos --server <ACME server end
point URL fetched from AppViewX GUI>
```

The process continues and the certificate from the specified path is created.

Revoking Certificate

Certificate revocation can be performed in two ways: either by using the certificate path or by using the certificate name:

- **Cert Path**

```
certbot revoke --cert-path <Path-to-fullchain.pem> --config-dir <Certbot-config-directory> --work-dir <Certbot-work-directory> -m <mail-id> --no-verify-ssl

 --agree-tos --server <ACME server endpoint URL fetched from AppViewX GUI>
```

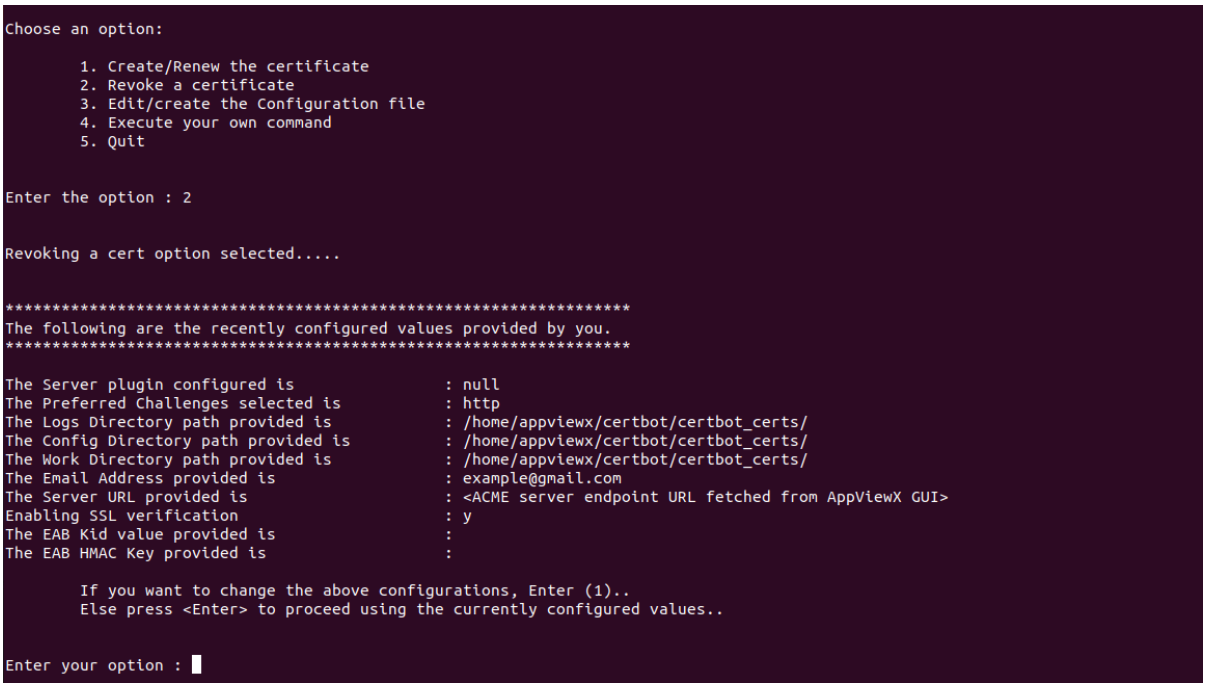
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Cert Name**

```
certbot revoke --cert-name <domain_name> --config-dir <Certbot-config-directory> --work-dir <Certbot-work-directory> -m <mail-id> --no-verify-ssl --agree-tos
 --server <ACME server endpoint URL fetched from AppViewX GUI>
```

1. To revoke a certificate, enter 2.

   A JSON configuration file is displayed that has the fields with previously saved values.



2. To proceed with the displayed values (already existing values in the JSON configuration file), press the **Enter** key.
3. Enter the *certificate path* for which the certificate needs to be revoked.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
Revoking a cert option selected.....

ir /home/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m example@gmail.com --agree-tos --server <ACME serv
er endpoint URL fetched from AppViewX GUI>
```

b. Once the credentials file is created, you can continue with the existing credentials file values or modify them to proceed with the new values by using the prompted guidance on the screen.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

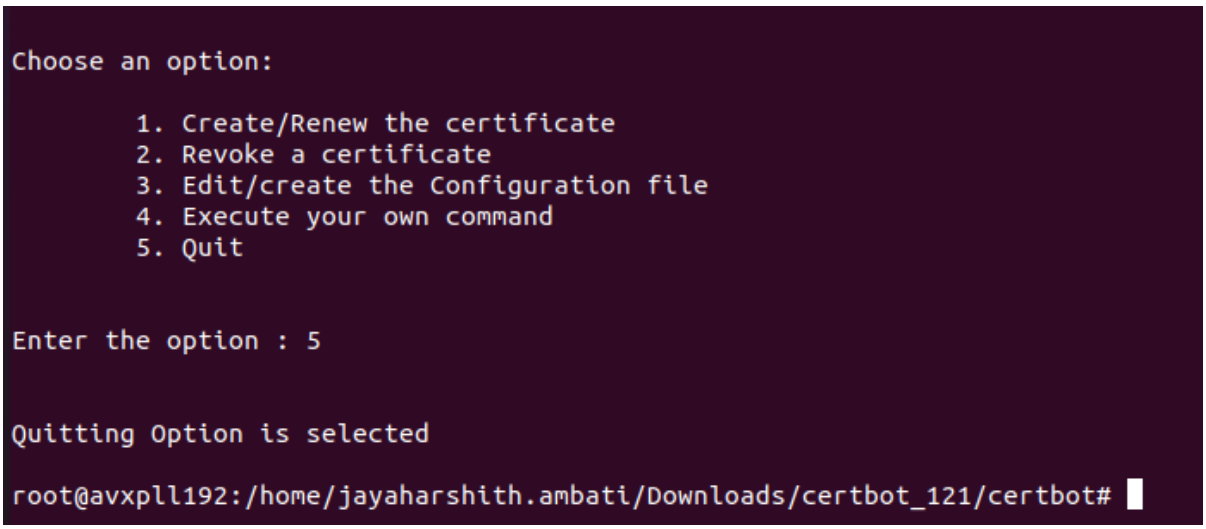
c. Only for DNS route 53, the Certbot application stores the required credentials/tokens in the /root/.aws/credentials path. Initially it checks for the .aws folder in /root/.aws path; if not found, it creates a .aws folder and a credentials file inside it.

d. If the .aws folder and credentials file is found in the root directory, the values are updated per the inputs provided. You can proceed with the existing values or with new values by editing the credentials file.

e. For all the remaining DNS servers, inputs (tokens/keys) for the credentials file are taken from the user. Once the credentials file is created, you can continue with existing credentials file values or modify and proceed with the new values by using the prompted guidance on the screen.

5. To run your own commands manually, select/enter option 4.

6. After the selected option's functionality is done, all the five options are displayed each time in the same virtual environment until the quit option 5 is selected.



Points to Remember

1. Preferred challenges must either be given as **http** or **dns** only.
2. **Agree to terms of services** and **verify ssl** fields must either be given as *y (yes) or n (no)*.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the **verify ssl** field is enabled (when the **verify ssl** field is given as **y**), see Section, *Adding Custom CA Certificates to Trust Store*.

3. Provide valid **email address** and **domain names**.
4. The **eab_kid** and **eab_hmac_key** fields.
   a. These are optional fields, so you can proceed by pressing the **Enter** key without providing the values.
   b. The values can be cleared from the JSON configuration file by selecting **1** at the time of editing the configuration file.
5. During the configuration process, you can also specify the key type (RSA/ECDSA) and key size. Depending on the key type provided, input for RSA key size or elliptic curve details will be requested.
6. You can enter new values when option 3 (Edit/Create the Configuration file) is selected. Select fields can be edited/updated. For all retaining old values, press the **Enter** key.
7. The **domain name** field:
   a. Provide a *single domain name* to acquire a certificate for a particular domain.
   b. Provide comma separated *multiple domain names* to acquire a certificate for all the given domains.
   c. *Wildcard certificates* can be acquired by providing input for a particular domain.
8. The **jq** package.
   a. Having the **jq** package installed on your system is a prerequisite (must) to proceed with the user prompt guidance provided by the script. Ignore this step if it is not compatible with your environment.
   b. After running the execute.sh script, the system checks if the **jq** package is installed on your system.
   c. If it is not installed on your system and you want to access the user prompt guidance, click 1 to proceed with the installation.
   d. You may also click 2 to exit and run your own command manually in the same virtual environment created by execute.sh script.

Best Practices

- For auto-enrollment, create a separate certificate group and CA policy in AppViewX.
- Enable auto-renewal in the AppViewX policy.
- During policy creation, select only the required bit-length (minimum 2048-bit).
- It is recommended to use EAB settings to ensure that only the intended clients are able to generate certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting

Accessing the ACME Logs

1. Access the terminal window.
2. Go to <Installed_Path>/logs directory and find the name format with <avxgw-HTTPS-<yyyy-mm-dd>.log>, for example, <avxgw-HTTPS-2021-03-17.log>.
   - If the file size exceeds 100MB, it will be rolled over and the latest logs will be available in the latest file named with an incrementing counter starting from 1 such as avxgw-HTTPS-<yyyy-mm-dd>.<incrementing_counter>.log, for example, <avxgw-HTTPS- 2021-03-17.1.log>.
   - ACME plugin logs:

     </home/appviewx/appviewx/logs/avx-vendor-cert-acme-agent-<pod_name>.log>

Client-side Errors

General Errors

Sr. No.	Error Message	Description	Troubleshooting
1	Challenge failed for domain testav.appviewx.com Notifying user: Certbot failed to authenticate some domains (authenticator: standalone). Some challenges have failed.	HTTP challenge validation failed.	Make a DNS entry.
2	Unable to locate credentials To use certbot-dns-route53, configure credentials as described at https://boto3.readthedocs.io/en/latest/guide/configuration.html#best-practices-for-configuring-credentials and add the necessary permissions for Route53 access.	DNS challenge validation failed. Invalid credentials were utilized for DNS challenge validation.	Ensure the credentials in the credentials file are valid.
3	An error occurred (InvalidClientTokenId) when calling the ListHostedZones operation: The security token included in the request is invalid.	DNS challenge validation failed. The required credentials	Ensure the credentials file with the required credentials is

Sr. No.	Error Message	Description	Troubleshooting
			domain name or certificate common name.

Other General Errors

Sr.No.	Error and Cause	Solution
1	Firewall blockage connectivity error A "firewall blockage connectivity error" when using Certbot typically occurs when the Certbot client is unable to establish a connection to external servers due to network restrictions or firewall rules. This can prevent Certbot from successfully completing the domain ownership verification process required to obtain SSL/TLS certificates.	Ensure that network restrictions or firewall rules are configured as necessary.
2	The port to contact with Acme End point is not accessible error	**Firewall Rules:** If your server is behind a firewall or network security appliance, ensure that the necessary ports (typically ports 80 and 443) are allowed for inbound and outbound connections. ACME challenges often use these ports to verify domain ownership. **Blocked Ports:** Some hosting providers or network environments might block certain ports, including ports 80 and 443, to prevent web services from being accessible. Verify that the necessary ports are open and accessible.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Errors due to extra arguments

Errors are also encountered if any extra arguments, other than supported arguments are given in the Certbot command. They are as follows:

1. **Sample command:** `certbot -vv certonly -d sampledomain.info --preferred-challenges dns --dns-route53 --logs-dir /home/appviewx/certbot/certbot_certs/ --config-dir /home/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX GUI> -`

   Error: certbot: error: unrecognized arguments

2. **Sample command:** `certbot certbot -vv certonly -d sampledomain.info --preferred-challenges dns --dns-route53 --logs-dir /home/appviewx/certbot/certbot_certs/ --config-dir /home/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX GUI> cert`

   Error: certbot: error: unrecognized arguments: cert

3. **Sample command:** `certbot -vv certonly -d sampledomain.info --preferred-challenges dns --dns-route53 --logs-dir /home/appviewx/certbot/certbot_certs/ --config-dir /home/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX GUI> -cert`

   Error: certbot: error: Unable to open config file: ert. Error: No such file or directory

4. **Sample command:** `certbot -vv certonly -d sampledomain.info --preferred-challenges dns --dns-route53 --logs-dir /home/appviewx/certbot/certbot_certs/ --config-dir /home/appviewx/certbot/certbot_certs/ --work-dir /home/appviewx/certbot/certbot_certs/ -m <mail_id> --agree-tos --no-verify-ssl --server <ACME server endpoint URL fetched from AppViewX GUI> -test`

   Error: certbot: error: argument -t/--text: ignored explicit argument 'est'

Glossary

Keywords used in Certbot Commands

Keyword	Expected Input	Comments
-v, --verbose	NA	This flag can be used multiple times to incrementally increase the verbosity of the output, for example, -vvv. (default: 0)
(default) run	NA	Obtain and install a certificate in your current web server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in Certbot Commands (continued)

Keyword	Expected Input	Comments
certonly	NA	Obtain or renew a certificate, but do not install it.
--standalone	NA	Run a standalone web server for authentication.
-d (Domain)	<domain1.com> or <domain2.com>, <domain3.com>, <domain4.com>	Comma-separated list of domains to obtain a certificate for.
--preferred-challenges	http/dns	A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first. The default value of preferred challenges is an **empty list.**
--config-dir	<path_to_config_directory>	The config directory contains Certbot's configuration files, including information about the certificates, domains, renewal settings, and more. It is where Certbot stores its persistent configuration data. Certbot keeps track of the certificates it manages, their associated options, and renewal schedules in this directory. Custom configuration directory path (**default**: /etc/letsencrypt).
--work-dir	<path_to_work_directory>	The work directory is used by Certbot to store temporary files and data while it performs operations like certificate issuance and renewal. This directory is where Certbot creates and stores temporary

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in Certbot Commands (continued)

Keyword	Expected Input	Comments
		challenges required for domain ownership verification during the certificate issuance process. It is a workspace for Certbot's internal processes. Custom working directory path (**default**: /var/lib/letsencrypt).
--logs-dir	<path_to_logs_directory>	The logs directory contains log files that record the activities and events related to Certbot's operations. These logs can provide valuable information for troubleshooting issues and understanding the certificate issuance and renewal process. Logs include details about challenges, certificate renewals, errors, and more. Custom logs directory path (**default**: /var/log/letsencrypt).
-m	<example1@gmail.com> or <example2@gmail.com>, <example3@gmail.com>	Email used for registration and recovery contact. Use commas to register multiple emails. Email address for important account notifications.
--agree-tos	NA	Agree to the ACME server's Subscriber Agreement.
--no-verify-ssl	NA	Disable verification of the ACME server's certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in Certbot Commands (continued)

Keyword	Expected Input	Comments
--server	<Acme Server Endpoint URL fetched from AppViewX GUI>	ACME Directory Resource URI. (default: https://acme-v02.api.letsencrypt.org/directory)
--eab-kid EAB_KID	<value_of_EAB_KID>	Key Identifier for External Account Binding (Optional).
--eab-hmac-key EAB_HMAC_KEY	<value_of_EAB_HMAC_KEY>	HMAC key for External Account Binding (Optional).
revoke	NA	Used for revoking a certificate.
--cert-path	<path_to_certificate> Example: /home/appviewx/certbot/certbot_certs/live/certbot.appviewx.info/fullchain.pem	Path to where certificate is saved (with certonly --csr), installed from, or revoked (default: None)
--dns-route53	NA	Obtain certificates using a DNS TXT record (if you are using Route53 for DNS). (default: False).
--attributes	Sample input: **"name:AppViewX,city:Coimbatore"** The string should not be empty and must contain at least one name-value pair.	The --attributes field allows users to provide multiple attributes as a string with comma and colon separated values in the Certbot command. [It is optional, but **--attributes** field must be accompanied with the **--attribute-type** field.]
--attribute-type	Any one of the following : **cert/custom/both**	Takes in one of the following inputs **cert/custom/both**. [It is optional, but must be included when **--attributes** is passed.]

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in Certbot Commands (continued)

Keyword	Expected Input	Comments
--retry-after	Integer	The waiting period in seconds, after which the next call in the polling is triggered. [Default value : 10]
--retry-frequency	Integer	The number of times for which the certificate is polled from the client side. [Default value : 20]

Configuring AppViewX Posh-ACME Client

Getting Started

Prerequisites

- The AppViewX server/cloud connector must be bound with a valid certificate. See Section, *Binding Custom Certificate to Gateway in Cloud Connector*.
- Root user permissions for setup process in Linux.
- Admin privileges are required during setup and runtime in Windows.
- A proper DNS entry for the services in the DNS server.
- A valid ACME endpoint must be configured on the AppViewX GUI.
- To enable client connections, it is essential to have port 31443 open for on-premise deployment and port 30020 (in cloud connector) open for SaaS deployment in AppViewX.
- If the DNS validation is for HTTP challenge, it is essential to have port 80 accessible on the client machine to allow AppViewX to establish a connection.
- If the DNS validation is for DNS challenge, then the DNS server must be up and running and the DNS credentials file should be correctly configured.
- Certificate attributes and custom attributes must be configured to capture the attributes in the AppViewX GUI (if required).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

System Requirements

- **Operating System:** Windows Server 2019, Linux (Ubuntu 20, RHEL 8)
- **For IIS Server Binding:** Windows PowerShell 5.1 or later (Desktop edition) with .NET Framework 4.7.1 or later

Providing Sudo Permissions in Linux

1. To provide access to port 80 for a non-root user:
   a. Ensure that you are currently located within the POSHACME_AVX directory.
   b. Run the following command to grant the pwsh executable the capability to bind to port 80 without requiring root privileges:

      ```
      sudo setcap 'cap_net_bind_service=+ep' pwsh
      ```

      This step is essential to facilitate the http-01 challenge.
2. To add custom CA certificates to TrustStore:
   a. Determine the appropriate trust store on your Linux system. Common locations for trust stores are /etc/ssl/certs/ca-certificates.crt and /etc/ssl/certs/ca-bundle.crt.
   b. Obtain the acmetrustchain.crt file provided by the administrator from the POSHACME_AVX directory and place it in the trust-store of the machine.
   c. Log in as the root user. Run:

      ```
      sudo -i
      ```

   d. Copy the entire contents of the acmetrustchain.crt certificate chain file and append them to the end of the trust store file using the `cat` command:

      ```
      cat acmetrustchain.crt >> /etc/ssl/certs/ca-bundle.crt
      ```

   e. After execution, exit from the sudo user session.

Installing Posh-ACME

For Administrators

1. Download the latest version of Posh-ACME client from the AppViewX release portal.
2. Open your terminal/command prompt and navigate to the directory where the downloaded Posh-ACME ZIP file is present.
3. Unzip AppViewX_ACME_PoshACME_Client.zip to the current directory using the command:
   Linux

   ```
   unzip AppViewX_ACME_PoshACME_Client.zip
   ```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Windows

```
tar -xf AppViewX_ACME_PoshACME_Client.zip
```

4. Go to the extracted folder named POSHACME_AVX using the command:

```
cd POSHACME_AVX
```

5. Obtain server trust chain certificates. If the server certificate is created in AppViewX, download it from the AppViewX inventory, else download the certificate chain files (.pem or .crt) for the Certificate Authority (CA). This chain of files must include the root certificate as well as any intermediate certificates of the server.

   Linux

   If there are individual certificates for root CA and intermediate CAs, combine these certificate files into a single file. This can be done either through a text editor or by using the cat command:

```
cat intermediateca.crt rootca.crt > acmetrustchain.crt
```

   In this case, acmetrustchain.crt represents the name of the server trust chain certificate file. Now place this server trust chain certificate within the POSHACME_AVX directory.

   Windows

   If there are individual certificates for root CA and intermediate CA, then place the root CA certificates and intermediate CA certificates in the POSHACME_AVX directory under the RootCA and IntermediateCA folders, respectively.

6. Navigate from POSHACME_AVX to its parent directory using the command:

```
cd ..
```

7. Create a new zip archive named AppViewX_ACME_PoshACME_Client.zip for the POSHACME_AVX directory with the command:

   Linux

```
zip -r AppViewX_ACME_PoshACME_Client.zip POSHACME_AVX
```

   Windows

```
tar -a -c -f AppViewX_ACME_PoshACME_Client.zip POSHACME_AVX
```

   The resulting zipped folder can be shared among the users.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For Linux Users

1. Download the latest version of Posh-ACME client received from the administrator.
2. Open your terminal/command prompt and navigate into the directory where you downloaded the Posh-ACME ZIP file.
3. Unzip AppViewX_ACME_PoshACME_Client.zip using the command:

   ```
   unzip AppViewX_ACME_PoshACME_Client.zip
   ```

4. Go to the extracted folder named POSHACME_AVX using the command:

   ```
   cd POSHACME_AVX
   ```

5. Ensure the following permissions have been granted:
   - Port 80 access to a non-root user for HTTP challenge.
   - Presence of server trust chain certificates in the system truststore for SSL verification.

   Note: For more details, see Section, *Providing Sudo Permissions in Linux.*

6. Run:

   ```
   ./install.sh
   ```

   Running this command relocates the Powershell folder from the current directory to the current user's local/share/ directory.

7. Before performing CLM Actions, run:

   ```
   ./pwsh
   ```

   This command initiates the PowerShell environment. Ensure that you are in the POSHACME_AVX directory.

For Windows Users

1. Download the latest version of Posh-ACME client received from the administrator.
2. Open your command prompt as an administrator and navigate to the directory where you downloaded the Posh-ACME ZIP file.
3. Unzip AppViewX_ACME_PoshACME_Client.zip using the command:

   ```
   tar -xf AppViewX_ACME_PoshACME_Client.zip
   ```

4. Go to the extracted folder named POSHACME_AVX using the command:

   ```
   cd POSHACME_AVX
   ```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Ensure to add custom CA certificates to the TrustStore.
   In Windows, you can add the root CA and intermediate CA certificates located within the RootCA and Intermediate CA directories found in the POSHACME_AVX directory provided by the administrator to the *Trusted Root Certification Authorities* and *Intermediate Certification Authorities* stores, respectively.

   Access to these stores can be achieved through the **Manage Computer Certificates** control panel.
6. Run:

   ```
   install.bat
   ```

   Running this command relocates the Posh-ACME folder and Posh-ACME.Deploy folder from the current directory to the C:\Program Files\WindowsPowerShell\Modules\ directory.
7. Before performing CLM Actions, initiate Windows PowerShell environment as an administrator. Ensure you are in the POSHACME_AVX directory.

Actions using Posh-ACME

Enrolling Certificates

Prerequisites

1. Run the following command to import Posh-ACME:

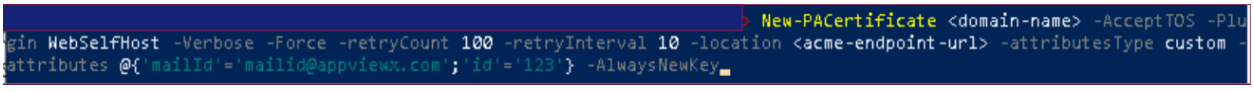
   ```
   Import-Module Posh-ACME -Force
   ```
2. Open PowerShell with admin privileges.
3. Ensure that you are in the POSHACME_AVX directory before you run the http-01 and dns-01 based challenge validation commands (described below) to enroll a certificate.

http-01 Based Challenge Validation

The command for an http-01 based challenge validation is:

```
New-PACertificate <Domain_Name> -AcceptTOS -Plugin WebSelfHost -Verbose -Force -retryCount <retryCount> -retryInterval <retryInterval> -location <ACME server endpoint URL> -attributes <Attributes> -attributesType <AttributesType> -AlwaysNewKey
```

A sample certificate enrollment command for HTTP validation is as shown:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

dns-01 Based Challenge Validation

Default DNS Challenge

The command for an dns-01 based challenge validation is:

```
New-PACertificate <Domain_Name> -AcceptTOS  -Contact <mail.id> -Plugin <Plugin_Name> -PluginArgs $pArgs -verbose -retryCount <retryCount>
-retryInterval <retryInterval> -location <ACME server endpoint URL> -attributes <Attributes> -attributesType <AttributesType> -AlwaysNewKey -Force
```

A sample certificate enrollment for DNS validation using route53 is as shown. Similarly other DNS plugins can be used.

Set-AWSCredential Command

```
Set-AWSCredential -StoreAs 'poshacme' -AccessKey '**********' -SecretKey '**********'
```

Purpose: This command stores AWS credentials under a named profile *poshacme*.

Parameters:

- -StoreAs 'poshacme': The name under which the AWS credentials are stored. This profile name is referenced later when configuring the Route 53 plugin.
- -AccessKey '**********': The AWS Access Key ID.
- -SecretKey '**********': The AWS Secret Access Key.

Plugin Arguments Configuration

```
$pArgs = @{R53ProfileName='poshacme'}
```

Purpose: This command sets up a hashtable $pArgs to store the Route 53 plugin arguments.

Key:

- R53ProfileName='poshacme': Specifies the AWS profile name (poshacme) to be used by the Route 53 plugin for authentication.

Enrollment Command

```
New-PACertificate <Domain_Name> -AcceptTOS -Plugin Route53 -PluginArgs $pArgs -attributesType cert -attributes @{'id'='0';'mail'='mailid@appviewx.com'} -retryCount 100 -retryInterval 12 -location <ACME server endpoint URL> -Verbose -Force -AlwaysNewKey
```

DNS Challenge

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
$pArgs==@{vendor='infoblox';vendorAccountName='infoblox'}
New-PACertificate <FQDN> -AcceptTOS -Contact <EMAIL> -Plugin Appviewx -PluginArgs $pArgs -retryInterval 30 -location <ACME_URL> -AlwaysNewKey
-Force -verbose
```

where the **vendor** value must be the DNS vendor name such as infoblox, **vendorAccountName** value must be the same as that configured in the AppViewX Integration Hub DNS Vendor settings, the **-Plugin** value must always be **Appviewx**.

Enterprise Secure Challenge

```
$pArgs=@{}
New-PACertificate <FQDN> -AcceptTOS -Contact <EMAIL> -Plugin Appviewx -PluginArgs $pArgs -retryInterval 30 -location <ACME_URL> -AlwaysNewKey
-Force -verbose
```

where the **pArgs** will be empty as there is no DNS vendor involved, the **Plugin** value must always be **Appviewx**.

Parameter Description

Parameters used in the http-01 and dns-01 based challenge validation

Parameter	Mandatory	Description
<ACME server endpoint URL>	Yes	Enter the appropriate ACME endpoint as configured in the AppViewX GUI.
<Domain_Name>	Yes	Enter a valid domain name for which the certificate needs to be enrolled. • Provide a **single domain name** to acquire a certificate for a particular domain. The domain name is the name of the order. Sample input for single domain name - *test1.appviewx.com* • Provide comma separated **multiple domain names** to acquire a certificate for all the given domains. The first domain name is the name of the order and is considered as the **main domain**, while the remaining domains are reflected in the Subject Alternative Names (SAN) of the certificate. Sample input for multiple domain names - *test2.appviewx.com,test3.appviewx.com*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters used in the http-01 and dns-01 based challenge validation (continued)

Parameter	Mandatory	Description
-attributes <Attributes> and **-attributesType <AttributesType>**	No	Posh-ACME can be run with **attributes**. These parameters allow you to provide multiple attributes. These attributes can include multiple name-value pairs, which are then included in the *Finalize Order* call along with the CSR. The values for these fields are provided as a JSON name/value pair, which can then be retrieved and mapped to the attributes in the application. This mapping enables you to include the attribute information in the certificate request for reporting purposes. For more information on the usage of attributes in Posh-ACME, see Defining Custom and Certificate Attributes.
-retryCount <retryCount> and **-retryInterval <retryInterval>**	No	These parameters allow you to customize polling behavior by defining the number of retry attempts and the wait time between each attempt respectively. For more information on polling in Posh-ACME, see Polling during Enrollment/Renewal.
-Plugin <Plugin_Name>	Yes (only for dns-01 Based Challenge Validation)	Replace <Plugin_Name> with the appropriate powershell compatible DNS Plugin Name to perform DNS Validation. For more information on DNS plugins, see PoshACME DNS Plugins.
-PluginArgs $pArgs	Yes (only for dns-01 Based Challenge Validation)	Enter the appropriate plugin arguments for the chosen DNS plugin. For more information on the usage of DNS plugin arguments, see PoshACME DNS Plugins.

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Binding Certificate to IIS Server in Windows

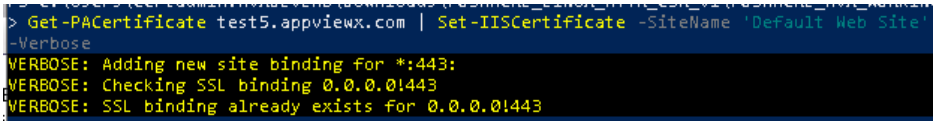
Posh-ACME supports issuance of certificates on their local IIS instance. To bind the certificate generated to local IIS instance, run:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
Get-PACertificate <Main_Domain_Name> | Set-IISCertificate -SiteName '<Site_Name>' -Verbose
```

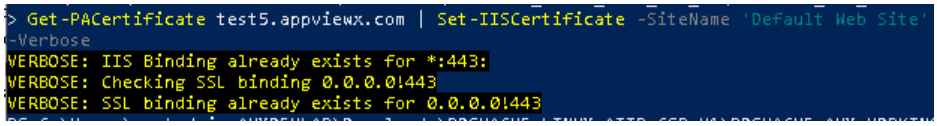
Parameters used in the http-01 and dns-01 based challenge validation

Parameter	Mandatory	Description
<Main_Domain_Name>	Yes	Enter a valid main domain name of the certificate to be bound.
<Site_Name>	Yes	Enter a valid IIS site name as shown: 
A sample command to bind a certificate to the IIS server is as shown:

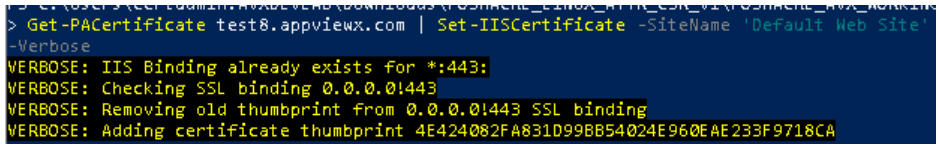


The certificate binding process only checks for the existence of an associated site binding.

- If a binding with the same domain name already exists, it will skip the binding process.



- If no such binding is found, it will proceed to bind the new certificate.



For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Working Behavior of Enrollment

Assuming there are multiple agents configured to the same server with distinct endpoint URLs, an example of the Agent X's Endpoint URL is `https://<server_hostname>:31443/avxapi/<acme_agent_x>/acme/directory`. Several scenarios can occur when enrolling a certificate for a domain name using ACME Agent X's Endpoint URL as described:

Scenario 1: No Previous Order Exists

If the domain-associated older order does not exist indicating that certificate enrollment for that domain has never been triggered:

- **Successful enrollment**: In the case of a successful enrollment, an order is created for that domain using Agent X's Endpoint URL and the certificate is successfully generated.
- **Interrupted/Failed enrollment**: If the enrollment process was interrupted or failed, an order may or may not be created for that domain using Agent X's Endpoint URL and the certificate is not generated.

Scenario 2: Previous Order Exists

If the domain-associated older order exists indicating that certificate enrollment for that domain was initiated earlier, this could be due to a previously successful enrollment or a previously interrupted enrollment call.

- **Successful enrollment**: If enrollment is successful, the previous domain-associated order linked to the domain is used, even if it was set up with a different Agent’s Endpoint URL. Attempting to use Agent X’s Endpoint URL will not work. The older certificate cannot be used and is backed up as a .bak file, while a new certificate is generated.
- **Interrupted/Failed enrollment**: If the enrollment process was interrupted or was unsuccessful, the domain-associated older order persists. The older certificate cannot be used and is backed up as a .bak file, and no new certificate is generated.

To address situations where the domain-associated older order’s Endpoint URL is being used instead of creating a new order with Agent X's Endpoint URL, a proposed solution is as follows:

1. Delete the domain-associated older order and associated certificate-related files. This allows for a new certificate issuance process using ACME Agent X’s Endpoint URL.
2. To delete the domain-associated older order, use the following command in the PowerShell environment:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
Remove PA-Order -Name <Domain_Name>
```

```
PS /home/appviewx/POSHACME_TEST/POSHACME_AVX> Remove-PAOrder -Name test4.appviewx.com

Deleting an order will also delete the certificate and key if they exist.
Are you sure you wish to delete order 'test4.appviewx.com'?
[Y] Yes  [N] No  [S] Suspend  [?] Help (default is "Y"): Y
```

Renewing Certificates

Certificates generated by POSH-ACME are renewed as needed. The system assesses the validity of all the certificates to identify those requiring renewal. This depends on the threshold specified during the execution of the renewal.ps1 script using the **renewalDaysThreshold** parameter. Certificates with a remaining validity period (measured in days) less than the specified threshold will only be considered for renewal.

Renewing Certificates

1. Open PowerShell with admin privilege.
2. Ensure that you are in the POSHACME_AVX directory before you run any commands to renew certificates.
3. Run:

```
./renewal.ps1 -retryCount <retryCount> -retryInterval <retryInterval> -renewalDaysThreshold <renewalDaysThreshold>
```

```
PS /home/appviewx/POSHACME_TEST/POSHACME_AVX> ./renewal.ps1 -retryCount 5 -retryIn
terval 4 -renewalDaysThreshold 20
```

The above command implies that certificates with a validity of less than 20 days are considered for renewal.

Parameters used in the renew command

Parameter	Mandatory	Description
-retryCount <retryCount> and **-retryInterval <retryInterval>**	No	These parameters enable users to customize polling behavior by defining the number of retry attempts and the wait time between each attempt respectively. For more information on polling in Posh-ACME, see Polling during Enrollment/Renewal.
<renewalDaysThreshold>	No	Specify the threshold number of days. The default value is set to 30.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When there is an incomplete renewal, the old certificate that is being renewed is deleted from the client's machine.

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Scheduling Tasks for Automated Certificate Renewal

Linux

A single scheduled task runs every day at a specified time and checks the validity of all the certificates to determine if any of them should be renewed based on the threshold **renewalDaysThreshold** specified.

To automate renewal for Posh-ACME through cron job, exit PowerShell environment and run:

```
(crontab -l ; echo "MM HH * * * <path to renewal.sh file> -retryCount <retryCount> -retryInterval <retryInterval> -renewalDaysThreshold <renewalDaysThreshold>
 -poshACMEDirectoryPath <poshACMEDirectoryPath> >> <path_to_renewal_log_file> 2>&1") | crontab -
```

Parameters used in the schedule task renew command (Linux)

Commands	Description
MM HH	Specify time for renewal in **HH** (hours), **MM** (minutes).
<path to renewal.sh file>	Specify the path to the renewal.sh file which is present in the POSHACME_AVX directory.
<poshACMEDirectoryPath>	Specify the path to the POSHACME_AVX folder.
<path_to_renewal_log_file>	Specify the path to a text file where automated renewal activities are logged. This file can be used to track renewal processes.
<renewalDaysThreshold>	Specify the threshold days renewal. The default value is set to 30.
-retryCount <retryCount> and **-retryInterval <retryInterval>**	These parameters enable users to customize polling behavior by defining the number of retry attempts and the wait time between each attempt respectively. For more information on polling in Posh-ACME, see Polling during Enrollment/Renewal.

Example:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
[appviewx@i POSHACME_AVX]$ crontab -l
[appviewx@i POSHACME_AVX]$ (crontab -l ; echo "30 14 * * * /home/appviewx/nov_22
/posh/POSHACME_AVX/renewal.sh -retryCount 100 -retryInterval 10 -renewalDaysThre
shold 6000 -poshACMEDirectoryPath /home/appviewx/nov_22/posh/POSHACME_AVX/ >> /h
ome/appviewx/nov_22/posh/POSHACME_AVX/re.log 2>&1") | crontab -
[appviewx@i POSHACME_AVX]$ crontab -l
30 14 * * * /home/appviewx/nov_22/posh/POSHACME_AVX/renewal.sh -retryCount 100 -
retryInterval 10 -renewalDaysThreshold 6000 -poshACMEDirectoryPath /home/appview
x/nov_22/posh/POSHACME_AVX/ >> /home/appviewx/nov_22/posh/POSHACME_AVX/re.log 2>
&1
```

In the above example, the scheduled renewal task is triggered at 02:30 pm daily. Certificates that have less than 6000 days of remaining validity will qualify for renewal.

Note: See the renewalLogs.log file located in the POSHACME_AVX directory for logs of the certificate renewal process

Some helpful commands to use for the renewal process.

Parameters used in the schedule task renew command

Command	Description
date	Cron jobs operate according to the server's predefined timezone, typically set to UTC by default. You can verify this timezone by running the ***date*** command in the terminal. Scheduled tasks will commence in accordance with the cron system's understanding of time and time zones.
crontab -e	If you need to modify the time for a cron job that you have previously set up, you can adjust it by editing the time in the crontab file.
crontab -l	Used to check the scheduled cron jobs.

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

A single scheduled task runs every day at a specified time and checks the validity of all the certificates to determine if any of them should be renewed based on the threshold **renewalDaysThreshold** specified.

To automate renewal for Posh-ACME through a scheduled task, open PowerShell with admin privilege (ensure that you are in the POSHACME_AVX directory) and run:

```
.\renewal_schedule_windows.ps1 -retryCount <retryCount> -retryInterval <retryInterval> -renewalDaysThreshold <renewalDaysThreshold> -time HH:MM
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters used in the schedule task renew command

Commands	Description
HH:MM	Specify time for renewal in **HH** (hours), **MM** (minutes).
<renewalDaysThreshold>	Specify the threshold days renewal. The default value is set to 30.
-retryCount <retryCount> and **-retryInterval <retryInterval>**	These parameters enable users to customize polling behavior by defining the number of retry attempts and the wait time between each attempt respectively. For more information on polling in Posh-ACME, see Polling during Enrollment/Renewal.

Example:

```
> .\renewal_schedule_windows.ps1 -retryCount 5 -retryInterval 2 -renewalDaysThres
hold 40 -time 14:30

Scheduled task named 'Posh-ACME Renewal' has been successfully created. It will r
un daily at 14:30 with a renewal days threshold of 40.
```

As per the above command, the scheduled renewal task is triggered at 02:30 pm on a daily basis. Certificates that have less than 40 days of remaining validity are subject to renewal.

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Working Behavior of Renewal

- **Successful Renewal:** When the renewal of a domain certificate is successfully completed, the older certificate cannot be used and is backed up as a .bak file and is then replaced with the newly generated certificate. This ensures that a copy of the older certificate is preserved while the updated certificate takes its place.
- **Interrupted Renewal:** If the renewal process is prematurely interrupted, the older certificates may not be successfully renewed. In such cases, the older certificates become unusable and they are deleted and backed up as a result of the interrupted renewal process.

Revoking Certificates

Certificates can be revoked either by providing the certificate's **main domain** name or the **certificate file path**.

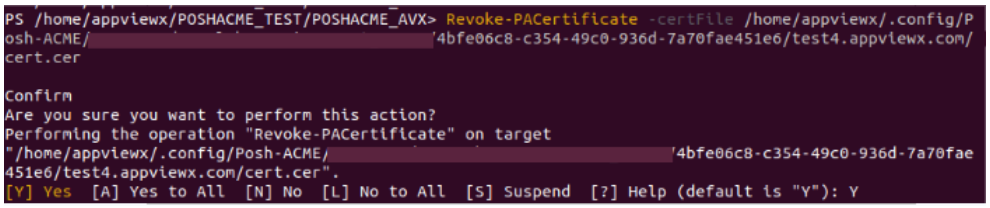
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Open PowerShell with admin privileges.
2. Ensure that you are in the POSHACME_AVX directory before you run any commands to revoke certificates.
3. To revoke certificates:
   - By specifying the **main domain** name of the certificate.

```
Revoke-PACertificate -Name <Main_Domain_Name>
```

   - By specifying the **certificate file path**.

```
Revoke-PACertificate -certFile <certFilePath>
```



> **Tip:** To skip the revocation confirmation prompt, use the flag **-Force** along with the command.

Using the Revoke-PACertificate command does not automatically delete the order associated with the revoked certificate. Consequently, Posh-ACME makes renewal attempts for revoked certificates during the next scheduled renewal process. To avoid this, delete that specific domain-associated order manually.

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Executing Certbot with Enhanced Data

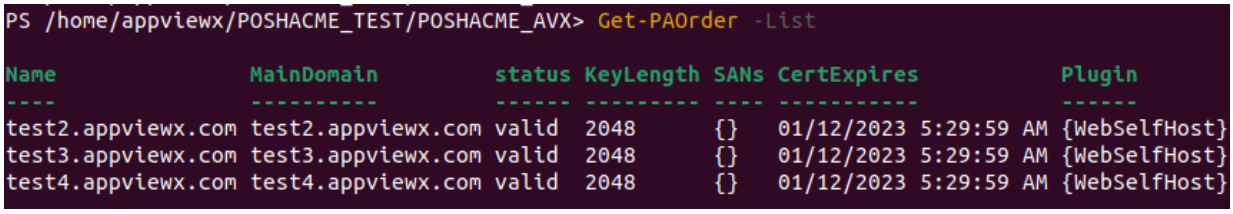
Accessing Orders and Certificates

The following set of commands are used for accessing orders and certificates:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- To return details such as domains, key length, expiration, and status for one or more ACME orders previously created, run:

```
Get-PAOrder -List
```



- To return details such as thumbprint, subject, validity, SANs, and file locations for one or more ACME certificates previously created, run:

```
Get-PACertificate -List | Format-List
```

- To return details such as Thumbprint, Subject, Validity, SANs, and file locations for a specific certificate, run:

```
Get-PACertificate <Main_Domain_Name> | Format-List
```

- The common OS specific certificate directory paths are as follows:
  - **Linux**: /home/<user>/.config/Posh-ACME/<server-name>/<account-id>/<order(Main_Domain_Name)>/
  - **Windows**: C:\Users\<user>\AppData\Local\Posh-ACME\<server-name>\<account-id>\<order(Main_Domain_Name)>\

  The files within this certificate directory must have the following contents:
  - cert.cer (Base64 encoded PEM certificate)
  - cert.key (Base64 encoded PEM private key)
  - cert.pfx (PKCS12 container with cert+key)
  - chain.cer (Base64 encoded PEM with the issuing CA chain)
  - chainX.cer (Base64 encoded PEM with alternate issuing CA chains)
  - fullchain.cer (Base64 encoded PEM with cert+chain)
  - fullchain.pfx (PKCS12 container with cert+key+chain)

Note: The password protecting the PFX files is **poshacme**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Defining Custom and Certificate Attributes

attributes and attribute-type

The **-attributes <Attributes>** parameter allows you to provide multiple attributes in the Posh-ACME command. To provide attributes, list each attribute in the format of **'attribute_name'='attribute_value'** and separate each attribute with a semicolon.

Sample input for **attributes**:

```
-attributes @{'id'='1098';'environment'='development';'Director'='director_id'}
```

The **-attributesType <AttributesType>** parameter must be accompanied with the **-attributes <Attributes>** parameter which takes in one of the following inputs **cert/custom/both**.

Sample input for **attributesType**:

```
-attributesType custom
```

Usage of attributes with attributesType

- When **attributesType** is passed as **cert**, the attributes from the **attributes** field are taken as certificate attributes.

  Sample certificate attributes input: `-attributes @{'Id'='1';'eai'='test';'inScope'='yes';'environment'='envi1'} -attributesType cert`

  The image shows the certificate attributes defined in the Posh-ACME command:

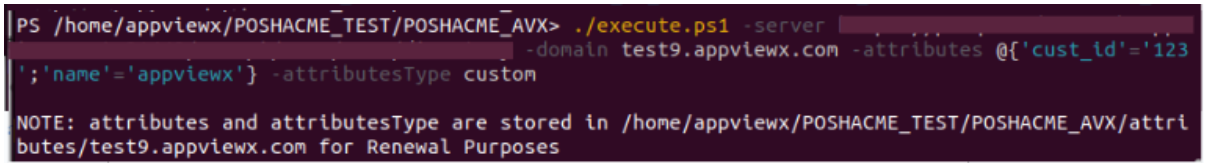
  The following image shows the certificate attributes and custom attributes sent as part of the request:

- When **attributesType** is passed as **custom**, the attributes from the **attributes** field are taken as custom attributes.

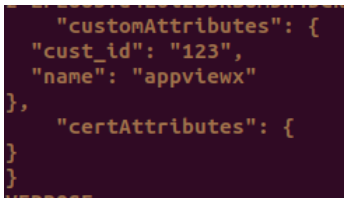
  Sample custom attributes input: `-attributes @{'cust_id'='123';'name'='appviewx'} -attributesType custom`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The image shows the certificate attributes defined in the Posh-ACME command:



The following image shows the certificate attributes and custom attributes sent as part of the request:



- When **attributesType** is passed as **both**, a JSON mapping is expected by the AppViewX Posh-ACME. A json file in the name attributesMapping.json needs to be created inside the POSHACME_AVX directory. There is a template file named attributesMappingTemplate.json present within the POSHACME_AVX directory, which can also be renamed to attributesMapping.json.

  A sample attributesMapping.json is as shown:

  ```
  {
  "senior_director" : "Sr Director",
  "intermediate_director" : "Intermediate Director"
  }
  ```

  - The *key* [in the *key:value* pair from attributesMapping.json] refers to the certificate attribute key provided in the command, while the *value* corresponds to the custom attribute key where the value of the certificate attribute must be passed.
  - The attributes passed as input are sent as certificate attributes and for the attributes present in the attributesMapping.json, the mapped value is being used as attribute name and sent as custom attribute.

  Sample certificate attributes input: `-attributes`

  `@{'cust_id'='123';'name'='appviewx';'senior_director':'srDirector_id_1','intermediate_director':'IntDirector_2'} -attributesType both`

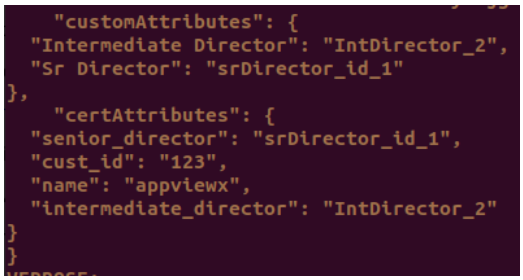
  The image shows the attributes defined in the Posh-ACME command:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
PS /home/appviewx/POSHACME_TEST/POSHACME_AVX> ./execute.ps1 -server
                                              -domain test9.appviewx.com -attributes @{'cust_id'='123
';'name'='appviewx';'senior_director'='srDirector_id_1';'intermediate_director'='IntDirector_2'}
-attributesType both

NOTE: attributes and attributesType are stored in /home/appviewx/POSHACME_TEST/POSHACME_AVX/attri
butes/test9.appviewx.com for Renewal Purposes
```

The following image shows the certificate attributes and custom attributes sent as part of the request:



Some important points to note are:

- The use of *-attributes <Attributes> -attributesType <AttributesType>* is optional.
- Omitting this parameter will not disrupt the current flow of certificate creation. You may proceed with the certificate generation process without any issues.
- The values provided in the **attributes** field and **attributesType** field while enrolling are stored in a folder named attributes inside the POSHACME_AVX directory under the name of the certificate's domain.
- These values are fetched and used when the certificate of that domain name is being renewed.

Polling during Enrollment/Renewal

Polling can be activated when manual approval is configured for certificate generation. In this scenario, the client conducts polling for the certificate within a specified timeframe as determined by the configured parameters. If the certificate is approved before the polling duration expires, it will be retrieved. To enable polling in the certbot client, you can pass the following parameters as mentioned:

Parameters to be passed with Posh-ACME commands

Parameters	Type	Mandatory	Description
-retryInterval	Integer	No	The waiting period (in seconds) after which the next call in the polling is triggered. [Default value : 2]
-retryCount	Integer	No	The number of times the certificate is polled from the client side.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters to be passed with Posh-ACME commands (continued)

Parameters	Type	Mandatory	Description
			[Default value : 30]

A sample usage of the above parameters: `-retryCount 8 -retryInterval 5`

In this example, the **-retryInterval** is set to 5 seconds, and the **-retryCount** is set to 8. Hence, the certificate will be polled 8 times (retryCount) with a 5 second interval (retryInterval) for each polling attempt. The polling process will take a total of 8 * 5 = 40 seconds to complete.

Points to note:

- The use of *-retryCount <retryCount>* and *-retryInterval <retryInterval>* is optional and is required only when the **Certificate Requests Need Approval** attribute is enabled in the CA policy settings of the ACME Server.
- Omitting these parameters will not disrupt the current flow of certificate creation.
- If necessary, the default values for polling are used. You may proceed with the certificate generation process without any issues.

Providing CSR and EAB Fields

Fields to be provided in the CSR and for External Account Binding (EAB) can be configured in a JSON file. A JSON file in the name certConfig.json with the configured fields needs to be created inside the POSHACME_AVX directory. There is a template file named certConfigTemplate.json present within the POSHACME_AVX directory, which can be renamed to certConfig.json.

CSR fields that can be provided:

- Subject fields:
  - Organization
  - Organization unit
  - Country
  - State
  - Locality
- Hashing algorithm (when using RSA)
- Key-Size

EAB fields that can be provided:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- EAB hmac
- EAB kid
- EAB Algorithm

A sample certConfig.json is as shown:

```
{
"csr_params": {
        "organization" : "cert_appviewx",
        "organization_unit" : "crypto_avx",
        "country" : "IN",
        "state" : "Andhra Pradesh",
        "locality" : "Rajahmundry",
        "hashing_algorithm":"SHA384",
        "key_size":"2048"
        },
"eab": {
        "kid":"",
        "mac":"",
        "alg":"hs256"
}
}
```

Note:

- When EAB is not configured on the server side, the fields for *kid*, *mac*, and *alg* can be configured to empty strings ("").
- If you intend using the default configuration of Posh-ACME, you may set the fields in the certConfig.json file to empty strings ("").

For more information on the keywords used in the Posh-ACME commands, see Keywords in Posh-ACME commands.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Best Practices

- **Prefer Stronger Key Sizes:** Use higher key sizes where applicable—consider using RSA 2048 or above for increased cryptographic strength.
- **Distribute Renewal Schedules:** Ensure that certificate renewal cron jobs or schedulers are spread out in time to avoid concentrated load on the ACME server and ensure smooth, uninterrupted renewals.
- **Use External Account Binding (EAB):** Use EAB as an added layer of authentication for enhanced security.
- **Secure your API credentials:** Store DNS provider API keys securely (e.g., environment variables, encrypted files).
- **Challenge methods:** Customize plugins with fallback and retries if DNS propagation is slow.
- **Automation:** Use scheduled tasks or pipelines (like Jenkins/GitHub Actions) to automate renewals. Use **Renew-PAOrder** in a loop or job script.
- **Deployment**: Use **Export-PACertificate** with **-OutPath** or **-PfxPass** for downstream systems.
- **Automate deployment to**:
  - **IIS**: Import-PfxCertificate, New-WebBinding
  - **Remote systems**: use PowerShell Remoting, WinRM, or secure file copy.
- **Secure Storage**: Avoid storing API keys in plain text. Use PowerShell's **ConvertTo-SecureString** and **Export-Clixml**.
- **Custom Package Verification**: Make sure the AppViewX DNS plugin is available in Posh-ACME package if the user is using the AppViewX DNS Challenge or the Enterprise Secure DNS Challenge option.

Troubleshooting

Accessing ACME Logs

1. Access the terminal window.
2. Go to <Installed_Path>/logs directory and find the name format with <avxgw-HTTPS-<yyyy-mm-dd>.log>, for example, <avxgw-HTTPS-2021-03-17.log>
   - If the file size exceeds 100MB, it will be rolled over and the latest logs will be available in the latest file named with an incrementing counter starting from 1 such as avxgw-HTTPS-<yyyy-mm-dd>.<incrementing_counter>.log, for example, <avxgw-HTTPS- 2021-03-17.1.log>.
   - ACME plugin logs:

     </home/appviewx/appviewx/logs/avx-vendor-cert-acme-agent-<pod_name>.log>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Errors

General errors that can be encountered

1. Invalid End-point URL	
Description	When an invalid ACME endpoint URL is provided in Posh-ACME, it will result in the following error.
Error	`Set-PAServer: Name or service not known`
Troubleshooting	Ensure that the provided URL is valid and set up through the AppViewX GUI.
2. CA Certificate not configured in the client's trust store	
Description	When the CA certificate of the ACME server is not configured in the client's trust store, the following error is expected.

Error	`Set-PAServer: The remote certificate is invalid because of errors in the certificate chain: PartialChain`
	
	or
	
	`Set-PAServer: The underlying connection was closed: Could not establish trust relationship for the SSL/TLS secure channel.`

Troubleshooting	See Point 2 (To add custom CA certificates to TrustStore) in the Section, Providing Sudo Permissions in Linux.
3. Invalid Acme Agent	
Description	When the specified ACME agent name in the endpoint URL does not match any configured agent in the AppViewX GUI, it will trigger the following error.
Error	`Set-PAServer: {"detail":"Unable to fetch acme server url. - Agent Settings name given is invalid","type":"urn:ietf:params:acme:error:serverInternal"}`
Troubleshooting	Ensure that the provided URL is valid and set up through the AppViewX GUI.
4. Invalid Port in the End-point URL	
Description	This error is expected when invalid port details are provided in the acme end-point URL.

Error	`InvalidArgument: /home/<user>/.local/share/powershell/Modules/Posh-ACME/4.18.0/Public/Set-PAServer.ps1:53`
	`Line |`
	`53 | $uri = [uri]$DirectoryUrl`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General errors that can be encountered (continued)

		~~ | Cannot convert value "https://<server_hostname>:31443234/avxapi/<acme_agent>/acme/directory" to type "System.Uri". | Error: "Invalid URI: Invalid port specified."
Troubleshooting	Ensure that the port specified in the URL is valid.
5. Port 80 permission is missing for PowerShell	
Description	When PowerShell pwsh executable lacks the capability to bind to port 80 without requiring root privileges, it will result in the following error.

Error	`MethodInvocationException: Exception calling "Start" with "0" argument(s): "Permission denied"`
	or
	`Exception calling "Start" with "0" argument(s): "Access is denied"`

Troubleshooting	See Point 1 (To provide access to port 80 for a non-root user) in the Section, Providing Sudo Permissions in Linux.
6. Invalid Domain Name	
Description	When an enrollment call is made for an invalid domain name, the certificate issuance process will not proceed.
Error	Exception: /home/<user>.local/share/powershell/Modules/Posh-ACME/4.18.0/Public/New-PACertificate.ps1:271 Line | 271 | Submit-ChallengeValidation | ~~~~~~~~~~~~~~~~~~~~~~~~~~ | Authorization invalid for example.appviewx.com:
Troubleshooting	In order for the domain to be considered valid and for the certificate issuance to succeed, a proper DNS entry must be made for the server corresponding to the domain before attempting to enroll a certificate for it.
7. Incorrect usage of attributes and attributesType fields	
Description	When only one field - either the ‘attributes’ or ‘attributesType’ is provided in the arguments of the enrollment command, it results in the following error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General errors that can be encountered (continued)

Error	Submit-OrderFinalize: Attribute type must be one of the following values : cert/custom/both) Both attributes and attributesType must be provided to add attributes in the certificate request...
Troubleshooting	The **attributesType** field must be accompanied with the **attributes** field. See Accessing Orders and Certificates section for more information.
8. Incorrect attributeType	
Description	An incorrect value is provided for the **-attributesType** field.
Error	Submit-OrderFinalize: Attribute type must be one of the following values : cert/custom/both)
Troubleshooting	The **attributesType** field must be one of the following values : cert/custom/both). See the Accessing Orders and Certificates section for more information.
9. Incorrect IIS Site Name	
Description	An incorrect IIS site name is used for the field -SiteName.
Error	Set-IISCertificate : Site <Site_Name> not found.
Troubleshooting	The 'SiteName' field must be valid (present in the Sites of IIS Manager of the machine).
10. Missing EAB Credentials	
Description	EAB Credentials ('eab:hmac' and 'eab:key' fields) are set to empty string ("") in the 'certConfig.json' file, while the end-point server requires external account credentials.
Error	New-PACertificate : The current ACME server requires external account credentials to create a new ACME account. Please run New-PAAccount with the ExtAcctKID and ExtAcctHMACKey
Troubleshooting	Provide valid EAB credentials for the 'eab:hmac' and 'eab:key' fields in the 'certConfig.json' file.
11. Invalid EAB Kid	
Description	Incorrect EAB kid is provided in the 'certConfig.json' file.
Error	New-PACertificate: The "externalAccountBinding.protected" field is invalid.:: kid is invalid
Troubleshooting	Provide a valid EAB kid which is configured in AppViewX ACME configuration settings.
12. Invalid EAB Algorithm	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General errors that can be encountered (continued)

Description	Incorrect EAB Algorithm is provided in the ‘certConfig.json’ file.
Error	New-PACertificate : Some of the errors was found in request.
Troubleshooting	Provide a valid EAB Algorithm which is configured in AppViewX ACME configuration settings.
13. Invalid Key Length	
Description	Incorrect key length is provided in the ‘certConfig.json’ file.
Error	New-PACertificate : Cannot validate argument on parameter 'CertKeyLength'. Must be 'ec-256','ec-384','ec-521' for EC keys or between 2048-4096 (divisible by 128) for RSA keys
Troubleshooting	Provide valid key length value. Must be 'ec-256','ec-384','ec-521' for EC keys or between 2048-4096 (divisible by 128) for RSA keys.

#	Error Message	Description	Troubleshooting
1	Self DNS Challenge token validation/IP Validation option is selected but EAB details/Allowed domains are not configured for the agent settings.	When AppViewX **DNS Challenge** or **Enterprise Secure Challenge Validations** is selected but **Allowed Domains** or EAB details are not provided from the ACME client, you get this error.	1. Provide valid domains under the **Allowed Domains** field. 2. Enable either **Static EAB** or **Dynamic EAB credentials**.
2	DNS Challenge validation failed. IP Options are not selected for agent settings. Allowed options are STRICT, ANY, NONE.	If Enterprise Secure Challenge type other than **Secure, Any, Ignore** is selected in the ACME Settings.	Select any one of the following under Enterprise Secure Challenge options: **Secure, Any, Ignore.**
3	DNS Challenge validation failed. ACME DNS challenge verification via DNS A record failed. For STRICT Option IP didn't Match.	If the **Secure** option is selected under **Enterprise Secure Challenge** type and the ACME client’s IP address does not match	Make sure that the DNS A record of the requesting domain contains the same IP address as the ACME client's IP address.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
		with the available DNS A record for the particular domain.	
4	DNS Challenge validation failed. ACME DNS challenge verification via DNS A record failed. For STRICT Option there are more IP address entries in DNS A Record.	If the **Secure** option is selected under **Enterprise Secure Challenge** type and the DNS A record for the requesting domain is fetched with more than one IP address.	Make sure that the DNS A record of the requesting domain contains only one IP address, which is the same as the ACME client's IP address.
5	DNS Challenge validation failed. No DNS A records are found to validate ANY type.	If the **ANY**option is selected under **Enterprise Secure Challenge** type and the DNS A records for the requesting domain are fetched in which none of the IP address matches with the ACME client’s IP address.	Make sure that the DNSA records of the requesting domain contains any one IP address, which is the same as the ACME client’s IP address.
6	DNS Challenge validation failed. DNS A record for the domain <domain name> is not available.	When AppViewX is not able to obtain the DNS A records for the requesting domain.	• Check if the DNS Server is reachable from AppViewX to resolve and obtain the DNS A records of the requesting domain. • Check if the provided DNS server hostname is proper to resolve and obtain the DNS A records.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
7	DNS Challenge validation failed. Error while executing Create/Delete record operation.	1. When AppViewX is not able to reach the DNS server for creating DNS TXT for the requesting domain. 2. When there are errors while performing creation or deletion of DNS TXT records in the DNS server.	1. Check if the DNS server is reachable from AppViewX. 2. Check AppViewX logs for detailed errors regarding creation and deletion of errors.

Keywords in Posh-ACME commands

Keywords used in the Posh-ACME commands

Keyword	Expected Input	Comments
-domain	<Domain_Name> (Type: String) **domain1.com** (or) **domain1.com, domain2.com, domain3.com**	Comma-separated list of domains to obtain a certificate for.
-server	<Acme Server Endpoint URL fetched from AppViewX GUI> (Type: String)	ACME Directory Resource URI.
-attributes	[format: @{'id'='1098';'environment'='development';'Director'=' director_id'}]	The -attributes field allows users to provide multiple attributes in the format of **'attribute_name'='attribute_value'** and separate each attribute with a semicolon in the Posh-ACME command.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in the Posh-ACME commands (continued)

Keyword	Expected Input	Comments
		[optional, but **-attributes** field must be accompanied with the **-attributesType** field]
-attributesType	Any one of the following : **cert/ custom/both** (Type: String)	Takes in one of the following inputs **cert/custom/both**. [optional, but must be included when **-attributes** is passed]
-retryInterval	<retryInterval> (Type: Integer)	The waiting period in seconds, after which the next call in the polling is triggered. [Default value : 2] (Optional)
-retryCount	<retryCount> (Type: Integer)	The number of times for which the certificate is polled from the client side. [Default value : 30] (Optional)
-renewalDaysThreshold	<renewalDaysThreshold> (Integer)	Threshold value for renewal. Certificates with a remaining validity period (measured in days) less than the specified threshold will only be considered for renewal. [Default value: 30] (Optional)
-poshACMEDirectoryPath	<poshACMEDirectoryPath>	Path to the POSHACME_AVX folder.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Keywords used in the Posh-ACME commands (continued)

Keyword	Expected Input	Comments
-Name	<Main_Domain_Name> (Type: String)	The main domain name of the certificate. It is the same as the order name.
-SiteName	<Site_Name> (Type: String)	Name of the site in IIS.
-certFile	<certFile> (Type: String)	Path to the certificate to be revoked.

Keywords in Posh-ACME certConfig.json

Json keys used in the Posh-ACME certConfig.json file

Json keys	Type	Comments
csr_params:organization **csr_params:organization_unit** **csr_params:country** **csr_params:state** **csr_params:Locality**	String	Choose the appropriate subject fields for the CSR. (Optional)
csr_params:hashing_algorithm	String	Hashing algorithm for signing (RSA). Specify any one algorithm from {SHA256, SHA384, SHA512}. [Default value: SHA384] (Optional)
csr_params:key_size	String	The type and size of private key to use for the certificate. For RSA keys, specify a number between 2048-4096 (divisible by 128). For ECC keys, specify either 'ec-256'\'ec-384'\'ec-521'.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Json keys used in the Posh-ACME certConfig.json file (continued)

Json keys	Type	Comments
		[Default value: 2048] (Optional) Whenever ECC keys are used, the hashing algorithm is set internally and cannot be changed from configuration file.
eab:kid	String	The value of Key Identifier for External Account Binding. (Optional)
eab:hmac	String	The value of HMAC key for External Account Binding. (Optional)
eab:alg	String	Signature Algorithm for External Account Binding. Specify any one algorithm from {HS256, HS384, HS521}. [Default value: HS256] (Optional)

Configuring AppViewX LEGO Client

AppViewX introduces LEGO client--an ACME client similar to the AppViewX EST client. This client incorporates major customizations implemented in all ACME clients provided by AppViewX, including Posh-ACME, win-acme, and Certbot.

This section explains implementation of LEGO client for Microsoft Windows and Linux.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- LEGO client has no installation steps. The binary will be provided for both Microsoft Windows and Linux and can be consumed directly.
- For Windows, use the administrator command prompt for all the commands.
- For Linux:
  - **DNS:** Does not require sudo.
  - **HTTP:** This first command alone will require sudo.

```
sudo setcap 'cap_net_bind_service=+ep' <legoClient-binary>
```

- EAB is mandatory for LEGO plug-in.
- --dns.propagation-disable-ans flag is mandatory for enrollment and renewal as self-challenge validation must be disabled in these cases.
- Revocation command is similar to others.
- DNS challenge details
  1. --vendor -> vendor name [currently only infoblox is supported]
  2. --vendor-account -> vendor account name -> name of the configuration in integration hub
  3. Integration hub must be configured with the DNS server details.

```
Command:
./legoClient --domains <Domain-name-comma-seperated> --email <Email-id> --dns appviewx --accept-tos=true --server=<ACME-Directory-URL>
 --tls-skip-verify  --eab --kid "<KID>" --hmac "<HMAC>" --eab-algorithm <EAB-Algorithm> --dns.propagation-disable-ans --vendor <Vendor-name>
 --vendor-account <Vendor-Account-Name> run
```

- Enterprise secure challenge:

```
Command:
./legoClient --domains <Domain-name-comma-seperated> --email <Email-id> --dns appviewx --accept-tos=true --server=<ACME-Directory-URL>
 --tls-skip-verify  --eab --kid "<KID>" --hmac "<HMAC>" --eab-algorithm <EAB-Algorithm> --dns.propagation-disable-ans run
```

Windows Commands

Component/ Function	Command
Enroll HTTP	legoClient.exe --email= example@email.com --domains=domain.example.com --server=https://server.example.com:port/api/lego_http/acme/directory --http --tls-skip-verify run

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
Enroll EAB HTTP	legoClient.exe --email=example@email.com --domains=domain.example.com --server=https://server.example.com:port/api/lego_http/acme/directory --http --tls-skip-verify --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS512 run
DNS enroll (AWS Route 53)	set AWS_PROPAGATION_TIMEOUT=40 set AWS_ACCESS_KEY_ID=<aws-access-key-id> set AWS_SECRET_ACCESS_KEY=<aws-secret-access-key> set AWS_REGION=<aws-region> legoClient.exe --domains <domain> --email example@email.com --dns <dns-provider> --accept-tos=true --organization-name <organization-name> --organizational-unit <organizational-unit> --country <country-code> --province <province> --server https://<server>:<port>/avxapi/lego_dns/acme/directory --tls-skip-verify run **Note:** DNS configurations can vary depending on the DNS providers. For more information, refer to https://go-acme.github.io/lego/dns/.
DNS enroll (AppViewX)	legoClient.exe --domains <DOMAIN-NAMES> --email <EMAIL> --dns appviewx --accept-tos=true --server=<ACME-SERVER-URL> --tls-skip-verify --eab --kid "<EAB-KID>" --hmac "<EAB-HMAC>" --eab-algorithm <EAB Algorithm> --dns.propagation-disable-ans --vendor <dns-vendor-name> --vendor-account <vendor-account-name> run
Sample for custom and cert attributes	legoClient.exe --email=example@email.com --domains=domain.example.com --server=https://server.example.com:port/ api/lego_http/acme/directory --http --tls-skip-verify --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS512 --cert-emails "email1@example.com,email2@example.com" --province <province> --country <country-code> --organizational-unit <organizational-unit> --organization-name <organization-name> --cert-attributes "<cert-attributes>" --custom-attributes "<custom-attributes>" run **Sample for Customer and Certificate Attributes in case of multiple values:** --cert-attributes "aa=apple,bb=ball" --custom-attributes "test=customattribute1,test2=customattribute2"

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
Renew all	legoClient.exe --tls-skip-verify renew --renew-all --days <number-of-days> --no-random-sleep **Note:** --days indicates that the certificates will be renewed if their remaining validity is less than the number of days specified.
Renew one	legoClient.exe --email=example@email.com --domains=domain.example.com --server=https://server.example.com:port/api/lego_http/acme/directory --http --tls-skip-verify --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS512 --cert-attributes <cert-attributes> --custom-attributes <custom-attributes> renew --days <number-of-days>
DNS renew (AppViewX)	legoClient.exe --domains <DOMAIN-NAMES> --email <EMAIL> --dns appviewx --accept-tos=true --server=<ACME-SERVER-URL> --tls-skip-verify --eab --kid "<EAB-KID>" --hmac "<EAB-HMAC>" --eab-algorithm <EAB Algorithm> --dns.propagation-disable-ans --vendor <dns-vendor-name> --vendor-account <vendor-account-name> renew
Revoke	legoClient.exe --email=example@email.com --domains=domain.example.com --server=https://server.example.com:port/ api/lego_http/acme/directory --http --tls-skip-verify revoke <revocation reason>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
	Note: Revocation reasons can include any of the following: • unspecified (0) • keyCompromise (1) • cACompromise (2) • affiliationChanged (3) • superseded (4) • cessationOfOperation (5) • certificateHold (6) • removeFromCRL (8) • privilegeWithdrawn (9) • aACompromise (10)
Reinstate	legoClient.exe --email=example@email.com --domains=domain.example.com --server=https://server.example.com:port/api/lego_http/acme/directory --http --tls-skip-verify revoke 8 **Note:** It is important to include the `--keep` flag at the end of the reinstate command; else, the certificates will be deleted after the operation.
Windows schedule command	legoClient.exe --tls-skip-verify renew --renew-all --days <number-of-days> --no-random-sleep --schedule "HH:MM" --schedule-only

Linux Commands

Component/ Function	Command
Enroll HTTP	./legoClient --domains <domain> --email example@email.com --accept-tos=true --server https://<server>:<port>/api/lego_http/acme/directory --tls-skip-verify --http run

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
Enroll EAB HTTP	./legoClientLinux --domains <domain> --email example@email.com --accept-tos=true --server https://<server>:<port>/api/lego_http/acme/directory --tls-skip-verify --http --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS512 run
DNS enroll (AWS Route 53)	AWS_PROPAGATION_TIMEOUT=40 AWS_ACCESS_KEY_ID=<aws-access-key-id> AWS_SECRET_ACCESS_KEY=<aws-secret-access-key> AWS_REGION=<aws-region> ./legoClientLinux --domains <domain> --email example@email.com --dns <your-dns-provider> --accept-tos=true --server https://<server>:<port>/api/lego_dns/acme/directory --tls-skip-verify run **Note:** DNS configurations can vary depending on the DNS providers. For more information, refer to https://go-acme.github.io/lego/dns/.
DNS enroll (AppViewX)	./legoClient --domains <DOMAIN-NAMES> --email <EMAIL> --dns appviewx --accept-tos=true --server=<ACME-SERVER-URL> --tls-skip-verify --eab --kid "<EAB-KID>" --hmac "<EAB-HMAC>" --eab-algorithm <EAB Algorithm> --dns.propagation-disable-ans --vendor <dns-vendor-name> --vendor-account <vendor-account-name> run

Renew all	./legoClientLinux --renew-all --tls-skip-verify renew --days <number-of-days> --no-random-sleep

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
	Note: --days indicates that the certificates will be renewed if their remaining validity is less than the number of days specified.
Renew one	./legoClientLinux --domains <domain> --email example@email.com --accept-tos=true --server https://<server>:<port>/api/lego_http/acme/directory --tls-skip-verify --http --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS384 --cert-attributes '<cert-attributes' --custom-attributes '<custom-attributes>' renew --days 368
DNS renew (AppViewX)	./legoClient --domains <DOMAIN-NAMES> --email <EMAIL> --dns appviewx --accept-tos=true --server=<ACME-SERVER-URL> --tls-skip-verify --eab --kid "<EAB-KID>" --hmac "<EAB-HMAC>" --eab-algorithm <EAB Algorithm> --dns.propagation-disable-ans --vendor <dns-vendor-name> --vendor-account <vendor-account-name> renew
Revoke	./legoClientLinux --domains <domain> --email example@email.com --accept-tos=true --server https://<server>:<port>/api/lego_http/acme/directory --tls-skip-verify --http --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS384 --cert-attributes '<cert-attributes>' --custom-attributes '<custom-attributes>' revoke <revocation reason code> **Note:** Revocation reasons can include any of the following: • unspecified (0) • keyCompromise (1) • cACompromise (2) • affiliationChanged (3) • superseded (4) • cessationOfOperation (5) • certificateHold (6) • removeFromCRL (8) • privilegeWithdrawn (9) • aACompromise (10)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Component/ Function	Command
Suspend	./legoClientLinux --domains <domain> --email example@email.com --accept-tos=true --server https://<server>:<port>/api/lego_http/acme/directory --tls-skip-verify --http --eab --kid <EAB-KID> --hmac <EAB-HMAC> --eab-algorithm HS384 --cert-attributes '<cert-attributes>' --custom-attributes '<custom-attributes>' revoke 6 **Note:** It is important to include the `--keep` flag at the end of the suspend command; else, the certificates will be deleted after the operation.
Linux cron scheduler	legoClient --tls-skip-verify renew --renew-all --days <number-of-days> --no-random-sleep --schedule "MM HH * * *" --schedule-only

Troubleshooting

Windows acme client > HTTP challenge (especially for IIS)

If the **IIS challenge validation** fails (when using the **IIS webroot** method), even though the hostname correctly resolves to the Windows server and the required ports are open, verify the **MIME types** configuration for the IIS site. Click **Add** under **MIME Types**, and add the following entries:

- **File name extension:** `.`
- **MIME type:** `application/json`

SCEP

What is SCEP?

Simple Certificate Enrollment Protocol (SCEP) is an open source certificate management protocol to enable easier, scalable and secure certificate issuance. The primary characteristics of SCEP are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The request/response model is based on HTTP and supports RSA-based cryptography.
- Requires the use of a *challenge password* within the certificate signing request (CSR) which is shared between the server and the requester.
- Does not support certificate revocation online, and has limited Certificate Revocation List (CRL) retrieval support.

Note: AppViewX does not inherently rely on Network Device Enrollment Service (NDES); instead, it uses its own built-in server for the SCEP protocol. This gives AppViewX the advantage of seamlessly integrating with any Certificate Authority, unlike NDES, which is primarily tied to Microsoft Active Directory Certificate Services (ADCS).

How does SCEP work?

- **Gateway API URL:** SCEP allows devices to communicate with PKI through API URL, and then the users can put this URL in the mobile device management (MDM) for sending a payload to devices for which the client certificates are to be enrolled.
- **Shared Secret:** A shared secret is a case-sensitive challenge password shared between the SCEP server and the certificate authority (CA) to verify the CA with the appropriate server for signing certificates.
- **Certificate Request:** After the SCEP gateway is set and the shared secret is exchanged between the server and the CA, a configuration profile is developed to allow auto-enrollment of certificates for managed devices. Once the CA authenticates, the signed certificate is deployed on the device.
- **Signing Certificate:** The MDMs require SCEP signing certificate which is signed by the CA and includes the entire certificate chain of trust (Root CA, Intermediate CA and the signing certificate).

The SCEP enrollment and usage generally follows this workflow:

1. Obtain and validate a copy of CA certificate.
2. Generate CSR and send it to CA.
3. Poll the SCEP server to verify whether the certificate is signed.
4. Re-enroll for obtaining new certificates before the existing certificate expires.
5. Retrieve the CRL as needed, the preferred method is via a CRL distribution point (CDP) query.

Why is SCEP used?

Issuing public key infrastructure certificates requires an extensive process of information exchange and approval procedures with a trusted certificate issuing entity or certificate authority (CA). SCEP helps in automating the entire process, thus making it simpler, easier and faster for the IT security teams to

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

enroll and deploy certificates onto devices without any manual process. A device can easily enroll for certificates by using URL and a shared secret to communicate with CA. Mobile Device Management (MDM) systems like Microsoft Intune and Apple use SCEP for enrolling PKI certificates for the increasing number of smartphones and mobile devices.

The SCEP protocol services can be configured in AppViewX to enable the communications between the client (device endpoints) and AppViewX northbound services that processes the client requests such as certificate enrollment and renewal. Once the protocol service gets enabled, AppViewX will act as an RA in receiving and serving the client requests. The protocol must be enabled as an HTTP service.

What's Next?

- Configuring AppViewX SCEP Server

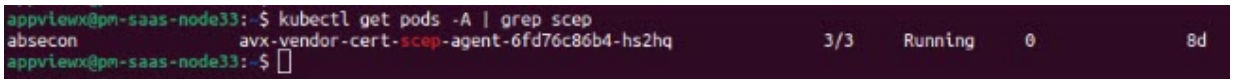
Configuring AppViewX SCEP Server

Prerequisites

Onprem

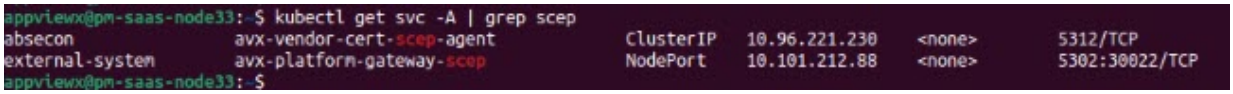
- Make sure that the SCEP pod is running in the cluster by using the command:

```
kubectl get pods -A | grep scep
```



- Make sure that <avx-platform-gateway-scep> and <avx-vendor-cert-scep-agent> services are running in the cluster by running:

```
kubectl get svc -A | grep scep
```



SaaS

Ensure the https gateway is enabled on the cloud connector while installing it. To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run

```
cd deps/tools
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Run

```
./k3s kubectl get svc -A | grep http
```

Note: It should have the avx-mid-server-gateway-http or avx-mid-server-gateway-https under namespace cc.

```
[appviewx@pe-qa-cc-n8 tools]$ ./k3s kubectl get svc -A | grep http
cc            avx-mid-server-gateway-http     NodePort    10.43.0.23     <none>        5302:30022/TCP
cc            avx-mid-server-gateway-https    NodePort    10.43.0.197    <none>        5300:30020/TCP
[appviewx@pe-qa-cc-n8 tools]$
```

Enabling SCEP Services

For Onprem

1. Log onto the AppViewX installer node. Open the terminal window.
2. Go to </installation_folder/appviewx_kubernetes/scripts> folder.
3. Add the avx-vendor-cert-scep-agent and avx_platform_gateway_external in ENABLED_PLUGINS in the appviewx.conf file.
4. Specify the datacenter (DC) where the gateway must be deployed:
   - avx_vendor_cert_scep_agent=<dc name>
   - avx_platform_gateway_external=<dc name>
5. Run the <plugins_install.sh>
6. Verify if SCEP is enabled by running kubectl get pods -A | grep scep

```
appviewx@pm-saas-node33:~$ kubectl get pods -A | grep scep
absecon              avx-vendor-cert-scep-agent-6fd76c86b4-hs2hq              3/3     Running     0              8d
appviewx@pm-saas-node33:~$
```

7. Verify the plugin status and port number by running:

```
kubectl get services -A | grep scep
```

8. Make sure that the avx-vendor-cert-scep-agent and avx-vendor-cert-scep-agent are running.

```
appviewx@pm-saas-node33:~$ kubectl get svc -A | grep scep
absecon              avx-vendor-cert-scep-agent              ClusterIP   10.96.221.230   <none>        5312/TCP
external-system      avx-platform-gateway-scep               NodePort    10.101.212.88   <none>        5302:30022/TCP
appviewx@pm-saas-node33:~$
```

9. Make sure that the port number is 5303:30022 in avx-platform-gateway-est.

Note: The number 30022 must be used in the UI configuration.

10. Identify the nodes running the SCEP services by using:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
<kubectl get pods -n external-system -o wide>
```

```
-bash-4.2$ kubectl get pods -n external-system -o wide
NAME                                    READY   STATUS          RESTARTS   AGE   IP              NODE
avx-platform-gateway-676f67587b-54jj8   1/1     Running         5          64d   10.244.198.136  trialnode2.appviewx.net
avx-platform-gateway-676f67587b-h6xrf   1/1     Running         4          62d   10.244.251.30   trialnode3.appviewx.net
avx-platform-gateway-676f67587b-tbqcs   0/1     NodeAffinity    0          64d   <none>          trialnode3.appviewx.net
-bash-4.2$
```

SCEP is available on all the nodes where the external system runs.

For SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run:

```
cd deps/tools
```

3. Run:

```
./k3s kubectl get svc -A
```

Note: Ensure that avx-mid-server-gateway-http is present under namespace cc.

Configuring SCEP Endpoint

1. Click (**Menu**) > **CERT+** > **Administration** > **Auto Enrollment** > **SCEP**.
   The **Auto Enrollment : SCEP** page appears.
2. Click the **+ Add** button.
3. Enter the following fields:

Field description on Auto Enrollment : SCEP page

Field	Description
Endpoint Details	
***Name**	A unique name (alphanumeric string) to identify the agent setting. Name should not start with special characters. Acceptable characters: A-Z, a-z, 0-9, '.', '_', '-'
***IP/FQDN**	**For Onprem** **Without load balancer:**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	FQDN: • **HTTP:** Must contain the FQDN of the node where the external gateway is running. To get the details, run `kubectl get pods -n external-system -o wide`. If the external gateway is running on multiple nodes, you can specify any one of those nodes. • **HTTPS:** Must be same as the web URL. **With load balancer:** **HTTP:** • **FQDN:** Must be the FQDN of the load balancer. **For SaaS:** **Using On-premises CC:** **Without load balancer** • **FQDN:** Must be the **FQDN** of the cloud connector where the auto-enrollment gateway is running. **With load balancer** • **FQDN:** Must be the FQDN of the load balancer. **Using Direct Gateway** In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, the FQDN/IP address will be the tenant URL with "-aep" before the domain name. The format is as follows: <tenant>-aep.<domainname>.
***SCEP URL**	Select either HTTP or HTTPS. Based on the selection of this field, the SCEP endpoints will be configured with HTTP or HTTPS URL. The port information will be dynamically updated based on this selection. **Using Direct Gateway** In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, use HTTPS.
***Port**	**For Onprem**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Without load balancer:
	• **Port:**
	  • **HTTP:** By default, it is port 30022. Leave it as is.
	  • **HTTPS:** By default, it is port 31443. Leave it as is.
	
	With load balancer:
	
	HTTP
	• **Port:** Must be the listening port of the load balancer.
	
	Note:
	• It is recommended to set the listening port as 30022, which is the same as AppViewX.
	• If the load balancer's listening port is different from 30022, then update the respective port.
	
	For SaaS:
	
	Using On-premises CC:
	
	Without load balancer
	• **Port:**
	  • **HTTP:** By default, it is port 30022. Leave it as is.
	  • **HTTPS:** By default, it is port 30020. Leave it as is.
	
	With load balancer
	• **Port:** Must be the listening port of the load balancer.
	
	Note:
	• It is recommended to set the listening port as 30022, which is the same as AppViewX.
	• If the load balancer's port is different from 30022, then update the respective port.
	
	Using Direct Gateway

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, use only port 443.
Challenge Password	A challenge token to be used while enrolling certificates. In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, it is recommended to provide a challenge password.
CA Accounts	
***Certificate Group**	Select a specific group under which certificate needs to be enrolled.
***Certificate Category**	Select a specific certificate type (Server / Client) to be enrolled.
***Select CA**	Select the required CA from the available options. The certificate will be enrolled under the selected CA. The CAs associated with the Default certificate group are: • AppViewX • AppViewX PKIaaS • AppViewX PKIaaS Native • Amazon Private CA • DigiCert • DigiCert One • EJBCA • Entrust • Entrust MPKI • GlobalSign Atlas • GlobalSign MSSL • Google • HydrantID • IDnomic • Microsoft Enterprise • Microsoft Standalone • Nexus • OpenTrust • Sectigo (Commodo Certificate Manager) • SwissSign

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The Vendor Specific Details and Custom Attributes section are displayed for some of the CAs as follows: • DigiCert • EJBCA • Entrust • Entrust MPKI • GlobalSign MSSL • MS Enterprise • Nexus
***:** mandatory fields.	

Note: Use the port number that is appearing when you enable SCEP services.

Health check URL for load balancer:

Onprem

a. **HTTP method:** GET
b. **Healthcheck API:** https://<FQDN>:30022
   i. **FQDN:** FQDN of the external gateway running nodes.
   ii. **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

SaaS

- **HTTP method:** GET
- **Healthcheck API:** https://<FQDN>:30022 (HTTP) / https://<FQDN>:30020 (HTTP)
- **FQDN:** FQDN of cloud connector enabled with the HTTP/HTTPS gateway.
- **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

When **AppViewX** is selected as CA. The fields for AppViewX CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for AppViewX CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with the SCEP client machine.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **AppViewX PKIaaS Native** is selected as CA. The fields for AppViewX PKIaaS Native are as follows:

Details for AppViewX PKIaaS Native - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Template Name	Select a template name from the dropdown list.
***Issuer Name**	Select an issuer name to issue the certificate.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
*: mandatory fields.	

When **Amazon Private CA** is selected as CA. The fields for Amazon Private CA are as follows:

Details for Amazon Private CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Region**	Select a valid region associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Issuer**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Signature Algorithm**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value from the group's associated policy. Select an appropriate value as required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **AppViewX PKIaaS** is selected as CA. The fields for AppViewX PKIaaS CA are as follows:

Details for AppViewX PKIaaS CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with the SCEP client machine.
***Issuer Location**	Select the issuer location associated with the CA.
***Issuer Name**	Select the issuer name used to issue the certificate.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **DigiCert** is selected as CA. The fields for Digicert CA are as follows:

Details for DigiCert CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Division**	Select a division associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Certificate Type**	Select a valid certificate type associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Order Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

If the **Select CA =DigiCert**, then a separate section **Vendor Specific Details** is displayed after the CA Accounts section with two fields described below.

Vendor Specific Details for Digicert CA - Field Description Table

Fields	Description
***Server Type**	Select a server type. The dropdown is populated with the first available value. Select an appropriate value as required.
***Payment Method**	Select a payment method. The possible options are: • **Bill To Account Balance** - Pay with the account balance. Returns an error if this option is disabled for the account or if the account has an insufficient fund. • **Bill To Default Credit Card** - Pay with the account's default credit card. Returns an error if no default credit card is configured for the account
*: mandatory fields.	

When **DigiCert One** is selected as CA. The fields for DigiCert One CA are as follows:

Details for DigiCert One CA - Field Description Table

Fields	Description
***CA Account Name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server or Client.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Proxy Required	Enable this field if the CA communication needs to happen via proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center for CA communication, with the CC node being the recommended option. The selected node will handle the communication through the chosen CC node.
CA Configuration	
***Base URL**	This URL will contain the hostname of the DigiCert CA instance and used for constructing the API requests.
***Authentication method**	By default, API Token is selected.
***API Token**	Enter the API token to authorize the communication between AppViewX and DigiCert One.
Allow Seat ID during enrollment	Enabling this field displays a Seat ID field in the Auto enrollment settings that you can use instead of the CA settings.
***Seat ID**	Unique value assigned to identify an entity in the DigiCert One account.You can provide multiple ID separated by a comma. They can be used for enrollment, renewal, and regeneration.
Use DigiCert One to switch certificates from DigiCert MPKI	Enable this field to automatically switch your DigiCert MPKI certificates to DigiCert One with auto-enrollment/auto-regenerate.
***: mandatory fields.	

When **EJBCA** is selected as CA. The fields for EJBCA CA are as follows:

Details for EJBCA CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Registration Authority Certificate**	Add the chosen CA’s issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
*: mandatory fields.	

If the selected CA is **EJBCA**, a separate section **Vendor specific details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for EJBCA CA - Field Description Table

Fields	Description
***End Entity Profile Name**	Select a profile of an end entity.
End entity user name	Enter the user name for the end entity.
***Issuer Common Name**	Select a common name of an issuer.
***Certificate Profile Name**	Select a profile name of certificate.
*: mandatory fields.	

When **Entrust** is selected as CA. The fields for Entrust CA are as follows:

Details for Entrust CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Type**	Select a valid certificate type associated with the CA account. • If the **Certificate Category** radio button is selected to *Server*, the dropdown list is populated with the first available value. Select an appropriate value as required. • If the **Certificate Category** radio button is selected to *Client*, the dropdown list is populated with 'None' as the default value.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

If the selected CA is **Entrust**, a separate section displaying **Vendor specific details** and **Custom Attributes** is displayed after the **CA Accounts** section.

Note: Based on the Entrust ECS account configuration **Custom Attributes section** may also be displayed.

Vendor Specific Details for Entrust CA - Field Description Table

Fields	Description
Additional Emails	Enter the valid email address in the field.
Requester Name	Enter the requester name.
Requester Email	Enter a valid email ID.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Requester Phone	Enter the 10-digit phone number.
***: mandatory fields.	

When **Entrust MPKI** is selected as CA. The fields for Entrust MPKI CA are as follows:

Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***: mandatory fields.	

If the selected CA is Entrust MPKI, a separate section **Vendor Specific Details** is displayed after the CA Accounts section. The fields for Vendor specific details are as follows:

Vendor Specific Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Name**	Select a CA name from the dropdown list.
***Certificate Profile**	Select a certificate profile from the dropdown list.
***: mandatory fields.	

When **GlobalSign Atlas** is selected as CA. The fields for GlobalSign Atlas CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for GlobalSign Atlas CA - Field Description Table

Fields	Description
***Select CA**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
API Credential Friendly name	Select a CA Account to communicate with during the certificate enrollment actions.
Certificate Profile	Select the certificate Profile from the dropdown list.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

A **Generic Fields** section is also displayed below the **CA Accounts** section. It contains the fields related to the CSR parameters based on the profile (API Credential Friendly name) selected. Only the Organization field is mandatory and is fetched from the selected profile. Rest of the fields are optional.

When **GlobalSignMSSL** is selected as CA. The fields for GlobalSign MSSL CA are as follows:

Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
CA Account	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Product Type	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
CA Connector Name	Name of the CA connector after the certificate is enrolled.
Certificate Validity	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***Profile**	Select the Profile based on the configurations made in the Certificate Authority setting.
*: mandatory fields.	

The following field is displayed in the **Point of Contact** section as per the selected CA. The CA mandates the point of contact information for traceability. All auto-enrollment requests via this endpoint will be registered with the point of contact information entered here.

Point of Contact Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***First Name**	Enter the first name.
***Email Address**	Enter the valid email address.
***Phone Number**	Enter the valid phone number.
*: mandatory fields.	

When **Google** is selected as CA. The fields for Google CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for Google CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate profile type.
***Issuer Location**	Select an issuer location that is associated with the CA account.
***Pool Name**	Select a pool name to issue the certificate.
Template Name	Select an appropriate template name to issue the certificate.
***Issuer Name**	Select an issuer name to issue the certificate.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **HydrantID** is selected as CA. The fields for HydrantID CA are as follows:

Details for HydrantID CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***HydrantID Policy**	Select the policy associated with the CA Account to be used for certificate operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **IDnomic** is selected as CA. The fields for IDnomic CA are as follows:

Details for IDnomic CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Fields	Description
*: mandatory fields.	

When **Microsoft Enterprise** is selected as CA. The fields for Microsoft Enterprise CA are as follows:

Details for Microsoft Enterprise CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

If the selected CA is Microsoft Enterprise, a separate section **Vendor specific details** is displayed with a **Template Name** dropdown after the CA Accounts section.

When **Microsoft Standalone** is selected as CA. The fields for Microsoft Standalone CA are as follows:

Details for Microsoft Standalone CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

When **Nexus** is selected as CA. The fields for Nexus CA are as follows:

Details for Nexus CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Fields	Description
***Procedure**	Select the procedure based on the configurations made in the Certificate Authority Setting.

When **OpenTrust** is selected as CA. The fields for OpenTrust CA are as follows:

Details for OpenTrust CA - Field Description Table

Fields	Description
***CA Account name**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Management Profile**	Select the certificate issuance policy defined in OpenTrust CA.
Zone	The AppViewX configuration wrapper that maps to a CA + profile, and is used by end-users or automation to request certificates consistently.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

When **Sectigo (Comodo Certificate Manager)** is selected as CA. The fields for Sectigo (Comodo Certificate Manager) CA are as follows:

Details for Sectigo (Comodo Certificate Manager) CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Certificate Type**	Select a value from the dropdown list.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

Details for SwissSign CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate creation operations.
***Client Name**	Select the specific client.
***Product**	Select the specific product.
***Registration Authority Certificate**	Add the chosen CA's issued server certificate with the private key. This certificate acts as the RA certificate for SCEP enrollments. Search the required certificate from the AppViewX server inventory by typing the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":"

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

4. Configure the **Advanced Settings** details as follows:

   The following table provides the field description for Advanced Settings:

Advanced Settings - Field Description Table

Fields	Description
***Include Truststore Certificates**	Select whether the issuer certificate needs to be sent to client machines after enrollment.
***Fetch Certificate Parameters**	Select *Yes* or *No*. Setting the radio button to *Yes* enables the system to automatically fetch certificate parameters from a Suggestive Policy and append them to the client CSRs.
High Speed Transactions	Based on the selection of this field, the endpoint will be configured with or without High Performance transaction times. ACME protocol's Revocation actions are not supported in High Performance mode. Request information pertaining to High-Performance can be viewed on the Direct Requests page. **Note:** By default, this field is set to **Yes** for AppViewX PKIaaS CA.
***Return Existing Certificate**	If this option is enabled (**Yes**) then for request with AppViewX should check and return the existing valid certificate for the same CSR & public key from inventory if available otherwise it should proceed with enrollment and return the certificate. • If it is set to **Yes**, the Certificate Threshold field is displayed. • If it is set to **No**, then the AppViewX will do the default behavior of enrolling a new certificate for each request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Retry Count**	Based on this value, the SCEP agent will trigger the number of calls to collect the certificate from AppViewX until it is received. Values accepted between 5 - 99.
***Retry Frequency**	The value specified in this field determines the duration taken between the trigger calls by the SCEP agent. Values accepted between 10 - 99.
***Certificate Poll Type**	Select *Issuer and Subject* or *Transaction ID*. The client agent will use this field to poll the issued certificate from the agent to the subsystem certificate plugin.
Duplicate Certificate Migration	Selecting this check-box will cause the previously issued certificates for the same CSR parameters to be revoked and deleted from AppViewX. **Note:** By default, this field is enabled for AppViewX PKIaaS CA.
*: mandatory fields.	

5. Click **Save**.

Validating SCEP

1. Configure the SCEP endpoint in AppViewX GUI using the preceding steps.
2. The agent configuration should be in **valid** status.

3. If the above steps are completed, then refresh the following URL from the web browser

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. <scep endpoint URL from appviewx GUI>?operation=GetCACaps

b. **Expected response:** In the browser window, you should see the following data:

```
Unset
AES9
DES3
GetNextCACert
POSTPKIOperation
Renewal
SHA-1
SHA-256
SCEPStandard
```

If you get the above response, then you can confirm that AppViewX is working fine.

Enrolling and Renewing Certificates via SCEP

The following conditions must be met, if the SCEP client sends a CSR to AppViewX SCEP Server for a certificate renewal:

1. If the signing certificate is self-signed, then validate if the subject name in the self-signed certificate matches with the common name in the CSR subject.
   a. If it matches, then AppViewX will proceed with enrollment.
   b. If it does not match, then validate whether the challenge passphrase is configured for the endpoint and is validated by the application.

   Note: If the device enrollment uses a self-signed certificate, it is advised to configure challenge passphrase as part of the endpoint. This must be configured on the SCEP client side for any enrollment.

2. If the request is signed with an RA certificate (as configured in AppViewX SCEP endpoint) then AppViewX will proceed with the enrollment.
3. If the signer certificate is any other certificate in the inventory, then check if this certificate belongs to the same entity by doing the common name match. Check if the common name of the signer certificate and the common name in the CSR subject, if it matches, then it is considered as renewal and the certificate is issued.
4. If the signer certificate is any other certificate in the inventory and its common name doesn't match with the common name in the CSR subject, then the certificate request is rejected.

MS Intune

- Configuring AppViewX MS Intune Server
- Configuring AppViewX MS Intune Client

What is MS Intune?

MS Intune or **Microsoft Intune** is a cloud-based service that focuses on mobile device management (MDM) and mobile application management (MAM). AppViewX has a SCEP based integration with MS Intune. This integration provides for provisioning of certificates to Microsoft Intune managed mobile devices.

- There should be an agent (avx_vendor_cert_intune_agent) up and running for MS Intune in AppViewX.
- This Intune plugin can either be in HTTPS or HTTP, but it needs a HTTP gateway running in order to communicate with the client.
- In order to make that HTTP gateway up and running go to /home/appviewx/appviewx/avxgw/avxgw-profile.json. Enable the HTTP profile and restart the gateway.
- It is highly recommended to keep the 'Approval Required' flag in OFF state from **Menu > Inventory > Certificate > Policy** page.
- A valid agent settings should be available in **Menu > Inventory > Certificate > Settings**.

Microsoft Intune is a cloud-based service that focuses on mobile device management (MDM) and mobile application management (MAM). Intune is integrated with Microsoft's Enterprise Mobility + Security (EMS) suite, it manages the application and protects the organization data. Users can configure specific policies to control the applications. It makes sure that the organization data is protected and isolated from the personal data.

What is SCEP?

Simple Certificate Enrollment Protocol (SCEP) is a protocol that allows devices to enroll for a certificate using URL and a shared secret to communicate with a PKI. It uses the CA certificate to secure the message exchange for the CSR. SCEP is used for Certificate-based authentication, whereby access to services such as Wi-Fi, VPN, and securing e-mail through encryption is carried out using certificates.

What is MS Intune Connector?

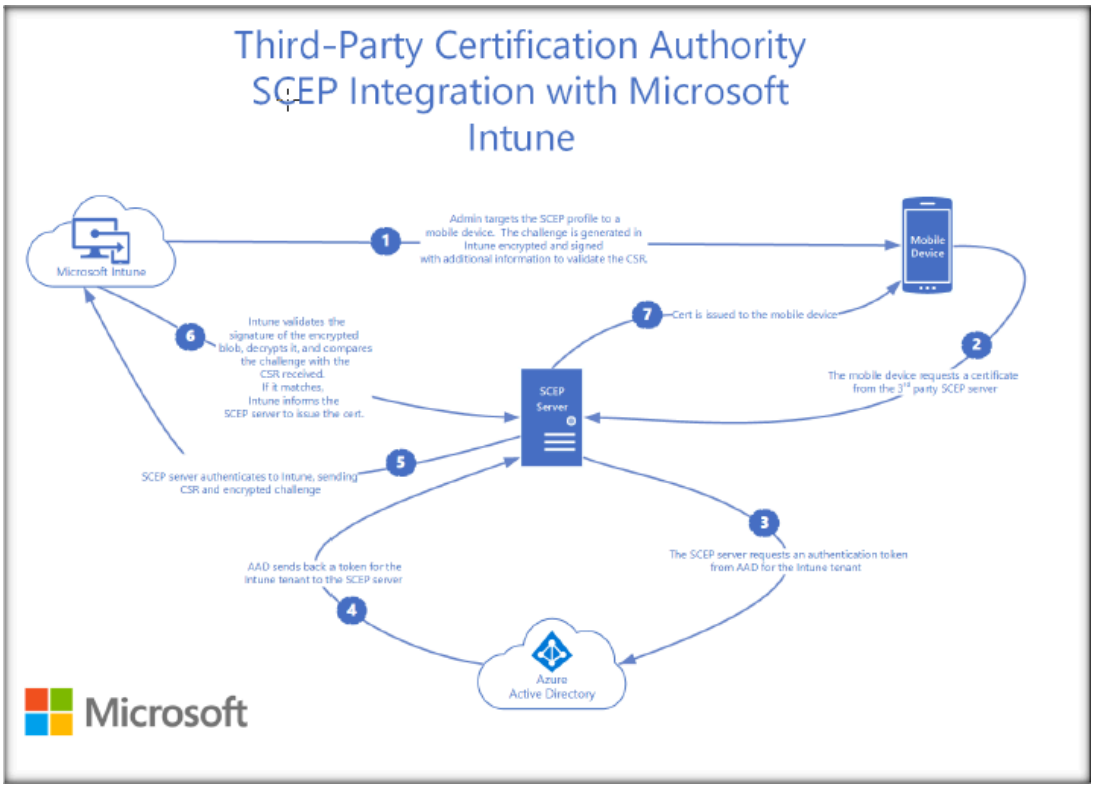
MS Intune AppViewX Connector is a SCEP server that handles certificate request validation through Microsoft Intune and certificate enrollment through AppViewX. To use the SCEP for certificates in Intune

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. In Intune, the administrator creates a SCEP certificate profile, and then targets the profile to users or devices.
2. The device checks into Intune.
3. Intune creates a unique SCEP challenge. It adds the additional integrity-check information, such as what the expected subject and SAN should be.
4. Intune encrypts and signs both the challenge and integrity-check information, and then sends this information to the device with the SCEP request.
5. The device generates a certificate signing request (CSR) and a public/private key pair on the device based on the SCEP certificate profile that is pushed from Intune.
6. The CSR and encrypted/signed challenge are sent to the third-party SCEP server endpoint.
7. The SCEP server sends the CSR and the challenge to Intune. Intune then validates the signature, decrypts the payload, and compares the CSR to the integrity-check information.
8. Intune sends back a response to the SCEP server and states whether the challenge validation is successful or not.
9. If the challenge is successfully verified, then the SCEP server issues the certificate to the device.

The following illustration shows the end-to-end flow of the device certificate enrollment via Microsoft Intune with help of SCEP server and third-party CA.

Figure 4. End-to-End Flow of the Device Certificate Enrollment



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

MS Intune AppViewX connector plays the role of the third-party SCEP server that enables certificate enrollment through AppViewX. This SCEP server performs as follows:

1. Handles the GetCACaps SCEP request by providing the capabilities that are supported by the CA.
2. Handles the GetCACert SCEP request by providing the SCEP server certificate.
3. Handles the certificate enrollment SCEP request by performing the below steps:
   a. Validates the incoming enrollment requests using the Microsoft java library.
   b. If the validation is successful, get the certificate issued by AppViewX and send it back to the device.
   c. Send appropriate (success/failure) notifications to Intune using the Microsoft library.

Managing devices using MS Intune

In Intune, users can manage the devices using a systematic approach that is required for the organization. The organization-owned devices may require full control on the devices that include settings, features, and security. In this approach, devices and users of these devices **enroll** to Intune. Once enrolled, they receive predefined rules and settings through policies configured in Intune. For example, you can set credentials, security threat protections, create VPN connections and so on.

When devices are enrolled and managed in Intune, administrators can:

- Check the devices enrolled and get an inventory of devices accessing organization resources.
- Configure the devices to set security and health standards for organization. For example, blocking the jail-broken devices.
- Push certificates to devices so users can easily access your Wi-Fi network or use a VPN to connect to your network.
- Check the reports on users and devices that are compliant, and not compliant.
- Remove the organization data if a device is lost, stolen, or not in use.

Third-party CA or RAs can provision mobile devices with new or renewed certificates by using the simple certificate enrollment protocol (SCEP).

What's Next?

Configuring AppViewX MS Intune Server

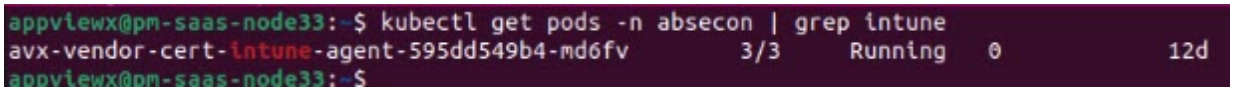
Prerequisites

Onprem

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

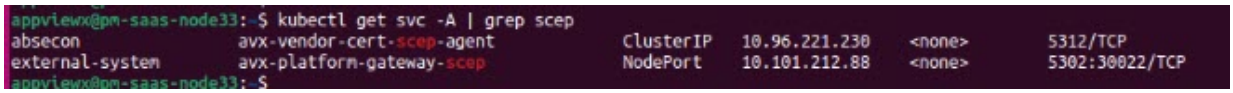
- Make sure that the Intune pod is running in the cluster by using the command:

```
kubectl get pods -A | grep intune
```



- Make sure that <avx-platform-gateway-scep> is running in the cluster by using the command:

```
kubectl get svc -A | grep scep
```



SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

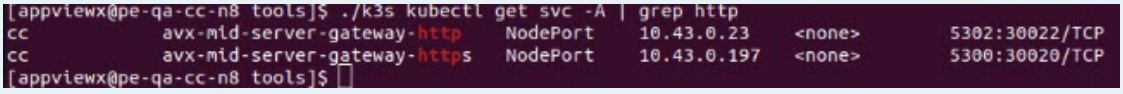
1. Navigate to the installation directory of the cloud connector software.
2. Run

```
cd deps/tools
```

3. Run

```
./k3s kubectl get svc -A | grep http
```

Note: It should have the avx-mid-server-gateway-http or avx-mid-server-gateway-https under namespace cc.



Enabling MS Intune Services

For Onprem

1. Log onto the AppViewX installer node. Open the terminal window.
2. Go to </installation_folder/appviewx_kubernetes/scripts> folder.
3. Add the avx-vendor-cert-intune-agent and avx_platform_gateway_external in ENABLED_PLUGINS in the appviewx.conf file.
4. Specify the datacenter (DC) where the gateway must be deployed:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- avx_vendor_cert_intune_agent=<dc name>
- avx_platform_gateway_external=<dc name>

5. Run the <plugins_install.sh>
6. Verify if Intune is enabled by running kubectl get pods -A | grep intune

```
appviewx@pm-saas-node33:~$ kubectl get pods -A | grep intune
absecon                avx-vendor-cert-intune-agent-595dd549b4-xkjxg            3/3
appviewx@pm-saas-node33:~$
```

7. Verify the plugin status and port number by running:

```
kubectl get svc -A | grep scep
```

```
appviewx@pm-saas-node33:~$ kubectl get svc -A | grep scep
absecon                avx-vendor-cert-scep-agent           ClusterIP   10.96.221.230   <none>        5312/TCP
external-system        avx-platform-gateway-scep            NodePort    10.101.212.88   <none>        5302:30022/TCP
appviewx@pm-saas-node33:~$
```

Make sure that the avx-platform-gateway-scep is running and the port number is 5303:30022 in avx-platform-gateway-scep.

Note: The number 30022 must be used in the UI configuration.

8. Identify the nodes running the SCEP services by using:

```
<kubectl get pods -n external-system -o wide>
```

```
NAME                                    READY   STATUS         RESTARTS   AGE   IP              NODE
avx-platform-gateway-676f67587b-54jj8   1/1     Running        5          64d   10.244.198.136  trialnode2.appviewx.net
avx-platform-gateway-676f67587b-h6xrf   1/1     Running        4          62d   10.244.251.30   trialnode3.appviewx.net
avx-platform-gateway-676f67587b-tbqcs   0/1     NodeAffinity   0          64d   <none>          trialnode3.appviewx.net
-bash-4.2$
```

SCEP is available on all the nodes where the external system runs.

For SaaS

HTTP/HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run:

```
cd deps/tools
```

3. Run:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
./k3s kubectl get svc -A
```

Note: Ensure that avx-mid-server-gateway-http is present under namespace cc.

Configuring AppViewX MS Intune Server

To conduct mobile device certificate enrollments for MS Intune managed devices using the MS Intune protocol (SCEP-based) on AppViewX, the administrator or the privileged user must initially configure the MS Intune server agent using the AppViewX portal. Once the MS Intune server agent is successfully set up through the portal, a URL will be generated. Clients can then use this URL to submit enrollment requests to AppViewX via MS Intune.

1. Go to **(Menu)** > **Cert+** > **Administration** > **Auto Enrollment** > **MS INTUNE**.
2. Click **Configure Now** or **+Add** icon.
3. Configure the **End Point Details** as follows:

   Prerequisites for entering the IP/FQDN field:

   - For SaaS
     - The **Cloud Connector Name** (in the Add Cloud connector page) must be the same as the FQDN name entered.
     - If the customer is using LB on top of multiple CC, then the FQDN of the LB should be used.
   - For On-Prem
     - The IP / FQDN of the machine where the external gateway is running.
     - If the customer is using LB on top of multiple CC then the FQDN of the LB should be used.
   - The given FQDN must be resolvable in the cloud connector machine and also in the company portal Application running machine
   - The CC should have the reachability to the Endpoint.

   The fields for Endpoint Details are as follows:

Endpoint Details - Field Description Table

Fields	Description
***Name**	A unique name (alphanumeric string) to identify the agent setting. Name should not start with special characters. Acceptable characters: A-Z, a-z, 0-9, '.', '_', '-'
***IP/FQDN**	**For Onprem** **Without load balancer:**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	FQDN: • **HTTP:** Must contain the FQDN of the node where the external gateway is running. To get the details, run `kubectl get pods -n external-system -o wide`. If the external gateway is running on multiple nodes, you can specify any one of those nodes. • **HTTPS:** Must be same as the web URL. **With load balancer:** • **FQDN:** Must be the FQDN of the load balancer. **For SaaS:** **Using On-premises CC:** **Without load balancer** • **FQDN:** Must be the FQDN of the cloud connector where the auto-enrollment gateway is running. **With load balancer** • **FQDN:** Must be the FQDN of the load balancer. **Using Direct Gateway** In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, the FQDN/IP address will be the tenant URL with "-aep" before the domain name. The format is as follows: <tenant>-aep.<domainname>.
***Intune URL**	Select either HTTP or HTTPS. Based on the selection of this field, the Intune endpoints will be configured with HTTP or HTTPS URL. The port information will be dynamically updated based on this selection. **Using Direct Gateway** In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, use HTTPS.
***Port**	**For Onprem**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description

	Without load balancer:
	• **Port:**
	  • **HTTP:** By default, it is port 30022. Leave it as is.
	  • **HTTPS:** By default, it is port 31443. Leave it as is.
	
	With load balancer:
	
	HTTP
	• **Port:** Must be the listening port of the load balancer.
	
	Note:
	• It is recommended to set the listening port as 30022, which is the same as AppViewX.
	• If the load balancer's listening port is different from 30022, then update the respective port.
	
	For SaaS:
	
	Using On-premises CC:
	
	Without load balancer
	• **Port:**
	  • **HTTP:** By default, it is port 30022. Leave it as is.
	  • **HTTPS:** By default, it is port 30020. Leave it as is.
	
	With load balancer
	• **Port:** Must be the listening port of the load balancer.
	
	Note:
	• It is recommended to set the listening port as 30022/30020, which is the same as AppViewX.
	• If the load balancer's port is different from 30022/30020, then update the respective port.
	
	Using Direct Gateway

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	In the SaaS setup, to use the direct AEP gateway without installing the cloud connector, use only port 443.
Proxy Required	Select the checkbox if required. If enabled, the communication with the Azure portal to validate the challenge password will go via the proxy details provided in the general settings. It is used to perform the challenge verification in Intune, via the proxy server (if there is no internet connectivity).
***Data Center**	The communication with the Azure portal to validate challenge password will go via the CC in the datacenter. Internet connectivity for the CC is mandatory. In the SaaS setup, to consume the direct AEP gateway without installing the cloud connector, select **cloud-dc** (it is the only available value for this configuration).
***: mandatory fields.	

4. Configure the **Intune Details**.

Intune Details - Field Description Table

Fields	Description
***Client ID**	Client ID of the Intune Account - this value should have been captured during Intune App Registration.
***Tenant ID**	Tenant ID is the domain name in your account ID. For example, if your account id is **admin@test.onmicrosoft.com**, then the tenant ID is **test.onmicrosoft.com**.
***Client Secret**	Client Secret for the Intune Account - this value should have been captured during Intune App Registration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Cloud Type**	Select any of the options: • **Azure Public:** This is the most common and traditional deployment model in which Azure's resources are owned and operated by Microsoft sharing them across multiple tenants. • **Azure Government:** This is a specialized version of Azure designed to meet the specific regulatory and compliance needs of government agencies in the US. It is isolated from the public Azure cloud and provides the highest level of security.
***: mandatory fields.	

Health check URL for load balancer:

Onprem

- **HTTP method:** GET
- **Healthcheck API:** https://<FQDN>:30022
- **FQDN:** FQDN of the external gateway running nodes.
- **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

SaaS

- **HTTP method: GET**
- **Healthcheck API:** https://<FQDN>:30022 (HTTP) (or) https://<FQDN>:30020 (HTTPS)
- **FQDN:** FQDN of cloud connector enabled with the HTTP/HTTPS gateway.
- **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

5. Configure the **CA Accounts** as follows:

CA Accounts - Field Description Table

Fields	Description
Certificate Group	Select a specific group under which certificate needs to be enrolled.
Certificate Category	Select a specific certificate type (Server / Client) to be enrolled.
Select CA	Select the required CA from the available options. The certificate will be enrolled under the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The CAs associated with the Default certificate group are: • AppViewX • AppViewX PKIaaS • AppViewX PKIaaS Native • Amazon Private CA • DigiCert • DigiCert One • EJBCA • Entrust • Entrust MPKI • Globalsign Atlas • Globalsign MSSL • Google • HydrantID • IDnomic • Microsoft Enterprise • Microsoft Standalone • Nexus • OpenTrust • Sectigo (Comodo Certificate Manager) • SwissSign **Note:** The Vendor Specific Details section is displayed only after the following CA Account is selected: • DigiCert • EJBCA • Entrust • Entrust MPKI • GlobalSign MSSL • Microsoft Enterprise • Nexus
***: mandatory fields.	

When **AppViewX** is selected as CA, the fields for AppViewX CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for AppViewX CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with SCEP client machine.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **AppViewX PKIaaS Native** is selected as CA. The fields for AppViewX PKIaaS Native are as follows:

Details for AppViewX PKIaaS Native - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Template Name	Select a template name from the dropdown list.
***Issuer Name**	Select an issuer name to issue the certificate.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
*: mandatory fields.	

When **AppViewX PKIaaS** is selected as CA, the fields for AppViewX PKIaaS CA are as follows:

Details for AppViewX PKIaaS CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with the SCEP client machine.
***Issuer Location**	Select an issuer location that is associated with the CA account.
***Issuer Name**	Select an issuer name to issue the certificate.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***CA Certificate**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with MSIntune client machine.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*****: mandatory fields.	

When **Amazon Private CA** is selected as CA, the fields for Amazon Private CA are as follows:

Details for Amazon Private CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Region**	Select a valid region associated with the CA account. The dropdown list is populated with the first available value. Select an appropriate value as required.
***Issuer**	Select a valid issuer associated with the CA account. The dropdown list is populated with the first available value. Select an appropriate value as required.
***Signature Algorithm**	Select a valid issuer associated with the CA account. The dropdown list is populated with the first available value from the group's associated policy. Select an appropriate value as required.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

When **DigiCert** is selected as CA, the fields for DigiCert CA are as follows:

Details for DigiCert CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Division**	Select a division associated with the CA account. The dropdown list is populated with the first available value. Select an appropriate value as required.
***Certificate Type**	Select a valid cert type associated with the CA account. The dropdown list is populated with the first available value. Select an appropriate value as required.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Order Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the selected CA is **DigiCert**, a separate section **Vendor Specific Details** is displayed after the **CA Accounts** section. The fields for Vendor specific details are as follows:

Vendor Specific Details for DigiCert CA - Field Description Table

Fields	Description
***Server Type**	Select a server type.
***Payment Method**	Select a payment method. The possible options are: • **Bill To Account Balance** - Pay with account balance. Returns an error if this option is disabled for the account or if the account has insufficient fund. • **Bill To Default Credit Card** - Pay with account's default credit card. Returns an error if no default credit card is configured for the account.
***: mandatory fields.	

When **DigiCert One** is selected as CA. The fields for DigiCert CA are as follows:

Details for DigiCert One CA - Field Description Table

Fields	Description
***CA Account Name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names shouldnot start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server or Client.
Proxy Required	Enable this field if the CA communication needs to happen via proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center for CA communication, with the CC node being the recommended option. The selected node will handle the communication through the chosen CC node.
CA Configuration	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Base URL**	This URL will contain the hostname of the DigiCert CA instance and used for constructing the API requests.
***Authentication method**	By default, API Token is selected.
***API Token**	Enter the API token to authorize the communication between AppViewX and DigiCert One.
Allow Seat ID during enrollment	Enabling this field displays a Seat ID field in the Auto enrollment settings that you can use instead of the CA settings.
***Seat ID**	Unique value assigned to identify an entity in the DigiCert One account.You can provide multiple ID separated by a comma. They can be used for enrollment, renewal, and regeneration.
Use DigiCert One to switch certificates from DigiCert MPKI	Enable this field to automatically switch your DigiCert MPKI certificates to DigiCert One with auto-enrollment/auto-regenerate.
*: mandatory fields.	

When **EJBCA** is selected as CA, the fields for EJBCA CA are as follows:

Details for EJBCA CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
*: mandatory fields.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the selected CA is **EJBCA**, a separate section **Vendor specific details** is displayed after the **CA Accounts** section. The fields for Vendor specific details are as follows:

Vendor Specific Details for EJBCA CA - Field Description Table

Fields	Description
***End Entity Profile Name**	Select a profile of an end entity.
End entity user name	Enter the user name for the end entity.
***Issuer Common Name**	Select a common name of an issuer.
***Certificate Profile Name**	Select a profile name of certificate.
*: mandatory fields.	

When **Entrust** is selected as CA. The fields for Entrust CA are as follows:

Details for Entrust CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Type**	Select a valid certificate type associated with the CA account. • If the **Certificate Category** radio button is selected to *Server*, the dropdown list is populated with the first available value. Select an appropriate value as required. • If the **Certificate Category** radio button is selected to *Client*, the dropdown list is populated with 'None' as the default value.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: mandatory fields.	

If the selected CA is **Entrust**, a separate section displaying **Vendor specific details** and **Custom Attributes** is displayed after the **CA Accounts** section.

Note: Based on the Entrust ECS account configuration **Custom Attributes section** may also be displayed.

Vendor Specific Details for Entrust CA - Field Description Table

Fields	Description
Additional Emails	Enter the valid email address in the field.
Requester Name	Enter the requester name.
Requester Email	Enter a valid email ID.
Requester Phone	Enter the 10-digit phone number.
*: mandatory fields.	

When **Entrust MPKI** is selected as CA, the fields for Entrust MPKI CA are as follows:

Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the selected CA is **Entrust MPKI**, a separate section **Vendor specific details** is displayed after the **CA Accounts** section.

The fields for Vendor specific details are as follows:

Vendor Specific Details for Entrust MPKI CA - Field Description Table

Fields	Description
***CA Name**	Select a CA name from the dropdown list.
***Cert Profiles**	Select a cert profile from the dropdown list.
*: mandatory fields.	

When **GlobalSign Atlas** is selected as CA, the fields for GlobalSign Atlas CA are as follows:

Details for GlobalSign Atlas CA - Field Description Table

Fields	Description
***Select CA**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
API Credential Friendly name	Select a CA Account to communicate with during the certificate enrollment actions.
Certificate Profile	Select the certificate Profile from the dropdown list.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A **Generic Fields** section is also displayed below the CA Accounts section. It contains the fields related to the CSR parameters based on the profile (API Credential Friendly name) selected. Only the Organization field is mandatory and is fetched from the selected profile. Rest of the fields are optional.

When **GlobalSignMSSL** is selected as CA, the fields for GlobalSign MSSL CA are as follows:

Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
CA Account	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
Product Type	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Vendor Specific Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***Profile**	Select the Profile based on the configurations made in the Certificate Authority setting.
*: mandatory fields.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The following field is displayed in the **Point of Contact** section as per the selected CA. The CA mandates the point of contact information for traceability. All auto-enrollment requests via this endpoint will be registered with the point of contact information entered here.

Point of Contact Details for GlobalSign MSSL CA - Field Description Table

Fields	Description
***First Name**	Enter the first name.
***Email Address**	Enter the valid email address.
***Phone Number**	Enter the valid phone number.
*: mandatory fields.	

When **Google** is selected as CA, the fields for Google CA are as follows:

Details for Google CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Certificate Profile**	Select the certificate profile type.
***Issuer Location**	Select an issuer location that is associated with the CA account.
***Pool Name**	Select a pool name to issue the certificate.
Template Name	Select an appropriate template name to issue the certificate.
***Issuer Name**	Select an issuer name to issue the certificate.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: mandatory fields.	

When **HydrantID** is selected as CA, the fields for HydrantID CA are as follows:

Details for HydrantID CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***HydrantID Policy**	Select the policy associated with the CA Account to be used for certificate operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***** **CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

When **Microsoft Enterprise** is selected as CA, the fields for Microsoft Enterprise CA are as follows:

Details for Microsoft Enterprise CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

If the selected CA is Microsoft Enterprise, a separate section **Vendor specific details** is displayed after the CA Accounts section with a dropdown field - **Template Name** - Select a template from the dropdown list.

When **IDnomic** is selected as CA, the fields for IDnomic CA are as follows:

Details for IDnomic CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

When **Microsoft Standalone** is selected as CA, the fields for Microsoft Standalone CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for Microsoft Standalone CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

The following table provides the field description for **Nexus CA**:

Details for Nexus CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate-creation operations.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields.	

When **OpenTrust** is selected as CA. The fields for OpenTrust CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for OpenTrust CA - Field Description Table

Fields	Description
***CA Account name**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Management Profile**	Select the certificate issuance policy defined in OpenTrust CA.
Zone	The AppViewX configuration wrapper that maps to a CA + profile, and is used by end-users or automation to request certificates consistently.
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
*: mandatory fields.	

A **Profile Parameters** section is also displayed below the CA Accounts section. It contains the fields such as **Common Name*, *Organizational Unit*, **Organization*, **Email*, **Password*. or as configure in the Certificate Authority settings page.

When **Sectigo (Comodo Certificate Manager)** is selected as CA. The fields for Sectigo (Comodo Certificate Manager) CA are as follows:

Details for Sectigo (Comodo Certificate Manager) CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Certificate Type**	Select a value from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Server Certificate**	Select the chosen CA-issued certificate, using which the trusted inventory is validated. Type the exact common name or serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).
*: mandatory fields	

When **SwissSign** is selected as CA. The fields for SwissSign CA are as follows:

Details for SwissSign CA - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate creation operations.
***Client Name**	Select the specific client.
***Product**	Select the specific product.
***Server Certificate**	Select the certificate issued by the selected CA using which the trusted inventory is validated. You can search for it by typing the exact common name or the serial number. **Note:** You can search for certificates using the serial number with or without colon ":".
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.
*: mandatory fields.	

6. Configure the **Advanced Settings**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The fields in the Advanced Settings section are as follows:

Advanced Settings - Field Description Table

Fields	Description
***Fetch Certificate Parameters**	Select Yes or No Setting the radio button to Yes, will enable the system to automatically fetch certificate parameters from a Suggestive Policy, and append them to the client CSRs.
***Retry Count**	Based on this value, the EST agent will trigger the number of calls to collect the certificate from AppViewX until it is received. Values accepted between 5 - 99.
***Retry Frequency**	The value specified in this field determines the duration taken between the trigger calls by the EST agent. Values accepted between 10 - 99.
***Certificate Poll Type**	Select *Issuer and Subject* or *Transaction ID*. The client agent will use this field to poll the issued certificate from the agent to the subsystem certificate plugin.
***High Speed Transactions**	Based on the selection of this field, the endpoint will be configured with or without High Performance transaction times. ACME protocol's Revocation actions are not supported in High Performance mode. Request information pertaining to High-Performance can be viewed on the Direct Requests page. **Note:** By default, this field is set to **Yes** for AppViewX PKIaaS CA.
***Return Existing Certificate**	If this option is enabled (**Yes**) then for request with AppViewX should check and return the existing valid certificate for the same CSR & public key from inventory if available otherwise it should proceed with enrollment and return the certificate. • If it is set to **Yes**, the Certificate Threshold field is displayed. • If it is set to **No**, then the AppViewX will do the default behavior of enrolling a new certificate for each request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Duplicate Certificate Migration	Selecting this check-box will cause the previously issued certificates for the same CSR parameters to be revoked and deleted from AppViewX. **Note:** By default, this field is enabled for AppViewX PKIaaS CA.
***Mitigate Certificates issued within**	This field is enabled only when the **Duplicate Certificate Migration** check-box is selected.
***: mandatory fields.	

7. Click **Save**.

Validating MS Intune

1. Configure the MS Intune endpoint in AppViewX GUI using the preceding steps.
2. The agent configuration should be in **valid** status.

3. If the above steps are completed, then refresh the following URL from the web browser:
   a. <intune endpoint URL from appviewx GUI>?operation=GetCACaps
   b. **Expected response:** In the browser window, you should see the following data:

```
Unset
        AES
        DES3
        SHA-1
        SHA-256
        POSTPKIOperation
```

If you get the above response, then you can confirm that AppViewX is working fine.

Configuring AppViewX MS Intune Client

You can configure the AppViewX MS Intune client with the steps detailed in this section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Testing on Windows v10.0 Device

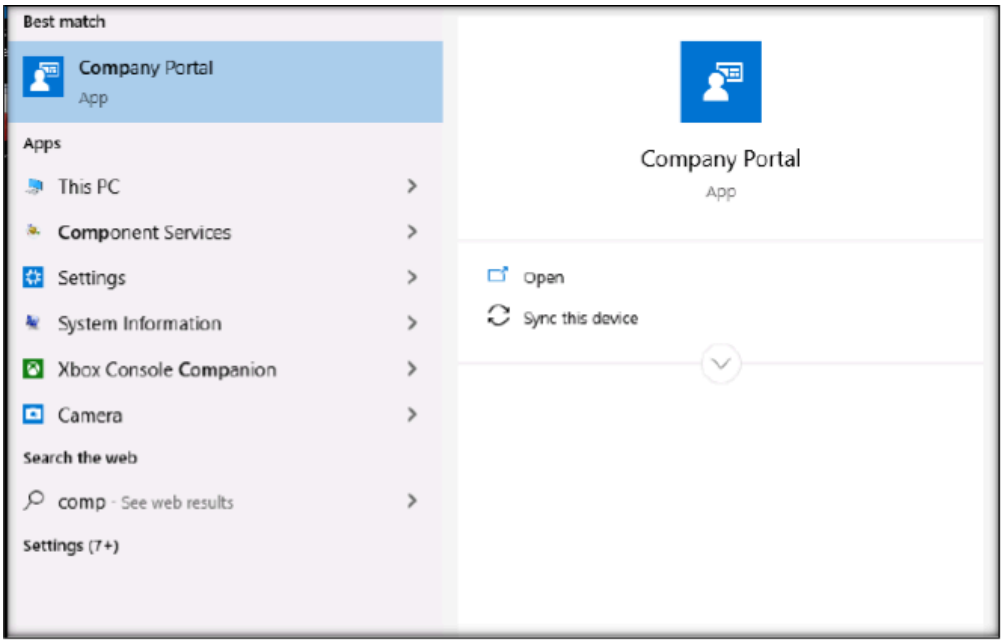
AppViewX MS Intune integration can be tested by enrolling in a Windows v10.0 device. To enroll in other devices, follow the same procedure. To enroll, the Windows v10.0 device must be installed with a **Company Portal** application from the Microsoft Store.

Configuring Windows Accounts Setting

1. Log in to the system that has Windows v10.0 operating system.
2. Open **Settings**.
3. Click **Accounts > Access work or school**.
4. Click **Connect** and confirm your work or school account.
5. Click **Next** to proceed further by providing Azure subscription credentials.
6. Once the account is set, the successful message window is displayed.
7. Click **Done**.

Configuring Company Portal

1. Open the Company Portal application and proceed with the device setup by providing the Azure subscription.



2. Click **Connect** and confirm your work or school account.
3. Provide a valid e-mail address and click **Next** to proceed further to complete the set up.
4. Click **Done**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Verifying Enrollment Result

1. Once configuration is completed, the device invokes the GetCACaps, GetCACerts, and PKIRequest (enrollment request) APIs to SCEP server.
2. Monitor the SCEP agent logs in AppViewX and verify that the message ‘AppviewxScepServicePostAction:49 - Response sent successfully for operation: PKIOperation’ occurs in the logs.
3. In the AppViewX application, the newly generated certificate must be shown in the inventory.
4. If the certificate is requested, the device certificate newly generated certificate will be available in the **Server** tab in the certificate inventory.
5. If the certificate is a requested user certificate, the new certificate will be available under the **Client** tab in the certificate inventory.
6. In the Windows device, open the cert store (Windows key+R -> certlm.msc) and make sure that the serial number of the certificate available in the personal cert store matches with the serial number of the certificate that is newly created in AppViewX.

Best Practices

• For auto-enrollment, create a separate certificate group and CA policy in AppViewX.
• During policy creation, select only the required bit-length (minimum 2048-bit).

Troubleshooting

#	Error Message	Description	Troubleshooting
1	Challenge Password Authentication Failed	The issue is either with 1. Not enough API permissions available for the tenant in the Azure portal. 2. Tenant details (Tenant ID, client ID and secret) provided during Intune	Check the following: 1. Tenant needs three API permissions under App registrations in the Azure portal. See the following attached image:  2. Verify the tenant details provided in the Intune endpoint configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Error Message	Description	Troubleshooting
		endpoint configuration in AppViewX GUI might be incorrect.	
2	Given organization must match with organization defined in group policy.	The policy mapped for the MS Intune endpoint configured group is set as strict and organization is configured in the policy. The CSR sent from the client does not contain the exact organization name.	Set the policy as suggestive OR Provided a proper value for Organization in the SCEP profile in MS Intune portal.
3	Failed to submit the certificate to CA	Certificate enrollment has failed from the CA side due to the issue with the submitted CSR.	Check the respective VW request or direct request to find more about the error details and remediate the same.
4	Either CSR parameters,CA details or certificate algorithm values are not compliant with the policy	CSR parameters from the client are not matching with parameters configured in the AppViewX policy.	Check if the policy is set as strict. • Provide a proper value for Organization in the SCEP profile in MS Intune portal. • Change the policy type to Suggestive.

CMP

Certificate Management Protocol (CMP)

Certificate Management Protocol (CMP) is an internet protocol standardized by the Internet Engineering Task Force (IETF) used for obtaining X.509 digital certificates within a public key infrastructure (PKI). Some of the **general constraints** are as follows:

- Out-of-band distribution of authentication keys between RA and CA
  - RA / device should become a registered entity for AppViewX to accept requests from this entity
- Communication Protocol between RA and CA is SSL/TLS over TCP or HTTPS
  - Packet Exchanged are in the form of RFC 4210 and 4211 (Certificate Management Protocol and Certificate Request Message format)
  - All request and responses are digitally signed using certificate or MAC Key exchanged as challenge password
- User can be authenticated with two mechanisms:
  - SSL Certificate
  - Challenge Password
- HTTPS is the protocol used in CMP.
- Default port is 31443.

Certificate Management Protocol supports on-line interactions between PKI components. RA should be support for the following requests as per the standard:

- Initialization Request and Response
- Certification Request and Response

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Renewal Request and Response
- Revocation Request and Response
- Polling Request and Response

What's Next?

- Configuring AppViewX CMP Server

Configuring AppViewX CMP Server

Prerequisites

Onprem

- Make sure that the following pod is running in the cluster by using the command:

```
kubectl get pods -A | grep cmp
```

SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run

```
cd deps/tools
```

3. Run

```
./k3s kubectl get svc -A | grep https
```

Note: It should have the avx-mid-server-gateway-https under namespace cc.

Enabling CMP Services

For Onprem

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Log onto the AppViewX installer node.
2. Go to </installation_folder/appviewx_kubernetes/scripts> folder.
3. Add the avx-vendor-cert-cmp-agent in ENABLED_PLUGINS in the appviewx.conf file.
4. Specify the datacenter (DC) where the gateway must be deployed:
   - avx_vendor_cert_cmp_agent=<dc name>

For SaaS

HTTPS gateway must be enabled while installing the cloud connector (CC). To do this:

1. Navigate to the installation directory of the cloud connector software.
2. Run:

```
cc_installed_path/deps/properties
```

3. Open appviewx.properties and set the following fields as *true:*
   a. AUTO_ENROLL_ENABLED=true
   b. ENABLE_MTLS_PROFILE=true
   c. ENABLE_HTTP_PROFILE=true
   d. ENABLE_HTTPS_PROFILE=true
4. Scale down the avx-mid-server-platform pod.
5. Restart the avx-mid-server-starter pod.

> **Note:** Ensure that avx-mid-server-gateway-https is present under namespace cc.

Configuring AppViewX CMP Server

1. Go to **(Menu)** > **CERT+** > **Administration** > **Auto Enrollment** > **CMP**.
2. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
3. Configure the **Agent Details** as follows:

Agent Details - Field Description Table

Field	Description
***Name**	Unique name to identify the agent setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	No special characters other than '.', '-','_' are allowed. Name should not start with special characters.
***Host**	**For Onprem** • Enter the FQDN address of the AppViewX node gateway. It must be the same as the web URL's hostname. **For SaaS** **Using On-premises CC:** • **Without load balancer:** Hostname must be the hostname of the cloud connector where the auto-enrollment gateway is running. • **With load balancer:** Hostname must be the hostname of the load balancer.
***CMP URL**	Select either HTTP or HTTPS. Based on the selection of this field, the CMP endpoints will be configured with HTTP or HTTPS URL. The port information will be dynamically updated based on this selection.
***Port**	**For Onprem** • By default, it is port 31443. Leave it as is. **For SaaS** **Using On-premises CC** • **Without load balancer:** By default, it is port 30020. Leave it as is. • **With load balancer:** Port must be the listening port of the load balancer. **Note:** • It is recommended to set the listening port as 30020, which is the same as AppViewX. • If the load balancer's listening port is different from 30020, then update the respective port.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

4. Configure the **Client Authentication** details as follows:

Client Authentication - Field Description Table

Field	Description
***Authentication Mode**	This field has two values • MAC • Certificate Based Authentication
***Challenge Password**	This field is enabled when **Authentication Mode = MAC**. Enter the password which is used to authenticate the CMP packet.
***Issuer Certificate**	This field appears when **Authentication Mode = Certificate Based Authentication**. Enter the issuer certificate used to authenticate the client certificate,
***RA Certificate**	This field appears when **Authentication Mode = Certificate Based Authentication**. Enter the common name/ serial number of the RA certificate,
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

Load balancer configuration

It is recommended to set the listening port as 30020, which is the same as AppViewX.

Health check URL for load balancer:

- **HTTP method:** GET
- **Healthcheck API:** https://<FQDN>:30020/
- **Hostname:** Hostname of cloud connector enabled with the HTTPS gateway.
- **Expected response code:** 404. As the load balancer is accessing the URL without any parameters, it will receive a 404 response.

5. Configure the **CA Accounts** details as follows:

The fields for CA Accounts section are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Accounts - Field Description Table

Field	Description
***Certificate Group**	Select a specific group under which certificate needs to be enrolled.
***Certificate Category**	Select a specific certificate type (Server / Client) to be enrolled.
***Select CA**	Select the required CA from the available options: • AppViewX • AppViewX PKIaaS • AppViewX PKIaaS Native • Amazon Private CA • DigiCert • DigiCert One • EJBCA • Entrust • Entrust MPKI • Globalsign • Globalsign Atlas • Globalsign MSSL • Google • HydrantID • IDnomic • Microsoft Enterprise • Microsoft Standalone • Nexus • OpenTrust • Sectigo (Comodo Certificate Manager) • SwissSign

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The Vendor Specific Details and Custom Attributes section are displayed for some of the CAs as follows: • Digicert • EJBCA • Entrust • Entrust MPKI • GlobalSign MSSL • MS Enterprise • Nexus The certificate will be enrolled under the selected CA.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **AppViewX** is selected as CA, the fields for AppViewX CA are as follows:

Details for AppViewX CA - Field Description Table

Field	Description
***CA Account**	Select the specific CA Account associated with the selected CA to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with CMP client machine.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

When **AppViewX PKIaaS Native** is selected as CA. The fields for AppViewX PKIaaS Native are as follows:

Details for AppViewX PKIaaS Native - Field Description Table

Fields	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Template Name	Select a template name from the dropdown list.
***Issuer Name**	Select an issuer name to issue the certificate.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. **Note:** For some CAs, the validity available in their respective CA portal is considered despite the specified certificate validity.
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

When **Amazon Private CA** is selected as CA, the fields for Amazon Private CA are as follows:

Details for Amazon Private CA - Field Description Table

Field	Description
***CA Account**	Select the specific CA Account associated with the selected CA to be used for certificate creation operations.
***Region**	Select a valid region associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Issuer**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value. Select an appropriate value as required.
***Signature Algorithm**	Select a valid issuer associated with the CA account. The dropdown is populated with the first available value from the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	group's associated policy. Select an appropriate value as required.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **DigiCert** is selected as CA, the fields for DigiCert CA are as follows:

Details for DigiCert CA - Field Description Table

Field	Description
***CA Account**	Select the specific CA Account associated with the selected CA to be used for certificate creation operations.
***Division**	Select the division associated with the CA account.
***Certificate Type**	Select certificate type to issue the certificate.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Order Validity**	Validity of the certificate to be enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

If the selected CA is **DigiCert**, a separate section **Vendor Specific Details** is displayed after the **CA Accounts** section.The fields for Vendor specific details are as follows:

Vendor Specific Details for DigiCert CA - Field Description Table

Field	Description
***Server Type**	Select a server type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	Select a payment method. The possible options are: • **Bill To Account Balance** - Pay with account balance. Returns an error if this option is disabled for the account or if the account has insufficient fund. • **Bill To Default Credit Card** - Pay with account's default credit card. Returns an error if no default credit card is configured for the account.
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

When **DigiCert One** is selected as CA. The fields for DigiCert One CA are as follows:

Details for DigiCert One CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server or Client.
Proxy Required	Enable this field if the CA communication needs to happen via proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center for CA communication, with the CC node being the recommended option. The selected node will handle the communication through the chosen CC node.
CA Configuration	
***Base URL**	This URL will contain the hostname of the DigiCert CA instance and used for constructing the API requests.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Authentication method**	By default, API Token is selected.
***API Token**	Enter the API token to authorize the communication between AppViewX and DigiCert One.
Allow Seat ID during enrollment	Enabling this field displays a Seat ID field in the Auto enrollment settings that you can use instead of the CA settings.
***Seat ID**	Unique value assigned to identify an entity in the DigiCert One account.You can provide multiple ID separated by a comma. They can be used for enrollment, renewal, and regeneration.
Use DigiCert One to switch certificates from DigiCert MPKI	Enable this field to automatically switch your DigiCert MPKI certificates to DigiCert One with auto-enrollment/auto-regenerate.
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

When **EJBCA** is selected as CA, the fields for EJBCA CA are as follows:

Details for EJBCA CA - Field Description Table

Field	Description
***CA Account**	Select the specific CA Account associated with the selected CA to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

If the selected CA is **EJBCA**, a separate section **Vendor specific details** is displayed after the CA Accounts section.The fields for Vendor specific details are as follows:

Vendor Specific Details for EJBCA CA - Field Description Table

Field	Description
***End Entity Profile Name**	Select a profile of an end entity.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the user name for the end entity.
***Issuer Common Name**	Select a common name of an issuer.
***Certificate Profile Name**	Select a profile name of certificate.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Entrust** is selected as CA, The fields for Entrust CA are as follows:

Details for Entrust CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Type**	Select a valid cert type associated with the CA account. If the **Certificate Category** radio button is selected to *Server*, the dropdown list is populated with the first available value. Select an appropriate value as required. If the **Certificate Category** radio button is selected to *Client*, the dropdown list is populated with 'None' as the default value.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

If the selected CA is Entrust, a separate section displaying **Vendor specific details** is displayed after the CA Accounts section.

Note: Based on the Entrust ECS account configuration **Custom Attributes section** may also be displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details for Entrust CA - Field Description Table

Field	Description
Additional Emails	Enter the valid email address in the field.
Requester Name	Enter the demo details
Requester Email	Enter a valid eamil id
Requester Phone	Enter the 10-digit phone number.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Entrust MPKI** is selected as CA, the fields for Entrust MPKI CA are as follows:

Details for Entrust MPKI CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

If the selected CA is Entrust MPKI, a separate section **Vendor Specific Details** is displayed after the CA Accounts section. The following table provides the field description for Vendor specific details:

Vendor Specific Details for Entrust MPKI CA - Field Description Table

Field	Description
***CA Name**	Select a CA name from the dropdown list.
***Cert Profiles**	Select a cert profile from the dropdown list.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **GlobalSign** is selected as CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The fields for GlobalSign CA are as follows:

Details for GlobalSign CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Type**	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. (in days/months/years)

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following field is displayed in the **Vendor Specific Details** section as per the selected CA, if the **Select CA =GlobalSign**, and the **Certificate type = Alpha SSL or Domain SSL**

Vendor Specific Details for GlobalSign CA - Field Description Table

Field	Description
***Domain Admin Email**	Select the email id to receive the approval requests from GlobalSign CA.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following fields are displayed in the **Vendor Specific Details** section as per the selected CA, if the **Select CA =GlobalSign**, and the **Certificate type = Extended SSL**

Vendor Specific Details for GlobalSign CA - Field Description Table

Field	Description
***Incorporating Agency Reg. No**	Enter the Registration number of the incorporating agency.
***Designation**	Enter the designation of the requester.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Business Category**	Select the type of business (private org., government entity, or business entity

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following field is displayed in the **Point of Contact** section as per the selected CA if the **Select CA =GlobalSign**, and the **Certificate type = Organization SSL** . The CA mandates the point of contact information (**First Name**) for traceability. All auto-enrollment requests via this endpoint are registered with the point of contact information entered here.

When **GlobalSign Atlas** is selected as CA

The fields for GlobalSign Atlas CA are as follows:

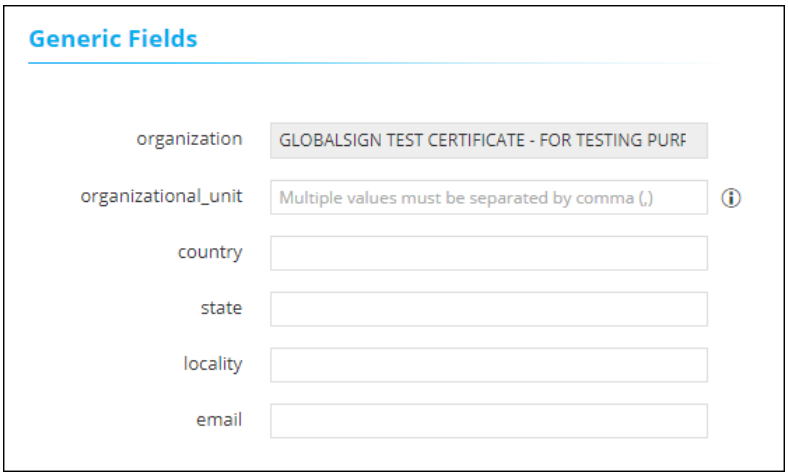
Details for GlobalSign Atlas CA - Field Description Table

Field	Description
***Select CA**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***API Credential Friendly name**	Select a CA Account to communicate with during the certificate enrollment actions.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***CA Certificate**	Select the specific issuer certificate, that will be used for signing CSR by the certificate authority. Certs available in the root or intermediate cert inventory are displayed.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled. (in days/months/years)

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

A **Generic Fields** section is also displayed below the CA Accounts section. It contains the fields related to the CSR parameters based on the profile (API Credential Friendly name) selected. Only the Organization field is mandatory and is fetched from the selected profile. Rest of the fields are optional.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



When **GlobalSign MSSL** is selected as CA.

The fields for GlobalSign MSSL CA are as follows:

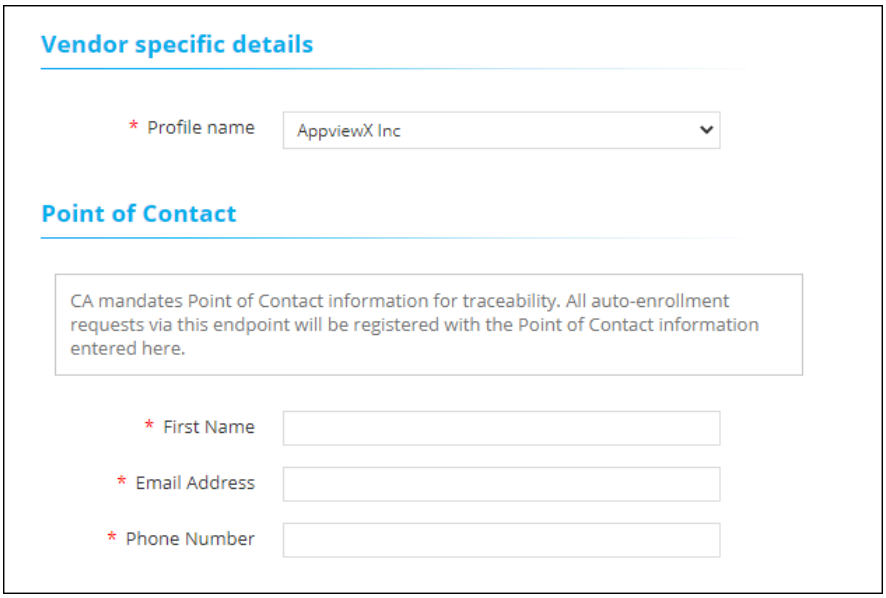
Details for GlobalSign MSSL CA - Field Description Table

Field	Description
CA Account	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
Product Type	Select the specific Certificate Type. The values are fetched from the CA Settings configuration.
CA Connector Name	Name of the CA connector after the certificate is enrolled.
Certificate Validity	Validity of the certificate to be enrolled. (in days/months/years)

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following field is displayed in the **Vendor Specific Details** and **Point of Contact** section as per the selected CA:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Vendor Specific Details for GlobalSign MSSL CA - Field Description Table

Field	Description
***Profile**	Select the Profile based on the configurations made in the Certificate Authority setting.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following field is displayed in the **Point of Contact** section as per the selected CA. The CA mandates the point of contact information for traceability. All auto-enrollment requests via this endpoint are registered with the point of contact information entered here.

Point of Contact Details for GlobalSign MSSL CA - Field Description Table

Field	Description
***First Name**	Enter the first name.
***Email Address**	Enter the valid email address.
***Phone Number**	Enter the valid phone number.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

When **Google** is selected as CA, the fields for Google CA are as follows:

Details for Google CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Type 3 or more letters of the certificate keywords after which a list of server certificates issued from the above selected CA account will be displayed, one certificate can be selected for further communications with CMP client machine.
***Issuer Location**	Select the issuer location associated with the CA account.
***Issuer Name**	Select a issuer name to issue the certificate.
Template Name	Select a template name from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The fields for Vendor Specific details are as follows:

Field	Description
Certificate ID	Enter the valid certificate id.

When **HydrantID** is selected as CA, the fields for HydrantID CA are as follows:

Details for Lets HydrantID CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***HydrantID Policy**	Select the policy associated with the CA Account to be used for certificate operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **IDnomic** is selected as CA, the fields for IDnomic CA are as follows:

Details for IDnomic CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Profile**	Select the certificate Profile from the dropdown list.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Microsoft Enterprise** is selected as CA, the fields for Microsoft Enterprise CA are as follows:

Details for Microsoft Enterprise CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

If the selected CA is Microsoft Enterprise, a separate section displaying **Vendor specific details** is displayed after the CA Accounts section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Field	Description
***Template Name**	Select the desired template name. This value is based on the policy setting and its group association.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Microsoft Standalone** is selected as CA, the fields for Microsoft Standalone CA are as follows:

Details for Microsoft Standalone CA - Field Description Table

Field	Description
***CA Account**	Select the specific CA Account associated with the selected CA to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Nexus** is selected as CA.

The fields for Nexus CA are as follows:

Details for Nexus CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled (in days/months/years).

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

The following field is displayed in the **Vendor Specific Details** section as per the selected CA:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Field	Description
***Procedure**	Select the Procedure based on the configurations made in the Certificate Authority Setting.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **OpenTrust** is selected as CA.

The fields for OpenTrust CA are as follows:

Details for OpenTrust CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA which is to be used for certificate creation operations.
***Certificate Management Profile**	Select one issuer certificate from the dropdown list. This issuer certificate will be used for signing the CSR by the certificate authority. **Note:** Only the issuer certificates available in the root or intermediate certificates inventory will be shown for selection.
Zone	Select the zone pertaining to the Certificate Management Profile
***CA Connector Name**	Name of the CA connector after the certificate is enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

When **Sectigo (Comodo Certificate Manager)** is selected as CA. The fields for Sectigo (Comodo Certificate Manager) CA are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for Sectigo (Comodo Certificate Manager) CA - Field Description Table

Fields	Description
***CA Account**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. *Example*: Server and Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen. (CC node is recommended) i.e., whichever node is selected the communication will happen via that CC node.
CA Configuration	
***Base URL**	This URL will contain the hostname of the Sectigo CA instance and used for constructing the API requests.
***Login URI**	Provide the customer login URI for API authentication.
***User Name**	Enter the Username of the Sectigo portal to communicate with the CA.
***Password**	Enter the Password of the Sectigo portal to communicate with the CA.
***Organization Id**	Enter the organization id used for the certificate lifecycle action. (You will find it in the Organization tab of the Sectigo portal)
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.	

When **SwissSign** is selected as CA, the fields for SwissSign CA are as follows:

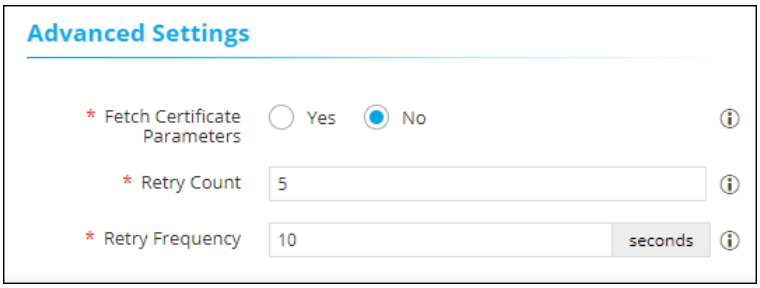
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Details for SwissSign CA - Field Description Table

Field	Description
***CA Account**	Select a specific CA Account from the selected CA to be used for certificate creation operations.
***Client Name**	Select the specific client.
***Product**	Select the specific product.
***Server Certificate**	Select the certificate issued by the selected CA using which the trusted inventory is validated. You can search for it by typing the exact common name or the serial number.
***CA Connector Name**	Name of the CA connector after the certificate is being enrolled.
***Certificate Validity**	Validity of the certificate to be enrolled.

Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

6. Configure the **Advanced Settings** section as follows:



The following table provides the field description for the Advanced Settings section:

Advanced Settings - Field Description Table

Field	Description
***Fetch Certificate Parameters**	Setting the radio button to Yes, will enable the system to automatically fetch certificate parameters from a Suggestive Policy, and append them to the client CSRs.
***Retry Count**	Specify a retry count up to which the agent will retry for the certificate to be fetched.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Retry Frequency**	Specify a retry frequency up to which the agent will wait for each retry count.

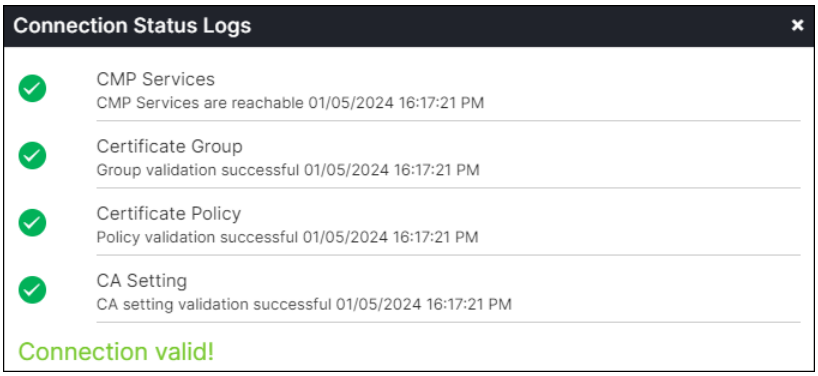
Note: Fields with the red asterisk (*) symbol indicate mandatory fields.

Validating CMP

Once the CMP settings are added validation needs to be done to check whether the CA and Agent related details are properly configured.

1. Go to **(Menu)** > **CERT+** > **Administration** > **Auto Enrollment** > **SCEP**.
2. On the **CMP** page, click **Check** from the Status column to validate the CMP setting that has been created.
   The CMP settings will be validated and the **Status** will be shown as either **Success** or **Failure**.

   Success Scenario



WAEP

Windows Auto-Enrollment Proxy (WAEP) is a powerful component developed by AppViewX to enable seamless certificate enrollment and migration for users and devices within a Microsoft domain. Designed to automate and simplify certificate lifecycle management, WAEP allows organizations to transition from their existing certificates to AppViewX PKI (Public Key Infrastructure).

WAEP comes equipped with extensible features that enhance its functionality and adaptability to enterprise needs. It includes the ability to automatically fetch certificate templates, streamlining the configuration process by dynamically pulling template details from the Microsoft Certificate Authority

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(CA). Additionally, WAEP supports per-template CA configuration, allowing administrators to specify distinct types of certificate for different templates, thereby offering greater control and flexibility. This robust integration empowers organizations to leverage their existing Microsoft domain infrastructure while benefiting from the advanced capabilities of AppViewX PKI.

Key Reasons to Migrate to PKI with WAEP

Migrating to AppViewX PKI using WAEP provides organizations with a modern, centralized approach to certificate lifecycle management, offering significant advantages over traditional Microsoft Certificate Authority (MSCA) solutions. While MSCA serves basic certificate needs within a Microsoft domain, it often falls short in providing unified visibility and efficient management of certificates across diverse environments. AppViewX PKI addresses these challenges by offering a single point of management for all certificates, enabling better control, enhanced visibility. This migration eliminates the complexity of managing certificates in fragmented systems, ensuring seamless integration.

AppViewX PKI includes advanced features such as centralized reporting, real-time certificate monitoring, and streamlined template configuration using WAEP. These capabilities allow organizations to maintain compliance, reduce operational inefficiencies, and strengthen their overall security posture, making it a superior choice for enterprises looking to upgrade from MSCA.

Microsoft CA Native Data Flow: Pre-AppViewX Stage

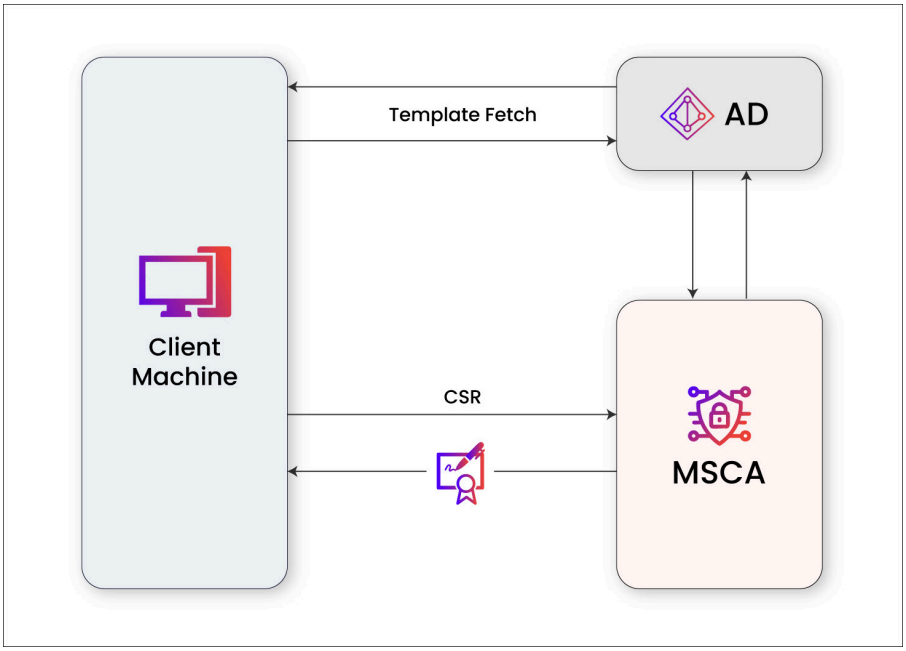
MSCA auto-enrollment can be configured in two ways:

- MSCA is installed without the Certificate Enrollment Policy (CEP) and Certificate Enrollment Services (CES) components
- MSCA is installed with the CEP and CES components

Both scenarios are explained as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. **MSCA Auto-Enrollment without CEP and CES**



Template Retrieval

The client machine sends a request to fetch the templates configured in the Active Directory (AD), and these templates are used for certificate enrollment.

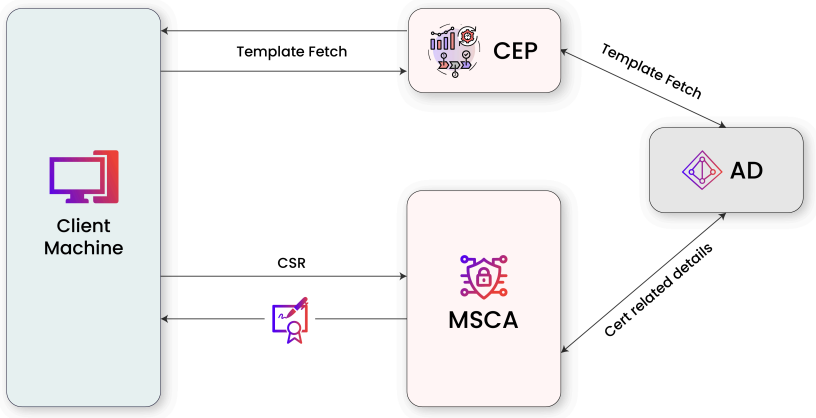
Certificate Enrollment Request and issuance

The client machine initiates a certificate enrollment call with a CSR to the MSCA and the MSCA issues the certificate to the end machine. If this is the existing environment, then CEP and CES must be installed and configured as mentioned in the Section, Prerequisites to proceed with WAEP.

2. **MSCA Auto-Enrollment with CEP and CES**

The following diagram illustrates the flow of the MSCA certificate enrollment process, starting from the Windows machine requesting a certificate to the issuance under the same domain.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Template Retrieval

The client machine sends a request to fetch the templates configured in the CEP, and these templates are used for certificate enrollment.

Certificate Enrollment Request and issuance

The client machine initiates a certificate enrollment call with a CSR to the MSCA and the MSCA issues the certificate to the end machine.

AppViewX-WAEP: Understanding the Data Flow

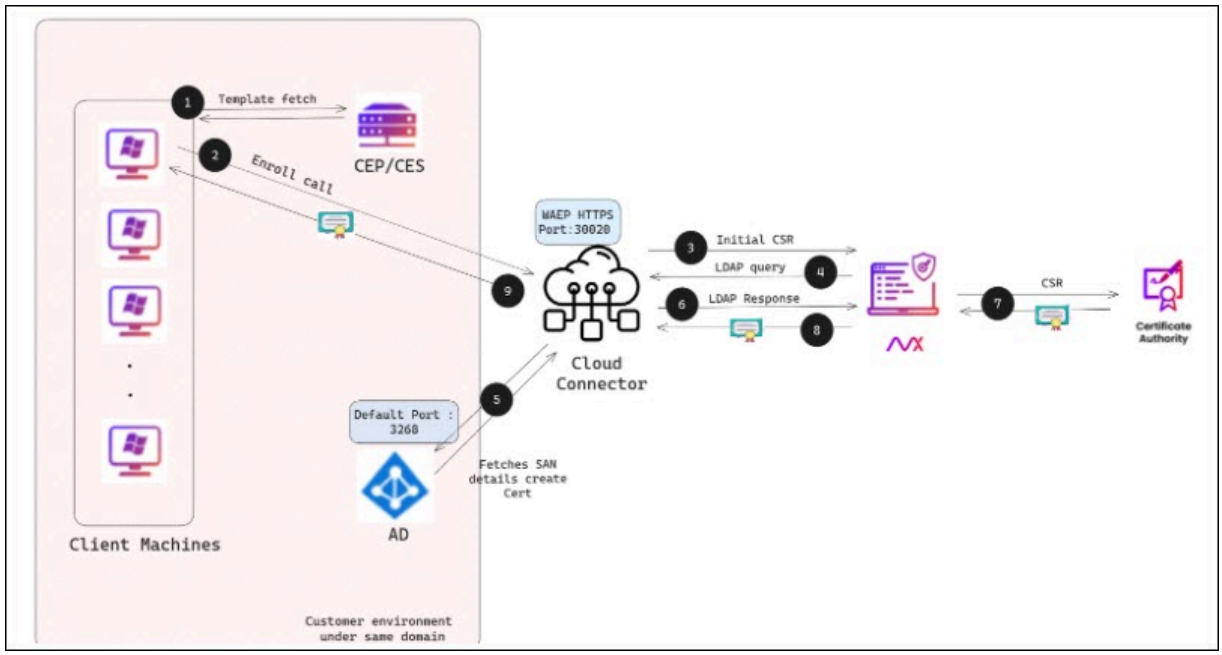
AppViewX auto-enrollment is supported through two approaches:

1. **CEP/CES**

   The following diagram illustrates the entire flow of the WAEP certificate enrollment process THOUGH cep/ces , starting from the Windows machine requesting a certificate to the PKI+ issuance of the certificate.

   The following diagram illustrates the entire flow of the WAEP certificate enrollment process, starting from the Windows machine requesting a certificate to the PKI+ issuance of the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Explanation of each call and its corresponding number is detailed:

- **Template Retrieval [1-2]**

  The client machine sends a request to fetch the templates configured in the CEP. CEP fetches the template from AD and responds to the request

- **Certificate Enrollment Request [3-4]**

  The client machine initiates a certificate enrollment call with a CSR to the cloud connector (CC) machine for a selected template. And the initial CSR is forwarded to AppViewX.

- **LDAP Query for SAN Details [5-7]**

  An LDAP query is made to retrieve SAN details from the AD machine via the cloud connector from AppViewX.

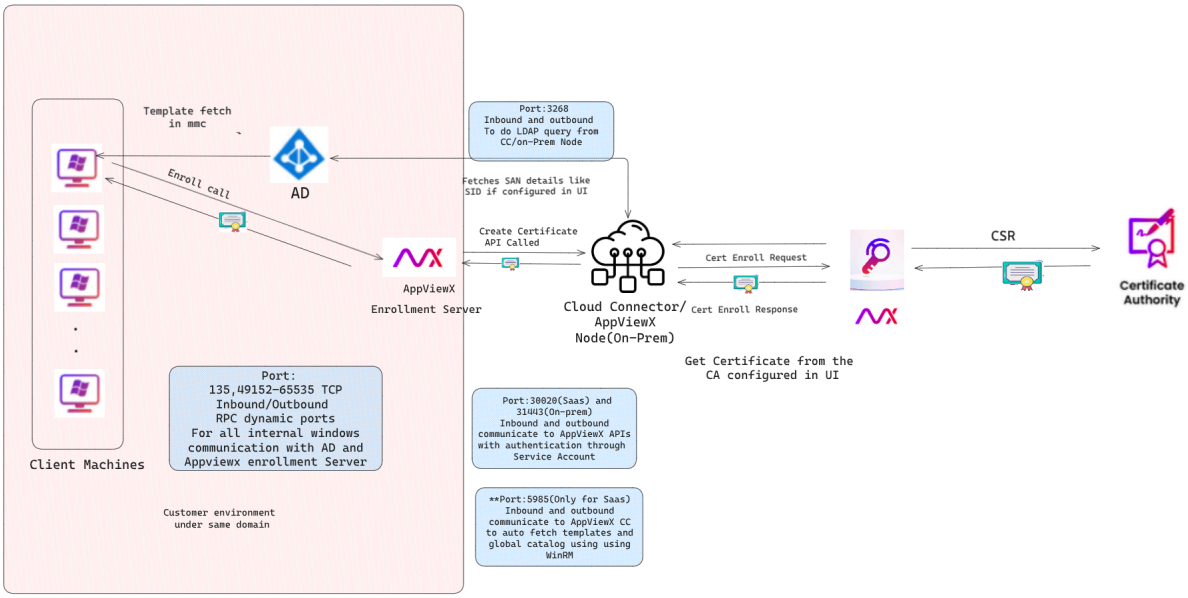
- **Certificate Issuance [8-10]**

  The SAN details are added to the certificate request, and the CSR is submitted to the CA for issuance. The issued certificate is then returned to the client machine.

2. **AppViewX Auto-enrollment Server**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

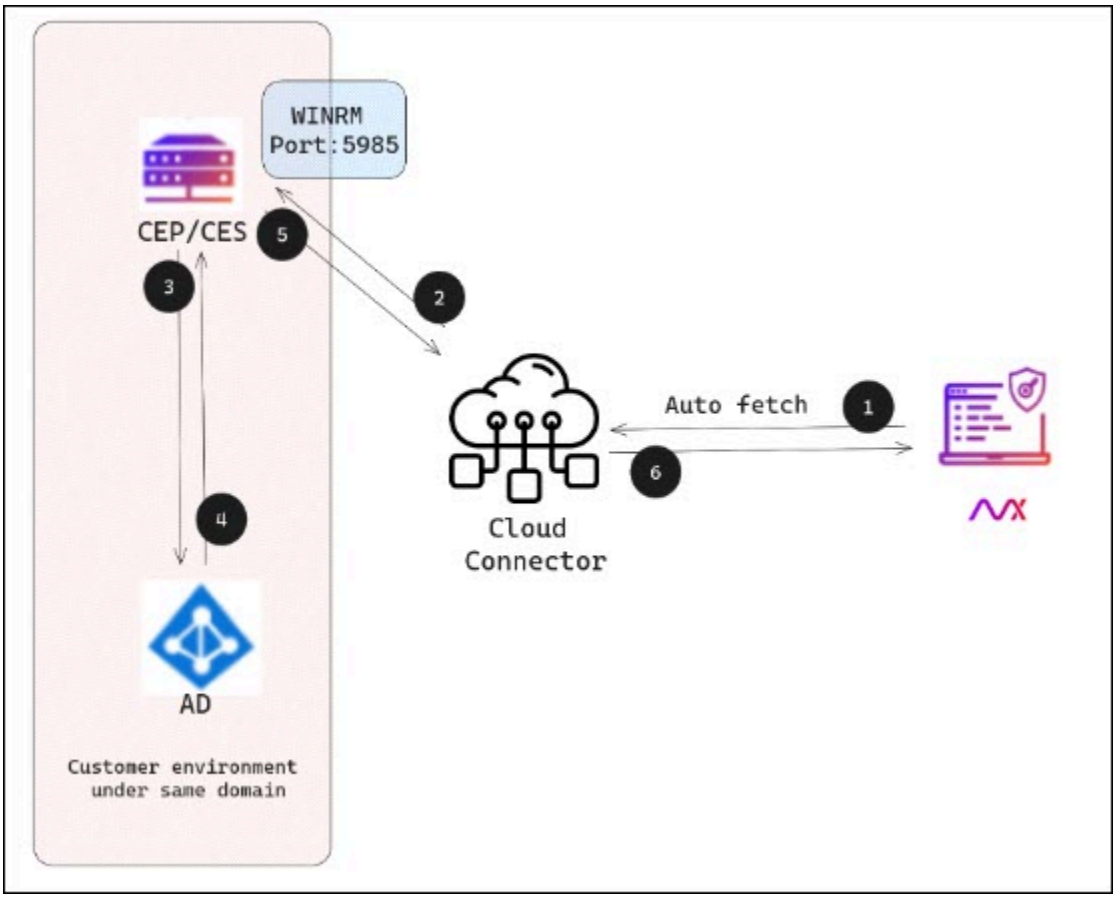
The following diagram illustrates the entire flow of the WAEP certificate enrollment process through AppViewX Enrollment Server starting from the Windows machine requesting a certificate to the PKI+ issuance of the certificate.



Auto-Fetch of Templates and Global Catalog (Applicable only for SaaS)

An auto-fetch call is initiated by AppViewX to the CC. Using WinRM, the query is executed on the CEP/ AppViewX Enrollment Server, which in turn retrieves the details from the AD machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The diagram explains the flow of auto-fetch of templates:

- AppViewX sends an auto-fetch request to the cloud connector (CC).
- The CC uses the WinRM to execute a query on the CEP/AppViewX Enrollment Server machine.
- The CEP/AppViewX Enrollment Server machine retrieves the certificate details from the Active Directory (AD).
- The fetched data is sent back to AppViewX for processing.

- CEP/CES
- AppViewX Enrollment Server
- Troubleshooting

CEP/CES

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Prerequisites
• Configuration Steps
• AppViewX WAEP Configuration

Prerequisites

Key Requirements

- **Service Account Configuration:** Ensure the service account is correctly set up with the necessary permissions.
- **CEP and CES Services:** Verify that Certificate Enrollment Policy (CEP) and Certificate Enrollment Services (CES) are installed and configured within the domain.

Configuration Steps

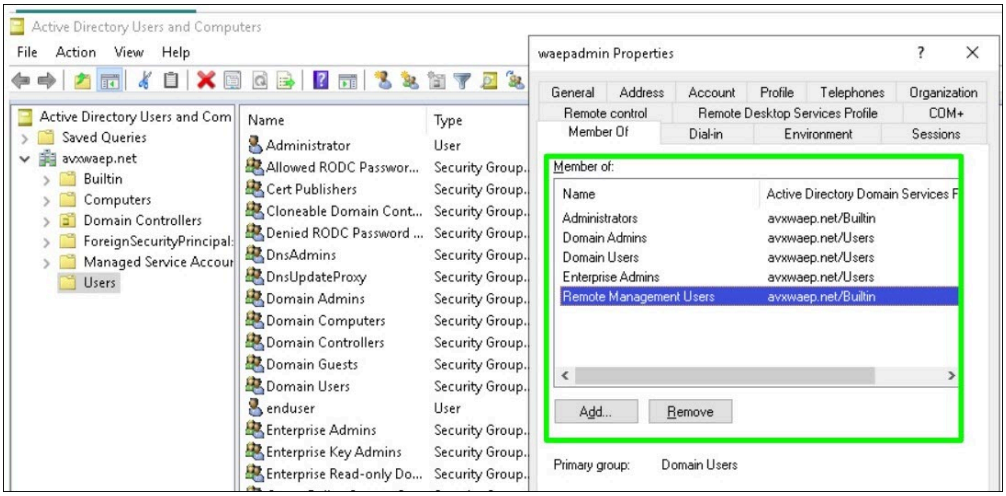
If CEP and CES are already installed and configured, you can proceed directly with the AppViewX WAEP Configuration. Ensure the prerequisites are verified to avoid any interruptions during the setup process.

• Configurations in AD
• Configurations in CEP/CES machine
• Updating CEP URL in AD
• Adding Templates in CA
• Validating MSCA using CEP/CES in Client Machine

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configurations in AD

1. Create a service account from the user group in the AD machine with the following permissions as shown:



2. Set the delegations in the AD machine using the following commands:

   a. `Get-ADUser -Identity <service_account> | Set-ADAccountControl -TrustedToAuthForDelegation $True`

   b. `Set-ADUser -Identity <service_account> -Add @{'msDS-AllowedToDelegateTo'=@('HOST/<CEP_machine_FQDN>','RPCSS/<CEP_machine_FQDN>')}`

Configurations in CEP/CES machine

1. **CEP/CES Installation**

   To install the Certificate Enrollment Services on the CEP/CES server:

   a. Open the Server Manager.
   b. Click **Add Roles and Features,** and click **Next**.
   c. Select Role-based or feature-based installation, and click **Next**.
   d. Choose **Select a server from the server pool,** and click **Next**.
   e. Expand the **Active Directory Certificate Services**, select **Certificate Enrollment Web Service** and **Certificate Enrollment Policy Web Service,** and click **Next**.
   f. Proceed until the **Confirmation** page, and click **Install**.

2. **CEP/CES Configuration**
   a. Click the new task shown in the **Server Manager notifications: Configure Active Directory Certificate Services** on the destination server.
   b. In the credentials panel shown, click **Change**.
   c. Enter an account service account which we created, click **OK** and then click **Next**.

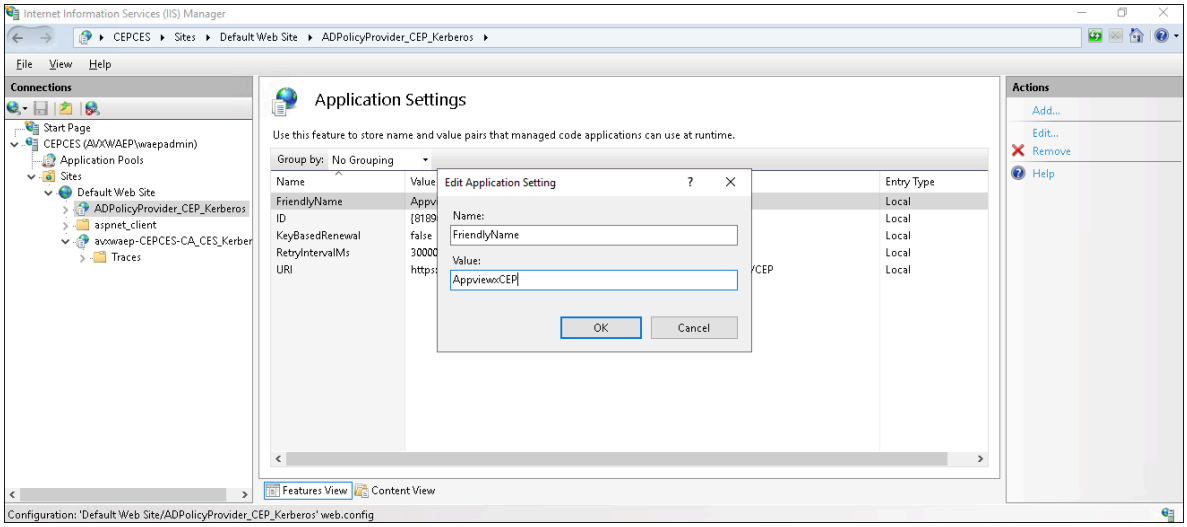
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

d. Select **Certificate Enrollment Web Service** and **Certificate Enrollment Policy Web Service** and click **Next**.
e. Select the CA Name.
f. Click **Select** and choose the Microsoft CA that will be issuing the certificates using certificate enrollment web service, click **OK** and then click **Next**.
g. For CES authentication type, select **Windows Integrated Authentication** and then click **Next**.
h. For CES service account, select **use built in application pool identity.**
i. Click **OK** and then click **Next**.
j. For CEP authentication type, select **Windows Integrated Authentication** and then click **Next**.
k. For Certificate authentication, select **Choose and assign a certificate for SSL later** and click **Next**.
l. Review the confirmation page and click **Configure**.
m. When the installation completes, click **Close**.

3. **Configuring IIS in CEP/CES machine**

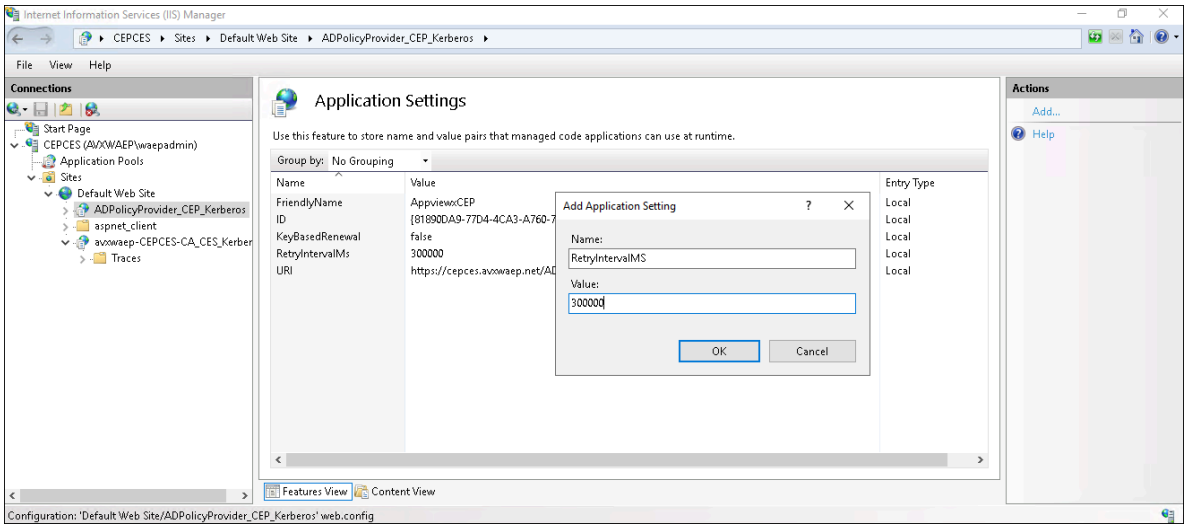
To configure the Internet Information Services (IIS) on ADCS:

a. Type InetMgr.exe in the command prompt to open the Internet Information Services (IIS) Manager.
b. Click your server name on the left-hand side.
c. Expand the selection for your server and click **Application Pools**.
d. Expand the default web site and click **ADPolicyProvider_CEP_Kerberos** and open **Application Settings**.
e. Edit the entry name **FriendlyName** and set the value to **AppViewX_Enrollment.** This is a name that clients will see only when they are manually requesting for certificates.



f. Click **Add** and create a new entry with the name **RetryIntervalMs** and value **300000**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

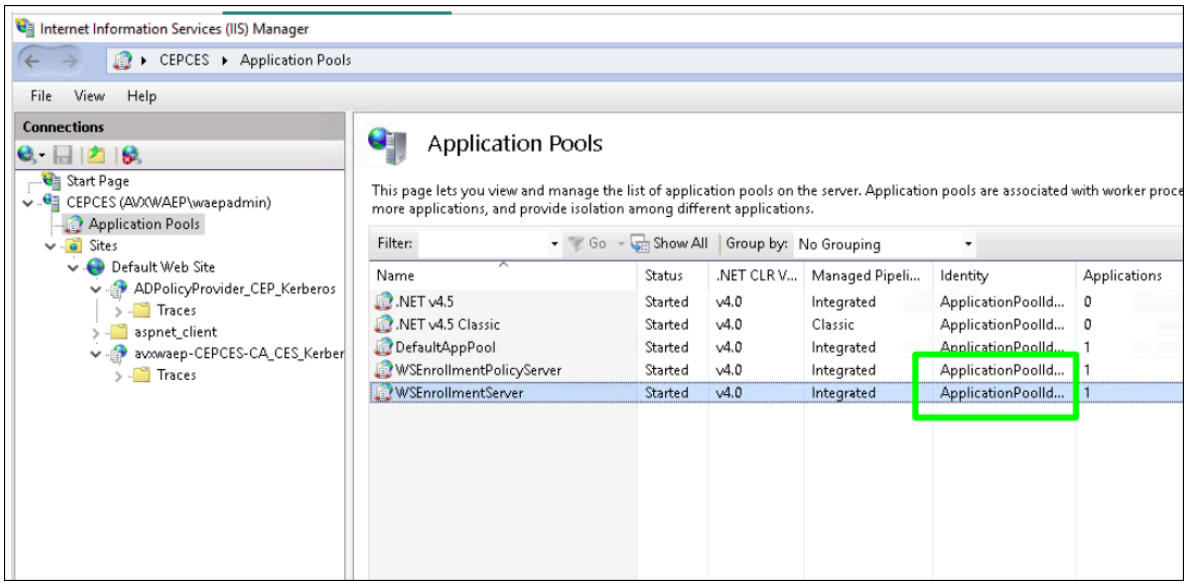


g. Click the URI and copy the URI to use for group policy updates.

h. Restart IIS by clicking the server name and then click **Restart** on the right-hand side.

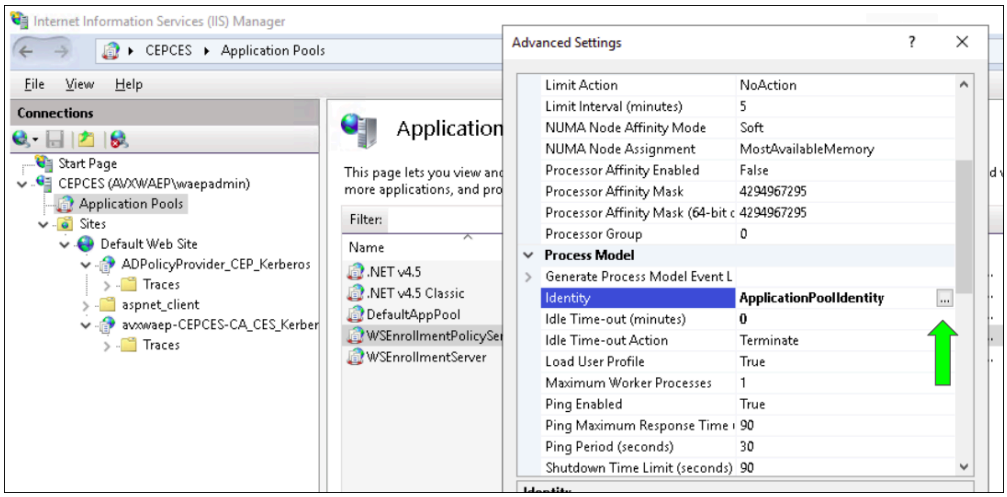
4. **Steps for configuration verification**

a. Validate if **Identity of WSEnrollmentPolicyServer** and **WSEnrollmentServer** is set to **ApplicationPoolsIdentity**.

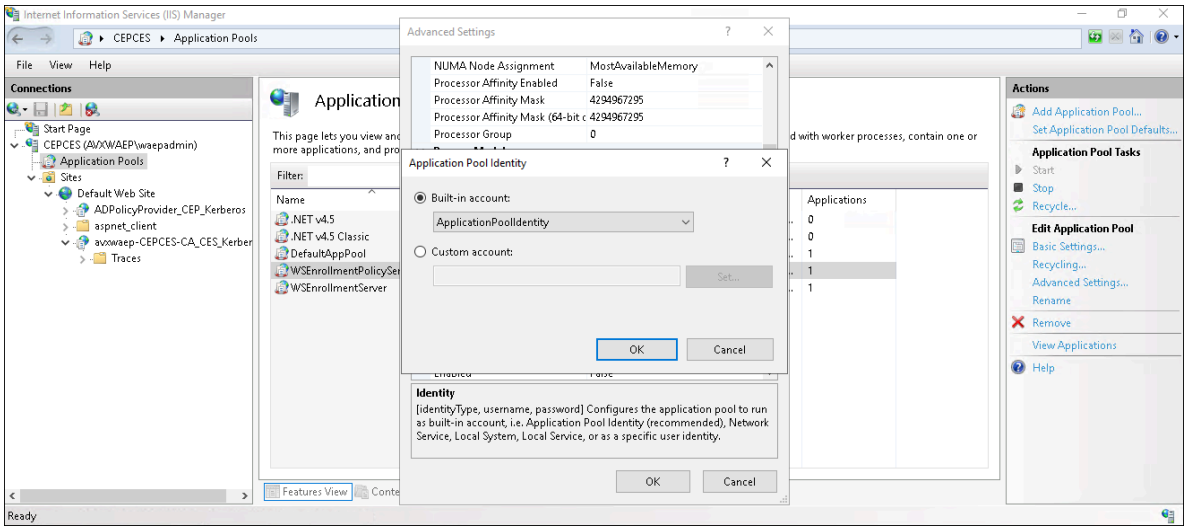


If not, right-click the application pool name and click **Advanced Settings > Identity**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



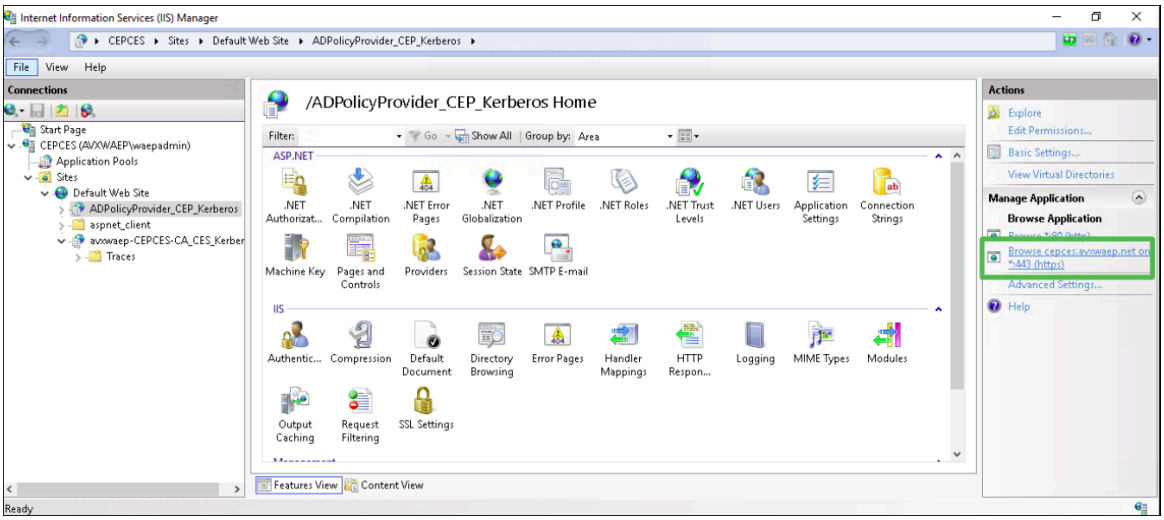
Click the three dots at the end of the identity and configure it as **Built in account > ApplicationPoolIdentity** as shown:



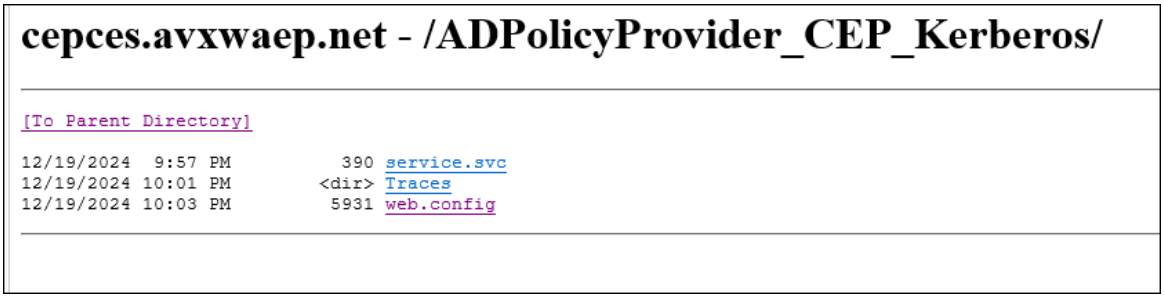
b. Enable directory browsing for validation.

- By clicking the website name **[ADPolicyProvider_CEP_Kerberos] > Directory browsing > Enable [Right Pane]**
- Once enabled, click the **Browse Application** URL as shown, and enter the service account credentials if required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The expected output is as shown:

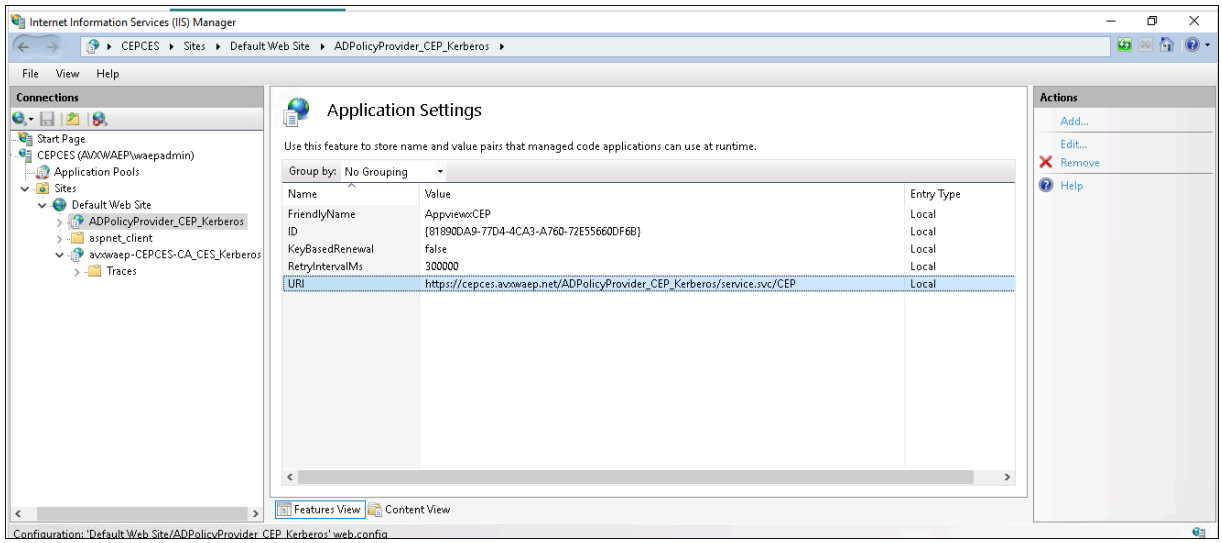


- Similarly enable the directory browsing and verify browsing for the CES [<CA_NAME>_CES_Kerberos].

Updating CEP URL in AD

1. Login to an AD machine using the service account created.
2. Get the CEP URL from the CEP/CES machine by going to **IIS > ADPolicyProvider_CEP_Kerberos > Application settings > URL**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



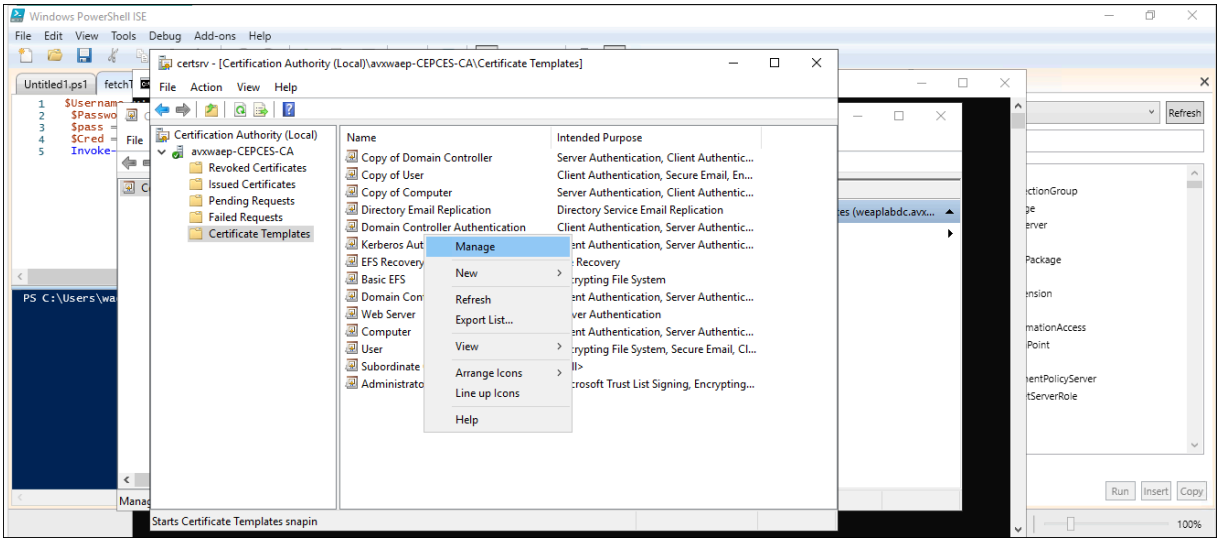
3. To update the Group Policy for Certificate Enrollment:
   a. Type `gpmc.msc` in the **Run** command to access Group Policy Management on the AD Domain Services server.
   b. Expand your domain forest > Domains > your domain name, and then select **Default Domain Policy.**
   c. Right-click **Default Domain Policy** and select **Edit**.
   d. Expand **Computer Configuration > Policies > Windows Settings > Security Settings > Public Key Policies.**
   e. Edit **Certificate Services Client – Certificate Enrollment Policy.**
   f. Change **Configuration Model** to *Enabled*.
   g. Remove the **Active Directory Enrollment Policy** from the Certificate Enrollment policy list, and click **Add.**
   h. Enter the policy server URI copied from the previous step, click Validate Server, and click **Add.**
   i. Select **Default**, and click **Add.**
   j. Expand **User Configuration > Policies > Windows Settings > Security Settings > Public Key Policies.**
   k. Edit **Certificate Services Client – Certificate Enrollment Policy.**
   l. Change **Configuration Model** to *Enabled*.
   m. Remove the **Active Directory Enrollment Policy** from the Certificate Enrollment policy list, and click **Add.**
   n. Enter the policy server URI copied from the previous step, click **Validate Server,** and click **Add.**
   o. Select **Default,** and click **OK.**
4. Open the command prompt as administrator and run the gpupdate /force command to update the group policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

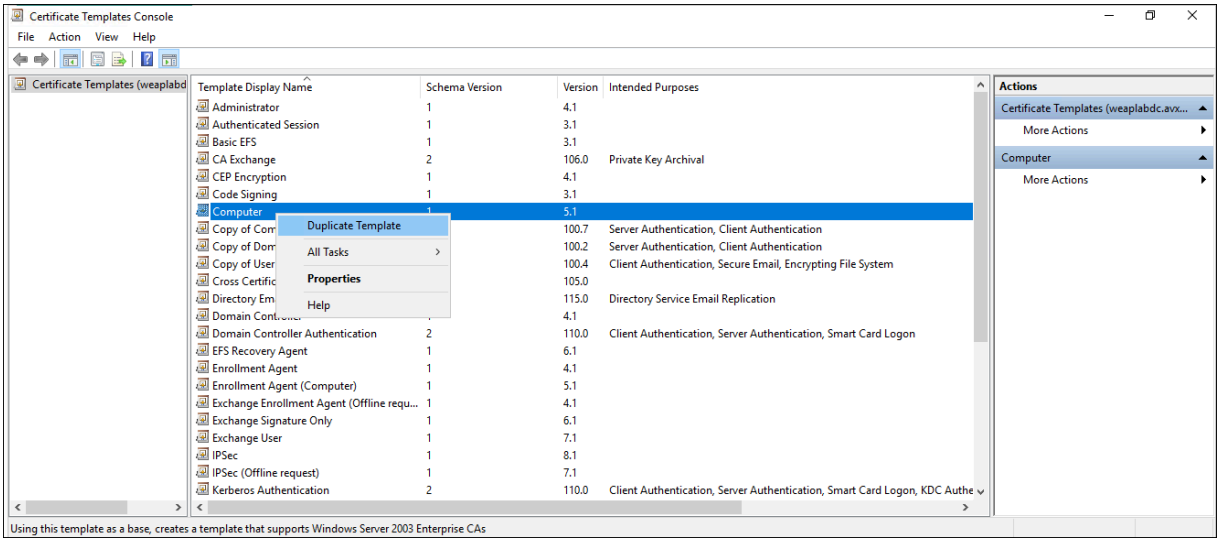
Adding Templates in CA

To ensure proper functionality with WAEP, the default templates must be duplicated. Follow these steps to duplicate the templates on the CEP/CES machine:

1. Open the **Run** dialog and enter certsrv.msc to launch the Certificate Authority interface.
2. Select the MSCA in use, then click on **Templates**.
3. On the right pane, right-click and select **Manage**.

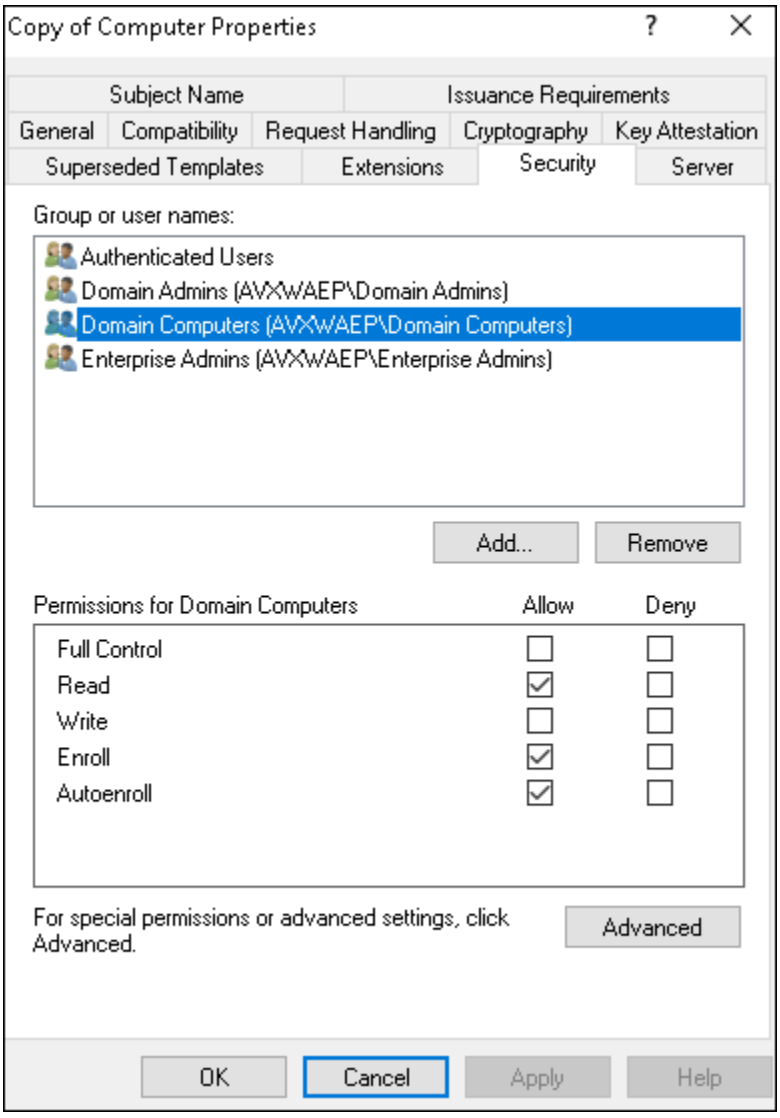


4. Locate the **Computer** template, right-click and choose **Duplicate Template**. Click **OK** to confirm.



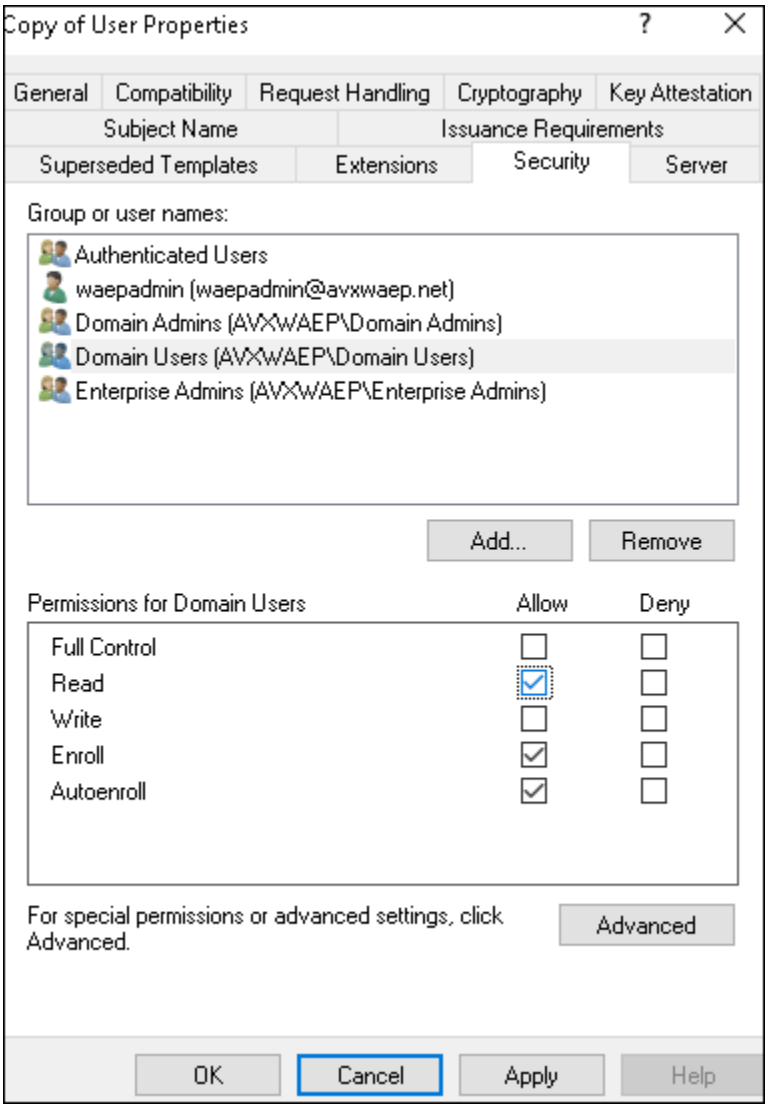
5. Ensure that the following permission for the domain computer is provided for the computer template:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

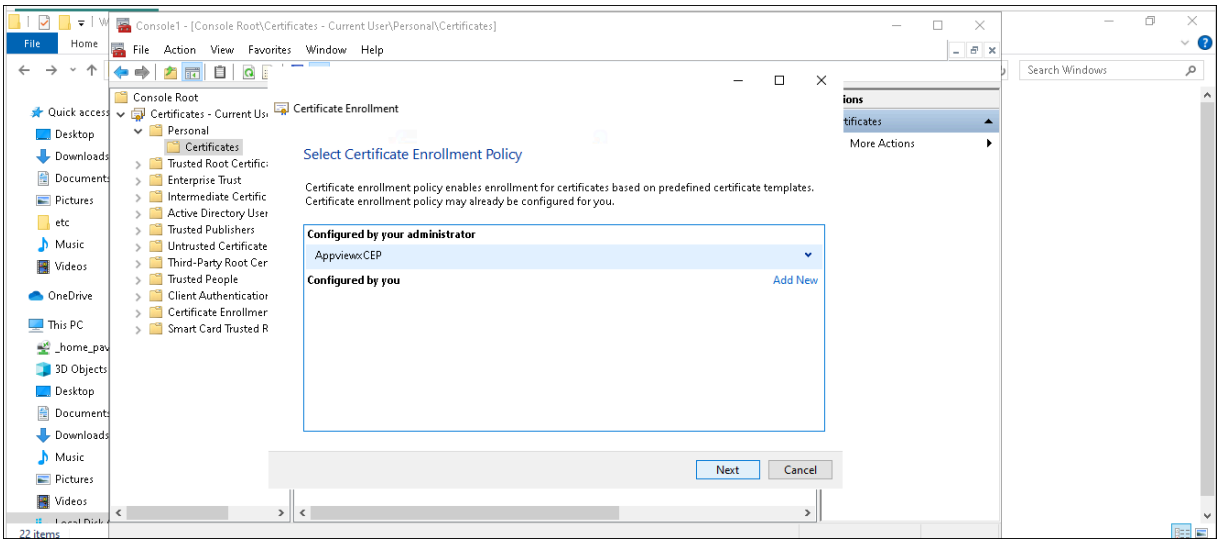
6. Repeat the process to duplicate the **User** template as well with permission for the domain users as shown:



Validating MSCA using CEP/CES in Client Machine

1. Login to an end machine using the service account created.
2. Open a command prompt as administrator and run the gpupdate /force command to update the group policy.
3. Go to MMC and add the user and machine certificate snap-ons.
4. Right-click the personal store of User Certificates and click **All-tasks > Request New Certificate.** The CEP friendly name configured earlier will be shown there. Click that and proceed to enroll a certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



5. Similarly test certificate enrollment for computer certificates.

AppViewX WAEP Configuration

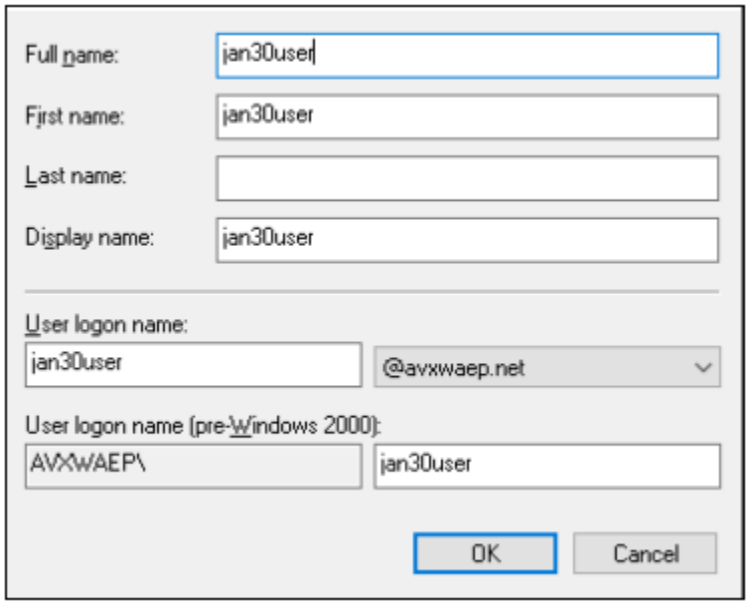
- System Requirements and Service Account Configuration
- Configuring WAEP Templates
- Configuring Windows Auto-Enrollment Proxy

System Requirements and Service Account Configuration

1. **A valid Service Account with the below permissions**
   - Enterprise Admin
   - Domain Admin
   - Remote Management Users
   - Administrator
   - Domain User
2. **Service account name**

   Ensure that the service account's full name is the same as the login name as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



3. **CC Service Setup**
   - Install ACME-HTTPS and SCEP-HTTP services on the CC.
   - Configure WAEP in the AppViewX GUI specific to CC.
4. **Domain Machine Requirements**
   - **SaaS Setup**
     - **Outbound Calls**
       - Port 30020 for unidirectional communication from domain machines to CC.
       - Port 30022 for CRL verification.
     - **Inbound Calls**
       - Port 5985 for auto-fetch requests from CC to the CEP machine.
   - **On-prem Setup**
     - **Outbound Calls**
       - Port 31443 for unidirectional communication from domain machines to CC.
       - Port 30022 for CRL verification.

> **Note:** Auto fetch/lift and shift functionalities are only supported in the SaaS model.

5. **Domain and Connectivity**
   - CEP must be in the same domain as the AD, with connectivity to the AD server.
   - Ensure a valid DNS record for the CC/AppViewX node exists in domain machines.
6. **Certificate and Trust Configuration**
   - Issue the certificate using AppViewX PKIaaS CA and enable trust on Windows domain machines.
   - Steps to add root and intermediate certificates to the Windows domain machines:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Log onto the AD machine using your service account.
b. Move the root and intermediate certificates that need to be trusted to the appropriate location.
c. Open the command prompt with administrator privileges.
d. To publish the **Issuing CA** certificate, run:

```
certutil -dspublish -f <PathToCertFile.cer> SubCA
```

e. To publish the **Root CA** certificate, run:

```
certutil -dspublish -f <PathToCertFile.cer> RootCA
```

f. Run the following command to force a policy update and push the certificates to the domain machines:

```
gpupdate /force
```

Configuring WAEP Templates

Templates can be fetched in two ways: manual and automatic. Fetching templates is essential for mapping each template to a specific CA configuration setting.

Note: To ensure proper functionality with WAEP, default templates must be duplicated. Follow these steps to duplicate templates on the CEP/CES machine from the Section, Adding Templates in CA.

Manual Fetch Configuration

Prerequisites

- Generate CSV file (Applicable only for manual upload of templates)

To generate CSV file:

1. Run Windows PowerShell.
2. To extract information of the certificate name, certificate template OID, validity period, and renewal period from the templates published on the ADCS server, run the command on the ADCS server:

```
Certutil -adtemplate -v | select-string distinguishedName,msPKI-Cert-Template-OID,pKIExpirationPeriod,pKIOverlapPeriod,'Major Version Number','Minor Version Number'
```

3. Copy the distinguished name (Template name), certificate template OID, validity period, and renewal period with major and minor version for templates as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
distinguishedName = Copy of Computer
msPKI-Cert-Template-OID = 1.3.6.1.4.1.311.21.8.60046.11887992.1200005.2037137.6303374.216.548621.13969983 Copy of
mputer
pKIExpirationPeriod =  4 Years
pKIOverlapPeriod =  6 Weeks
      Major Version Number=100
      Minor Version Number=42

4. Open a spreadsheet and create column headings:
   - **templateName:** In this column, add entries as Computer_Auto_enrollment template and User_autoenrollment.
   - **templateOID:** In this column, paste the OIDs copied in Step 3 against the respective template.
   - **validityPeriod:** In this column, enter the value as 365, which is the default value of the validity period.
   - **validityPeriodUnit:** In this column, enter the value as *days, weeks, months, or years*.
   - **renewalPeriod:** In this column, enter the value as 30, which is the default value of the renewal period.

     Note: The renewal period must be less than the validity period.

   - **renewalPeriodUnit:** In this column, enter the value as *hours, days, weeks, months, or years*.
   - **templateMinorVersion:** In this column, please enter the minor version associated with the template.
   - **templateMajorVersion:** In this column, please enter the major version associated with the template.
5. Once done, save the file in .xls, or .xlsx, or csv format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Auto-Fetch Configuration

Templates can also be automatically fetched from the Windows machines using WAEP. To use auto-fetch:

Enable Winrm services in AD and CEP machine

For the Lift & Shift feature to work, enable the WinRM service on the policy server (CEP/CES) and the AD servers configured in WAEP for global fetch configuration and publication of templates.

To configure WinRM service (Applicable only for automatic upload of templates):

1. Run winrm quickconfig on the PowerShell window as an administrator.
2. Type *y* when prompted to start the WinRM service.

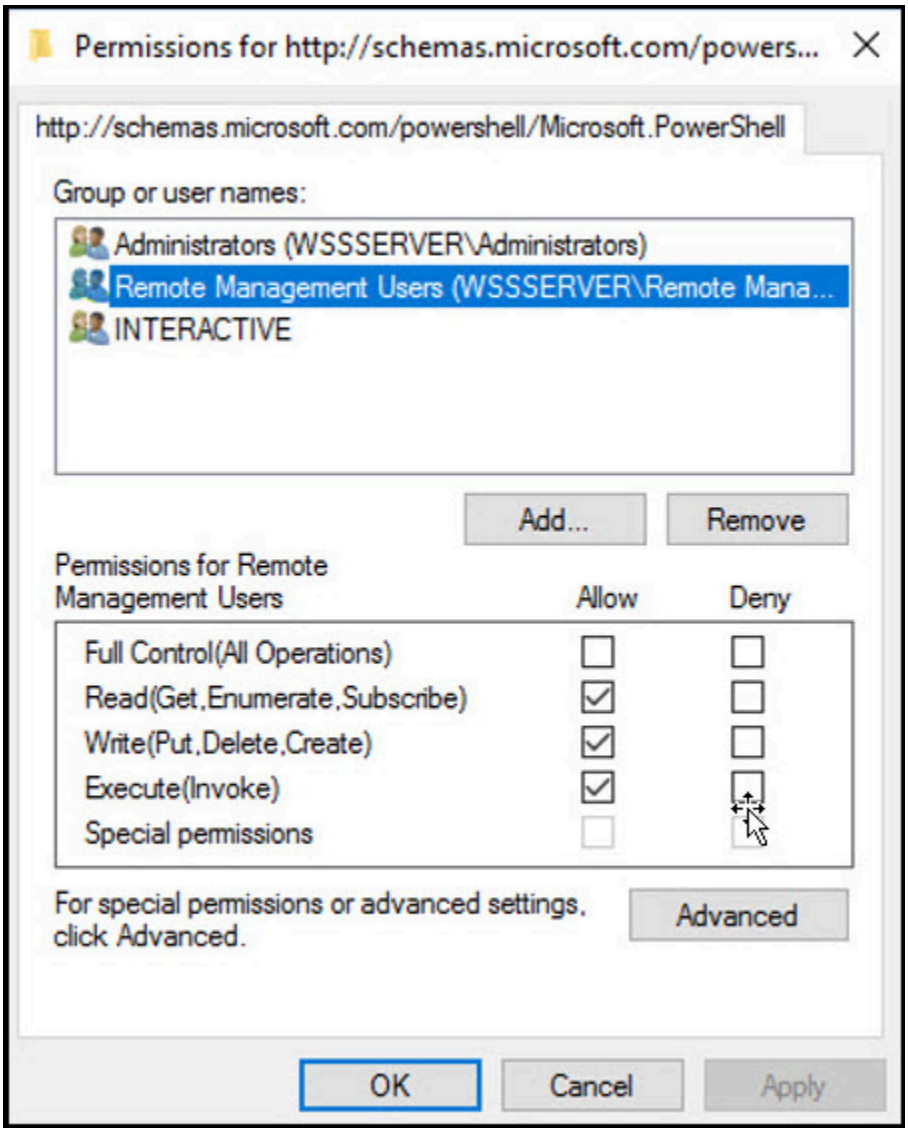
   The service account, for example: <waep_kerberos>, must be part of the Remote Management Users group.

3. To validate if the Remote Management Users group has permissions to execute the scripts, run the below command on the AD server and the policy server:

```
Set-PSSessionConfiguration -ShowSecurityDescriptorUI -Name Microsoft.PowerShell
```

4. Add the service account to the Remote Management Users group in AD.
5. Assign Read,Write, and Execute permissions to the group.

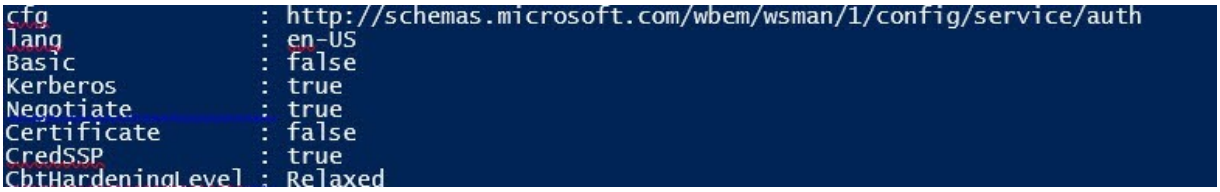
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Enable Credential Security Support Provider (CredSSP) authentication on the policy server (CEP/CES) and the AD servers by running the following command:

```
Enable-WSManCredSSP -Role Server
```

7. Once the server role is enabled, ensure the parameters, Kerberos, Negotiate, CredSSP, are set to *true* and CbtHardingLevel is set to *Relaxed* as shown:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Windows Auto-Enrollment Proxy

1. Log onto the AppViewX application using your credentials.
2. Go to (**Menu**) icon **> CERT+.**
   The CERT+ left navigation pane appears.
3. Expand the **Administration** menu and select **Auto Enrollment > WAEP.**
   The **Windows AEP** auto-enrollment page is displayed.
4. Click **+New Setting** to add a WAEP auto-enrollment request.
   The **Windows AEP : New Setting** page is displayed.
5. Enter the following fields:

Field Description for Windows AEP : New Setting page

Field	Description
Endpoint Details	
***Name**	Provide a unique name for the WAEP setting. **Note:** Only alphanumeric and the following special characters are allowed: period (.), hyphen (-), and underscore (_). The name cannot begin with a special character.
***Cloud Connector**	Select the hostname based on the domain.
***Data Center**	Field is auto-populated based on the Cloud Connector hostname.
Active Directory Configuration	
***Policy Server**	Provide the IP address or the hostname of the **Certificate Enrollment Policy Web Service (CEP)/ Certificate Enrollment Web Service (CES)** or policy server used to execute the remote Windows PowerShell scripts.
***LDAP Server**	Select or enter the hostname of the AD/LDAP server.
***Service Account with Base**	Provide the service account created for bind. For example: cn=test_service, ou=Kerberos_accounts, dc=avxtest, dc=com
***Service Account Password**	Provide the service account password.

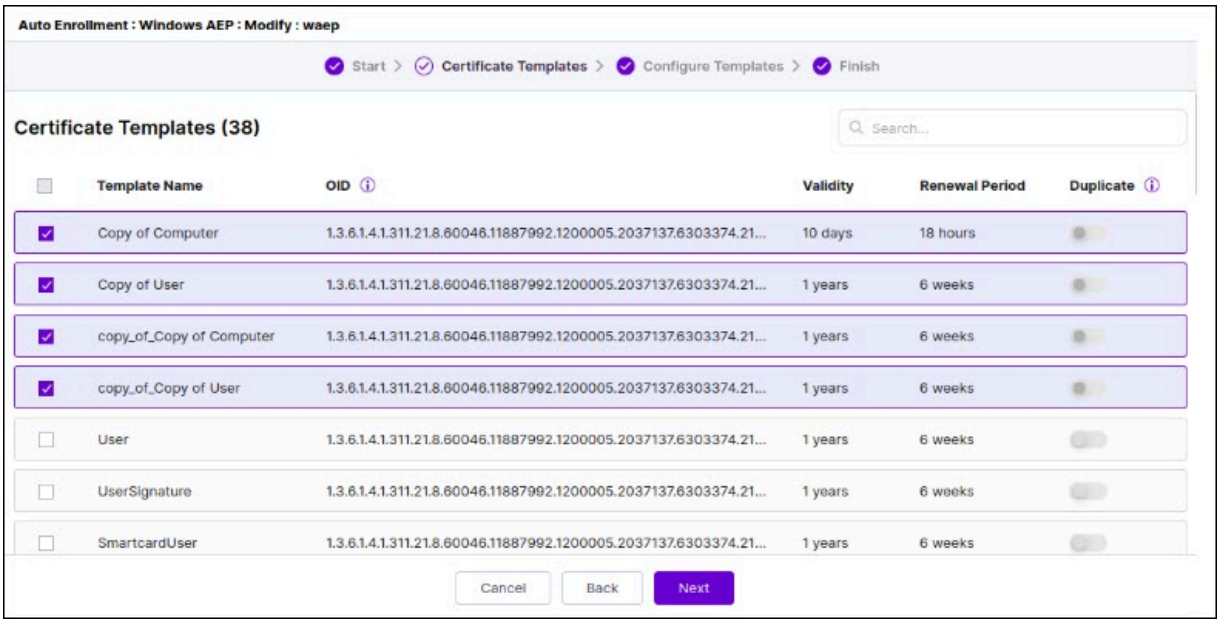
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Active Directory Sync	This field is optional for manual import of templates.Enable this toggle button to fetch all the global catalog servers in your forest. **Note:** Auto fetch and AD sync are present only for SaaS setup.
Global Catalog Configuration	
***Global Catalog Server IP**	If Active Directory sync is enabled, then this field lists all the global catalog servers in your forest as a dropdown list.
***Port**	Port 3268 is the MS default port for global catalog.
***LDAP Base DN**	If AD sync is enabled, the LDAP base DN is auto-populated based on the IP address of the global catalog server selected from the dropdown list.
Validate Account	Click the button to validate connection of the global catalog server with your service account credentials. If the validation is successful, you see *Success* displayed next to the button. If it fails, then check the service account credentials, or permissions to the global catalog server, or verify the global catalog server IP and try again.
Import Templates	
***Type**	By default, **Manual** is selected. It is recommended that you select the **Auto** option to automatically fetch your templates from your AD. If you have selected **Manual,** then drag and drop your template that you created or browse to the location it is saved. Auto-fetch is only supported in SaaS environment.
Fetch Templates	The templates are fetched and populated in the **Certificate Templates** screen.
Note: Fields marked with red asterisk (*) symbol are mandatory.	

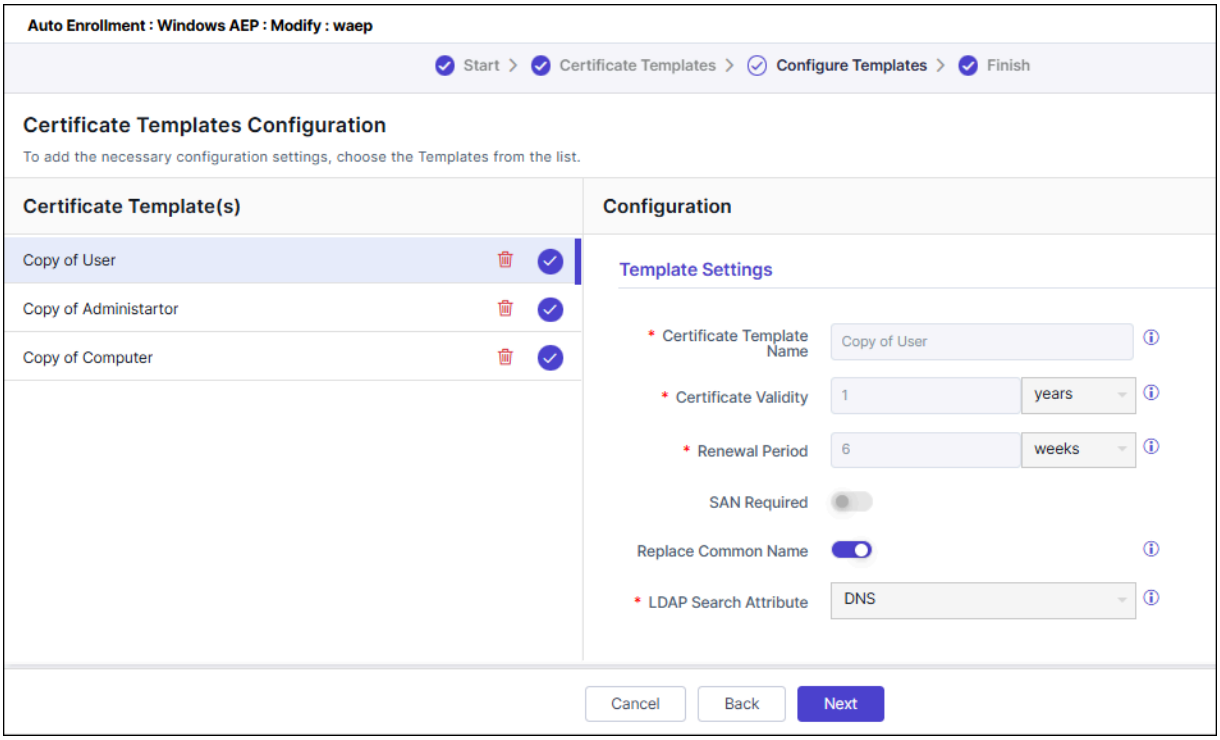
6. Click **Next.** A message that templates are imported successfully appears.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Certificate Templates** page appears along with all the fetched templates along with the details populated in the table as shown.



7. Select the templates you want to configure and click **Next.**
   The **Certificate Templates Configuration** page appears.
8. Click the template you want to configure and fill out the details in the **Configuration** page that appears on the RHS of the page.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Enter the following fields:

Field Description for Certificate Template Configuration page

Field	Description
Template Settings	
***Certificate Template Name**	Value is populated based on the auto-fetched or uploaded data.
***Certificate Validity**	Enter the expiry time limit for certificates.
***Renewal Period**	Enter the renewal time limit for the template.
SAN Required	This is disabled by default.
Replace Common Name	This is disabled by default. If enabled, the issued certificate's Common Name will be replaced with the value retrieved from the specified LDAP field name.
***LDAP Search Attribute**	This field appears only on enabling the **Replace Common Name** toggle. You can search the LDAP attribute by DNS, which is populated by default. This value will replace the Common Name in the issued certificate.
Subject Alternative Names	This field appears only when you select the **SAN Required** checkbox. Select from the following values: • DNS • Email • User Principal Name • Service Principal Name **Note:** You can either choose DNS/Email or both, or customized SAN such as User Principal Name/Service Principal Name or both. For example, if you select DNS/Email or both, you cannot select User Principal Name/Service Principal Name and vice versa.
***Certificate Profile**	This field will not appear for PKIaaS Native CA. Select the profile configured to set the Key Usage and EKU.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This profile must match the Key Usage values and EKU as seen in the actual on-prem Microsoft template in case of manual fetch.
CA Configuration	
***Certificate Group**	Select the certificate group for managing the certificates.
***CA Name**	Select a CA for WAEP to communicate for certificate enrollment.
***CA Account**	The field values are listed only when the account is added to CA settings.
***CA Certificate**	Select issuer certificate. It is recommended to select intermediate CA certificates to sign all the client certificates.
***Issuer Name**	Select the issuer name for the certificate.
***Issuer Location**	This field will not appear for PKIaaS Native CA. Select the issuer location for the certificate.
***Template**	This field appears only for PKIaaS Native CA. Select from the dropdown list.

On completion, you get a message that the template is saved successfully and a blue tick mark appears across the configured template.

Note:

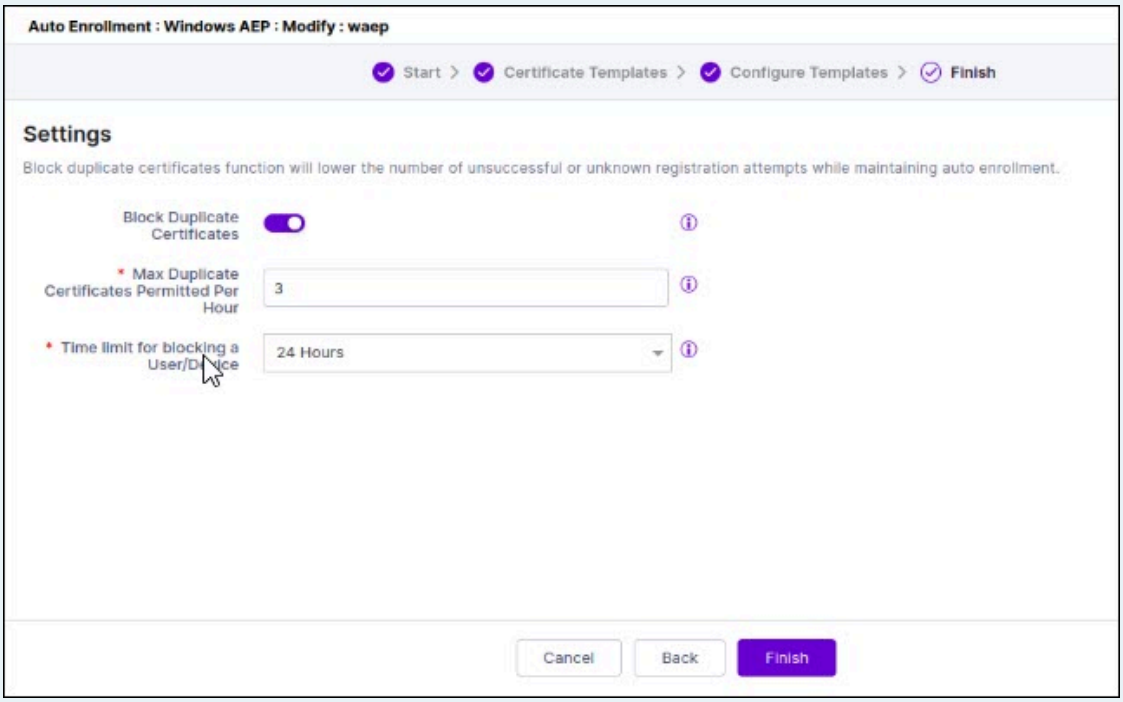
- You can select or clear the templates by going back to the previous page.
- You cannot click **Next** until all the selected templates are configured.
- Click the (**Delete**) to delete a selected template.

10. Click **Next.**

    The **Settings** page appears. By default, the **Block Duplicate Certificates** toggle button is disabled. If you enable it, you can customize the values for blocking the maximum number of duplicate certificates in an hour and the time limit to block a user/device issuing the certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: By default, the time limit for a user/device is 24h. If you change this value, ensure to update the **Occurrence Type** by navigating to **CERT+ > Administration > Job Scheduler** and selecting **Pkiaas AEP Purge log Job.** If you have set the time limit as 12h or 24h, then choose **Occurrence Type** as **Daily.** For values more than 24h, choose **Occurrence Type** as **Weekly.**

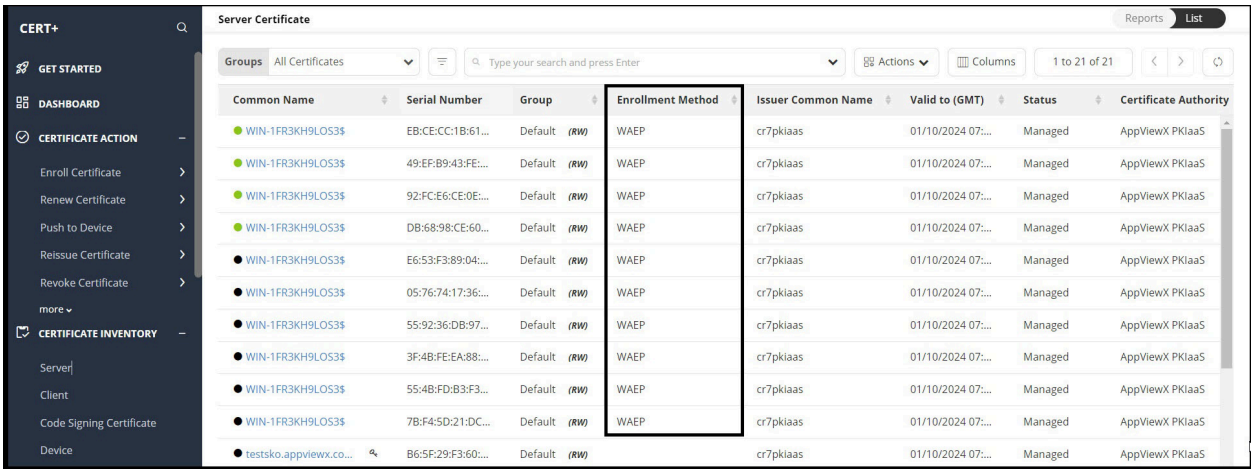


11. Click **Finish.**

    A message that the WAEP settings is saved successfully appears.

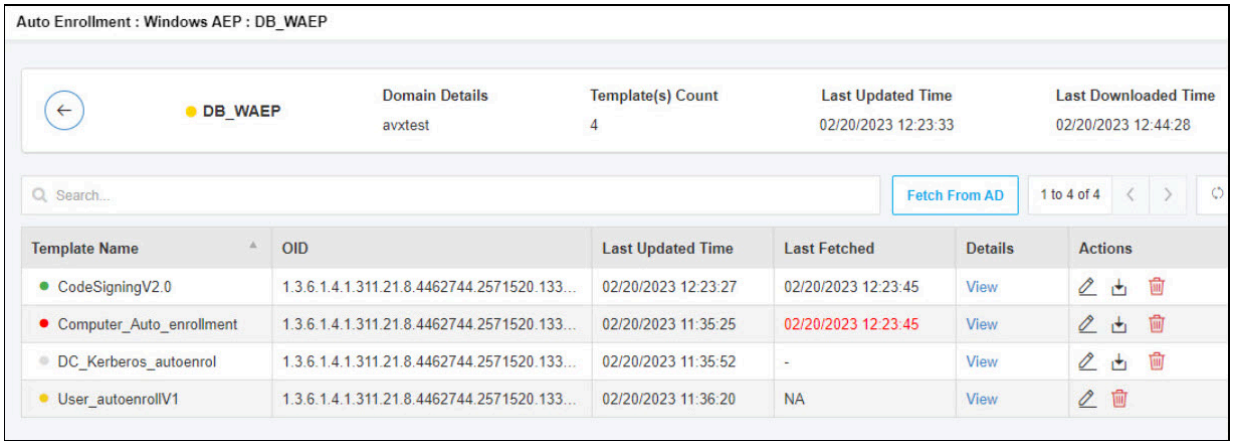
The AppViewX PKIaaS certificates that are auto-enrolled via WAEP appear on the **Cert+ > Certificate Inventory** page as shown. You can filter the AppViewX PKIaaS certificates using the WAEP enrollment method.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



What to do next:

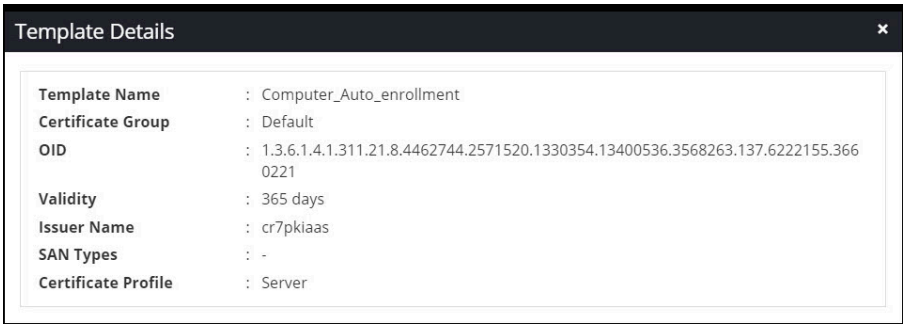
- [Applicable only if you have chosen automatic upload of template] Click **Download** to download the entire set of configured certificate template scripts and the runnable files to publish on your active directory.
- Click **Go to Inventory** to view the added WAEP setting on the dashboard.
- Click the **Endpoint Setting** hyperlink on the dashboard to view details of the configured certificate template.



- Once the templates are fully configured, click **Fetch from AD** to fetch the templates from the active directory. A message, *Template sync triggered successfully,* appears. Here are the color codes against the templates:
  - **Green:** indicates the templates were fetched successfully along with the last fetched time.
  - **Amber:** indicates the templates are partially configured. The last fetched time will be NA.
  - **Gray:** indicates the templates were not found in the AD or the templates not yet published. The last fetched time will be empty for these.
  - **Red:** indicates the templates were deleted along with the last fetched time.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Click **View** to get the certificate template details.



- Click the (**Edit**) icon to edit configuration of the certificate template.
- Click the (**Download**) icon to download a selected template, or click the (**Delete**) to delete a selected template.

- Viewing the added WAEP Setting on the Dashboard
- Updating AppViewX CES URL
- Verifying AppViewX CES URL
- Certificate Enrollment Validation using AppViewX PKI

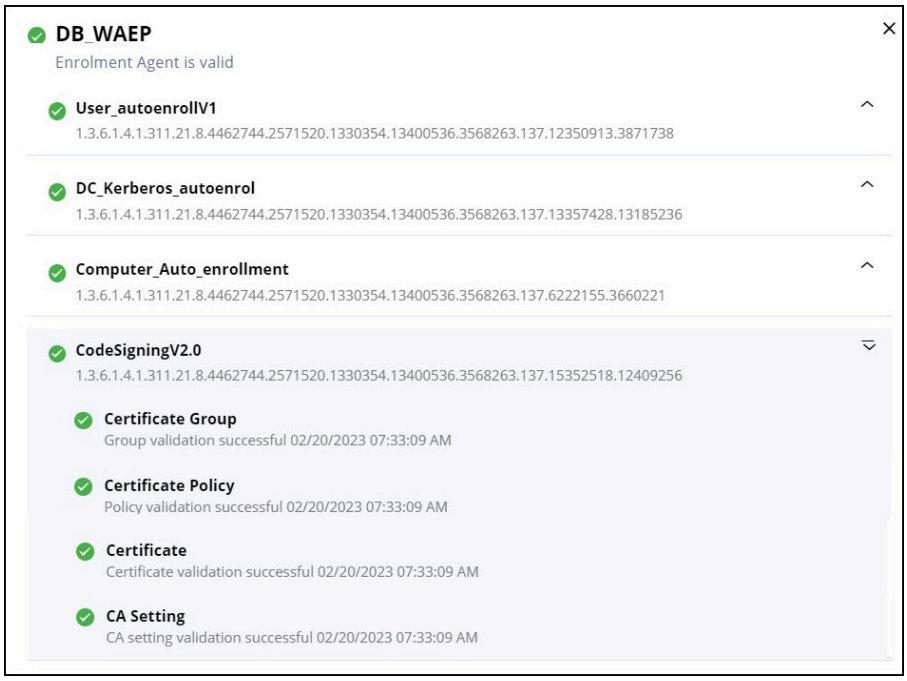
Viewing the added WAEP Setting on the Dashboard

To view the newly added WAEP setting on the dashboard:

1. Click **Go to Inventory** to view the added WAEP setting on the dashboard.
2. From this page, you can do any of the following actions:
   - Click **Check** to check if the certificate template configuration is successful. If the certificate template configuration is successful, the status changes to *Valid,* else it turns to *Invalid*. For incomplete template certificate configuration, the status shows as *Incomplete.* To complete the WAEP configuration, click the (**Edit**) icon.

     You can also expand to view the validation attributes and status of the connection separately for each of the certificate templates as shown:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- If the certificate is found in the enrolled Windows client machine, then the enrollment is successful and the **Success Requests** tab on the dashboard is incremented by 1. If it is unsuccessful, then the count in the **Failed Requests** tab is incremented by 1.
- If you have enabled the **Block Duplicate Certificates** on the **Settings** page, then based on the value set for the permissible duplicate certificates in an hour further auto-enrollment requests are blocked for the day with a log entry, *Duplicate Certificate request - Certificate entry with this Common Name, Certificate Template and SAN value has already been issued.* The user/device is automatically unblocked after the set time limit has elapsed.

  The administrator can manually enable the blocked user/device from the WAEP page by clicking **View** in the **Blocked Users** tab, selecting the checkbox against the user name to unblock, and clicking **Unblock.**

  Click the **Audit Log** to get details on the unblocked user/device. The details include the device/user name, domain, date and time on when it was blocked and unblocked, and who unblocked it. You can also download the audit log in the CSV format.

- Click the (**Edit**) icon to edit the WAEP configuration.
- Click the (**Delete**) to delete the WAEP configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Updating AppViewX CES URL

Once UI configurations are done and successful we can proceed to update the Windows Auto-Enrollment Server URL on ADCS.

1. Log onto the CEP machines using your service account.
2. Open a command prompt on the CEP windows machine.
3. To get the current URL, run:

```
certutil -config <FQDN\MSCACN> -enrollmentserverurl
```

4. Ensure to replace the server <FQDN> and <MSCACN> names with CEP machine's FQDN and MSCA common name.
5. Copy the URL displayed in the output of the previous command, which looks like https://<CEP-FQDN>/<CA-NAME>_CES_Kerberos/service.svc/CES.
6. To remove the existing enrollment server URL, run:

```
certutil -config <FQDN\MSCACN> -enrollmentserverurl https://<CEP-FQDN>/<CA-NAME>_CES_Kerberos/service.svc/CES delete
```

7. To add the new enrollment server URL, run:

```
certutil -config <FQDN\MSCACN> -enrollmentserverurl https://<CC\Appviewx-Hostname>:<Port-Number>/avxapi/msproxy/simpleenroll Kerberos
```

8. Ensure to replace the server <CC\Appviewx-Hostname> and <Port-Number> before running the previous command.

Verifying AppViewX CES URL

To get the current URL, run the command in CEP:

```
certutil -config <FQDN\MSCACN> -enrollmentserverurl
```

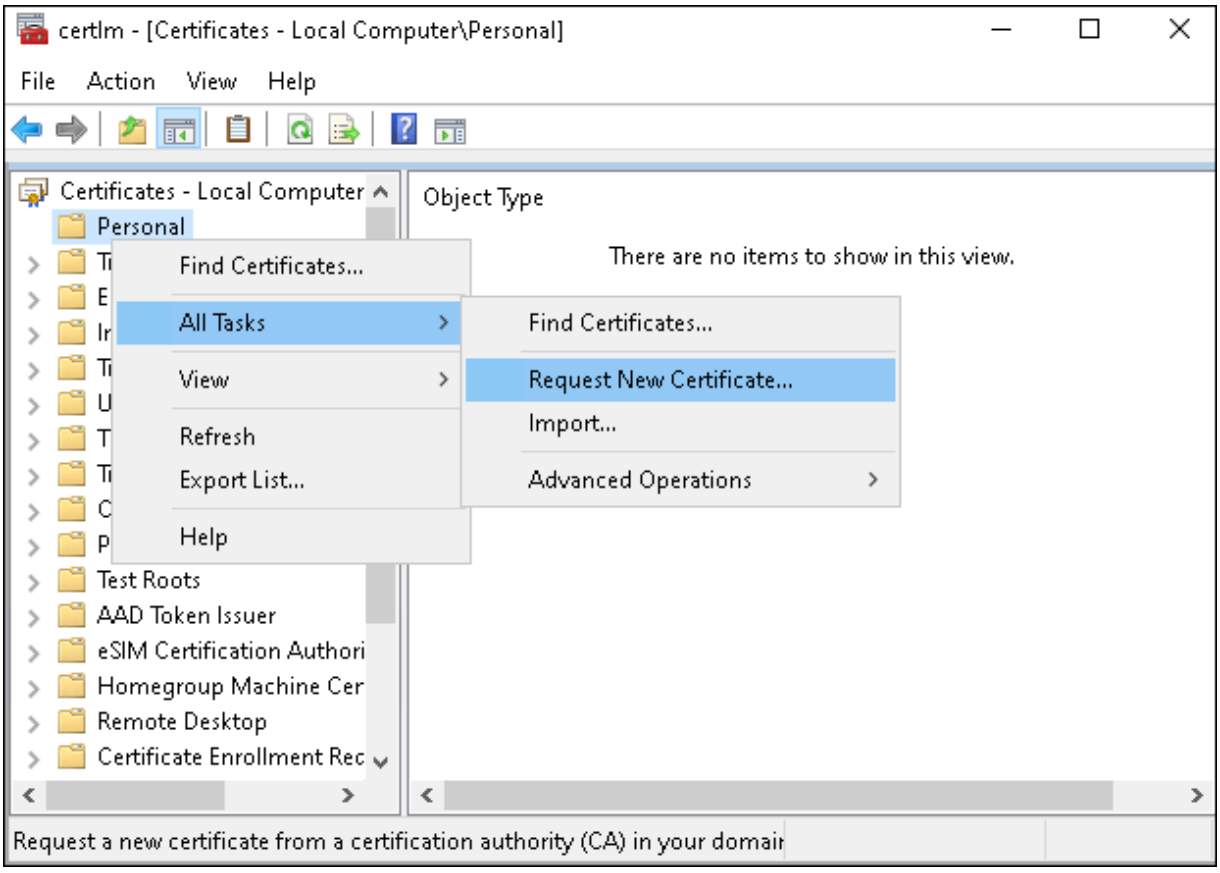
Note: The output of the previous command must be the AppviewX URL configured in the previous step.

Certificate Enrollment Validation using AppViewX PKI

1. **Login to the Client Machine**
   Open **MMC** and add **Computer** and **User Snap-ins**.
2. **Request a New Certificate**

   Navigate to the **Personal Store**, right-click, and select **Request New Certificate** as shown below:

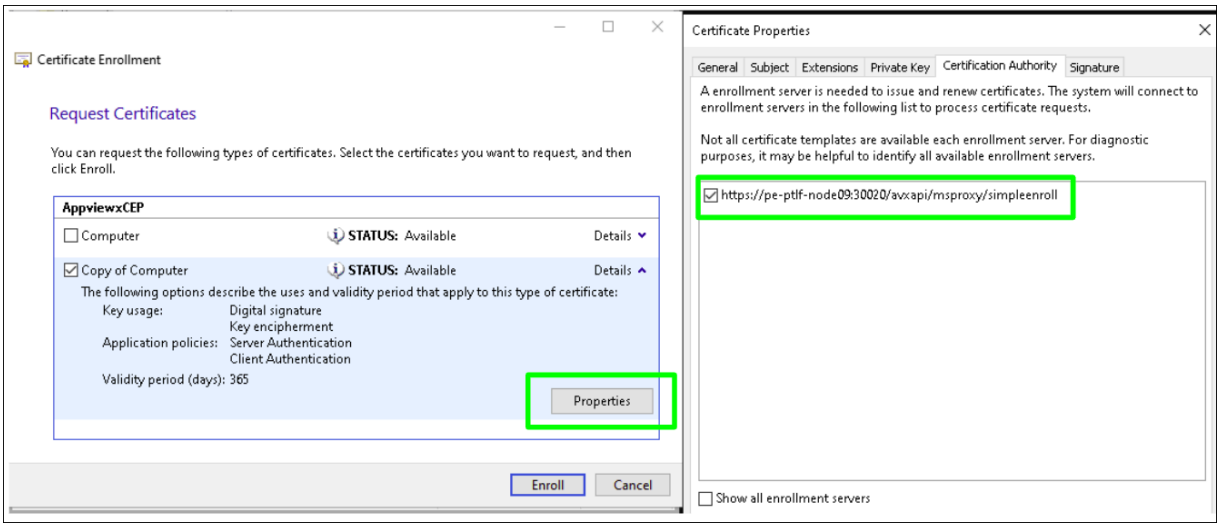
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Select the configured **CEP Server** and choose the template set up in the AppViewX GUI for enrollment.

3. **Verify CES URL Update**

   Open the template properties and check if the CC URL is listed under the **Certificate Authority** tab as shown below:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. **Complete Enrollment**
   - Click **Enroll** to proceed.

   The issued certificate will appear in both the **AppViewX Inventory** and the **Windows Certificate Store**.

AppViewX Enrollment Server

Introduction

The AppViewX Enrollment Server processes and automates certificate deployment and renewal for users and computers within an Active Directory domain. The process begins when the Windows autoenrollment client sends a certificate request to the AppViewX Enrollment Server. The server validates the request against the user's account in Active Directory, retrieving additional attributes as needed to meet template requirements defined by organizational policy. It then forwards the request to the Certificate Authority (CA), which processes it according to the certificate profile configured in the AppViewX UI. Once issued, the certificate is returned to the Enrollment Server and delivered to the requesting client. If enabled, the server can also publish the certificate to Active Directory for wider accessibility.

System Requirements and Service Account Configuration

1. **A valid Service Account with the below permissions**
   - Enterprise Admin
   - Domain Admin
   - Remote Management Users
   - Administrator
   - Domain User
2. **CC Service Setup**
   - Install ACME-HTTPS and SCEP-HTTP services on the CC.
   - Configure WAEP in the AppViewX GUI specific to CC.
3. **Domain Machine Requirements**
   - **SaaS Setup**
     - **Outbound Calls**
       - Port 30020 for unidirectional communication from domain machines to CC.
       - Port 30022 for CRL verification.
     - **Inbound Calls**
       - Port 5985 for auto-fetch requests from CC to the Enrollment Server machine.
   - **On-prem Setup**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Outbound Calls**
  - Port 31443 for unidirectional communication from domain machines to AppViewX Node from Enrollment Server Machine.
  - Port 30022 for CRL verification.

> **Note:** Auto fetch/lift and shift functionalities are only supported in the SaaS model.

4. **Domain and Connectivity**
   - AppViewX Enrollment Server must be in the same domain as the AD, with connectivity to the AD server.
   - Ensure a valid DNS record for the CC/AppViewX node exists in domain machines.
5. **Certificate and Trust Configuration**
   - Issue the certificate using AppViewX PKIaaS CA and enable trust on Windows domain machines.
   - Steps to add root and intermediate certificates to the Windows domain machines:
     a. Log onto the AD machine using your service account.
     b. Move the root and intermediate certificates that need to be trusted to the appropriate location.
     c. Open the command prompt with administrator privileges.
     d. To publish the **Issuing CA** certificate, run:

```
certutil -dspublish -f <PathToCertFile.cer> SubCA
```

     e. To publish the **Root CA** certificate, run:

```
certutil -dspublish -f <PathToCertFile.cer> RootCA
```

     f. Run the following command to force a policy update and push the certificates to the domain machines:

```
gpupdate /force
```

Configuring WAEP Templates

Templates can be fetched in two ways: manual and automatic. Fetching templates is essential for mapping each template to a specific CA configuration setting.

Manual Fetch Configuration

Prerequisites

- Generate CSV file (Applicable only for manual upload of templates)

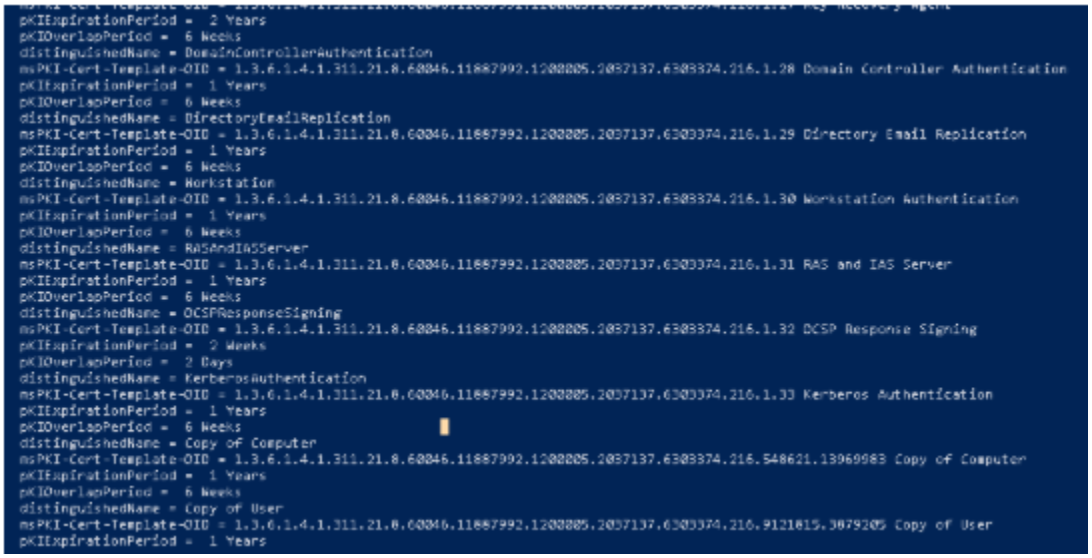
To generate CSV file:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Run Windows PowerShell.
2. To extract information of the certificate name, certificate template OID, validity period, and renewal period from the templates published on the ADCS server, run the command on the ADCS server:

```
Certutil -adtemplate -v | select-string distinguishedName,msPKI-Cert-Template-OID,pKIExpirationPeriod,pKIOverlapPeriod
```

3. Copy the certificate name, certificate template OID, validity period, and renewal period for Computer_Auto_enrollment template and User_autoenrollment template as shown.



> **Note:** The Copy of Computer template is used to enroll devices while the Copy of User template is used to enroll users.

4. Open a spreadsheet and create column headings:
   - **templateName:** In this column, add entries as Computer_Auto_enrollment template and User_autoenrollment.
   - **templateOID:** In this column, paste the OIDs copied in Step 3 against the respective template.
   - **validityPeriod:** In this column, enter the value as 365, which is the default value of the validity period.
   - **validityPeriodUnit:** In this column, enter the value as *days, weeks, months, or years*.
   - **renewalPeriod:** In this column, enter the value as 30, which is the default value of the renewal period.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The renewal period must be less than the validity period.

- **renewalPeriodUnit:** In this column, enter the value as *hours, days, weeks, months, or years*.

5. Once done, save the file in .xls, or .xlsx, or csv format.

Auto-Fetch Configuration

Templates can also be automatically fetched from the Windows machines using WAEP. To use auto-fetch:

Enable WinRM services in AD and AppViewX Enrollment machine

For the Lift & Shift feature to work, enable the WinRM service on the AppViewX Enrollment machine and the AD servers configured in WAEP for global fetch configuration and publication of templates.

To configure WinRM service (Applicable only for automatic upload of templates):

1. Run winrm quickconfig on the PowerShell window as an administrator.
2. Type *y* when prompted to start the WinRM service.

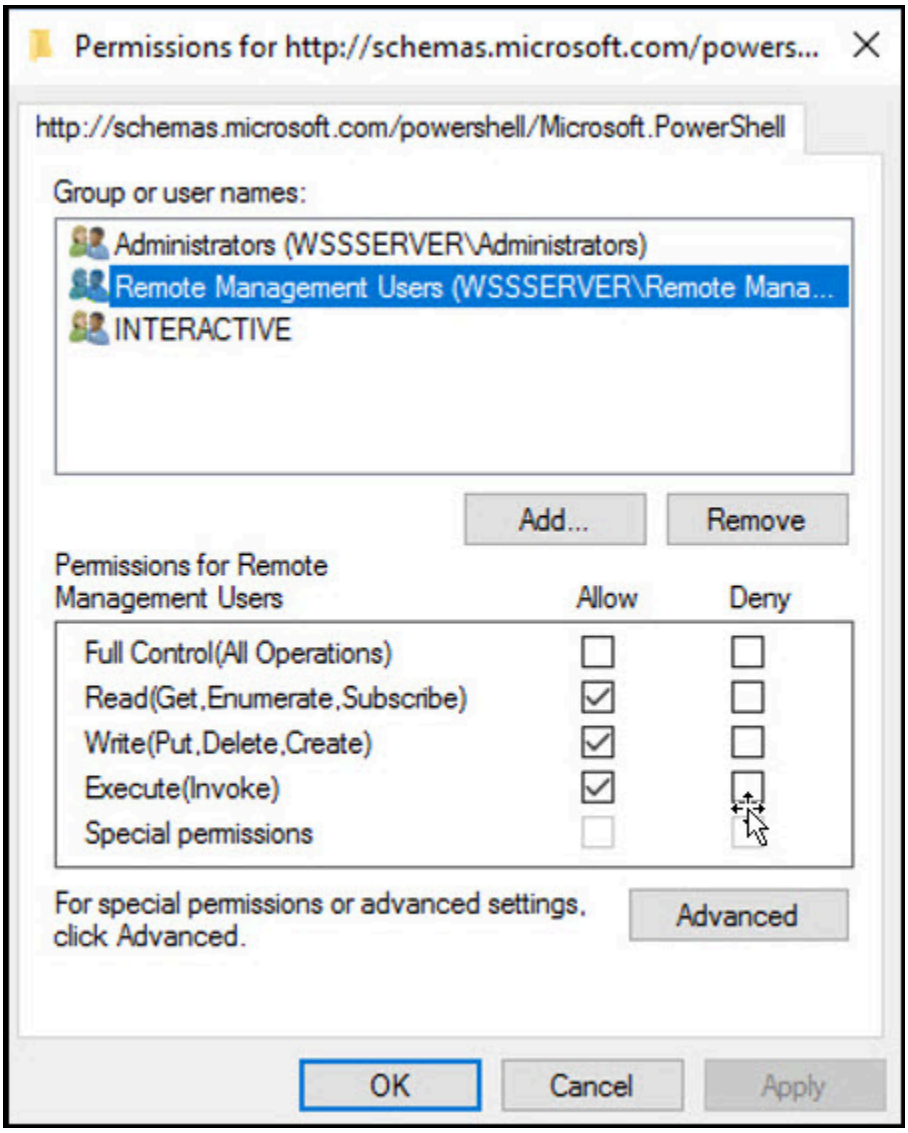
   The service account, for example: <waep_kerberos>, must be part of the Remote Management Users group.

3. To validate if the Remote Management Users group has permissions to execute the scripts, run the below command on the AD server and the AppViewX Enrollment Server:

```
Set-PSSessionConfiguration -ShowSecurityDescriptorUI -Name Microsoft.PowerShell
```

4. Add the service account to the Remote Management Users group in AD.
5. Assign Read,Write, and Execute permissions to the group.

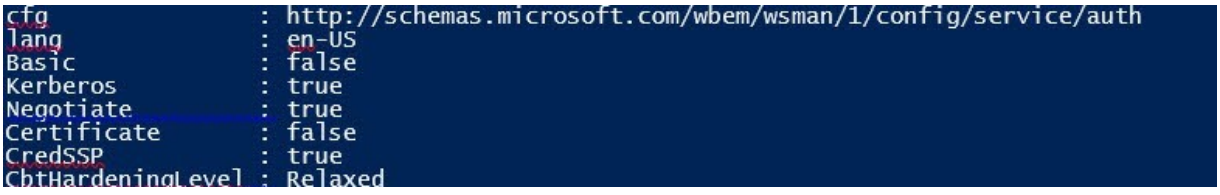
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Enable Credential Security Support Provider (CredSSP) authentication on the enrollment server and the AD servers by running the following command:

```
Enable-WSManCredSSP -Role Server
```

7. Once the server role is enabled, ensure the parameters, Kerberos, Negotiate, CredSSP, are set to *true* and CbtHardingLevel is set to *Relaxed* as shown:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Windows Auto-Enrollment Proxy

1. Log onto the AppViewX application using your credentials.
2. Go to (**Menu**) icon **> CERT+.** The CERT+ left navigation pane appears.
3. Expand the **Administration** menu and select **Auto Enrollment > WAEP.** The **Windows AEP** auto-enrollment page is displayed.
4. Click **+New Setting** to add a WAEP auto-enrollment request. The **Windows AEP : New Setting** page is displayed.
5. Enter the following fields:

Field Description for Windows AEP : New Setting page

Field	Description
Endpoint Details	
***Name**	Provide a unique name for the WAEP setting. **Note:** Only alphanumeric and the following special characters are allowed: period (.), hyphen (-), and underscore (_). The name cannot begin with a special character.
***Cloud Connector /Host**	Choose the hostname of the Cloud Connector for SaaS deployments, or the hostname of the On-Premise Node where the MS-Proxy pod is enabled
***Data Center**	Select the data center.
Active Directory Configuration	
***Policy Server**	Provide the IP address or the hostname of the machine where AppViewX Enrollment Server is installed.
***LDAP Server**	Select or enter the hostname of the AD/LDAP server.
***Service Account with Base**	Provide the service account created for bind. For example: cn=test_service, ou=Kerberos_accounts, dc=avxtest, dc=com
***Service Account Password**	Provide the service account password.
Active Directory Sync	This field is optional for manual import of templates.Enable this toggle button to fetch all the global catalog servers in your forest.

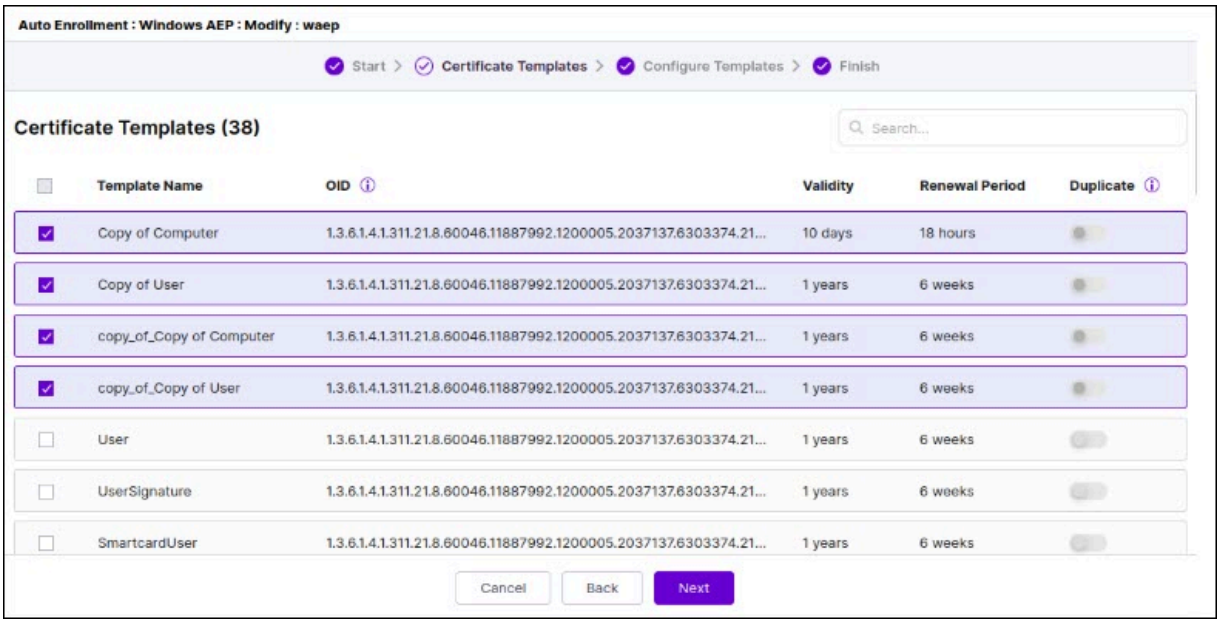
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This feature is available only for SaaS deployments.
Global Catalog Configuration	
***Global Catalog Server IP**	If Active Directory sync is enabled and it is applicable only for Saas deployments, then this field lists all the global catalog servers in your forest as a dropdown list. In case of non-SaaS based deployments, populate it with IP address of the AD machine. To enable the auto features for on-premise environments, install the cloud connector as an additional component.
***Port**	Port 3268 is the MS default port for global catalog.
***LDAP Base DN**	If AD sync is enabled, the LDAP base DN is auto-populated based on the IP address of the global catalog server selected from the dropdown list.
Validate Account	Click the button to validate connection of the global catalog server with your service account credentials. If the validation is successful, you see *Success* displayed next to the button. If it fails, then check the service account credentials, or permissions to the global catalog server, or verify the global catalog server IP and try again.
Import Templates	
***Type**	By default, **Manual** is selected. It is recommended that you select the **Auto** option to automatically fetch your templates from your AD. If you have selected **Manual,** then drag and drop your template that you created or browse to the location it is saved. For more details, see Configuring WAEP Templates.
Fetch Templates	The templates are fetched and populated in the **Certificate Templates** screen.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Note: Fields marked with red asterisk (*) symbol are mandatory.	

6. Click **Next.** A message that templates are imported successfully appears. The **Certificate Templates** page appears along with all the fetched templates along with the details populated in the table as shown.

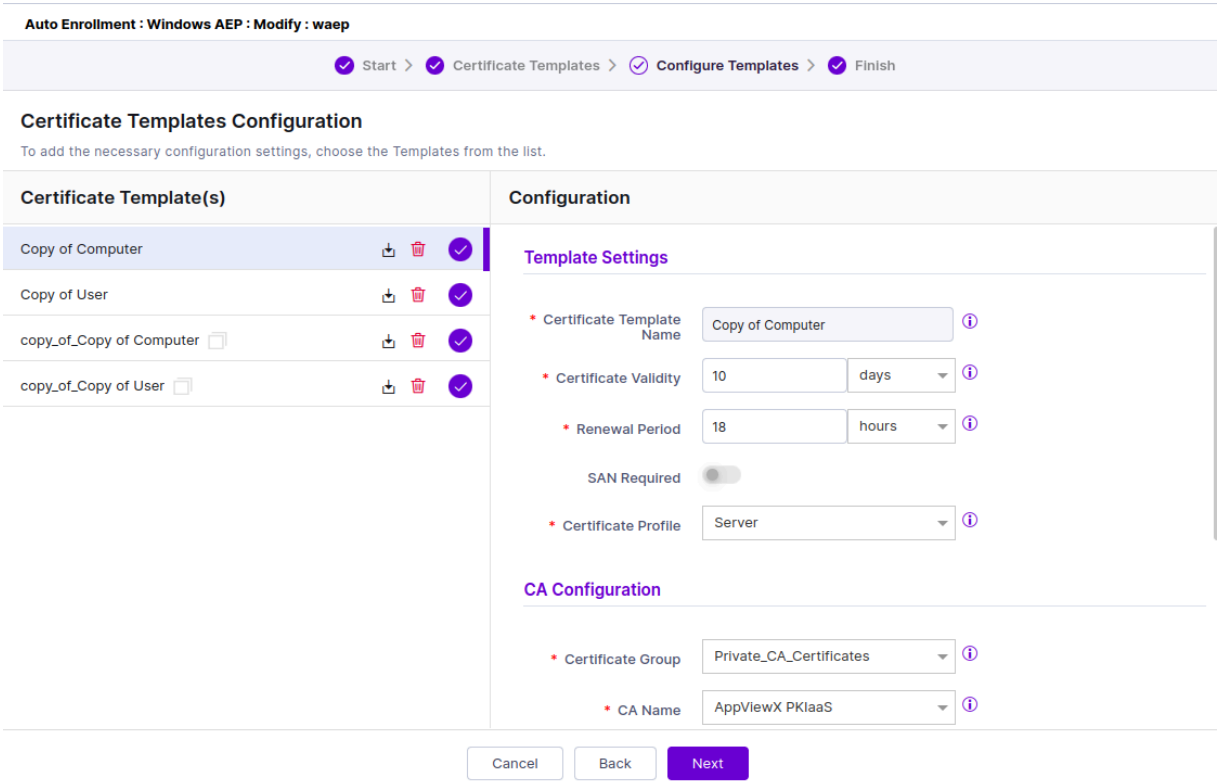


7. Select the templates you want to configure and click **Next.** The **Certificate Templates Configuration** page appears.

Note: [Applicable only if you have chosen automatic upload of templates] If you want to make a copy of an existing template, then select the checkbox against that template and slide the toggle button under the Duplicate column. The duplicated template name appears with the prefix: *copy_of_* along with the template name on the next page. For example, if you made a duplicate of the *DB_Test_Template* template, then the duplicate template appears with the name, *copy_of_DB_Test_Template*, which you can edit on the next page.

8. Click the template you want to configure and fill out the details in the **Configuration** page that appears on the RHS of the page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



9. Enter the following fields:

Field Description for Certificate Template Configuration page

Field	Description
Template Settings	
***Certificate Template Name**	Enter the name of the certificate template if you created a copy of it.
***Certificate Validity**	Enter the expiry time limit for certificates.
***Renewal Period**	Enter the renewal time limit for the template.
SAN Required	This is disabled by default.
Subject Alternative Names	This field appears only when you select the **SAN Required** checkbox. Select from the following values: • DNS • Email • User Principal Name • Service Principal Name

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: You can either choose DNS/Email or both, or customized SAN such as User Principal Name/Service Principal Name or both. For example, if you select DNS/Email or both, you cannot select User Principal Name/Service Principal Name and vice versa.
***Certificate Profile**	Select the profile configured to set the Key Usage and EKU. **Note:** This profile must match the Key Usage values and EKU as seen in the actual on-prem Microsoft template in case of manual fetch.
CA Configuration	
***Certificate Group**	Select the certificate group for managing the certificates.
***CA Name**	Select a CA for WAEP to communicate for certificate enrollment.
***CA Account**	The field values are listed only when the account is added to CA settings.
***CA Certificate**	Select issuer certificate. It is recommended to select intermediate CA certificates to sign all the client certificates.
***Issuer Name**	Select the issuer name for the certificate.
***Issuer Location**	Select the issuer location for the certificate.
***CA Connector Name**	By default, this is a CA Connector. If you created a CA connector manually, then provide that name here.

On completion, you get a message that the template is saved successfully and a blue tick mark appears across the configured template.

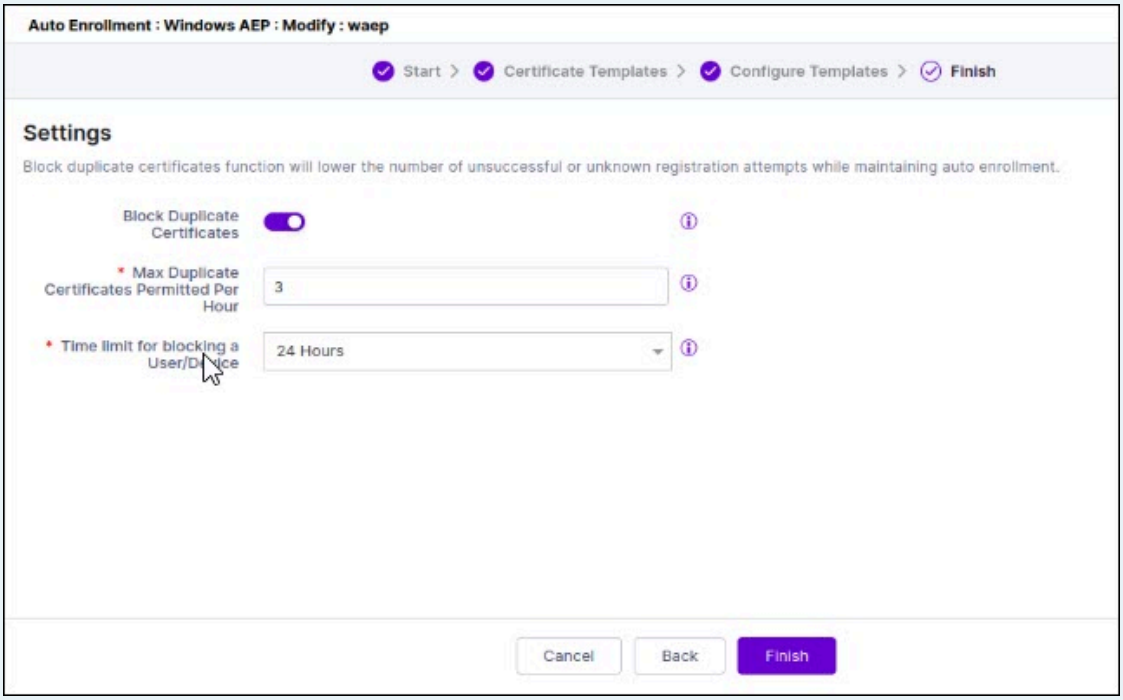
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- You can select or clear the templates by going back to the previous page.
- You cannot click **Next** until all the selected templates are configured.
- Click the (**Download**) icon to download a selected template (appears only if you have chosen automatic upload of templates) or click the (**Delete**) to delete a selected template.

10. Click **Next.** The **Settings** page appears. By default, the **Block Duplicate Certificates** toggle button is disabled. If you enable it, you can customize the values for blocking the maximum number of duplicate certificates in an hour and the time limit to block a user/device issuing the certificates.

Note: By default, the time limit for a user/device is 24h. If you change this value, ensure to update the **Occurrence Type** by navigating to **CERT+ > Administration > Job Scheduler** and selecting **Pkiaas AEP Purge log Job.** If you have set the time limit as 12h or 24h, then choose **Occurrence Type** as **Daily.** For values more than 24h, choose **Occurrence Type** as **Weekly.**



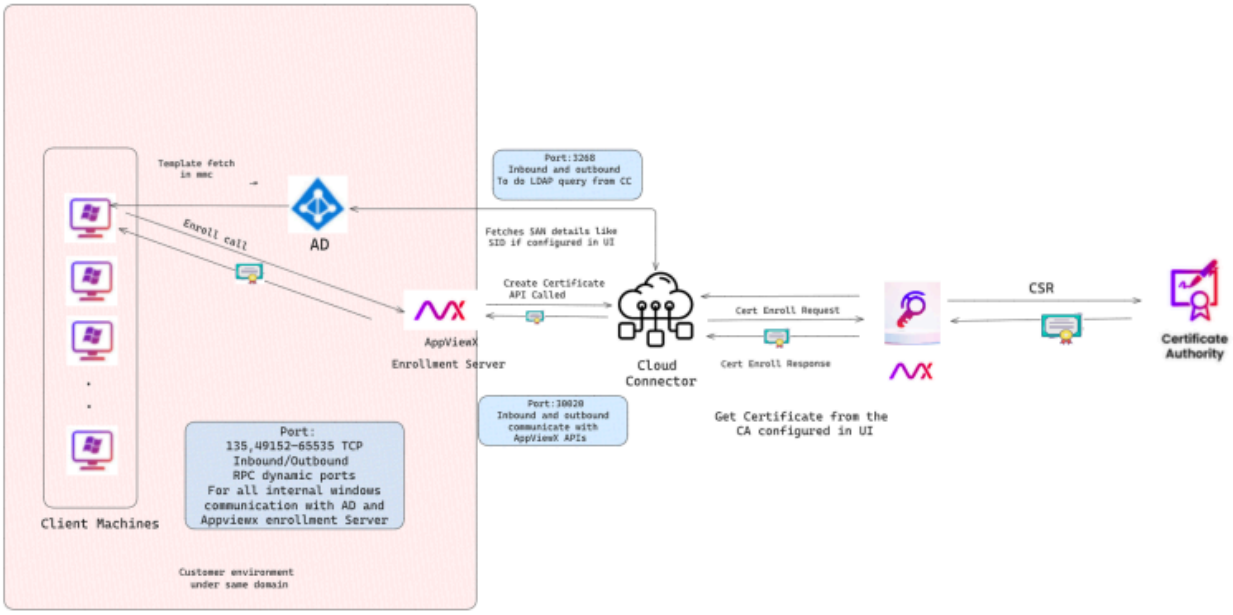
11. Click **Finish.** A message that the WAEP settings is saved successfully appears.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Auto-Enrollment Proxy

Introduction

The AppViewX Enrollment Server is a service that runs on a Windows machine, automating the deployment and renewal of certificates for users and computers within an Active Directory domain.



Prerequisites

- **Recommended Operating Systems:** The following operating systems are supported for client and server installations of the AppViewx Enrollment Server.

Role	Operating System
Client Machines(Machines requesting for Certificates)	Windows 10
	Windows 11
	Windows Server 2016
	Windows Server 2019
	Windows Server 2022
Server(Machines were AppViewX enrollment Server can be installed)	Windows Server 2016
	Windows Server 2019

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Role	Operating System
	Windows Server 2022

- **Software**

  2.1 .NET Framework

  - **Version:** .NET Framework 4.7.1
  - **Download Link:** Microsoft Download Center
- **Hardware**

  Recommended System Requirements

  - **Memory:** 16 GB RAM
  - **Hard Disk:** 100 GB available space
  - **Processor:** Quad-core or higher
- **Preparing the Windows Environment**

  Domain and Active Directory Requirements

  - A domain admin account is required for installing the AppViewx Enrollment Server.
  - A service account with admin privilege is required to perform LDAP queries from Appviewx and to fetch global configuration.
  - The AppViewX Enrollment Server machine must be installed in a Microsoft Windows domain with at least one Domain Controller.
  - Do NOT install the AppViewX Enrollment Server on the same machine running Microsoft Certificate Authority Services.
  - **Adding the Certificate Template Snap-In**

    Install the Certificate Template Snap-In for mmc to edit certificate template permissions. Follow the steps to add the certificate template snap-on as a domain administrator:

    1. Go to **Start > Administrative Tools > Server Manager.**
    2. Right-click **Server Manager** and select **Add Features.**
    3. Open **Remote Server Administration Tools > Role Administration Tools > Active Directory Certificate Services Tools** and select **Certification Authority Tools.**
    4. Click **Next.**
    5. Click **Install.**
  - **Allow Publishing to Active Directory**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The computer that runs the AppViewX Enrollment Server must be a member of the Active Directory group Cert Publishers for all domains, including the root domain. This grants the server the necessary permissions to publish newly issued certificates to Active Directory.

To add the server's computer account to the Cert Publishers group on machines with the Active Directory Domain Services role enabled:

1. Log on as the AppViewX Enrollment Server Administrator or as another user who is a member of the Enterprise Administrators group.
2. Go to **Administrative Tools > Active Directory Users and Computers.**
3. In the tree view on the left, expand your domain and click **Users.**
4. In the right panel, double-click the **Cert Publishers** group and go to the **Members** tab.
5. Click **Add** and add the computer account for the server running the AppViewX Enrollment Server. (You may need to include Computers in the Object Types filter to search for the computer name.)
6. Repeat these steps for the Cert Publishers group in every domain across your forest, including the root domain.

   For the new group membership to take effect, run this command on the machine where the AppViewX Enrollment Server is installed:

   ```
   gpupdate /force
   ```

- **Network and Firewall Requirements**

Required Ports

The machines using Enrollment server to request certificates must have the following ports open for communication with the AppViewX Enrollment Server:

Port	Protocol	Direction	Purpose
135	TCP	Inbound/Outbound	RPC endpoint mapper
49152–65535	TCP	Inbound/Outbound	RPC dynamic ports

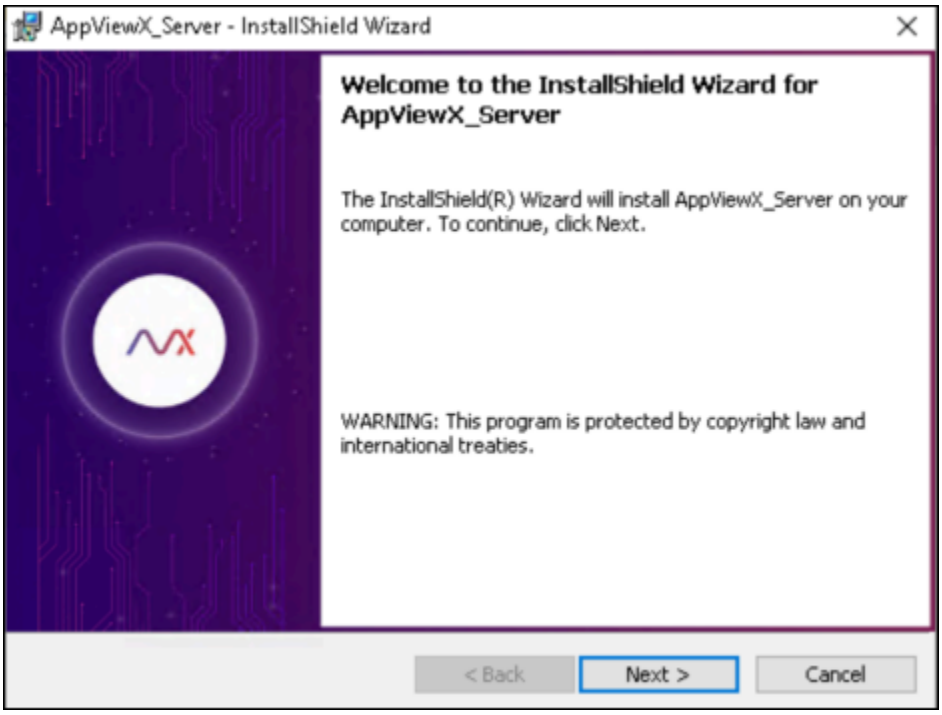
Note: The Enrollment server machines require both inbound and outbound access through port 30020 to communicate with the AppViewX APIs and request certificates from the CA.

Port 3268: Between the CC and the AD/LDAP server (used for LDAP queries if the template needs any ldap values to be embedded in SAN field or SID values).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

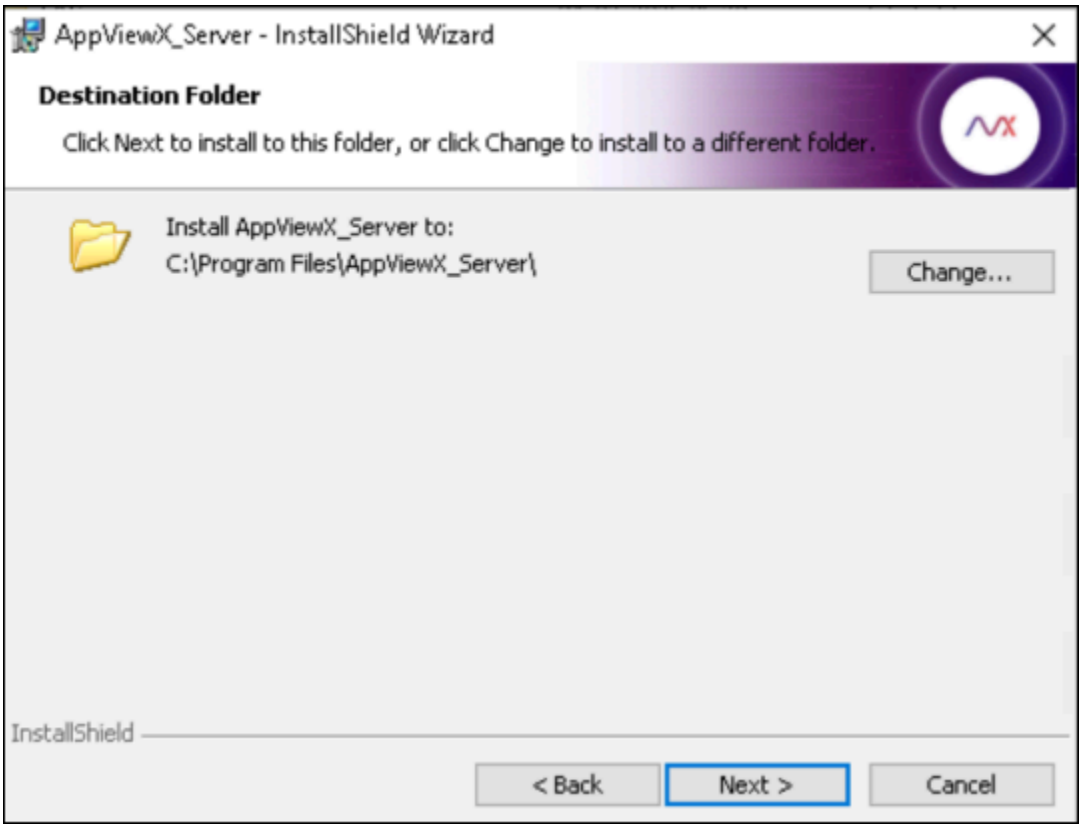
Installing AppViewX Enrollment Server

1. **Download:** Download the Appviewx_Enrollment_Server.zip file.
2. **Extract:** Extract the contents of the downloaded Appviewx_Enrollment_Server.zip file. Locate and extract the Appviewx_Enrollment_Server.exe file.
3. **Run as Administrator:** Right-click the Appviewx_Enrollment_Server.exe file and select **Run as administrator** to start the installation process and register it as a server.
4. **Welcome/Next:** In the installation wizard, select **Next** to proceed.



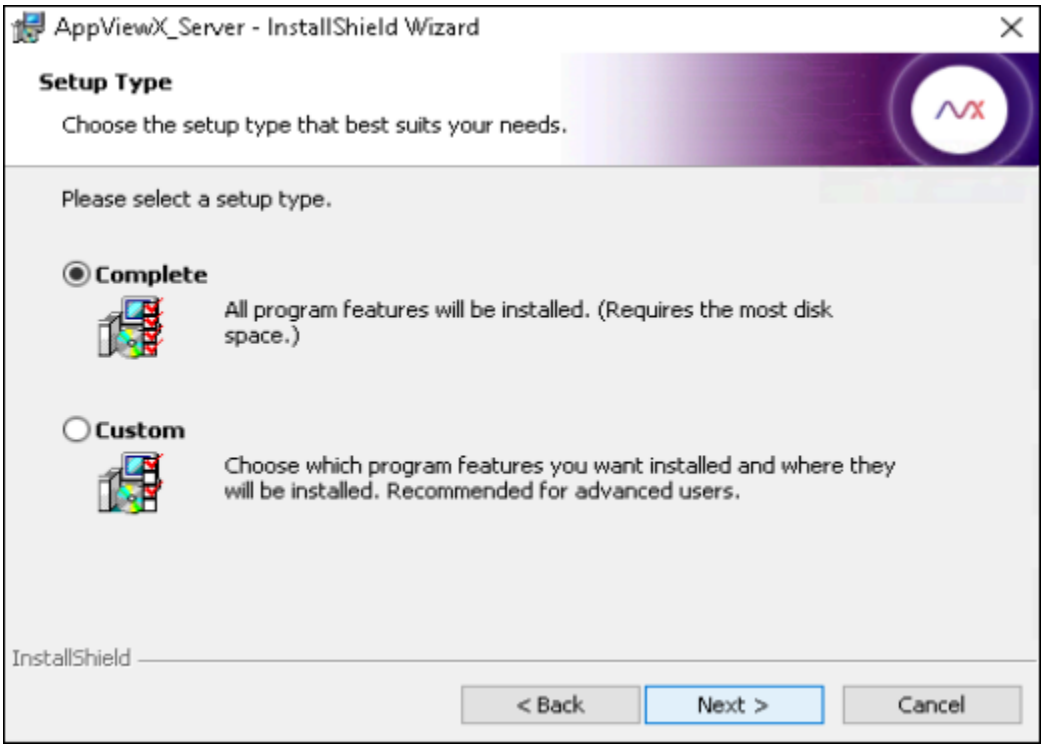
5. **Accept Agreement:** Accept the license agreement and select **Next**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. **Select Installation Location:** Choose the installation location for the service. The default location is recommended to be **Program Files (x86).** Select **Next** after choosing the location.
7. **Complete Installation:** Select the **Complete** installation option to proceed with the standard installation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

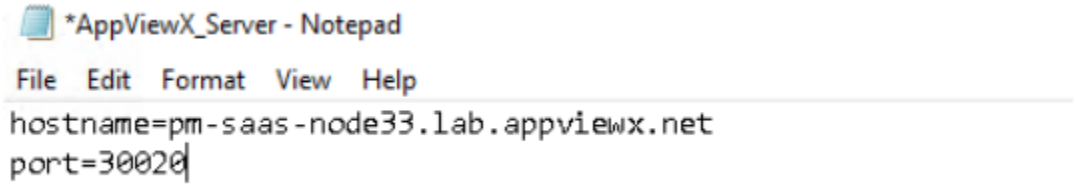


8. **Finish:** Complete the installation process by following any remaining prompts and selecting **Finish.**
9. **Modify the config files:** The configuration files are located in the **Installation Directory**, typically C:\Program Files\AppViewX_Enrollment_Server.

Update the main configuration file

Path: AppViewX_Enrollment_Server.ini

- Modify the **hostname** field with the (hostname/ip) of AppViewX Cloud Connector if CC is deployed or the on-premises deployment node or in case of multi-node please enter the details of the node in which the **ms-proxy pod** is installed.
- Set the **port** value to 30020 if using SaaS, or 31443 if using an on-premises deployment, or 443 if using a Load Balancer.



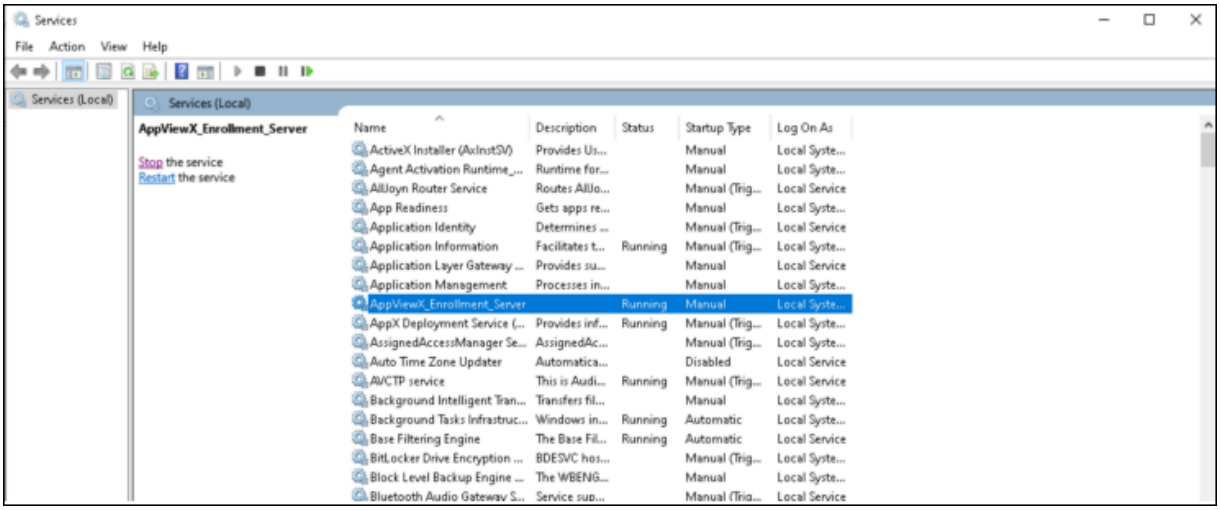
Update the client credentials file

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Path: Client_details.ini

- Update the **client-id** and **client-secret** fields with the CERT_AEP_SERVICE_ACCOUNT service account under platform tab in AppViewX GUI credentials.
- During the first-time setup client_id and client_secret_key are initially stored in plain text. On the first server startup, the client_id and client_secret_key are **automatically encrypted** and the file is updated securely.

10. **Start-Service:** Go to **Services** and start the **AppViewX_Enrollment_Server.**

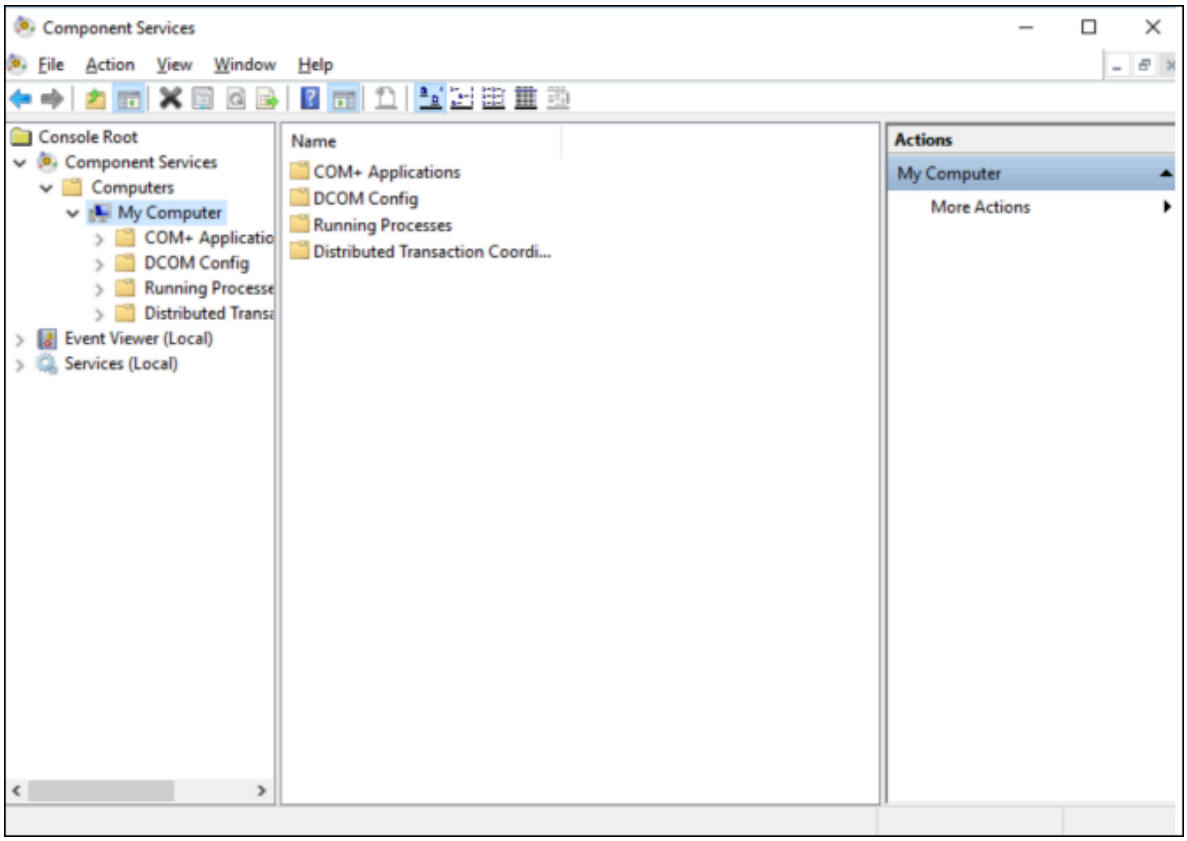


Configuring Permissions for AppViewX

1. **Enable DCOM on the Machine where the AppViewX Enrollment Server**
   a. Open **Component Services** from **Administrative Tools.**
   b. On the left pane, expand **Component Services > Computers > My Computer.**
   c. Right-click **My Computer,** select **Properties.**
   d. Go to the **Default Properties** tab.
   e. Ensure **Enable Distributed COM on this computer** is checked.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

f. Click **Apply** and then **OK.**



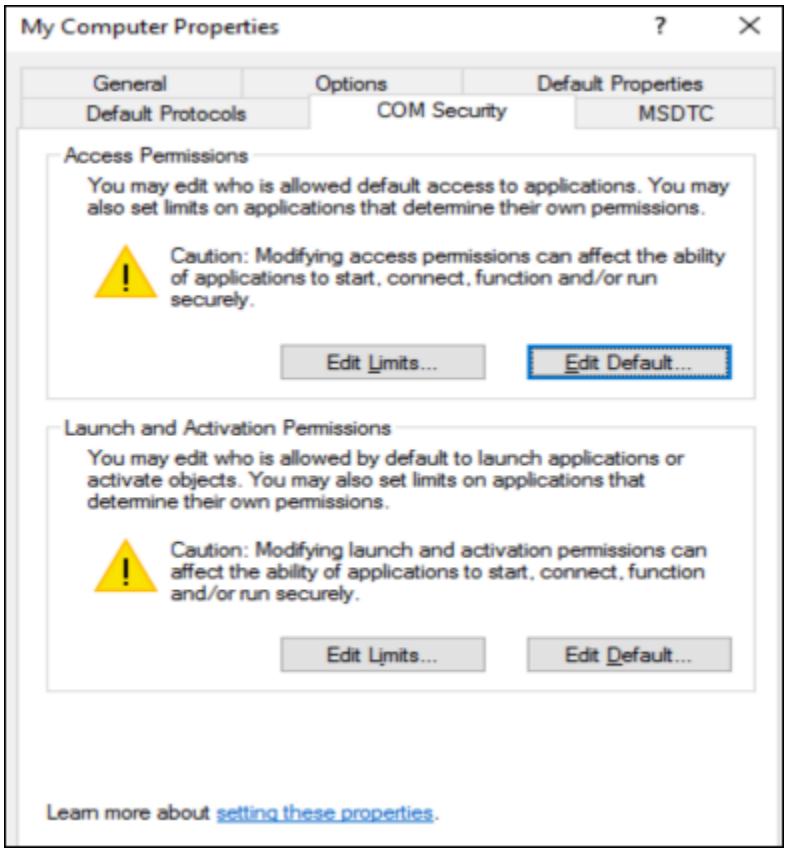
2. **Configure DCOM Access and Launch Permissions**

Set Global DCOM Access Permissions

a. Open **Component Services** again.

b. Right-click **My Computer** and go to the **COM Security** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



c. Under **Access Permissions,** grant **Local Access** and **Remote Access** to:
   - Domain Computers
   - Domain Controllers
   - Domain Users

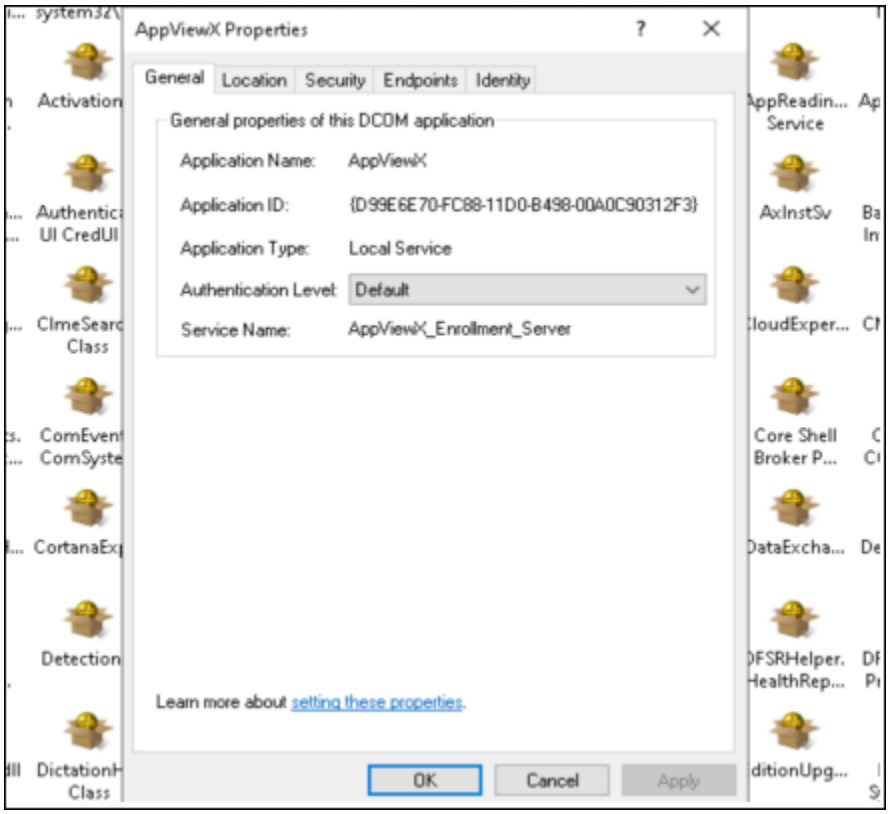
d. Under **Launch and Activation Permissions,** click **Edit Limits:**
   - Grant **Local Activation** and **Remote Activation.**
   - **Do not** select **Local Launch** or **Remote Launch.**
   - Apply the same permissions to:
     - Domain Computers
     - Domain Controllers
     - Domain Users

3. **Set Permissions for AppViewX Enrollment Server**

a. In **Component Services,** expand **DCOM Config.**

b. Find and right-click **AppViewX,** select **Properties.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



c. Go to the **Security** tab.

Launch and Activation Permissions:

- Choose **Customize** and click **Edit.**
- Grant **Local Access** and **Remote Access** to the same groups.
- Apply to:
  - Domain Computers
  - Domain Controllers
  - Domain Users
  - or Everyone, if no special security requirements exist

Access Permissions:

- Choose **Customize** and click **Edit**.
- Grant **Local Access** and **Remote Access** to the same groups.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Adding CA as Enrollment Service in AD

1. Run the following PowerShell command in the AD Machine with admin privileges and respective CA name and Domain name.

```
$CAName = "<CA_NAME>"
$Hostname = "<Hostname of FAS Machine>"
$Domain = "<Domain name>"

$domainComponents = $Domain.Split(".")
$DNComponents = $domainComponents | ForEach-Object {
"DC=$_" }
$DomainDN = ($DNComponents -join ",")

# Construct DN path for Enrollment Services
$DNPath = "CN=Enrollment Services,CN=Public Key
Services,CN=Services,CN=Configuration,$DomainDN"

# Construct FQDN for the CA machine dynamically
$CAAddress = "$Hostname.$Domain"

$certBase64 = @"
<BASE64 OF THE ROOT CA>
"@ -replace "`r`n", ""

$certBytes =
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
[System.Convert]::FromBase64String($certBase64)

# Get all certificate templates from Active Directory
$templates = Get-ADObject -Filter 'ObjectClass -eq
"pKICertificateTemplate"' `
    -SearchBase "CN=Certificate Templates,CN=Public Key
Services,CN=Services,CN=Configuration,$DomainDN" `
    -Properties Name
$templateNames = $templates | ForEach-Object { $_.Name }

# Create the AD object
New-ADObject -Name $CAName `
    -Type "pKIEnrollmentService" `
    -Path $DNPath `
    -OtherAttributes @{
        cACertificateDN     = "CN=$CAName,$DomainDN";
        dNSHostName         = $CAAddress;
        displayName         = $CAName;
        certificateTemplates= $templateNames;
        cACertificate       = $certBytes
    }
```

2. AD administrative access is also required for one time setup to run the PowerShell script to register the AppViewX Enrollment Service as **enrollment service object** within Active Director.
3. The **AD registering script template** file is attached in the installation directory of the enrollment server which can be used for registering.
4. Copy the full script and edit the values as needed. You can either paste and run it as one command in PowerShell or save it as a .ps1 file and execute that file.
5. Install the root certificate in the **Trusted Root Authority Cert Store** and publish it in domain using:

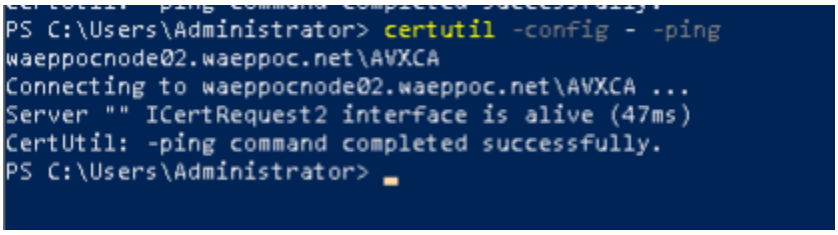
   ```
   certutil -dspublish -f <RootCA.crt> RootCA
   ```

6. **Test the AppViewX Enroll Server**

   Run the following PowerShell command select the **CA-Name** setup in the previous command:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
certutil -config - -ping
```



Adding Certificate Template to CA via ADSI Edit

1. **Open ADSI Edit**

   Press **Win + R,** type adsiedit.msc, and press **Enter.**

2. **Connect to the Configuration Naming Context**
   a. In ADSI Edit, right-click on ADSI Edit in the left pane and select Connect to.
   b. In the Connection Point, choose:

      Distinguished Name (DN) and enter:

      CN=Configuration, DC=yourdomain, DC=com (Replace yourdomain.com with your actual domain name)

3. **Navigate to the Enrollment Services Node**

   Expand the tree in the left pane:

   CN=Configuration, DC=yourdomain, DC=com

   → CN=Services

   → CN=Public Key Services 16

   → CN=Enrollment Services

4. **Select Your CA (Enrollment Service)**
   - Under **CN=Enrollment Services,** locate the object with the name of your CA (e.g., CN=YourCAName).
   - Right-click it and select Right-click it and select Properties.
5. **Edit the *certificateTemplates* Attribute**
   - On the **Properties** window, find the **certificateTemplates** attribute.
   - Click **Edit,** then click **Add** to add the name of the certificate template you want to support (e.g., User, Computer, CustomTemplateName).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. **Apply and Close**

   Click **OK** to close all dialogs and apply changes.

Log Location

The logs generated by the AppViewX Enrollment Server are stored in the C:\ProgramData\Appviewx_Enrollment_Server folder.

High Availability (HA) Setup

High availability can be achieved by installing the Enrollment Server on multiple machines. Certificate templates can be configured to requests through all deployed AppViewX Enrollment Servers, ensuring failover and load distribution.

Citrix FAS Integration

Configure Default FAS Rule

Ensure that the default FAS rule is updated to point to the Certificate Authority (CA) configured via the AppViewX Enrollment Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. **Obtain Authorization Certificate**
   a. **Remove Existing Authorization Certificate (If Already Configured)**: If an authorization certificate already exists:

      Open the Citrix FAS Console.

   b. Delete the existing authorization certificate.
2. **Generate Authorization Certificate Request**
   a. On the Citrix FAS server, run the following PowerShell command with administrator privileges:

```
New-FasAuthorizationCertificateRequest -DistinguishedName "CN=<Administrator.account_name>.<Domain>.NET, O=<Domain>.NET"
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

b. Replace <AdministratorAccountName> and <Domain> with appropriate values.

```
PS C:\Users\administrator.CTXFAS\Downloads\PSTools> New-FasAuthorizationCertificateRequest -DistinguishedName "CN=Admin
istrator.CTXFAS.NET, O=CTXFAS.NET"

Id                : c3a2171a-c099-41ca-8a29-c1772b6570d3
Address           : [Offline CSR]

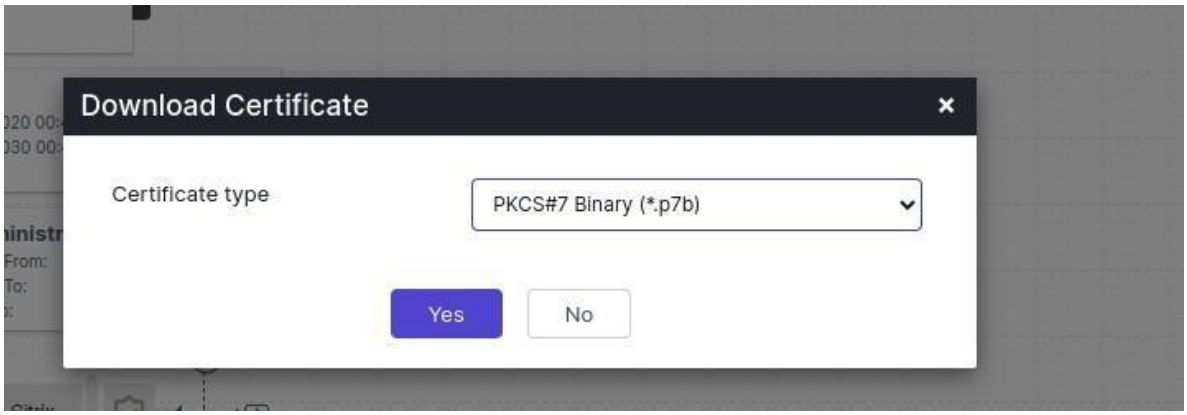
                     +VeOGRgONfezOCFFIV39xHdTH+PXtaqUA8e9lqTUtooy52+MPqdca0gispw/XPDmMt8Kj72azOTe
                     1KThCs7O3LP/uzXkoAW0BXafuu805OYcgM0MpZ2rcSyjaNSCbtEgrv4wXiWdN60NOfKjcAOQi+ph
                     iy3Sxt5MlDAyfp3w895i4QIDAQABoAAwDQYJKoZIhvcNAQENBQADggEBAESvD9oqp375qGCweQpp
                     b3BIyG+gZFG2doQxmQRI7OvMivmGs1CukVPGMBJ3/bL5zXf5fTi9O7hkmxWOU4+FFtMTNfmE188S
                     Bz4hpPSmmpIkNvL56Ie14E9+EzzyxYYyQd1+wMaXsdw1oBCMErhp8D4RL4n0ACIPZG7FbEzp9m6p
                     ZuuLHeYgIujTrWTdb11dBwni4Bzp5td4gIqkA/HyMZ6ePloIlP1Op1JcNYDiklRrYSbWl0L8MH0I
                     PmkYPFt5gvsqK1bCLB7aEMD9wspr5Deqx1XT0iSG8717rHhi2x+4Q02GNrU9oDBen4PPaqywoRyw
                     u5KGIddiZg+3j3ODeLA=
                     -----END CERTIFICATE-----
Status            : WaitingForApproval
```

3. **Submit CSR to AppViewX**
   a. Copy the generated Certificate Signing Request (CSR).
   b. Navigate to the Certificate page in the AppViewX Cert+ UI.
   c. Upload the CSR and download the issued certificate in PKCS#7 (.p7b) binary format.



4. **Import the Authorization Certificate**
   • Run the following command to import the certificate response:

```
Import-FasAuthorizationCertificateResponse -Id <IdFromPreviousCommand> -Pkcs7CertificateFile "<PathToCertificate.p7b>"
```

The Id is the value returned from the New-FasAuthorizationCertificateRequest command.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
Import-FasAuthorizationCertificateResponse    -Id    <id  from the previous
command>
-Pkcs7CertificateFile "<Path to your .p7b file>"
```

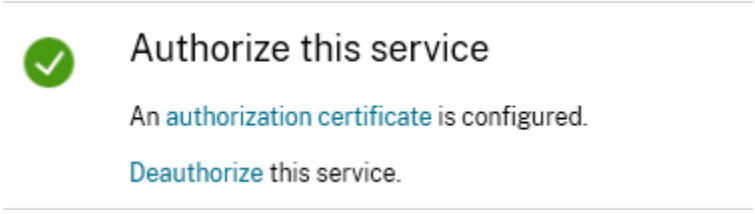
Note: The ID is acquired from the first powershell command

5. **Apply Changes in FAS Console**

   Open the FAS Console and click **Update Configuration** to apply the new authorization certificate.

   Result

   The authorization certificate is now successfully installed and applied to the Citrix FAS server.



6. **Test Smart Card Certificate Issuance**

   To validate the setup, run the following PowerShell command:

```
New-FasUserCertificate -UserPrincipalName "<user@domain.net>" -Rule Default -CertificateDefinition Default_Definition
```

Troubleshooting

General Errors

General errors that can be encountered

1. Global catalog validation fails in AppViewX GUI

Description	When an invalid ACME endpoint URL is provided in Posh-ACME, it will result in the following error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error	Validation fails in GUI.
Troubleshooting	• Check if CC is up and running. • Ensure that the service account's full name is the same as the login name as mentioned in the section.

2. CA Certificate not trusted in the windows domain machines	
Description	This error occurs when the issuer certificate of the bound certificate with CC is not trusted by the Windows domain machines.
Error	ERROR_WINHTTP_SECURE_INVALID_CA 12045
Troubleshooting	Ensure that both the issuing certificate authority (CA) certificate and the root CA certificate are added to the appropriate trust stores on each end machine. To implement trust at the domain level, see Point 6 within Section, System Requirements and Service Account Configuration .

3. Error when retrieving policy in windows domain machines	
Description	This error occurs when there is a connectivity issue between the CEP and end machines.
Error	**Error**An error occurred while obtaining certificate enrollment policy. **URL:** https://cepces.axxwaep.net/ADPolicyProvider_CEP_Kerberos/service.svc/CEP **Error:** The operation did not complete within the time allotted. **0x803d0006 (-2143485946)WS_E_OPERATION_TIMED_OUT**
Troubleshooting	• Check that the CEP server's certificate is valid. [IIS manager > Sites > Default site > Right click Edit bindings > check if the cert bound with 443 is valid]. If it's not, replace it with a valid one. Make sure the certificate's issuer is trusted by the domain machines. • Ensure that the CEP server hostname is resolved to the correct IP address from the end machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. An error occurred while enrolling for a certificate.

The certificate request could not be submitted to the certification authority.

Description	The error has occurred because either a firewall is interrupting the connection between the CC and the end machine, or a network device is filtering and preventing the certificate data from reaching its destination.
Error	**Error:** An error occurred while enrolling for a certificate. The certificate request could not be submitted to the certification authority. **URL:** https://testDomain:30020/avxapi/msproxy/simpleenroll **Error:** The operation did not complete within the time allotted. **0x803d0006 (-2143485946) WS_E_OPERATION_TIMED_OUT**
Troubleshooting	• Enable outbound traffic from domain machines to the Cloud Connector (CC) or AppViewX server on port 30020 for SaaS deployments and 31443 for on-premises deployments. • If a certificate is enrolled in the AppViewX GUI but not received by the Windows machine, verify that no network devices are blocking the certificate content.

Actions

You can perform any of the following actions on the EST, ACME, SCEP, MS Intune, or CMP agents:

- **Clone:** You can clone an existing agent with the same configuration settings under a new name, making it easy to duplicate and modify the setup without changing the original configuration.
- **Delete:** You can delete an agent by clicking the (Delete) icon and confirming deletion.

To clone an existing agent:

1. Click the **Clone** icon against the agent you want to clone.

   A confirmation window appears where you can enter the new name. By default, "_copy" is appended to the agent name being cloned.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click **Yes** to continue.

   A message appears that the agent has been cloned successfully.

3. To make changes to the existing configuration settings, click the cloned agent, make the changes, and click **Update**.

Note: When you clone an ACME agent, the **External Binding Account** field in the EAB Settings is set to **No** even if the setting was Yes in the agent being cloned.

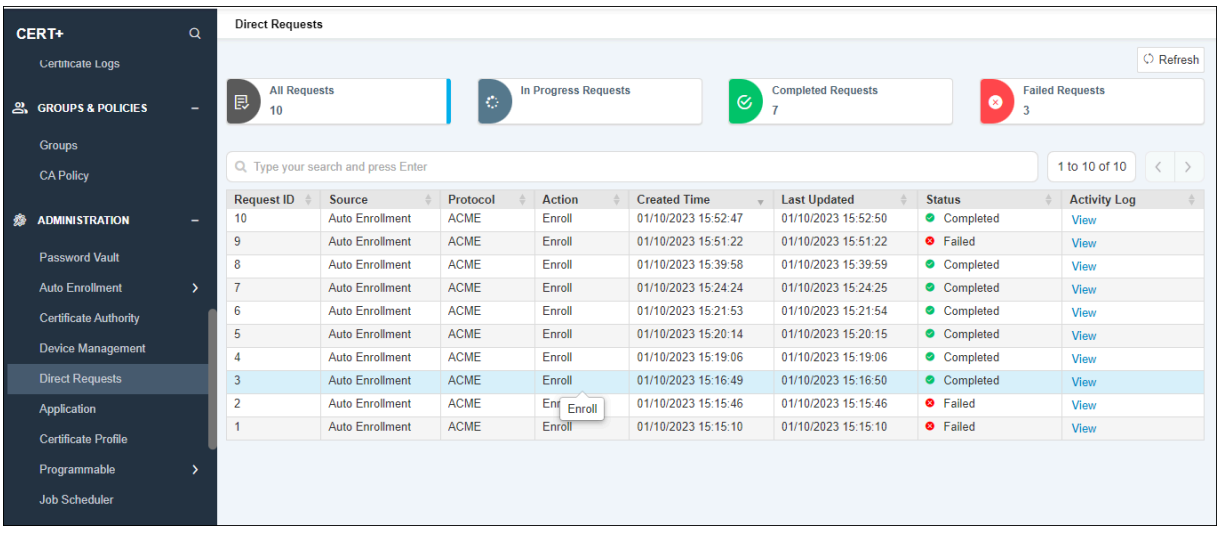
Direct Requests

The Direct Request page lists the auto-enrollment certificate requests for which the visual workflow will not be displayed for generating the certificates, resulting in a greatly improved performance. This page only displays the status and other details of certificate requests. No actions can be performed on this page.

Note: While creating an auto-enrollment request (for EST, ACME, SCEP, MS INTUNE), in the **Advanced Setting** section , select the radio button in **High Speed Transaction** field to “Yes” to display the requests in the Direct Requests page.

Accessing the Direct Request Page

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Direct Requests** .

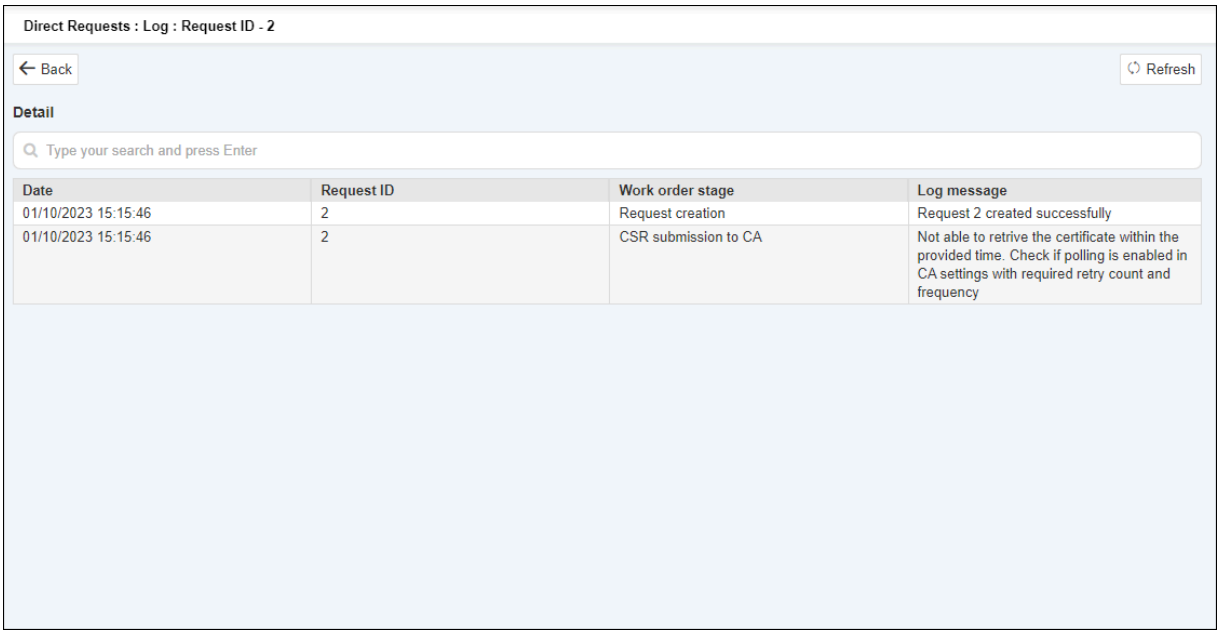


2. The Direct requests page displays the following:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Echelons** - All requests, In Progress Requests, Completed Requests, and Failed Requests. all echelons have the count of requests and are clickable. Clicking each echelon will display only those specific status requests.
- **Refresh** button
- **Search** field - users can enter values w.r.t. Request ID, Time Created, Request Status, CLM Action to search/filter for specific requests.
- Grid with the following columns -
  - *Request ID* - displays ID of the current request
  - *Source* - displays the source type, usually Auto Enrollment
  - *Protocol* - displays the type of protocol (EST, ACME, SCEP, MS INTUNE)
  - *Action* - displays the latest CLM action on the request
  - *Common Name*- displays the common name of the certificate
  - *Serial Number*- displays the serial number of the certificat
  - *Created Time* - displays the time the request was created
  - *Last Updated* - displays the time the request was last updated
  - *Status* - displays the status of the certificate request
  - *Activity Log* - displays the “View” link, when clicked displays the detailed logs at each status for the certificate request cycle.

An example of a failed request log is displayed below.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

MDM Device Integration for Certificate Lifecycle Management

• AppViewX Integration with JAMF

Integration of Mobile Device Management (MDM) with Auto-Enrollment Protocols

What is Mobile Device Management (MDM)?

Mobile Device Management (MDM) is a type of security software used by IT departments to monitor, manage, and secure employees' mobile devices such as smartphones and tablets. It involves the following steps:

- **Enrollment** - This step includes enrolling the mobile device into the MDM system. This can be done manually by the user or automatically through methods such as QR codes, email links, or by connecting to a company network.
- **Configuration** - Administrators create configuration profiles that define the settings and policies for the devices. These profiles can include Wi-Fi settings, VPN configurations, email settings, and more.
- **Deployment** - Once profiles and policies are created, they are pushed to the enrolled devices. This can happen over the air (OTA) through cellular or Wi-Fi connections.
- **Management** - Administrators can remotely manage the devices. This includes pushing updates, locking or wiping devices if they are lost or stolen, and troubleshooting issues.
- **Security** - MDM ensures that corporate data is protected through encryption, secure access controls, and the ability to remotely wipe data if a device is compromised.
- **Compliance** - Administrators can generate reports and audit trails to ensure compliance and for review purposes.

Benefits of using MDM with Auto-Enrollment Protocols

Mobile Device Management (MDM) systems often support auto-enrollment protocols like SCEP, EST, etc to streamline the process of enrolling devices into the management system. Auto-enrollment simplifies the initial setup for users and ensures that devices comply with organizational policies from the moment they are activated.

Benefits of using MDM with auto-enrollment protocols include:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Automation** - Automates the certificate issuance and renewal process, reducing administrative overhead and minimizing the risk of errors.
- **Scalability** - Easily scales to manage certificates for a large number of devices.
- **Seamless User Experience** - Provides a seamless experience for users, who don’t need to manually request or install certificates.

Use Cases

- **Wi-Fi Authentication** - Devices use certificates to authenticate to secure Wi-Fi networks, ensuring only authorized devices can connect.
- **VPN access** - Certificates authenticate devices when connecting to corporate VPNs, providing secure remote access.
- **Email encryption and signing** - Certificates enable secure email communications by supporting encryption and digital signing.
- **Application Authentication** - Certificates authenticate devices and users to enterprise applications, ensuring secure access to sensitive data.

AppViewX-supported MDMs

Some of the most popular MDMs that AppViewX integrates with are:

- **Microsoft Intune** - Part of the Microsoft 365 Suite, Intune provides comprehensive MDM and mobile application management (MAM) capabilities. Supports Windows, iOS, Android, and macOS devices.
- **Jamf Pro** - A leading MDM solution for Apple devices, widely used in enterprise and education settings. Supports macOS, iOS and iPadOS.
- **MobileIron** - A UEM platform that focuses on securing endpoints, apps, and cloud services. Support for iOS, Android, Windows, and macOS.

What's Next

AppViewX Integration with JAMF

What is JAMF

The advantages of using Jamf are as follows:

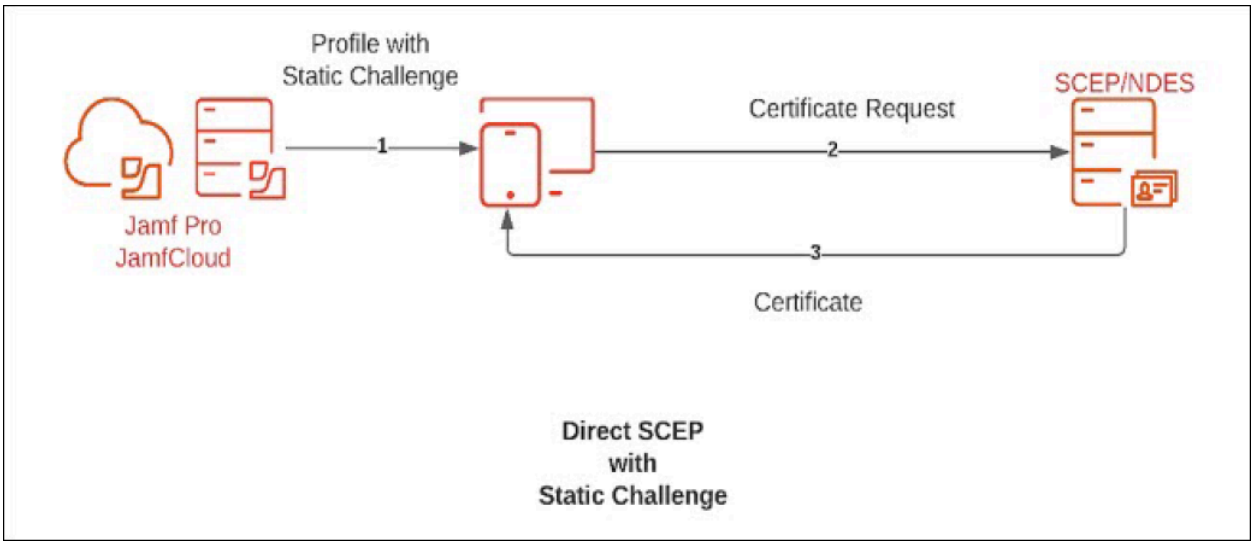
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **The Industry Standard for Apple Device Management** - The various products in the Jamf suite allow for seamless setup and deployment of devices, all offered in a single consolidated solution.
- **Cloud-Based Mobility** - Jamf Now is the ideal solution for small and medium enterprises as it empowers setting up, protecting, and managing devices right from one product.
- **Device Management Tool for The Pros** – An ultimate EMM (Enterprise Mobility Management) tool for your users. Jamf Pro features application and device management, deployment, security capabilities, inventory collection, and more.
- **Enhanced Identity Management** - Jamf Connect offers the flexibility to remotely and centrally manage passwords, groups, and users. It provides access to corporate cloud resources and applications that offer an advanced security and identity approach.
- **Mac-Exclusive Endpoint Protection** - Jamf Protect, developed natively on the iOS architecture offers deep visibility into any operations or threats at the endpoints. It has a dashboard, extensive reporting, and real-time alerts on the built-in security framework for macOS.

Deployment Models

SCEP obtains certificates from the CA and distributes them to managed mobile devices, providing a simplified way of handling large-scale certificate distribution. If you do not want computers or mobile devices to communicate directly with a SCEP server, you can configure settings that enable Jamf Pro to proxy the communication between a SCEP server and the computers and mobile devices in your environment. This allows Jamf Pro to communicate directly with a SCEP server to obtain certificates and install them on the device.

Jamf Pro can be configured using computers or mobile devices to communicate directly with a SCEP server.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

1. Disabling the checkbox in the **Global Management** > **PKI Certificates** screen.

   a. Login to JamfCloud (Sample URLs are mentioned below):
      i. **Cloud-hosted**— https://JAMF_PRO_URL.jamfcloud.com
      ii. **On-premise**— https://JAMF_PRO_URL.com:8443

   b. Click **Settings** > **All Settings** > **Global Management** > **PKI Certificates**.

   c. Ensure to disable the checkbox labeled **Enable Jamf Pro as SCEP Proxy for configuring profiles**.

   > **Note:** This is an important step to enable this deployment model.

2. Configure the **Challenge Password** in the **SCEP Configuration** and **AppViewX** endpoints.

   > **Note: Challenge Passphrase** is mandatory for MAC devices to connect to AppViewX SCEP Node.

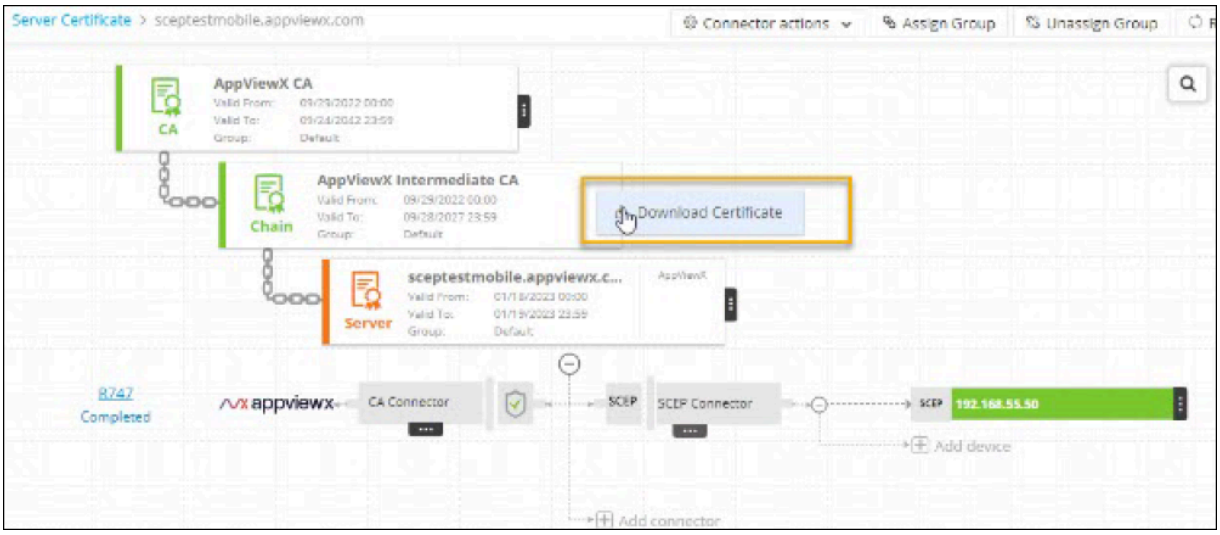
3. The MAC device should be able to connect to the SCEP server on port 30022.

Direct Communication with SCEP Server

Obtaining the Certificate Thumbprint/Fingerprint

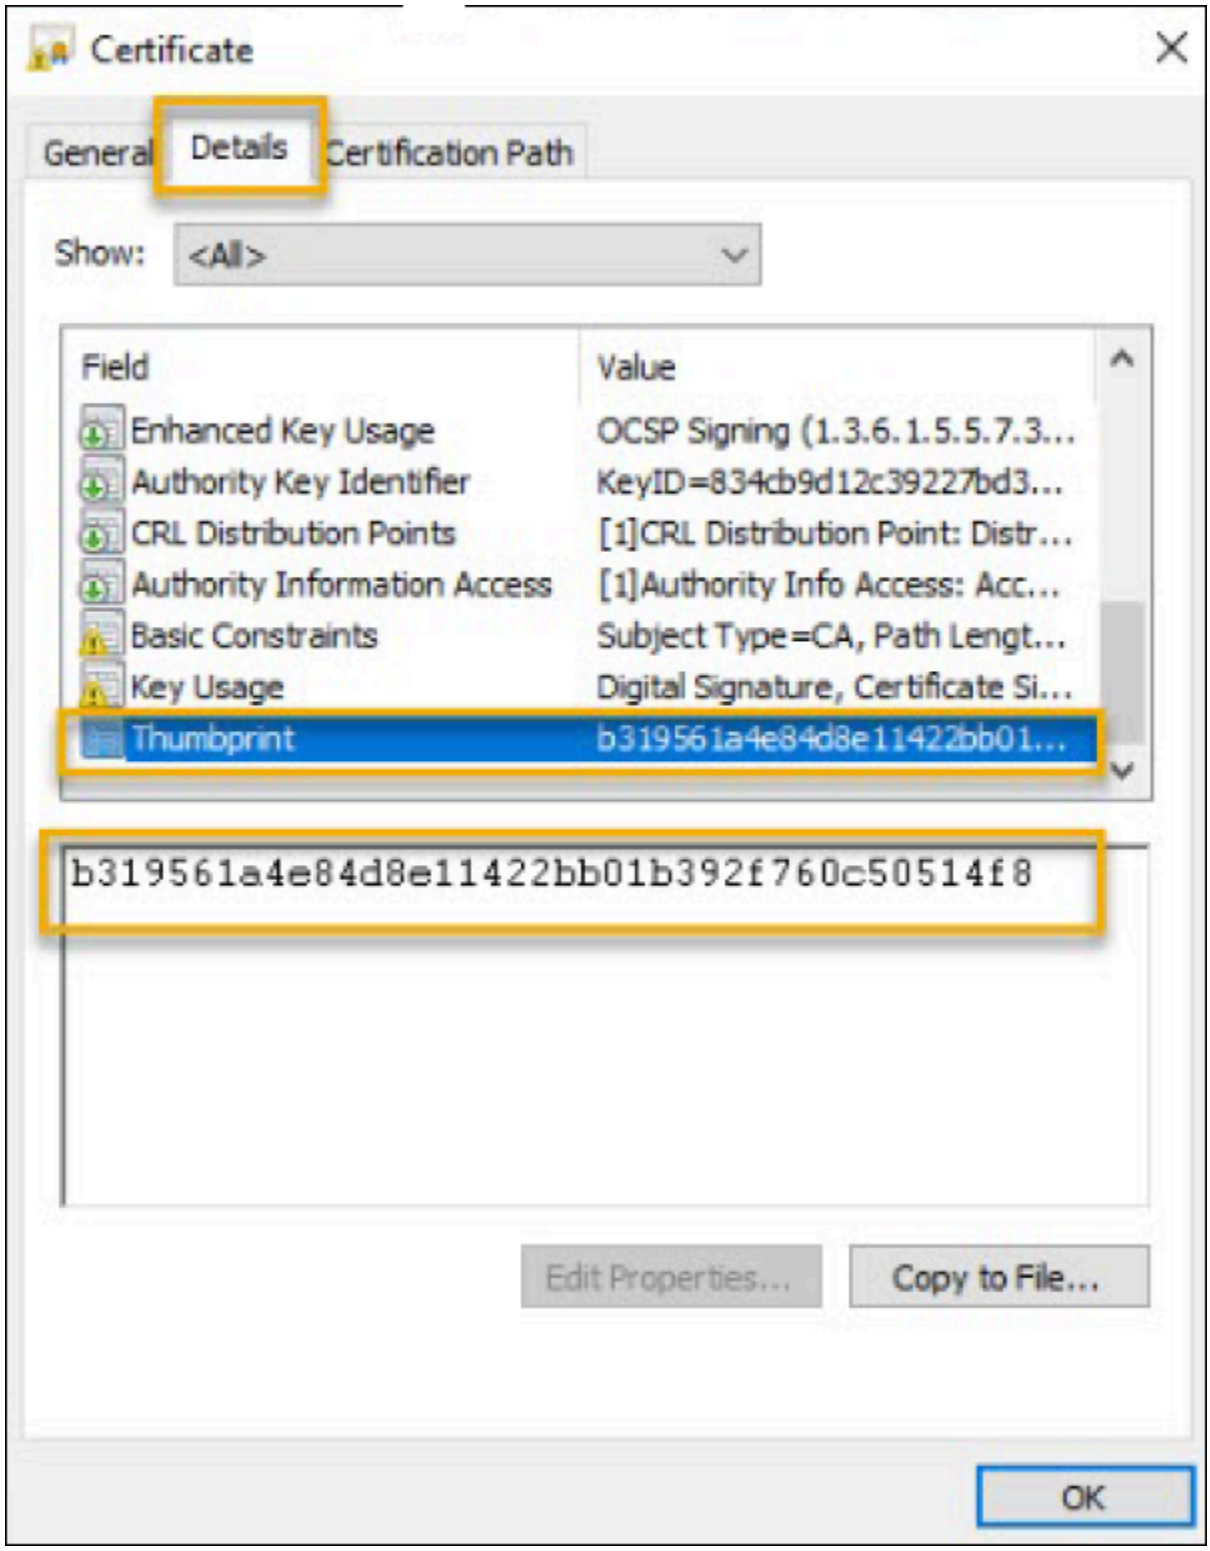
1. Log in to the AppViewX platform using valid credentials.
2. Hover on the menu icon and select CERT+.
3. Click **Certificate Inventory** on the left menu and select the certificate type (Server, Client, or Code Signing).
   The certificates with the common names are displayed on the right.
4. From the **Common Name** column, click on the desired certificate.
   All valid certificates are displayed.
5. Click the desired RA certificate to display the details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Click the three dots on the issuer certificate to display the **Download Certificate** option.
7. Click **Download Certificate** and save the certificate in the desired format.
8. Open the downloaded certificate.

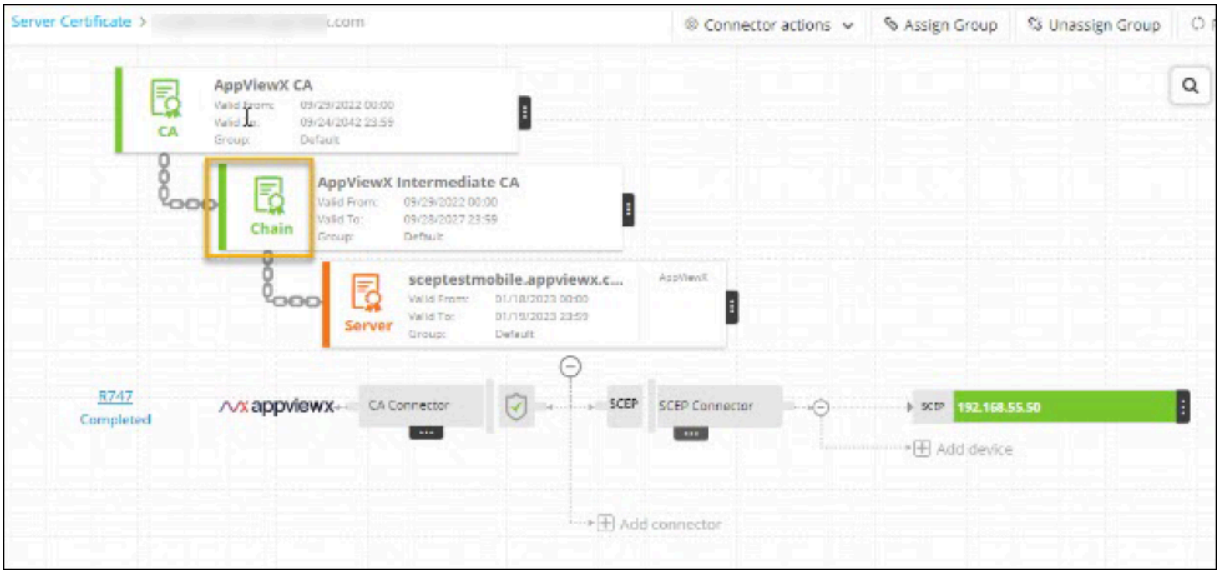
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



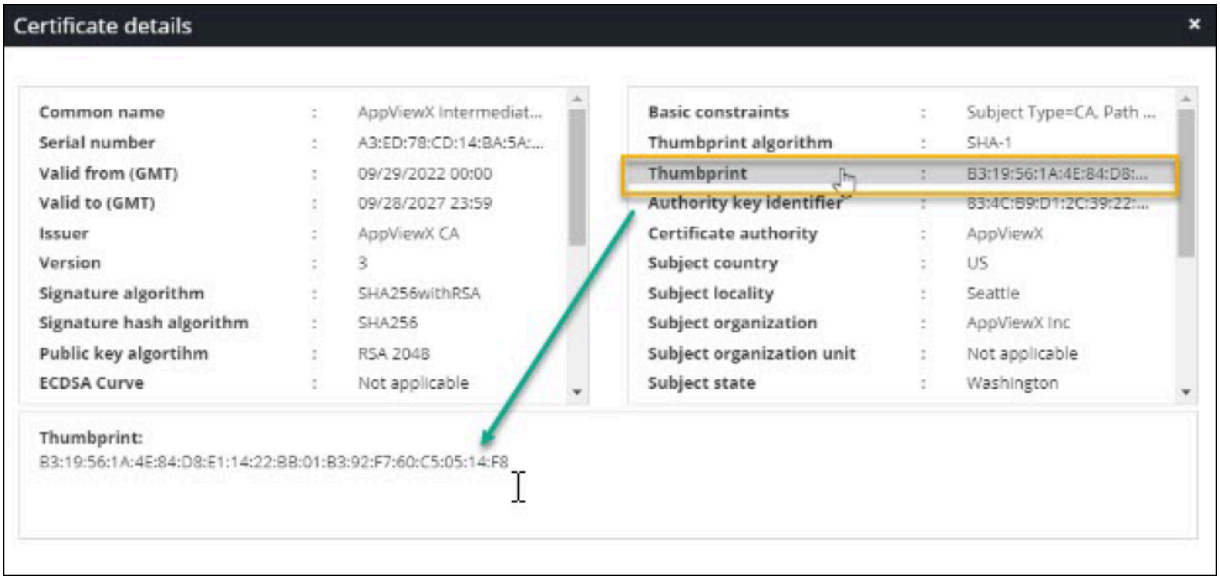
9. Click the **Details** tab and then select the Thumbprint field.
   The full value is displayed in the section below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. Copy this hex value and paste in the text pad. Use this value in the Fingerprint field in JAMF Pro (described in the section below).
    Consequently, another way to obtain the hex value without having to manually delete the colons in the thumbprint can is described below.
11. Execute steps 1 to 5 described above.



12. Click the Issuer certificate.

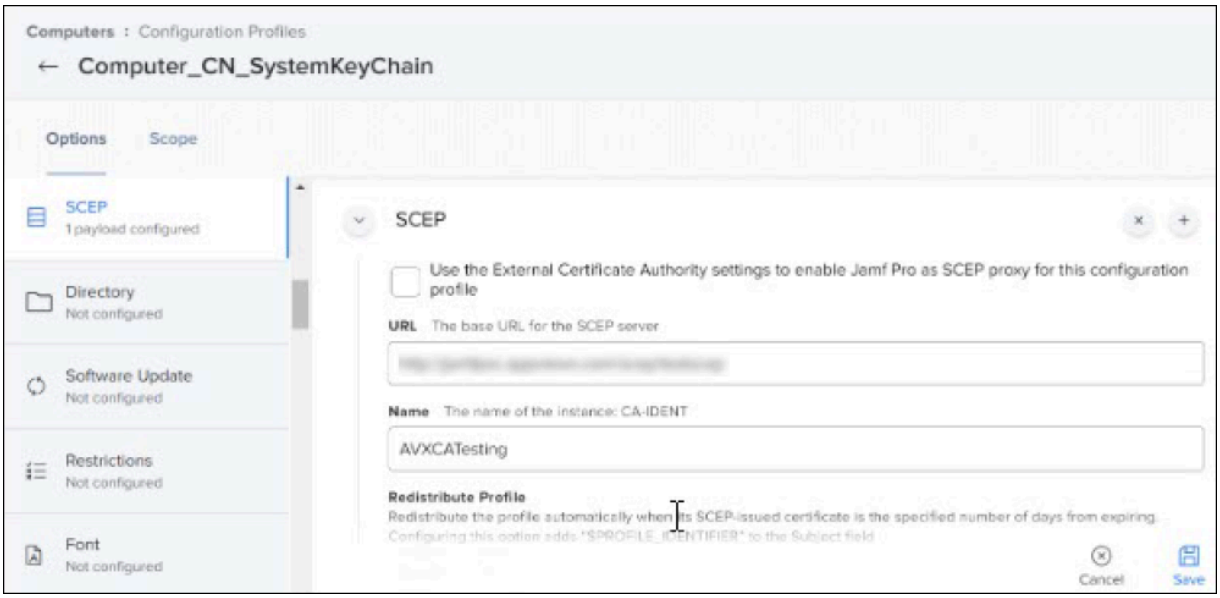


13. In the Certificate Details pop-up, click the **Thumbprint** value.
    The full value is displayed in the section below.
14. Copy this hex value and paste in the text pad. Ensure to remove all the colons before using it in the Fingerprint field in JAMF Pro (described in the section below).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

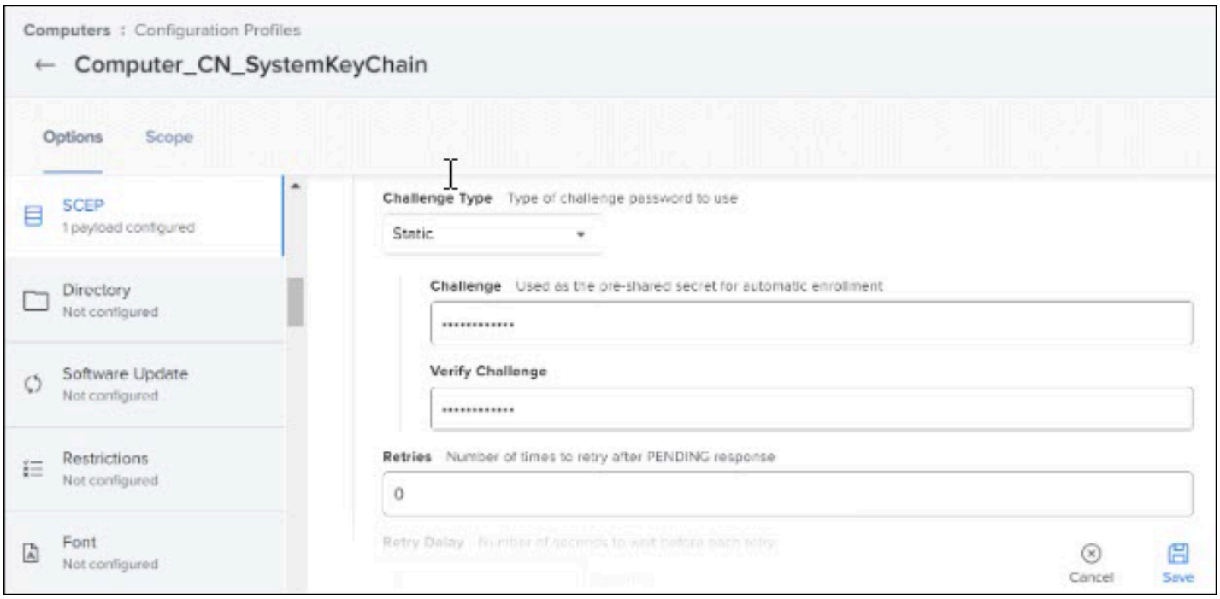
Configuring SCEP

1. Navigate to **SCEP Configuration Profiles** screen.



2. In the **URL** field, enter the AppViewX server's publicly exposed SCEP URL.
3. In the **Name** field, enter the desired name for this configuration.
4. From the **Redistribute Profile** dropdown, choose a value to specify the number of days before the certificate needs to be renewed. For example, if you want a certificate to be renewed 15 days before expiry, then set the **Redistribute Profile** to 15 days.
5. In the Subject field, enter the variable names. The $ (dollar) sign may be used with the variable name. Refer to the Mobile Device Configuration Profiles page to learn about the variable names supported in Jamf.
6. From the **Subject Alternative Name Type** dropdown, select *None*.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



7. From the Challenge Type dropdown, select the following:

   a. **Static** - If you want all computers and mobile devices to use the same challenge password, choose “Static” and specify a challenge password. The challenge password will be used as the pre-shared secret for automatic enrollment.

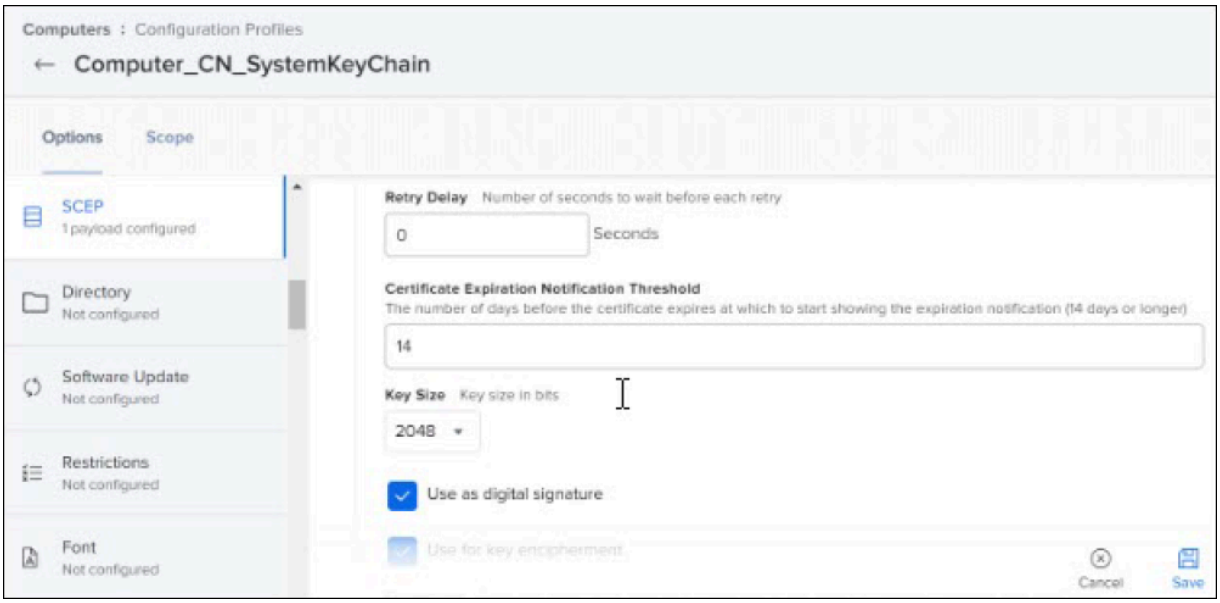
   b. **Dynamic** - If you are using a non-Microsoft CA and you want each computer and mobile device to use a unique challenge password, choose “Dynamic”. The Dynamic challenge type requires use of the Classic API and membership in the Jamf Developer Program. The Dynamic challenge uses the "Fingerprint" or "Thumbprint" to authenticate the user instead of a username and password. The Thumbprint hash value for the **Fingerprint** field in Jamf Pro can be found on the profile you receive. Before selecting this option, contact your Jamf account representative to learn more about the Jamf Developer Program and the additional steps you need to take to use this option.

   > **Note:** Currently, CERT+ does not support the dynamic challenge passphrase.

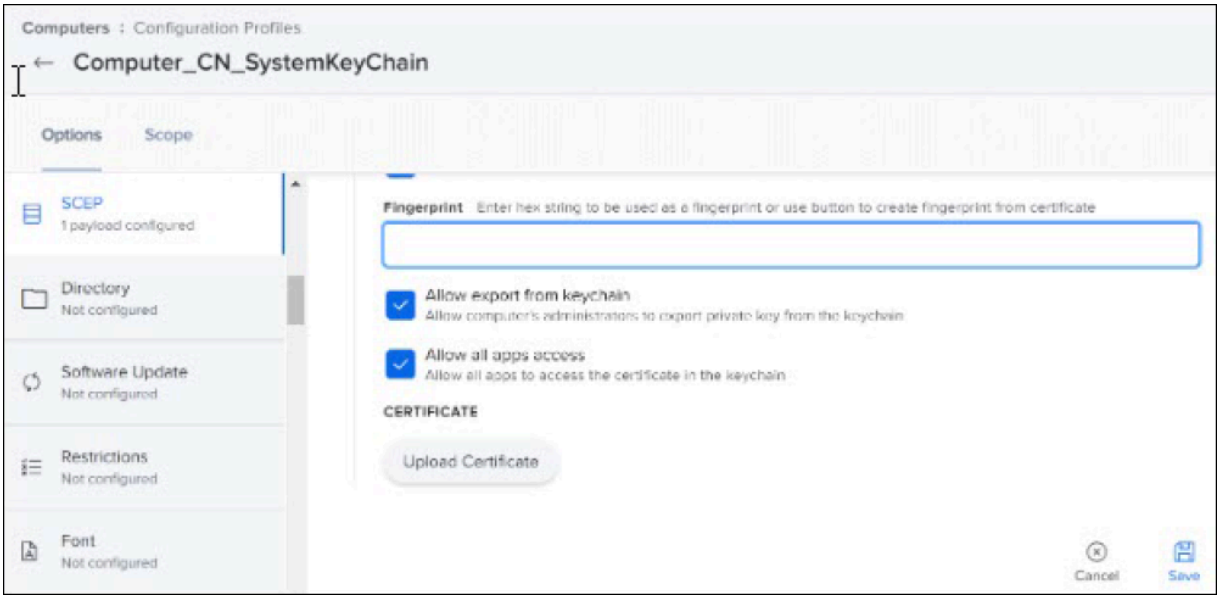
8. In the **Challenge** and **Verify Challenge** fields, enter the AppViewX SCEP Challenge Password configured in AppViewX SCEP UI.

> **Note:** This is a mandatory step. The Challenge password is mandatory while using this deployment model. The same challenge password set in the prerequisite should be configured in the JAMF.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

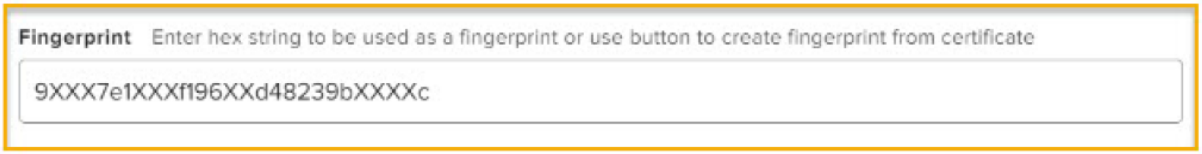


9. In the **Retry Delay** field, enter a desired value (in seconds).
10. In the **Certificate Expiration Notification Threshold** field, enter the number of days before the certificate expiration at which a notification will start displaying.
11. From the **Key Size** dropdown, select value *2048*.
12. Select the checkboxes **Use as digital signature** and **Use for key encipherment**.



13. In the **Fingerprint** field, enter the hex string to be used as a fingerprint.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

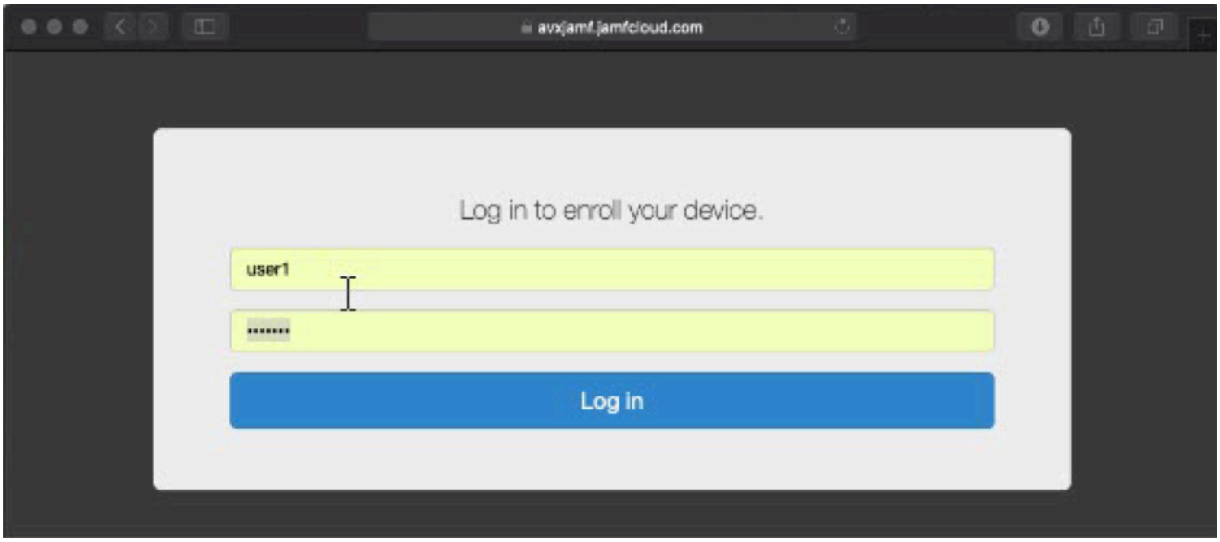


14. Select the checkboxes **Allow export from keychain** and **Allow all apps access**.
15. Click **Save**.

Initiating the Enrollment from a Device

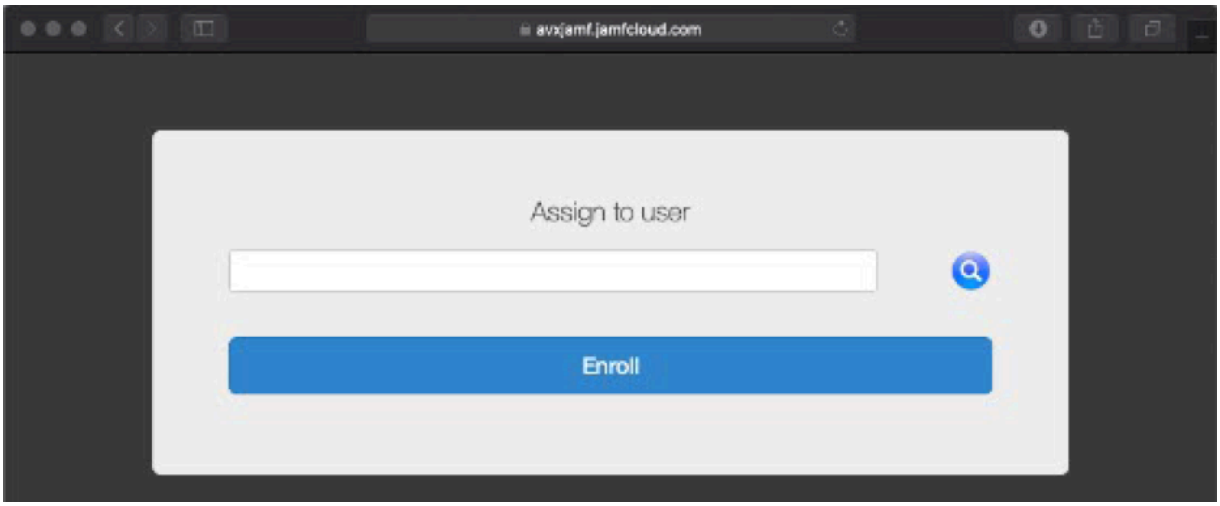
This section provides details of testing the Jamf cloud configuration performed in the previous section. It is recommended to open the JamfPro Enrollment URL using a Safari browser, as other browsers are not capable of identifying the received configuration profile and installation to the machine. Follow the instructions shown in the MacOS screen.

1. Enter the URL, for example - https://avxjamf.jamfcloud.com/enroll/ in the Safari browser.
2. Enter a valid username and password.

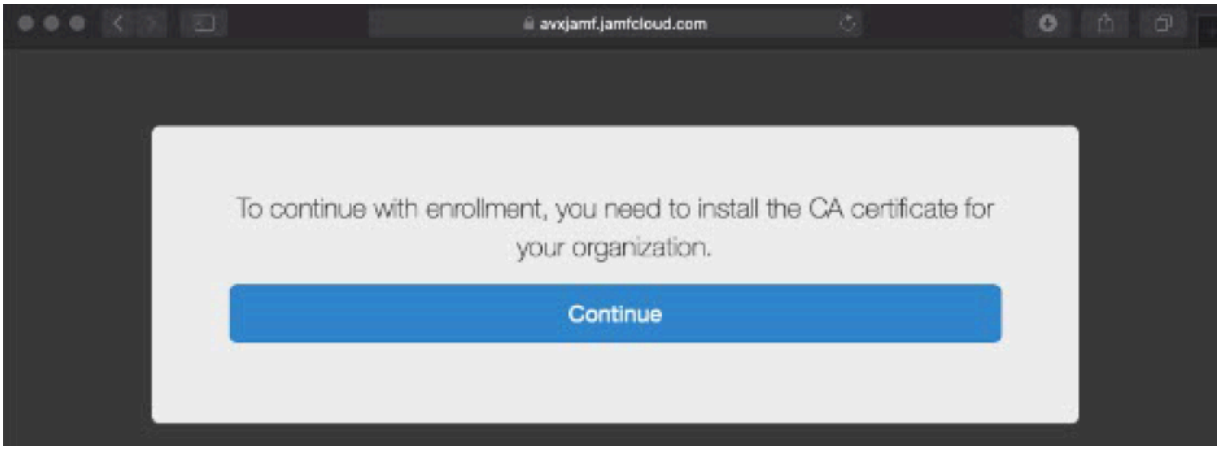


3. Leave the **Assign** to user field empty and click **Enroll**.

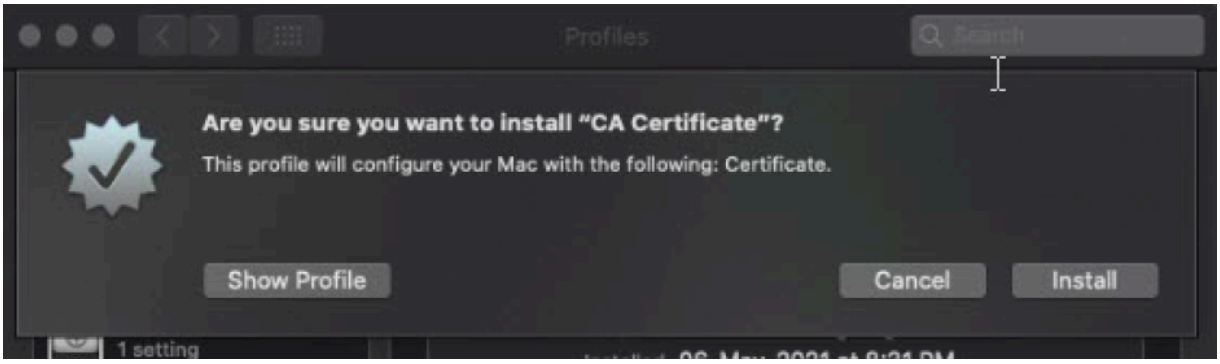
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. To continue with the enrollment (installation of CA certificate), click **Continue**.

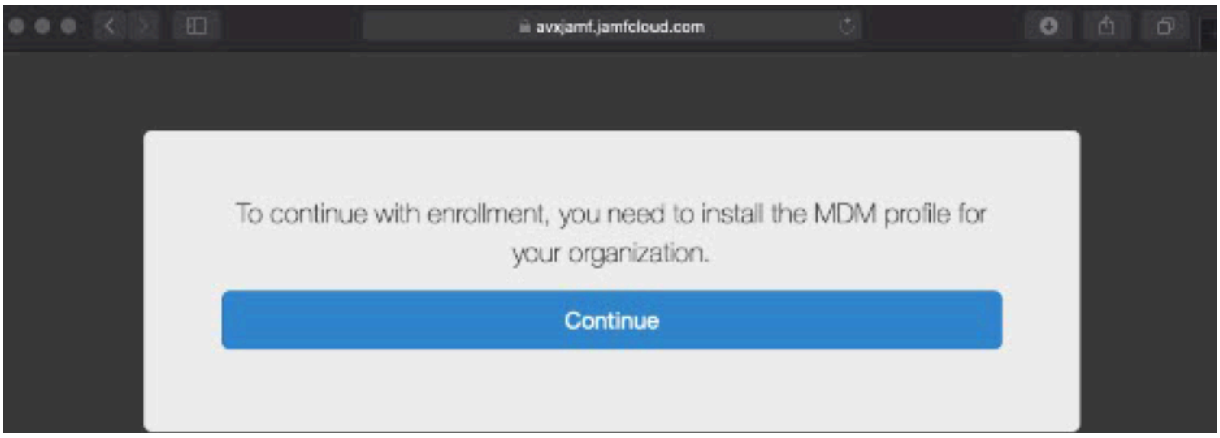


5. To confirm installation of the CA Certificate, click **Install**.

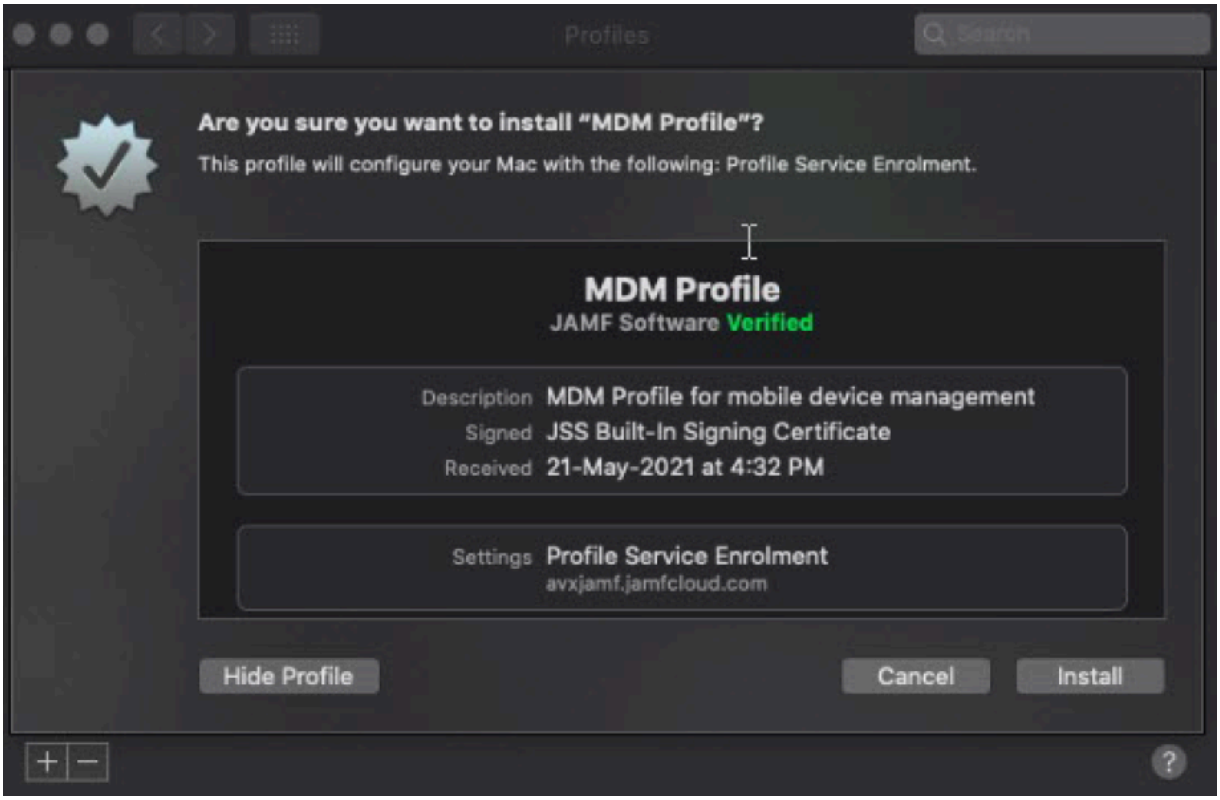


6. To continue with the enrollment (installation of the MDM profile), click **Continue**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



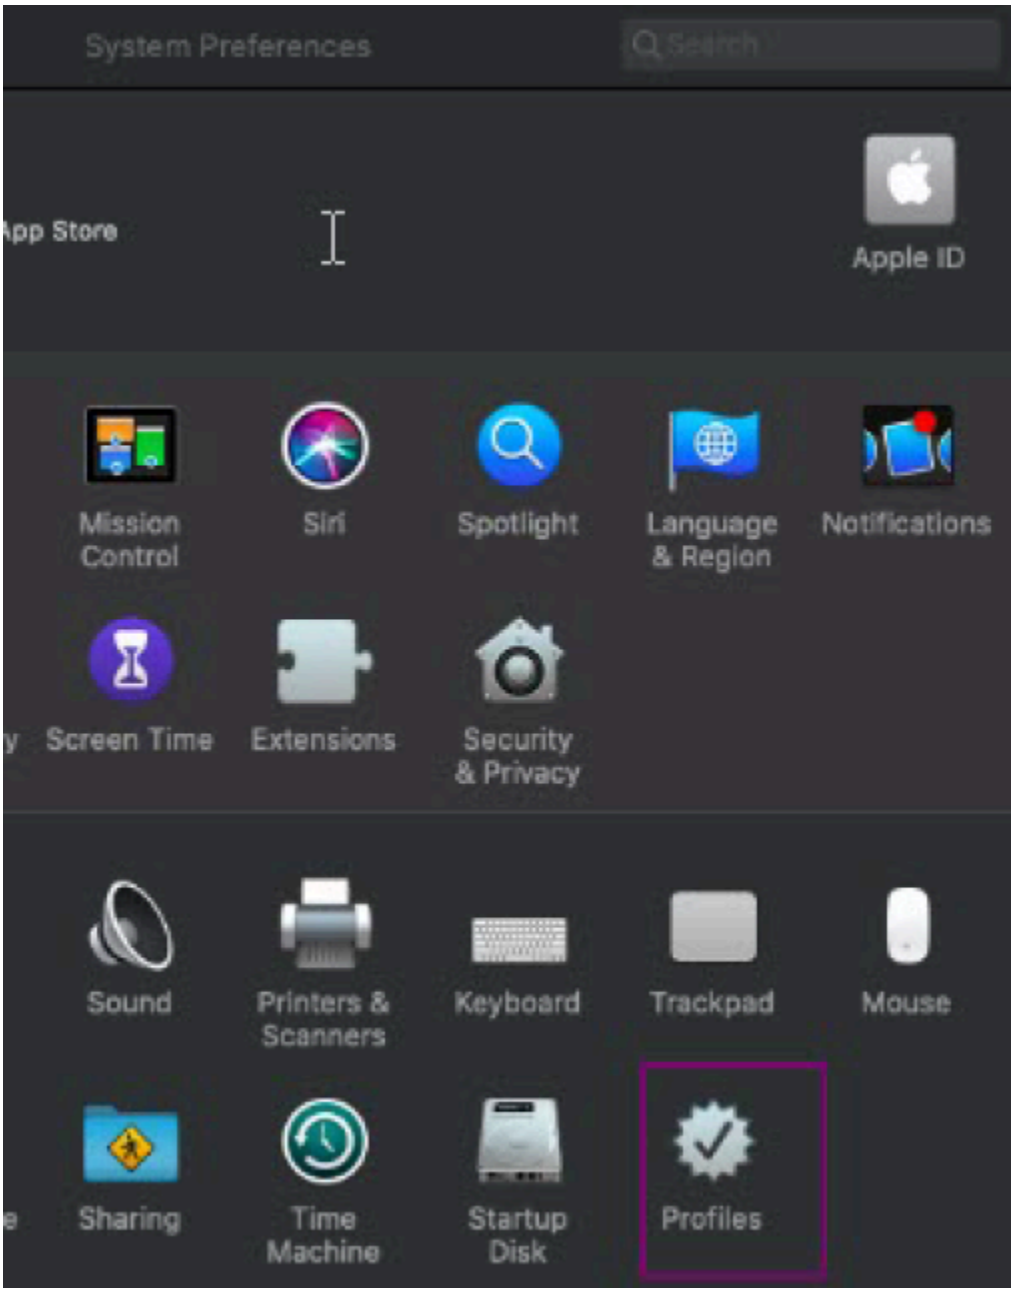
7. To confirm installation of the MDM Profile, click Install, and enter the valid credentials to carry out the installation.



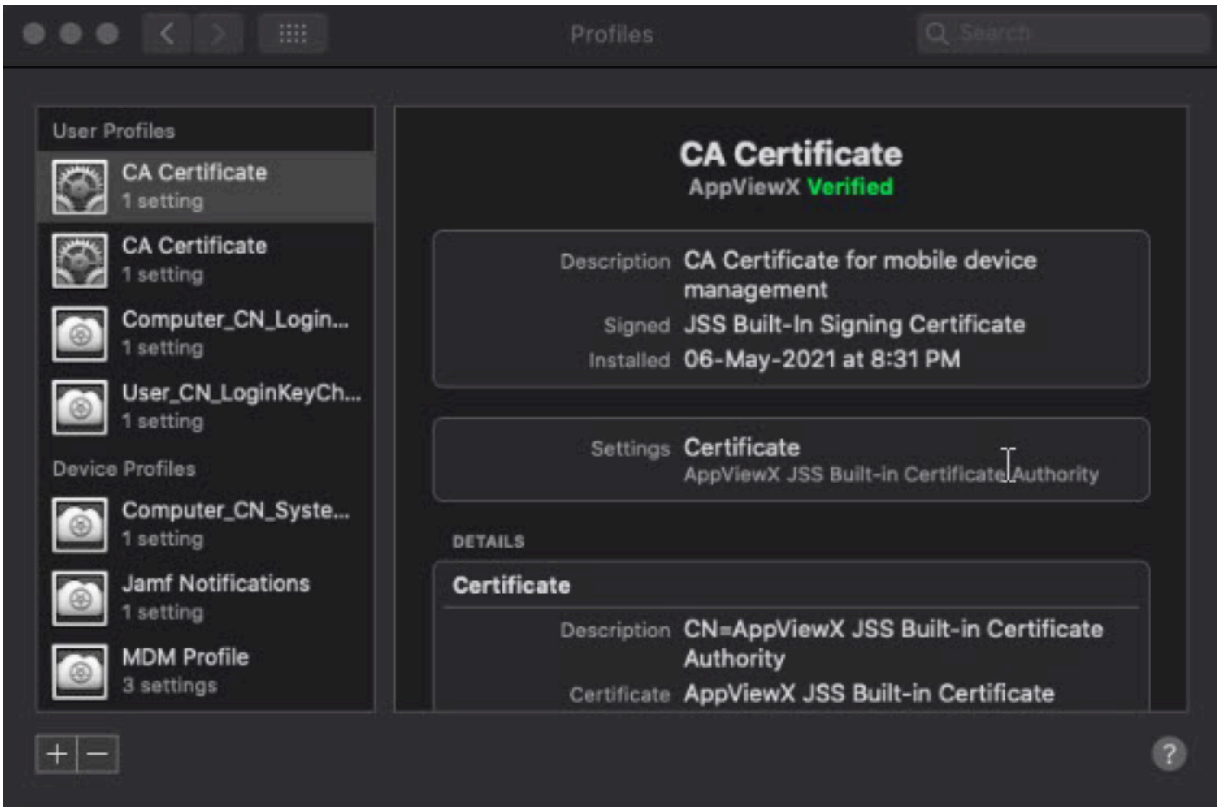
8. After the installation is complete, the following message is displayed – "The enrollment process is completed."
9. Wait for approximately one minute for the installation of the Profile and Certificate. (Profile contains SCEP configuration and during the installation process, the device directly sends a SCEP request to the AppVIewX Server.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. After the installation, the profiles can be verified by clicking **System Preferences** > **Profile**. All the installed profiles must be visible.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: Deleting the MDM profile deletes all the information from the Profiles. A fresh enroll may be tried later.

11. To verify the certificate, navigate to **Keychains** (User/System) and validate the certificates that were Installed for each configuration profiles with the respective CN Name.

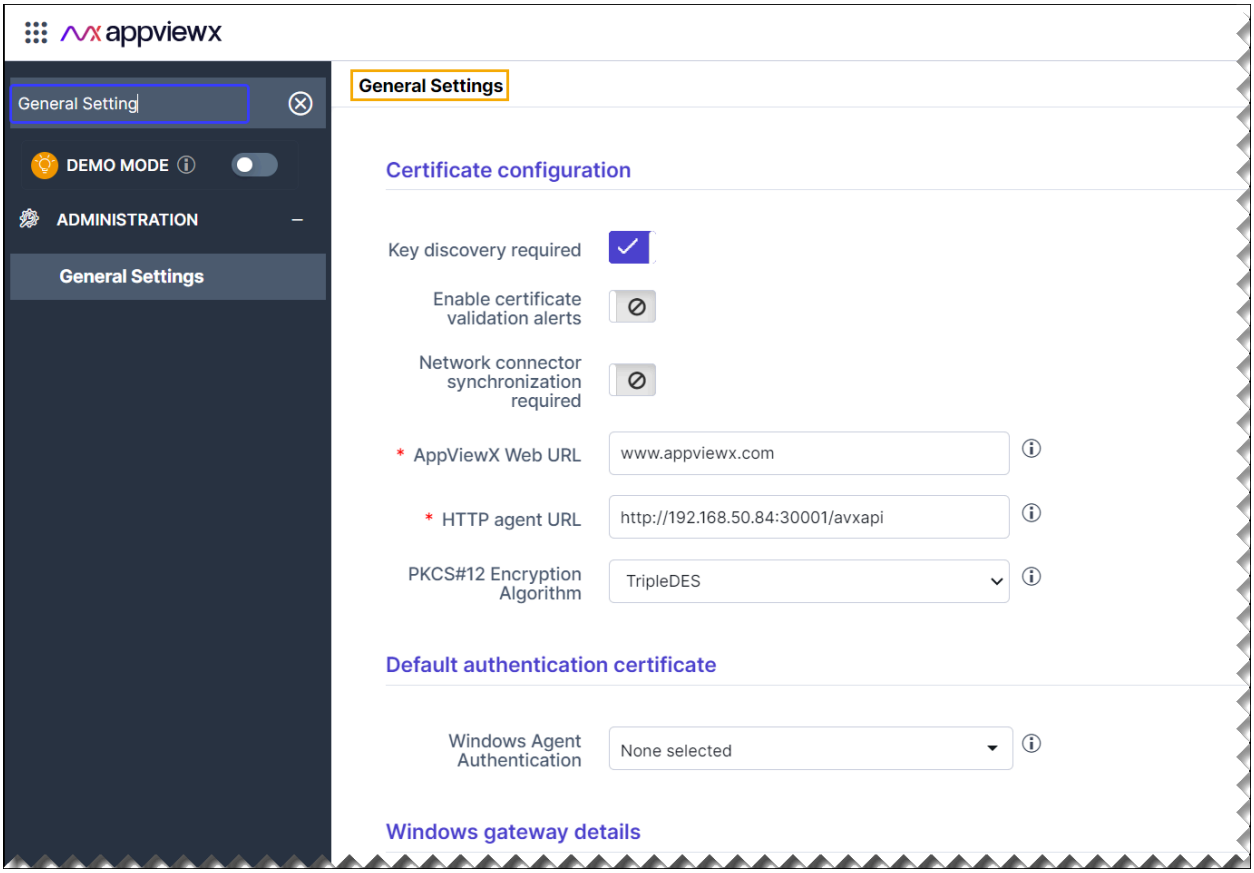
Configuring General Settings

The **Certificate Configuration** section manages key discovery, certificate alerts, and external agent connection settings. The **Default Authentication Certificate** allows the selection of a certificate for authenticating Windows agents. The **Windows Gateway Details** configure interactions with Windows systems, specifying the gateway's name, URL, and a client authentication certificate. This page is crucial for ensuring secure communication between AppViewX CERT+ and external systems, enabling automated certificate management and secure key handling.



1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION**, and then click **General Settings**.
2. Select/Enable the **Certificate Configuration** parameters.

Field description for Certificate Configuration Section

Fields	Description
Key discovery required	**Default**: Enabled. If enabled (as shown), this setting requires the platform to perform key discovery. This means CERT+ will attempt to find private keys

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	associated with certificates when importing or managing certificates in the system.
Enable certificate validation alerts	**Default**: Disabled. If enabled, the system would notify administrators or users of issues like certificate validation failures, expired certificates, or other alert-worthy conditions related to certificates.
Network connector synchronization required	**Default**: Disabled. This setting, when enabled, ensures synchronization between the CERT + platform and external network connectors. It is useful for ensuring that the certificate data is consistent across networked systems.
***AppViewX Web URL**	This field contains the base URL for the **AppViewX** web interface (in this case, `www.appviewx.com`). This URL is used send the client certificate to email address specified during certificate creation.
***HTTP agent URL**	Specifies the URL for the **HTTP agent**. The URL shown here (for example: `https://pe-cert-ecosystem-xxx.abc.appviewx.net:xxxx/...`) is used to perform CRL check for AppViewX issued certificate.
PKCS#12 Encryption Algorithm	**Default**: TripleDES. In this case, the encryption algorithm selected is **Triple DES**. This option controls the algorithm used to encrypt PKCS#12 files, which are used to bundle private keys with certificates. The available options are: • **TripleDES** • **AES**.
**: Mandatory fields*	

3. Select the **Default authentication certificate** parameter.

Field description for Default authentication certificate Section

Field	Description
Windows Agent Authentication	**Default**: None Selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown allows the selection of a certificate for use with **Windows Agent Authentication**. This certificate would authenticate the Windows agent communicating with AppViewX, ensuring secure interactions.

4. Select the **Windows gateway details** parameters.

Field description for Windows gateway details Section

Field	Description
***Windows gateway name**	It is used to specify the name of the Windows gateway that the AppViewX CERT+ platform will communicate.
***Windows gateway URL**	It should contain the URL or IP address of the Windows gateway. The gateway facilitates communication between the AppViewX platform and Windows environments, such as for certificate distribution or renewal.
Client Authentication Certificate	**Default**: filename.pkcs The field shows an input box where a **.pkcs** file can be uploaded. This file would contain the client authentication certificate, which is used to securely authenticate the connection between AppViewX and the Windows gateway. The certificate helps establish secure communication between the two systems. The **Upload** button allows you to upload the <.pkcs> file containing the client certificate
**: Mandatory fields*	

5. Click **Add**.
6. Click **Save**.
7. To reset the selected/entered details, click **Reset**.

Appendix A: Prerequisites for Enabling the Integrated Windows Gateway Mode

Refer to the following models for enabling the Integrated Windows Gateway mode.

- Privlilege model (For IIS devices)
- Minimum privilege model (CA and Devices other than IIS)

Privlilege Model (For IIS devices)

Usecases	Required	Level	Type	Details	Purpose
Device and CA communications	User account type	User	User Account	Added to Group 1. Domain Admin	To ensure seamless WinRM communication from a remote Java process, adding the user to the Domain Admin group is necessary. This grants the required permissions for enabling communication, remote execution,preventing operational failures and maintaining functionality.
				2. Remote Management Users	Adding the user to the Remote Management Users group is essential for enabling WinRM communication, as it grants the necessary permissions for remote execution and management tasks, ensuring secure and efficient operation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Privlilege Model (For IIS devices) (continued)

Usecases	Required	Level	Type	Details	Purpose

	User permission	System	Winrm Permissions	To enable WinRM communication in a Windows machine, follow the instructions given below:
				
				The following steps must be executed manually:
				
				1. **Enabling PSRemoting:**
				`Enable-PSRemoting -Force`
				2. **Configure WinRM service:**
				`Set-Service -Name WinRM -StartupType Automatic`
				`Start-Service -Name WinRM`
				3. **Allow WinRM through Firewall (if any):**
				`Enable-NetFirewallRule -Name "WINRM-HTTP-In-TCP-PUBLIC"`
				`Enable-NetFirewallRule -Name "WINRM-HTTP-In-TCP-DOMAIN"`
				4. **Permissions for WSMAN:**
					The WinRM methodology is used to connect Windows machines with the Cloud Connector, using PowerShell scripts and commands for executing actions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Privlilege Model (For IIS devices) (continued)

Usecases	Required	Level	Type	Details	Purpose
				winrm set winrm/config/service '@{AllowUnencrypted="true"}' winrm set winrm/config/service/auth '@{Basic="true"}'	
	Ports	System	5985	This port should be enabled and open for communication from CC	
		System	5986	For HTTPS communication, end devices should be enabled with HTTPS specific configuration (not certified yet). To enable HTTPS for a Cloud Connector configuration, add the following properties in the **<CC Installation Path>/deps/properties/appviewx.properties** file: WINRM_HTTPS_PORT=5986 WINRM_HTTPS_ENABLED=true	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Privlilege Model (For IIS devices) (continued)

Usecases	Required	Level	Type	Details	Purpose
				Note: Once WINRM with HTTPS is enabled for a Cloud Connector, all communications between the Cloud Connector and any Windows machine will happen exclusively over HTTPS. To enable HTTPS for a Windows machine, refer the **EnableHTTPs.ps1** script below.	

Minimum Privilege Model (CA and Devices other than IIS)

Usecases	Level	Type	Details
Device and CA communications (Other than IIS devices and management)	User account	service Account	A basic service account to communicate with Windows devices..
	User permission	Winrm Permissions	All these steps can be done by executing **UserPrivEnablement.ps1** script given below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Minimum Privilege Model (CA and Devices other than IIS) (continued)

Usecases	Level	Type	Details

			The following commands are executed as part of the **UserPrivEnablement.ps1** script.
			
			1. **Enable Auth:**
			`winrm set winrm/config/service/Auth '@{Basic="true"}'`
			2. **User group requirements:** Should be added to below groups
			a. Remote Management Users
			b. Performance Monitor Users
			c. WinRMRemoteWMIUsers (This Group should be created if not present)
			3. In a CMD Window (run as Administrator) execute
			`winrm configSDDL default`
			Add the **desired user** and configure permissions. Check 'Allow' for Read (Get, Enumerate, Subscribe) and Execute (Invoke)

Fetch CA - Command execution host	Device type	Domain controller (Primary)	Devices that are part of domain controllers gets all CA's available in that domain. Use the command to check the same: `systeminfo | findstr /C:"OS Configuration` The Device can either be domain controller or the device that responds with the CA templates for the command below:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Minimum Privilege Model (CA and Devices other than IIS) (continued)

Usecases	Level	Type	Details
			winrs -r:localhost -u:<username> -p:<password> powershell . "certutil -config "<CA_Server\CA_Name>" -caTemplates -v" *Sample command*: winrs -r:localhost -u:user1 -p:pass powershell . "certutil -config "TestCAServer.test.com\TestCaServer-001>" -caTemplates -v"
Ports	Winrm with HTTP	5985	This port should be enabled and open for communication from CC
	Winrm with HTTPS	5986	For HTTPS communication, end devices should be enabled with HTTPS specific configuration (not certified yet). To enable HTTPS for a Cloud Connector configuration, add the following properties in the **<CC Installation Path>/deps/properties/appviewx.properties** file: WINRM_HTTPS_PORT=5986 WINRM_HTTPS_ENABLED=true **Note:** Once WINRM with HTTPS is enabled for a Cloud Connector, all communications between the Cloud Connector and any Windows machine will happen exclusively over HTTPS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Minimum Privilege Model (CA and Devices other than IIS) (continued)

Usecases	Level	Type	Details
			To enable HTTPS for a Windows machine, refer the **EnableHTTPs.ps1** script below.

Script: **UserPrivEnablement.ps1**

```
# Get the username at runtime
$user = Read-Host "Enter the username"

# 1. Enable Authentication for WinRM
winrm set winrm/config/service/Auth '@{Basic="true"}'

# 2. Add the user to required local groups
net localgroup "Remote Management Users" /add $user
net localgroup "Performance Monitor Users" /add $user

# Check if "WinRMRemoteWMIUsers__" exists, if not create it
$groupName = "WinRMRemoteWMIUsers__"
$groupExists = Get-LocalGroup -Name $groupName -ErrorAction SilentlyContinue

if (-not $groupExists) {
    New-LocalGroup -Name $groupName -Description "WinRM Remote WMI Users"
}

# Add the user to the "WinRMRemoteWMIUsers__" group
Add-LocalGroupMember -Group $groupName -Member $user

# 3. Execute the 'winrm configSDDL default' command to configure permissions
Invoke-Expression -Command "cmd /c 'winrm configSDDL default'"

# Set permissions for the user (e.g., Read and Execute)
# Note: You would typically do this in the "winrm configSDDL default" command manually or via script
# to allow Read (Get, Enumerate, Subscribe) and Execute (Invoke) for the specific user, but this may require elevated permissions.

# 4. Update Group Policy
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
gpupdate /force

Write-Host "User account setup complete. Please check the permissions in the WinRM configuration if needed."
```

Script: **EnableHTTPs.ps1**

```
# Prompt user for the certificate thumbprint
$newCertThumbprint = Read-Host "Enter the new certificate thumbprint"

# Keep asking for the IP address until it is not empty
$ip = ""
while (-not $ip) {
    $ip = Read-Host "Enter the IP address (this cannot be empty)"
    if (-not $ip) {
        Write-Host "IP address cannot be empty. Please enter a valid IP address."
    }
}

$port = "5986"  # Default port is always 5986
$ipport = $ip+":"+$port  # Combine IP and port into one variable
$hostname = ([System.Net.Dns]::GetHostByName(($env:computerName))).Hostname

# Show the existing certificate thumbprint associated with the WinRM HTTPS listener
$currentBinding = netsh http show sslcert ipport=$ipport

if ($currentBinding -like "*Certificate Hash*") {
    $currentCertThumbprint = ($currentBinding | Select-String -Pattern "Certificate Hash" | ForEach-Object { $_.Line.Split(':')[1].Trim() })
    Write-Host "Current certificate thumbprint: $currentCertThumbprint"
} else {
    Write-Host "No existing certificate bound to port: $port"
}

# Disassociate the existing certificate if a thumbprint is found
if ($currentCertThumbprint) {
    netsh http delete sslcert ipport=$ipport

    # Verify deletion
    $postDeleteBinding = netsh http show sslcert ipport=$ipport
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
    if ($postDeleteBinding -like "*The system cannot find the file specified*") {
        Write-Host "Successfully removed the certificate binding from port $port"
    } else {
        Write-Host "Failed to remove the certificate binding. Exiting."
        exit 1
    }
} else {
    Write-Host "No certificate found to disassociate."
}

# Delete the existing WinRM HTTPS listener
Write-Host "Deleting the existing WinRM HTTPS listener..."
winrm delete winrm/config/Listener?Address=*+Transport=HTTPS

# Add the new thumbprint to the WinRM config
Write-Host "Setting the new certificate thumbprint in WinRM configuration..."
winrm set winrm/config/service "@{CertificateThumbprint=`"$newCertThumbprint`"}"

# Create a new listener and associate the new certificate with the specified port
Write-Host "Creating a new listener and binding the new certificate to port $port..."
$appId = [guid]::NewGuid().ToString()  # Generate a random app GUID
netsh http add sslcert ipport=$ipport certhash=$newCertThumbprint appid="{$appId}"

# Create the new listener using WinRM
New-Item -Path WSMan:\Localhost\Listener -Transport HTTPS -Address * -CertificateThumbprint $newCertThumbprint -HostName $hostname -Force

# Verify the new binding
$finalBinding = netsh http show sslcert ipport=$ipport
if ($finalBinding -like "*Certificate Hash*") {
    Write-Host "New certificate bound to port $port successfully."
} else {
    Write-Host "Failed to associate the new certificate."
    exit 1
}
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Appendix B: List of Scheduled Jobs

Note: To avoid queue overload when there are a large number of devices/multiple requests sent to the queue simultaneously, a delay has to be introduced for triggering the **Device and Certificate synchronization** and **Device Server Status Synchronization** jobs from the job scheduler at 12 AM and 3 AM.

To implement this, add a custom delay value in the cert_metadata collection. Following is a sample that configures a delay of 60 seconds:

```
Unset
{
"_id": "MISC_SYNC_QUEUE_DELAY_IN_SEC",
"constant": "60"
}
```

Currently, the discovery/config-sync calls for all devices are triggered in order, without any delay. With the delay configured, when the specified jobs are triggered, the discovery/config sync call for each device will be triggered after the pre-defined interval.

Auto Regenerate Certificates

This job is triggered periodically to check whether the regeneration action to be triggered for the certificates in the inventory that are enabled with Regenerate Automatically in the CA connector, based on whether the certificate is reached the time to trigger the regenerate action.

- **Check** - The cron job is executed for auto regeneration of certificates at a scheduled time.
- **Monitor** - The scheduled job is monitored and triggered by default daily at 02:00:00 A.M.

Note: Auto generates for the certificate available in the inventory, enabled with Auto regenerate action in the CA connector when the threshold is reached, as mentioned in the CA connector form, the auto regenerate will be triggered.

- **Audit** - The internal business logic of auto-regenerates certificates is captured via audit logs and notification logs in the logging module.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Automated Credential Rotation

This job automates the rotation of credentials (keys, passwords, or tokens) for integrated systems or devices. It can be scheduled to run at regular intervals based on the credential's TTL, or triggered on demand. The job is disabled by default and can be enabled as needed.

For instructions on enabling/disabling and configuring the job, see Working with the Job Scheduler.

Auto-Renew Certificates

This job is triggered periodically to check whether the renewed action to be triggered for the certificates in the inventory that are enabled with Renew Automatically in the CA connector, based on a certificate is reached the time to trigger the renew action.

- **Check** - To auto-renew certificates if it is scheduled.
- **Monitor** - The scheduled job is monitored and triggered by default daily every 6 hours.
- **Audit** - The internal business logic of auto-renew certificates is captured via audit logs and notification logs in the logging module.

CA Connector Validity Updater

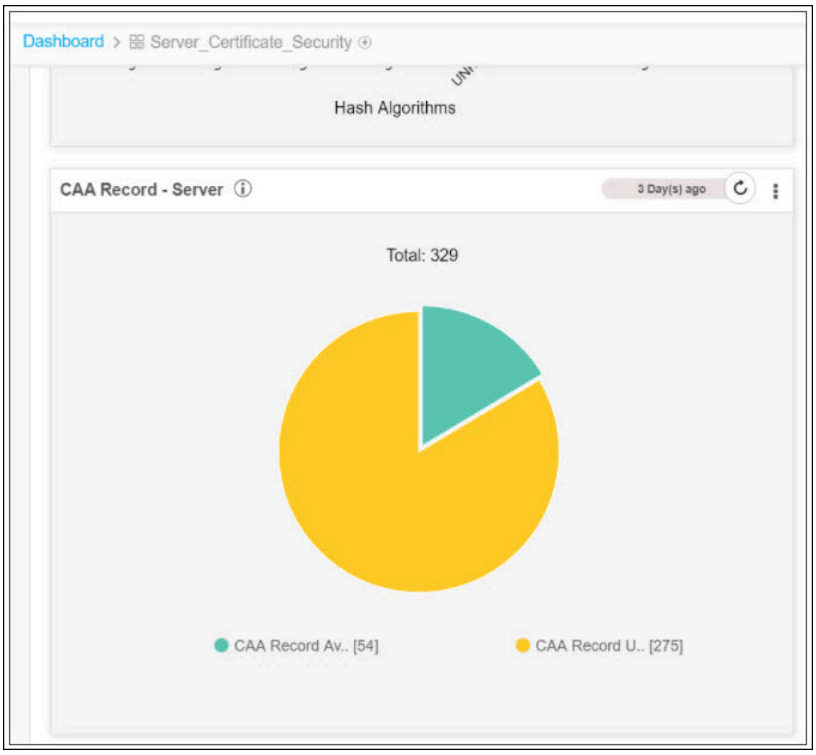
It allows to check the validity offered by CA and update the same in CA connector and policy.

- **Check** - The cron job is executed to check the validity offered by the External CA and update the same in CA connector and Certificate policy.
- **Monitor** - The scheduled job is monitored and triggered by default on every Sunday at 06:00:00 A.M.
- **Audit** - The internal business logic to update the CA connector and Policy is captured via audit logs and notification logs in the logging module.

Certificate CAA Record Check

A Certification Authority Authorization (CAA) record is used to specify which certificate authorities (CAs) are allowed to issue certificates for a domain.CAA records allow domain owners to declare which certificate authorities are allowed to issue a certificate for a domain. They also provide a means of indicating notification rules in case someone requests a certificate from an unauthorized certificate authority. If no CAA record is present, any CA is allowed to issue a certificate for the domain. If a CAA record is present, only the CAs listed in the record(s) are allowed to issue certificates for that hostname.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- **Check** -
  - The cron job is executed to check the CAA record for all the certificates in the inventory.
  - Once the job is completed, the CAA report is updated in the server_certificate_security dashboard.
- **Monitor** - The scheduled job is monitored and triggered by default weekly, on Monday.
- **Audit** - The internal business logic to check the CAA records for all the certificates are captured through audit logs and notification logs in the logging module.

Certificate Compliance Check

A compliance check is the process of review and analysis of the implemented controls to check that the implemented controls and their outputs meet the certificate policy requirements. It checks the compliance for all the certificates in the inventory. If the policy is changed the compliance will be in pending status till this job is executed.

- **Check**
  - The cron job is executed to check the compliance status for all certificates in the inventory.
  - If the policy is changed the compliance will be in pending status till this job is executed.
  - Once the job is completed, the **compliance report** is updated in the **server and client** certificates dashboard.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Monitor** - The scheduled job is monitored and triggered by default daily at 05:00 A.M.
- **Audit** - The internal business logic for compliance checks is captured via audit logs and notification logs.

Certificate Expiry Status Check

This job is triggered periodically to update the expiry status for all the certificates in the inventory.

- **Check** - The cron job is executed to check the expiry status of all the certificates available in the inventory.
- **Monitor** - The scheduled job is monitored and triggered by default daily 20 minutes every 5 hours.
- **Audit** - The internal business logic to check the expiry status is captured via audit logs and notification logs in the logging module.

Certificate Polling Request

This job gets triggered only during the performance of CLM actions. Once the CSR gets submitted to the Certificate Authority, until the signed certificate is received from the certificate authority, the polling request job gets triggered to collect the certificate in the response.

Certificate Revoke Status Check From CA

For all the certificates managed or monitored in the inventory, this job will be performed periodically at the configured duration. Based on this check, the certificate status in the inventory will be updated with either revoked or others.

Note: This feature is supported only for Digicert CA.

- **Check** - The cron job is executed to check only the certificate revoke status from the CA Portal.
- **Monitor** - The scheduled job is monitored and triggered by default every 15 minutes.
- **Audit** - The internal business logic to check the certificate revoke status from the CA portal is captured via audit logs and notification logs in the logging module.

Certificate Transparency Check

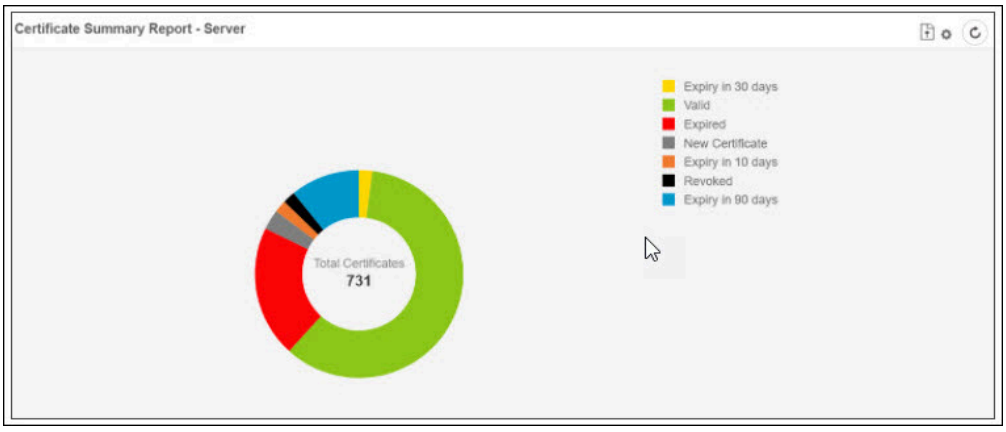
This is a periodical running job to update the certificate transparency report data available in the dashboard Server certificate security. It allows checking the certificate transparency for all certificates in the inventory (Google CT project). The Certificate Transparency safeguards the certificate issuance process by monitoring and auditing HTTPS certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Check**
  - The cron job is executed to check the Certificate transparency for all certificates in the inventory.
  - The internal business logic uses the Google CT project (Open source) to identify the violation
  - Once the job is completed, the CT and CAA reports are updated in the server_certificate_security dashboard.
- **Monitor** - The scheduled job is monitored and triggered by default weekly, on Sunday.
- **Audit** - The internal business logic to check the CT for all the certificates is captured via audit logs and notification logs in the logging module.

Certificate Validation Check

This is a periodical running job to validate the chain of trust information for all the certificates in the inventory. Based on this validation, the certificate validation report will be updated with the latest data in the server certificate dashboard.



- **Check**
  - The cron job is executed to check the validation for all certificates in the inventory.
  - Once the job is completed, the certificate summary report is updated in the Server Certificate and Client Certificate Dashboard.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Monitor** - The scheduled job is monitored and triggered by default weekly, on Monday.
- **Audit** - The internal business logic to check the CT for all the certificates is captured through audit logs and notification logs in the logging module.

Certificate Vulnerability Check

This is a periodical running job to update the vulnerability report data available in the dashboards Server endpoint security. It allows checking the vulnerability in the device such as Toodles, Heart bleed, and Roca.

- **Check** -
  - The cron job is executed to check the certificates and their device association
  - There is internal business logic to check the Poodle, Heart bleed, and Roca vulnerabilities for the associated device.
  - Once the job is completed the “Vulnerability reports” are updated in “Server_Endpoint_Security”, “Client_Endpoint_Security”.
  - The ROCA vulnerability is a cryptographic weakness that allows the private key of a key pair to be recovered from the public key in keys generated by devices with the vulnerability.
  - The Heartbleed Bug is a serious vulnerability in the popular OpenSSL cryptographic software library. This weakness allows stealing the information protected, under normal conditions, by the SSL/TLS encryption used to secure the Internet.
  - The Poodle vulnerability lets an attacker eavesdrop on communication encrypted using SSLv3. The vulnerability is no longer present in the Transport Layer Security protocol (TLS), which is the successor to Secure Socket Layer (SSL).
- **Monitor** - The scheduled job is monitored and triggered by default weekly, on Saturday.
- **Audit** - The internal business logic to check the vulnerability of the device. It is captured via audit logs and notification logs in the logging module.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CRL Certificate Revocation Check

To download the CRL for all the certificates in the inventory and validate with the downloaded CRL record. You can change the revocation status in the inventory.

- **Check**
  - The cron job is executed to download CRL data for all the certificates available in the inventory.
  - Once CRL is downloaded compare and change the revocation status in the inventory.
- **Monitor** - The scheduled job is monitored and triggered by default daily every 6 hours.
- **Audit** - The internal business logic for certificate revocation check is captured via audit logs and notification logs in the logging module.

CRL Download Monitor Job

To monitor the certificates in inventory and download the CRL for the newly added certificate. Make sure that the below actions are completed for the CRL download monitor job.

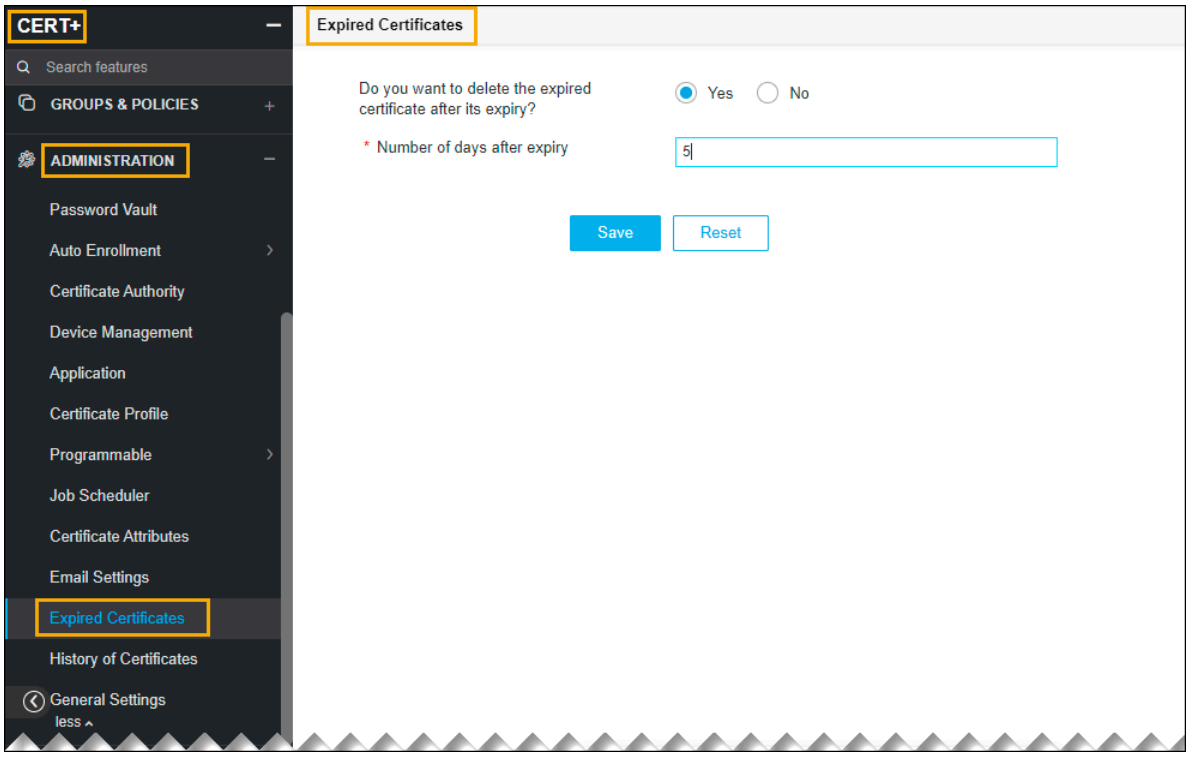
- **Check** - The cron job is executed to monitor the certificates in inventory to download the CRL for the newly synchronized certificate.
- **Monitor** - The scheduled job is monitored and triggered by default every 5 minutes.
- **Audit** - The internal business logic for the certificate download monitor job is captured via audit logs and notification logs in the logging module.

Delete Expired Certificates

This is a periodical job to check and delete the expired certificates available in the inventory. This job will be triggered only when this action is enabled in **Expired Certificates**.

- **Check** - The cron job is executed to delete the expired certificates in the inventory. To enable the delete expiry certificate function, do the following steps:
  1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Expired Certificates**.
  2. Enable **Yes** to delete the expired certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: Once enabled, automatically the expiry certificate will be deleted.

- **Monitor** - The scheduled job is monitored and triggered by default daily at 03:00:00 A.M.
- **Audit** - The internal business logic of auto regenerate certificates are captured via audit logs and notification logs in the logging module.

Device and Certificate synchronization

This periodical running job synchronizes the data such as certificates and objects used for application connectors from devices to AppViewX. The device includes ADC, Servers, Firewall, WAF, Cloud, and MDM.

- **Check**
  - The cron job is executed to synchronize the inventory certificates from the managed device inventory.
  - The device inventory is categorized as ADC, Server, WAF, Firewall, Cloud, MDM, and so on.
  - The job discovers all devices in the managed state.
- **Monitor**

Periodic CRL Update for AppViewX and Custom CAs

To do the CRL rotation for AppViewX and Custom CA. The CRL is regenerated, any expired certificates are removed from the CRL.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Check** - The cron job is executed to rotate CRL for AppViewX and Custom CA so that the CRL is regenerated, any expired certificates are removed from the CRL.
- **Monitor** - The scheduled job is monitored and triggered by default daily at 05:00:00 A.M.
- **Audit** - The internal business logic to update the CRL is captured through audit logs and notification logs in the logging module.

Working with the Job Scheduler

This topic describes the basic functionality of the job schedulers available in CERT+. These cron jobs are scheduled in the background to check, monitor, audit the certificates in inventory. The AppViewX Platform cron job checks the certificate cron job every 15 minutes and looks for the changes and triggers the job at a scheduled time.

The Cron job frameworks are:

- Check
- Monitor
- Audit

Check

- Each Cron Job is executed for the batch of certificates (depending on the job) asynchronously and on successful completion, the status is updated in the database.
- All Cron jobs executed asynchronously based on the scheduled time.
- Each Cron job is bound to the internal business logic to update the status in the database.

Monitor

- Cron jobs are scheduled at recurring intervals and customized to run the job multiple times in a day or months.
- Audit Logs are captured in the logging subsystem.

Audit

- The auditing is enabled subsystem-wise (ADC+ and CERT+) based on internal business logic.
- Notification logs and Audit logs are captured for each internal business logic.

For the full list and details of scheduled jobs supported in CERT+, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling/Disabling a Job

1. Go to (**Menu**) > **CERT+** > **Administration** > **Job Scheduler**.
2. Under **Task Name**, for the **required job** job, click the **Enabled**/**Disabled** toggle key.
   The key label shows the current job status.

Modifying the Configuration of a Job

1. Under **Task Name**, select the required job.
   A dialog box with the configuration for the selected job is displayed.
2. Update the job configuration as required and click **Update**.

Field descriptions for the job configuration

Frequency Type	Description
Description	Enter details related to the job. **Note:** Character limit: **2000 characters**
Time Zone	From the dropdown list, select the time zone in which the job will be triggered.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Minutes**
***Starts On**	Click **(Calendar** widget) to select a date to start triggering the job.
***Repeat**	(Optional) For **Occurrence Type** = **Daily**, from the dropdown list, select the number of **Times** a job should be triggered in the course of a day. (Mandatory) For **Occurrence Type** = **Minutes**, from the dropdown list, select the interval, in **Minutes**, after which the job should be triggered.
***Repeat On**	For **Occurrence Type** = **Weekly**, select the checkbox corresponding to the day of the week on which the job should be triggered.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Summary	Displays a summary of the selections made for the job schedule.
**: Mandatory fields*

Chapter 4: CERT+ API Guide

This guide provides information on the APIs to use for various CLM actions.

API Reference

To try the AppViewX exposed APIs on Swagger, follow these steps:

1. From the top right corner of your screen, click {...} **(API Reference)** icon.

   Note: The **API Reference** icon is displayed for the Admin user and users with ACF permission enabled for API Reference.

   You will be redirected to **AppViewX API Reference** page.

2. Click the required API to **Try it out**.

Enable ACF Permission for API Reference

To enable the ACF permission for non-admin roles to access the API reference, follow these steps:

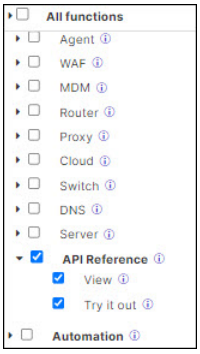
1. Go to **Platform** module **IDENTITY** > **Role**.

   You will be redirected to **Role** page.

2. Click on the role name to enable the ACF permission.

   You will be redirected to the **Modify :: [RoleName]** page, with the **Information** tab open by default.

3. Switch to the **Authorized Functions** tab and expand the **Platform** by clicking **(Expand)** icon.
4. To assign **API Reference**, select the checkbox beside **API Reference**.



5. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Best Practices for Working with the AppViewX API

- **Use appropriate HTTP methods.**

  Ensure that the correct HTTP method is used for each operation (e.g., GET for retrieval, POST for creation).

- **Handle errors gracefully.**

  Implement proper error handling in your application to manage API responses.

- **Use secure storage.**

  Store access tokens securely and avoid hardcoding them in your application code.

- **Implement pagination.**

  For endpoints that return large datasets, implement pagination using limit and offset parameters.

Understanding the AppViewX CERT+ API

The AppViewX CERT+ API provides a set of RESTful endpoints for managing certificates across your infrastructure. This section covers how to make requests, handle responses, and understand the structure of the API.

RESTful HTTPS Requests

The CERT+ API uses RESTful principles, leveraging standard HTTP methods to interact with resources. All requests must be made over HTTPS to ensure security.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Type	Description
GET	GET requests, retrieve resource representation/information only and not to modify it.
POST	POST APIs create new subordinate resources. For example, a file is subordinate to a directory containing it or a row is subordinate to a database table. In terms of REST, POST methods are used to create a new resource into the collection of resources.
PUT	PUT APIs are used to update existing resources (if a resource does not exist then API may decide whether to create a new resource or not).
DELETE	DELETE APIs are used to delete resources (identified by the Request-URI).

Requests

All API endpoints are accessed via the following base URL. The base URL is built in the same way by the following structure:

```
http://<IP/HostName/TenantName>:<GWPORT>/avxapi/<Endpoint>?<gwsource>
```

Explanation

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Request Structure

All endpoints accept a request structure that should consist of JSON formatted data. To ensure the request is accepted, set the header **Content-Type: application/json**.

The following example shows a request to add a resource:

```
{
"payload": {
"name": "resource_1",
"description": "This is a sample resource."
}
}
```

Response Structure

The Content-Type of the response is typically determined by the Content-Type header, and for most endpoints, it will be application/json. All requests that reach the server, regardless of the response code, will retrieve a response body. A successful request will contain a body with the requested information, for example:

```
https://appviewxapi.com/avxapi/resource?gwkey=f000ca01&gwsource=external
```

Returns the following JSON structure that a resource is added:

```
{
"response": "Resource added successfully",
"message": "Resource added successfully",
"appStatusCode": null,
"tags": null,
"headers": null
}
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Description of Server Responses

HTTP Code	Response Message
200 OK	The request was successful (some API calls may return 201 or 202 instead).
400 Bad Request	The request is not understood or required parameters are missing.
401 Unauthorized	Authentication failed or the user doesn't have permissions for the requested operation.
409 Forbidden	Access denied.
404 Not Found	Resource not found.
429 Too many requests	The number of requests to the service has crossed the threshold.
503 Service unavailable	The client cannot communicate with the service.
504 Gateway timeout	The given request has exceeded the expected time.

URI Scheme

- **Host :** {url}
- **BasePath :** /avxapi
- **Schemes :** HTTPS
- **URL :** https://{url}/avxapi

Types of Accounts in AppViewX

There are two types of accounts in AppViewX:

- **User Accounts**: These are used by actual users.
- **Service Accounts**: These are used by system services such as web servers, automation tools, and so on.

AppViewX recommends using a Service Account for accessing APIs from automation tools. Service Accounts are supported with oAuth standard for a more secure and standard way of accessing APIs.

Note: AppViewX supports both User Account and Service Account for accessing APIs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Authentication using a User Account

For accessing APIs using a User account:

- **User Account**

  A **user account** represents an individual person interacting with the application or the system. User accounts are used for accessing the system on behalf of a user.

  For accessing APIs with a user account, you need to get the session ID by providing a username and password in the Login API. This session ID can then be used for accessing other APIs.

  Note: You can also use the username and password in all API calls instead of the sessionId. However, this is not recommended.

- Retrieve session ID using login API
- Using Session ID for further API calls

Retrieve session ID using login API

This API used to retrieve the session ID using the login API for secure authentication and access to system resources.

Before you begin

- Make sure you have valid login credentials (Username and Password) for accessing the system.
- You cannot use OAuth credentials (Client ID and Client Secret) for login.
- To access the APIs using the service token, use the API with the Service Account.

Request Structure

Endpoint	`/login`
Type	`POST`
Sample URL	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/login?&gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request timeout period	15 minutes

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Input Parameters

	Description
username	(Mandatory) Use login name of the user.
Header	**Type:** String
	Example: "admin"
password	(Mandatory) Password for the username.
Header	**Type:** String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

	Description
	Example: "AppViewX@123"
otp *Header*	(Mandatory only if MFA is enabled) If MFA is enabled, enter the OTP received on your registered email ID in the header. Multifactor authentication (MFA) is a security mechanism that requires users to provide two or more verification factors to gain access to a resource If MFA is enabled, and you try to login with only the username and password, you will get the following error upon execution of the API: **MFA is enabled. We have sent an OTP to your email ID: aaa********r@appviewx.com**. In this case, ensure that the OTP is included in the header and try logging in again. **Type:** String **Example:** "OTP : **609700**"
Content-Type *Header*	(Mandatory) The parameter should be set to `application/json` to specify the nature of the data in the payload. **Type:** String **Example:** "application/json"
gwsource *Query*	(Mandatory) Source from which the request is triggered. The values can be: • web • external **Type:** String

Response Structure

- **Status Code:** 200 Ok
- **Message:** Login Successful
- **Headers:**
  - **Content-Type:** application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters

Name	Description
response	The response contains the attributes needed to retrieve the session ID.
message	Success message or failure description in case of error.
appStatusCode	Application specific status code for the response. Will be non-null for failure response.
tags	More info in case of failure response.

Name	Description
status	Indicates the overall status of the response. The values can be: • SUCCESS • FAILURE
appStatusCode	An application-specific status code, if applicable.
statusDescription	Description of the status, if available.
sessionId	Unique identifier for the session.
lockDownPeriod	Number of login attempts remaining.
termsAccepted	
passwordExpiryMsg	
emailId	

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Login successful
400 Bad request	ACCT_AUTH_001	Username or password cannot be null or empty.
401 Unauthorized	ACC_AUTH_022	Login failed. Invalid credentials.
401 Unauthorized	ACC_AUTH_006	Login failed. Invalid credentials.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample Request/Response

Use Case

Log in to the application with a username and password.

Sample Request URL

```
https://<IP/HostName/TenantName>:<GWPORT>/avxapi/login?&gwsource=external
```

Request Payload

```
{}
```

Sample Response

```
{
    "response": {
        "status": "SUCCESS",
        "appStatusCode": null,
        "statusDescription": null,
        "sessionId": "avx~~c73a4f56-f4ab-4cdf-aadf-6d90bf406077",
        "authCode": null,
        "lockDownPeriod": 15,
        "emailId": null,
        "termsAccepted": true,
        "passwordExpiryMsg": ""
    },
    "message": "Login successful.",
    "appStatusCode": null,
    "tags": null,
    "headers": null
}
```

What's next?

After the sessionID is retrieved using the login API, you can now use the session ID for API calls.

Using Session ID for further API calls

The sessionID retrieved using the login API can be used in the header for making further API calls.

In this section, as an example, we are using the session ID with the API call for reissuing a certificate in the async mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

Ensure the following before attempting to renew certificate from any CA through AppViewX:

- The CA setting must be configured in AppViewX for the CA.
- Connectivity to the CA via the chosen setting is working fine.
- **Approval is not required:** Enable this mode by setting the 'Certificate Requests Need Approval?' flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/action
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
userName *Header*	(Mandatory only if **sessionID** is not provided) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwkey *Query*	(Mandatory) Tenant Key. This is required only for multi-tenant installations and can be disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload	Contains all the parameters to be sent in the request body for the put request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Body	**Type**: Payload

Payload

Payload

Name	Description
resourceId	(Mandatory) Unique Id of the certificate. **Type**: String **Constraint**: Required if the commonName and serialNumber are not specified.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.
serialNumber	(Mandatory) Serial number of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.
action	(Mandatory) Action name for the reissue. **Type**: String **Possible values**: Reissue
reason	(Mandatory) Reason for reissue request. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response attributes for the reissue request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	Work order request Id. **Type**: String
message response	Success message - Reissue action triggered successfully. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - reason. **Remediation**: Ensure that the **reason** field is available in the request payload.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open workOrder for the certificate is completed.
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the reissue action. • There is no workOrder in progress for the specified certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		• Certificate does not belong to read only group. • Certificate is not in the monitored status.

Sample Request/Response

Request Payload

```
{
"commonName":"testcert8g.appviewx.plus",
 "serialNumber":"08:BD:54:35:FD:81:AC:A4:45:2B:FC:9F:77:56:FE:2C",
 "action":"Reissue",
 "reason":"Superseded"
 }
```

Response

```
{
"response": {
"resourceId": "5f51f7312fa95059a12b0aee",
"message": "Reissue action triggered successfully.",
"requestId": "238"
},
"message": "Reissue action has been triggered successfully",
"appStatusCode": null,
"tags": {},
"headers": null
}
```

Authentication using a Service Account

For accessing APIs using a Service account:

- **Service Account**

  A **service account** represents a non-human entity such as an application or a service. It is used for automated processes or system-to-system interactions without human intervention.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For accessing APIs with a service account, you need to get the Access Token by providing Client ID and Client Secret in get-service-token API. This Access Token can then be used for accessing other APIs.

Note: Access Token Validity is 30 minutes by default and it can be configured in **Settings** > **Authentication** > **oAuth Settings**.

- Retrieve Access Token using get-service-token API
- Using Access Token in the header for further API calls

Retrieve Access Token using get-service-token API

The API provides a streamlined process for retrieving service tokens related to account management tasks.

Before you begin

- Make sure you have valid login credentials for accessing the system.

Request Structure

Endpoint:	/acctmgmt-get-service-token
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/acctmgmt-get-service-token?gwsource=external To understand the elements of the sample URL, click here.
Headers:	
Content-Type:	application/json
Authentication:	Yes
Request timeout period	15 minutes

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Input Parameters

	Description
Authorization *Header*	(Mandatory) Please form a string in this format <Client ID>:<Client Secret> and do base64 encoding. Then prepend a key 'Basic' before the encoded value. Final value should be "Basic <EncodedValue>". **Type:** *String* **Example:** "admin"
Content-Type *Header*	(Mandatory) The parameter should be set to `application/json` to specify the nature of the data in the payload. **Type:** *String* **Example:** "application/json"

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

	Description
grant_type *Payload*	(Mandatory) Payload Type should be "Form". The value of the param should be "Client_Credentials". **Type:** *Text*

Response Structure

- **Status Code:** 200 Ok
- **Message:** Successful
- **Headers:**
  - **Content-Type:** application/json

Response Parameters

Name	Description
response	The response contains the attributes needed to retrieve the access token.
message	Success message or failure description in case of error.
appStatusCode	Application specific status code for the response. Will be non-null for failure response.
tags	More info in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Successful
400 Bad request	ACCT_SA_003	Service account is invalid/not found::[Service account not found in the database]
400 Bad request	OAUTH_CLNT_015	Client Password is incorrect::[Invalid Client credential]
400 Bad request	ACCT_SA_001	Invalid Request::[Invalid client Id or secret]
500 Internal Server Error	avx-common-011	Error while processing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample Request/Response

Use Case

Retrieve Access Token.

Request URL

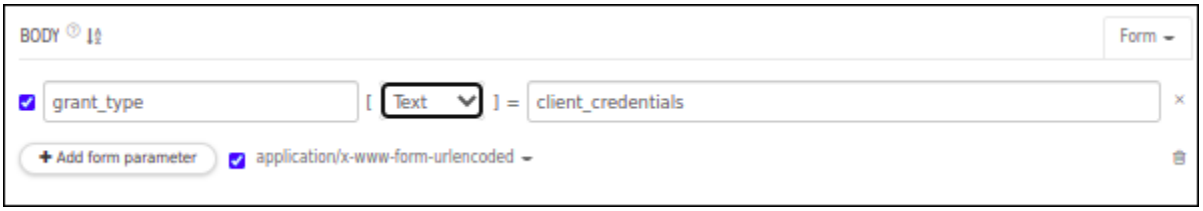
```
https://<IP/HostName/TenantName>:<GWPORT>/avxapi/acctmgmt-get-service-token?gwsource=external
```

Content-Type: application/x-www-form-urlencoded

Authorization: Basic

```
NTIxYzNhZDItZWE0ZS00NDdiLWE1MWItOTYyMWJiN2VhMTI2OjU1QVUjTk84JSpaaGd2TmZhWVVtdHZYMGRrRWhvZGJpCg==
```

Request Payload



Sample Response

```
{
"response":
 "eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJzdWIiOiJwbGF0Zm9ybSIsImF1ZCI6ImF2eCIsImNsaWVudElkIjoiOTcwNzRlNDEtOGFmOS00NTZkLTlhNjQtZjBj
 NGJiOTA4MDQ4IiwiaXNzIjoiYXZ4IiwiZXhwIjoxNjUwMzY5MzY3LCJncmFudCB0eXBlIjoiY2xpZW50X2NyZWRlbnRpYWxzIn0.HZnkuUEjXIeqJWqpqiNWFHqIDI7
 GYf4cWx6VwbjGD_0",
"message": null,
"appStatusCode": null,
"tags":{},
"headers": null
}
```

Using Access Token in the header for further API calls

The access token retrieved using the get-service-token API can be used in the header for making further API calls.

In this section, as an example, we are using the access token with the API call for reissuing a certificate in the async mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

- Access Token is obtained from the get-service-token API.
- Ensure that the Access Token is valid and has not expired.

Request Structure

Endpoint:	`/certificate/create`
Type:	`POST`
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/resource?gwsource=external` To understand the elements of the sample URL, click here.
Headers:	
Content-Type:	application/json

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Input Parameters

Name	Description
Token *Header*	(Mandatory) Use token retrieved from login API. **Type:** *String* **Example:** eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJzdWIiOiJwbGF0Zm9ybSIsImF1ZCI6ImF2eCIsImNsaWVudElkIjoiOTcwNzRlNDEtOGFmOS00NTZkLTlhNjQtZjBjNGJiOTA4MDQ4IiwiaXNzIjoiYXZ4IiwiZXhwIjoxNjUwMzY5MzY3LCJncmFudCB0eXBlIjoiY2xpZW50X2NyZWRlbnRpYWxzIn0.HZnkuUEjXIeqJWqpqiNWFHqIDI7GYf4cWx 6VwbjGD_0
gwsource *Query*	(Mandatory) Source from which the request is triggered. The values can be: • web • external **Type:** *String*
Payload *String*	(Mandatory) Input data for request body in application/json format. For payload details, see Payload section.

Payload

Name	Description
name *String*	(Mandatory) Name of the resource to create. Name cannot be duplicated. **Example:** "resource_1"
description *String*	(Optional) Description of the resource. **Example:** "This is a sample resource."

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure

- **Status Code:** 201 Created
- **Message:** Resource added successfully
- **Headers:**
  - **Content-Type:** application/json

Response Parameters

Name	Description
response	Contains the response attributes for resource added successfully.
message	Success message or failure description in case of error.
appStatusCode	Application specific status code for the response. Will be non-null for failure response.
tags	More info in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
201 Created	null	Resource added successfully
409 Conflict	RBAC_RE_005	Resource with the given name already exists
400 Bad Request	VALIDATION_ERROR_0004	'name' should have at least '2' characters, Mandatory Field 'name' is missing or empty
400 Bad Request	VALIDATION_ERROR_0004	Invalid "name".
401 Unauthorized	AVX_GW_012	Unauthorized access, reason - Invalid Token
407 Proxy Authentication Required	AVX_GW_011	Session validation failed, reason - Session information is missing.

Sample Request/Response

Use Case

Add a resource using API with Access Token.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample Request

```
https://<IP/HostName/TenantName>:<GWPORT>/avxapi/resource?gwsource=external
```

Request Payload

```
{
 "payload": {
 "name": "resource_1",
 "description": "This is a sample resource."
 }
 }
```

Sample Response

```
{
 "response": "Resource added successfully",
 "message": "Resource added successfully",
 "appStatusCode": null,
 "tags": null,
 "headers": null
 }
```

Create a Certificate in Async mode

The API initiates the creation of a new certificate in async mode. This mode requests certificate generation and provides a request ID in the response. The request payload varies depending on the Certificate Authority (CA) used for enrollment. After successfully triggering the create certificate API, the response includes the resourceId, which can be used to activate the search API and retrieve the created certificate. Please refer to the After you are done section for instructions on approving and implementing the request.

Before you begin

Ensure the following before attempting to enroll a certificate from a particular CA through AppViewX:

- The CA must configured in AppViewX from the Certificate Authority page.
- The user should have the ACF permission to submit certificates within the specified certificate's category.
- The group associated with the certificate must have RW permission.
- Connectivity to the CA via the chosen setting should be working correctly.
- A certificate group should be created and associated with the policy. If not, the certificate will be created under the Default group.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/create
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/create?gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Payload	Contains all the parameters to be sent in the request body for the post request.
Body	**Type**: Payload

Payload

Payload

Name	Description
csrGenerationSource	(Optional) Specifies where the CSR is to be generated. **Type**: **Possible values:**: appviewx, uploadCSR, ENDPOINT, hsm. **Default value**: appviewx
caConnectorInfo	(Mandatory) Details related to the certificate authority (CA) and the CSR parameters. **Type**: Any of the following data: • Amazon caConnectorInfo • AppViewX caConnectorInfo • DigiCert caConnectorInfo • EJBCA caConnectorInfo • Entrust caConnectorInfo • EntrustMPKI caConnectorInfo • GlobalSign caConnectorInfo • GoDaddy caConnectorInfo • Google caConnectorInfo • InCommon caConnectorInfo • LetsEncrypt caConnectorInfo • Microsoft Enterprise caConnectorInfo • Microsoft Standalone caConnectorInfo • OpenTrust caConnectorInfo • Sectigo caConnectorInfo

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	• Symantec caConnectorInfo • Trustwave caConnectorInfo
certificateGroup	Specifies the group (category) to which the newly created certificate should be assigned. **Type**: certificateGroup **Constraint**: Default certificate Group is "**Default**".
deviceDetails	(Optional) Information about the device or endpoint where the Certificate Signing Request (CSR) will be generated. **Type**: deviceDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **Endpoint**.
certificateHSMDetails	(Optional) Information about the Hardware Security Module (HSM) device. **Type**: certificateHSMDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **HSM**.
uploadCsrDetails	(Optional) Information about the CSR. **Type**: uploadCsrDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **uploadCSR**.
certificateFormat	(Optional) Certificate download format details. **Type**: certificateFormat

certificateGroup

Name	Mandatory
name	(Optional) Specifies the group under which the created certificate needs to be tagged. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateGroup (continued)

Name	Mandatory
	Constraint: The certificate group must be present in AppViewX.

deviceDetails

Name	Mandatory
category	(Mandatory) Specifies the device category **Type**: String **Possible values**: ADC, Server, and Firewall.
vendor	(Mandatory) Name of the vendor for the chosen device. For example, **Apache** is a vendor for **Server** category. **Type**: String
deviceName	(Mandatory) Name of the device as per AppViewX Device Inventory. **Type**: String
csrFileName	(Mandatory) Name of the CSR file that is generated in the device. **Type**: String
keyFileName	(Mandatory) Name of the key file that is generated in the device. **Type**: String
attributes	(Optional) Additional attributes for the chosen device as mentioned the sub-attributes - csrLocation, tenant, and partition. **Type**:
csrLocation attributes	(Optional) The location within the device where the CSR is generated. **Type**: String **Constraint**: It is **mandatory** when **deviceDetails.category** is **Server** and the **deviceDetails.vendor** is **Tomcat**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

deviceDetails (continued)

Name	Mandatory
tenant attributes	(Optional) Name of the partition within the AVI device. **Type**: String
partition attributes	(Optional) Name of the partition within the device. **Type**: String **Constraint**: It is **mandatory** when **deviceDetails.category** is **Friewall** and the **deviceDetails.vendor** is **Fortinet**.

certificateHSMDetails

Name	Mandatory
type	(Mandatory) Type of the HSM device. **Type**: String **Possible values**: ADC and HSM.
keyReference	(Mandatory) Reference name for the key that is mapped by the HSM device. **Type**: String
hsmSettings	(Mandatory) Configuration details for the HSM device. Contains the sub-parameters vendorType and vendorSpecificSettings **Type**: List <String>
vendorTypehsmSettings	(Mandatory) Category of the vendor. **Type**: String **Possible values**: Safenet, Thales, and Fortanix.
vendorSpecificSettingshsmSettings	(Mandatory) Settings related to HSM vendor. Contains the sub-parameter moduleId

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateHSMDetails (continued)

Name	Mandatory
	Type: String
moduleId `hsmSettings. vendorSpecificSettings`	(Optional) The module id. **Type**: String **Constraints**: Applicable if **hsmSettings.vendorType** is **Thales**.
vendor	(Mandatory) The name of the vendor for the chosen device e.g., F5. **Type**: String
deviceName	(Mandatory) The name of the device as per AppViewX Device Inventory. **Type**: String

uploadCsrDetails

Name	Mandatory
category	(Mandatory) Certificate category **Type**: String **Possible values**: Server, Client, and Code Signing
csrContent	(Mandatory) The CSR content for certificate enrollment request **Type**: String

certificateFormat

Name	Mandatory
format	(Mandatory) Certificate download format. Refer to the Possible values for Certificate Download Format table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateFormat (continued)

Name	Mandatory
	Type: String
password	(Optional) The field is mandatory for some parameters (refer to the table below). **Type**: String

Possible Values for Download Format

Certificate Extension	Value in the Payload	Password Required
.crt	CRT	No
.cert	CERT	No
.cer	CER	No
.pem	PEM	No
.der	DER	No
.cer	DERCER	No
.p7b	P7B	No
.p7c	P7C	No
.pk8	PK8	No
.pk12	PK12	Yes
.pfx	PFX	Yes
.jks	JKS	Yes

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
resourceId response	Identifier of the certificate record that has been created (the resourceId in the above request can be found using the search API using commonName, serial No. or other search parameters). **Type**: String
requestId response	Open work order request ID. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Certificate submission triggered successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_CSR_GEN_SOURCE	Invalid csr generation source specified. **Remediation**: Ensure that a valid value is provided for the csrGenerationSource field in the request.
417 Expectation failed	READ_GROUP	Group is given with read permission, so cannot perform any operation. **Remediation**: Ensure that the field csrGenerationSource field has read write permission.
404 Expectation failed	GROUP_NOT_FOUND	Invalid group name specified. **Remediation**: Ensure that a valid value is provided for the certificateGroup section in the request.
404 Not Found	CERT-CA-0001	CA settings are not available. **Remediation**: Ensure that a valid value is provided for the caSettingName section in the request.

References

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

- Trustwave

Amazon

Amazon Request Objects

Amazon caConnectorInfo

Name	Description
certificateAuthority	(Mandatory) Name of the certificate authority that issues the certificate. **Type**: String **Constraint**: The value should be **Amazon**.
isAutoRenewal	(Optional) Determines whether the certificate will be renewed before its expiration date. If enabled (true), renewal is initiated before the expiry date, following the specified number of days in "renewBefore." **Type**: Boolean **Constraint**: The value should be disabled (false) if autoRegenerateEnabled is true.
renewBefore	(Optional) Specifies the number of days prior to expiration when the renewal request should be triggered. **Type**: Integer **Constraint**: The value must be provided if isAutoRenewal is true.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Amazon caConnectorInfo (continued)

Name	Description
autoRegenerateEnabled	(Optional) Determines whether the certificate will be regenerated before its expiration date, as indicated by the "regenerateBeforeInDays" field. If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: Amazon CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: Amazon genericFields
name	(Optional) Name for the CA connector. **Type**: String

Amazon CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Amazon CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Amazon CSR Parameters (continued)

Name	Description
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameter is dNSNames.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String

Amazon genericFields

Name	Description
device_name_<certificateAuthority>	(Optional) Server device name for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.
vs_ip_<certificateAuthority>	(Optional) Server IP address for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.

AppViewX caConnectorInfo (continued)

Name	Description
	If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
certificateProfileName	(Optional) Determines the category of certificate that is being requested. **Type**: String **Constraint**: Possible values - Server, Client, and Code Signing. The default value is Server.
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: AppViewX CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: AppViewX genericFields
validityUnitValue	(Mandatory) Specifies the number of days, months, or years of validity for the CA based on the value in the "validityUnit." For example, if the expected validity is 1 year and "validityUnit" is months, then the "validityUnitValue" should be 12.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AppViewX caConnectorInfo (continued)

Name	Description
	Type: Integer **Constraint**: If the validityUnit is not provided, then the validityUnitValue must be provided in days.
validityInDays	(Optional) Specifies the validity in days. **Type**: Integer
validityUnit	(Optional) Specifies the unit in which the "validityUnitValue" is specified. **Type**: Integer **Constraint**: Possible values are days, months, or years.
name	(Optional) Name for the CA connector. **Type**: String

AppViewX CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AppViewX CSR Parameters (continued)

Name	Description
	Constraint: Default value - the value configured in the policy.
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located. **Type**: String **Constraint**: Default value - the value configured in the policy.
mailAddress	(Optional) Email address of the organization. **Type**: String
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AppViewX CSR Parameters (continued)

Name	Description
	Constraint: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameters are dNSNames and iPAddresses.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String
iPAddresses `enhancedSANTypes`	(Optional) List of IP address to be considered as subject alternative names. **Type**: Array of String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AppViewX genericFields

Name	Description
device_name_<certificateAuthority>	(Optional) Server device name for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.
vs_ip_<certificateAuthority>	(Optional) Server IP address for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.

DigiCert caConnectorInfo (continued)

Name	Description
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
divisionId	(Mandatory) Digicert division id. **Type**: String
certificateType	(Mandatory) Name of the certificate product offered by the certificate authority. **Type**: String
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: Digicert CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: Digicert genericFields
vendorSpecificDetails	(Optional) Data specific to the Digicert vendor. **Type**: Digicert vendorSpecificDetails
validityUnitValue	(Mandatory) Specifies the number of days, months, or years of validity for the CA based on the value in the "validityUnit." For example, if the expected validity is 1 year and "validityUnit" is months, then the "validityUnitValue" should be 12. **Type**: Integer **Constraint**: If the validityUnit is not provided, then the validityUnitValue must be provided in days.
validityInDays	(Optional) Specifies the validity in days.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

DigiCert caConnectorInfo (continued)

Name	Description
	Type: Integer
validityUnit	(Optional) Specifies the unit in which the "validityUnitValue" is specified. **Type**: Integer **Constraint**: Possible values are days, months, or years.
name	(Optional) Name for the CA connector. **Type**: String

Digicert CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String **Constraint**: Default value - the value configured in the policy.
streetAddress	(Optional) Street name where the organization is located. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Digicert CSR Parameters (continued)

Name	Description
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located. **Type**: String **Constraint**: Default value - the value configured in the policy.
postalCode	(Optional) Postal code for the organization address. **Type**: String
mailAddress	(Optional) Email address of the organization. **Type**: String
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Digicert CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameters are dNSNames and iPAddresses.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String
iPAddresses `enhancedSANTypes`	(Optional) List of IP address to be considered as subject alternative names. **Type**: Array of String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Digicert genericFields

Name	Description
device_name_<certificateAuthority>	(Optional) Server device name for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.
vs_ip_<certificateAuthority>	(Optional) Server IP address for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.

Digicert vendorSpecificDetails

Name	Description
caCertId	(Optional) Certificate id for the chosen certificate authority. **Type**: String **Constraint**: It is **mandatory** for DigiCert private product types e.g. "Private SSL Plus."
serverType	(Optional) The server category to which the certificate is requested, such as AOL. **Type**: String

EJBCA

EJBCA Request Objects

EJBCA caConnectorInfo

Name	Description
certificateAuthority	(Mandatory) Name of the certificate authority that issues the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

EJBCA caConnectorInfo (continued)

Name	Description
	Type: String **Constraint**: The value should be **Ejbca**.
isAutoRenewal	(Optional) Determines whether the certificate will be renewed before its expiration date. If enabled (true), renewal is initiated before the expiry date, following the specified number of days in "renewBefore." **Type**: Boolean **Constraint**: The value should be disabled (false) if autoRegenerateEnabled is true.
renewBefore	(Optional) Specifies the number of days prior to expiration when the renewal request should be triggered. **Type**: Integer **Constraint**: The value must be provided if isAutoRenewal is true.
autoRegenerateEnabled	(Optional) Determines whether the certificate will be regenerated before its expiration date, as indicated by the "regenerateBeforeInDays" field. If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String

GlobalSign

GlobalSign Request Objects

GlobalSign caConnectorInfo

Name	Description
certificateAuthority	(Mandatory) Name of the certificate authority that issues the certificate. **Type**: String **Constraint**: The value should be **GlobalSign**.
isAutoRenewal	(Optional) Determines whether the certificate will be renewed before its expiration date. If enabled (true), renewal is initiated before the expiry date, following the specified number of days in "renewBefore." **Type**: Boolean **Constraint**: The value should be disabled (false) if autoRegenerateEnabled is true.
renewBefore	(Optional) Specifies the number of days prior to expiration when the renewal request should be triggered. **Type**: Integer **Constraint**: The value must be provided if isAutoRenewal is true.
autoRegenerateEnabled	(Optional) Determines whether the certificate will be regenerated before its expiration date, as indicated by the "regenerateBeforeInDays" field. If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

GlobalSign caConnectorInfo (continued)

Name	Description
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
certificateType	(Mandatory) Name of the certificate product offered by the certificate authority. **Type**: String **Constraint**: Possible values - Alpha SSL, Domain SSL, Organization SSL, and Extended SSL.
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: GlobalSign CSR Parameters
vendorSpecificDetails	(Optional) Data specific to the GlobalSign vendor. **Type**: GlobalSign vendorSpecificDetails **Constraint**: Mandatory for the following "cerificateTypes" - Alpha SSL, Domain SSL, and Extended SSL.
validityInDays	(Optional) Specifies the validity in days. **Type**: Integer
name	(Optional) Name for the CA connector. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

GlobalSign CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String **Constraint**: Default value - the value configured in the policy.
streetAddress	(Optional) Street name where the organization is located. **Type**: String
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

GlobalSign CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: Default value - the value configured in the policy.
mailAddress	(Optional) Email address of the organization. **Type**: String
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

GlobalSign CSR Parameters (continued)

Name	Description
	Recommendation: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameters are dNSNames and iPAddresses.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String
iPAddresses `enhancedSANTypes`	(Optional) List of IP address to be considered as subject alternative names. **Type**: Array of String

GlobalSign vendorSpecificDetails

Name	Description
domainAdminMailId	(Mandatory) The local-part of the email address for the administrator or group responsible for issuing and approving certificate requests. For instance, in hostmaster@test.com, "hostmaster" is the local-part. **Type**: String
incorporatingAgencyRegistrationNumber	(Optional) The registration number of the company. **Type**: String **Constraint**: It **mandatory** if the "certificateType" is **extendedSSL**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

GlobalSign vendorSpecificDetails (continued)

Name	Description
designation	(Optional) The designation of the authorized signer. **Type**: String **Constraint**: It **mandatory** if the "certificateType" is **extendedSSL**.
businessCategory	(Optional) The category code for the business type. **Type**: String **Constraint**: It **mandatory** if the "certificateType" is **extendedSSL**.

Lets Encrypt CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Lets Encrypt CSR Parameters (continued)

Name	Description
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String **Constraint**: Default value - the value configured in the policy.
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located. **Type**: String **Constraint**: Default value - the value configured in the policy.
mailAddress	(Optional) Email address of the organization. **Type**: String
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Lets Encrypt CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy

Lets Encrypt CSR Parameters (continued)

Name	Description
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameter is dNSNames.
dNSNames	(Optional) List of subject alternative names for the certificate.
`enhancedSANTypes`	**Type**: Array of String

Lets Encrypt genericFields

Name	Description
device_name_LetsEncrypt	(Optional) Server device name for which certificate is requested. **Type**: String
vs_ip_LetsEncrypt	(Optional) Server IP address for which certificate is requested. **Type**: String
f5_device	(Optional) F5 device name/IP address. **Type**: String
data_group_name	(Optional) Data group name. **Type**: String
infoblox_device	(Optional) Infoblox device name/IP address. **Type**: String
validation_ip	(Optional) Validation IP address. **Type**: String

Lets Encrypt vendorSpecificDetails

Name	Description
challengeType	(Mandatory) The challenge validation type. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Lets Encrypt vendorSpecificDetails (continued)

Name	Description
	Possible values: DNS or HTTP.

Microsoft Enterprise

Microsoft Enterprise Request Objects

Microsoft Enterprise caConnectorInfo

Name	Description
certificateAuthority	(Mandatory) Name of the certificate authority that issues the certificate. **Type**: String **Constraint**: The value should be **Microsoft Enterprise**.
isAutoRenewal	(Optional) Determines whether the certificate will be renewed before its expiration date. If enabled (true), renewal is initiated before the expiry date, following the specified number of days in "renewBefore." **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Microsoft Enterprise caConnectorInfo (continued)

Name	Description
	Constraint: The value should be disabled (false) if autoRegenerateEnabled is true.
renewBefore	(Optional) Specifies the number of days prior to expiration when the renewal request should be triggered. **Type**: Integer **Constraint**: The value must be provided if isAutoRenewal is true.
autoRegenerateEnabled	(Optional) Determines whether the certificate will be regenerated before its expiration date, as indicated by the "regenerateBeforeInDays" field. If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: Microsoft Enterprise CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: Microsoft Enterprise genericFields

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Microsoft Enterprise caConnectorInfo (continued)

Name	Description
vendorSpecificDetails	(Optional) Data specific to the Microsoft Enterprise vendor. **Type**: Microsoft Enterprise vendorSpecificDetails
name	(Optional) Name for the CA connector. **Type**: String

Microsoft Enterprise CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String **Constraint**: Default value - the value configured in the policy.
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated.

Microsoft Enterprise CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located. **Type**: String **Constraint**: Default value - the value configured in the policy.
EmailAddress	(Optional) Email address of the organization. **Type**: String
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Microsoft Enterprise CSR Parameters (continued)

Name	Description
	Type: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameters are dNSNames, iPAddresses, directoryNames, rfc822Names, registeredIDs, uniformResourceIdentifiers, and otherNames.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String
iPAddresses `enhancedSANTypes`	(Optional) List of IP address to be considered as subject alternative names. **Type**: Array of String
directoryNames `enhancedSANTypes`	(Optional) List of Directory names as subject alternative names for the certificate. **Type**: Array of String **Constraint**: It should be a valid directory name.
rfc822Names `enhancedSANTypes`	(Optional) List of mail addresses as subject alternative names for the certificate. **Type**: Array of String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Microsoft Enterprise CSR Parameters (continued)

Name	Description
	Constraint: It should be a valid mail address.
registeredIDs enhancedSANTypes	(Optional) List of registered ids as subject alternative names for the certificate. **Type**: Array of String **Constraint**: It should be a valid registered id.
uniformResourceIdentifiers enhancedSANTypes	(Optional) List of URI as subject alternative names for the certificate. **Type**: Array of String **Constraint**: It should be a valid URI.
otherNames enhancedSANTypes	(Optional) List of other names as as subject alternative names for the certificate. **Type**: Array of String **Constraint**: It should be a valid name.

Microsoft Enterprise genericFields

Name	Description
device_name_<certificateAuthority>	(Optional) Server device name for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.
vs_ip_<certificateAuthority>	(Optional) Server IP address for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Microsoft Enterprise vendorSpecificDetails

Name	Description
templateName	(Mandatory) Template name to issue the certificate with. **Type**: String

MS Enterprise enhancedSANTypes

Name	Mandatory	Description	Field Type	Constraints
dNSNames	No	List of Subject Alternative names for the Certificate.	Array of String	Should be a valid domain name.
iPAddresses	No	IP addresses to be considered as Subject Alternative Names.	Array of String	Must be valid ip addresses.
directoryNames	No	List of Directory names as Subject Alternative names for the Certificate.	Array of String	Should be a valid directory name.
rfc822Names	No	List of mail addresses as Subject Alternative names for the Certificate.	Array of String	Should be a valid mail address.
registeredIDs	No	List of registered ids as Subject Alternative names for the Certificate.	Array of String	Should be a valid registered id.
uniformResourceIdentifiers	No	List of URI as Subject Alternative names for the Certificate.	Array of String	Should be a valid URI.
otherNames	No	List of other names as Subject Alternative names for the Certificate.	Array of String	Should be a valid other name.

caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
certificateType	(Mandatory) Name of the certificate product offered by the certificate authority. **Type**: String
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: Sectigo CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: Sectigo genericFields
vendorSpecificDetails	(Optional) Data specific to the Sectigo vendor. **Type**: Sectigo vendorSpecificDetails
validityUnitValue	(Mandatory) Specifies the number of days, months, or years of validity for the CA based on the value in the "validityUnit." For example, if the expected validity is 1 year and "validityUnit" is months, then the "validityUnitValue" should be 12. **Type**: Integer **Constraint**: If the validityUnit is not provided, then the validityUnitValue must be provided in days.
validityInDays	(Optional) Specifies the validity in days. **Type**: Integer
validityUnit	(Optional) Specifies the unit in which the "validityUnitValue" is specified.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sectigo caConnectorInfo (continued)

Name	Description
	Type: Integer **Constraint**: Possible values are days, months, or years.
name	(Optional) Name for the CA connector. **Type**: String

Sectigo CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
bitLength	(Optional) The bit length for the key is dependent on the key type chosen. It should be chosen from the possible values configured in the certificate policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sectigo CSR Parameters (continued)

Name	Description
	Type: String **Constraint**: Default value - the first value will be chosen from the policy
certificateCategories	(Mandatory) Purpose or intended use of the generated certificate **Type**: Array of string **Possible value**: Server, Client, Code Signing, and Email **Recommendation**: Assign only one of the possible values as the input. For example, if intended certificate category is client, set this parameter to **Client**.
ellipticCurve	(Optional) If the keyType chosen is EC, then the ellipticCurve must be specified depending on the bit length selected. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy
enhancedSANTypes	(Optional) The subject alternative names (SAN) for the certificate. The sub-parameter is dNSNames.
dNSNames `enhancedSANTypes`	(Optional) List of subject alternative names for the certificate. **Type**: Array of String

Sectigo genericFields

Name	Description
device_name_<certificateAuthority>	(Optional) Server device name for which certificate is requested. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sectigo genericFields (continued)

Name	Description
	Constraint: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.
vs_ip_<certificateAuthority>	(Optional) Server IP address for which certificate is requested. **Type**: String **Constraint**: The <certificateAuthority> has to be replaced with the value provided in the "certificateAuthority" field.

Sectigo vendorSpecificDetails

Name	Description
serverType	(Mandatory) The server category to which the certificate is requested, such as AOL. **Type**: String

Symantec

Symantec Request Objects

Symantec caConnectorInfo

Name	Description
certificateAuthority	(Mandatory) Name of the certificate authority that issues the certificate. **Type**: String **Constraint**: The value should be **Symantec**.
isAutoRenewal	(Optional) Determines whether the certificate will be renewed before its expiration date. If enabled (true), renewal is initiated before the expiry date, following the specified number of days in "renewBefore." **Type**: Boolean **Constraint**: The value should be disabled (false) if autoRegenerateEnabled is true.
renewBefore	(Optional) Specifies the number of days prior to expiration when the renewal request should be triggered. **Type**: Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Symantec caConnectorInfo (continued)

Name	Description
	Constraint: The value must be provided if isAutoRenewal is true.
autoRegenerateEnabled	(Optional) Determines whether the certificate will be regenerated before its expiration date, as indicated by the "regenerateBeforeInDays" field. If enabled (true), regeneration occurs before expiry, according to the specified number of days in "regenerateBeforeInDays." **Type**: Boolean **Constraint**: The value should be disabled (false) if isAutoRenewal is true.
regenerateBeforeInDays	(Optional) Specifies the number of days prior to expiration when the regenerate request should be triggered. **Type**: Integer
caSettingName	(Mandatory) Name of the CASetting created in AppViewX for the chosen certificate authority. **Type**: String
certificateType	(Mandatory) Name of the certificate product offered by the certificate authority. **Type**: String
description	(Optional) Information about the certificate. **Type**: String
csrParameters	(Optional) Parameters required for generating a CSR. **Type**: Symantec CSR Parameters
genericFields	(Optional) Custom fields configured for the CA/customer. **Type**: Symantec genericFields
vendorSpecificDetails	(Optional) Data specific to the Symantec vendor.

Name	Description
	Type: Symantec vendorSpecificDetails
validityInDays	(Optional) Specifies the validity in days. **Type**: Integer
name	(Optional) Name for the CA connector. **Type**: String

Symantec CSR Parameters

Name	Description
commonName	(Mandatory) A fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String **Constraint**: It must be compliant with the common name specified in the policy, if the policy is set as ‘Strict.’
organization	(Optional) Legal name of the organization. **Type**: String **Constraint**: Default value - the value configured in the policy.
organizationUnit	(Optional) Division or department of the organization handling the certificate. **Type**: String **Constraint**: Default value - the value configured in the policy.
locality	(Optional) City where the organization is located. The value should not be abbreviated. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Symantec CSR Parameters (continued)

Name	Description
	Constraint: Default value - the value configured in the policy.
state	(Optional) State or region where the organization is located. The value should not be abbreviated. **Type**: String **Constraint**: Default value - the value configured in the policy.
country	(Optional) A two-letter code for the country where the organization is located. **Type**: String **Constraint**: Default value - the value configured in the policy.
postalCode	(Optional) Postal code for the organization address. **Type**: String
mailAddress	(Optional) Email address of the organization. **Type**: String **Type**: String
encryptedChallengePassword	(Mandatory) Base64 encoded challenge password.
hashFunction	(Optional) The hash function to be used in the Certificate, e.g. SHA160. It should be chosen from the possible values configured in the certificate policy. **Type**: String **Constraint**: Default value - the first value will be chosen from the policy.
keyType	(Optional) The algorithm to be used for key generation, e.g. RSA, DSA, or EC. It should be chosen from the possible values configured in the certificate policy.

Common Payload Objects

genericFields

Name	Mandatory	Description	Field Type	Constraints
device_name_<certificateAuthority>	No	Device name of the Server for which certificate is requested.	String	In the field name, <certificateAuthority> has to be replaced by the value provided for certificateAuthority in caConnectorInfo.
vs_ip_<certificateAuthority>	No	IP address of the server for which certificate is requested.	String	In the field name, <certificateAuthority> has to be replaced by the value provided for certificateAuthority in caConnectorInfo.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Create a Certificate in Sync mode

The API sends a request for certificate creation in the sync mode, where the certificate is generated immediately and returned in the response. The request payload differs based on the Certificate Authority (CA) for which enrollment or creation is being requested. Unlike async APIs, two parameters, **isSync** and **ttl**, stand out. When **isSync** (Sync Mode) is set to **true**, it overrides the certificate request approval policy to create a new certificate. These parameters are applicable to all CAs mentioned in the async APIs.

Before you begin

- The CA must configured in AppViewX from the Certificate Authority page.
- The user should have the ACF permission to submit certificates within the specified certificate's category.
- The group associated with the certificate must have RW permission.
- Connectivity to the CA via the chosen setting should be working correctly.
- A certificate group should be created and associated with the policy. If not, the certificate will be created under the Default group.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/create
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/create?gwsource=external&isSync=true&ttl=300` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId	(Mandatory) Session Id received after login.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
isSync *Query*	Determines whether use the sync or async APIs. If **true** - use sync and **false** - use async API. The default value is **FALSE**. **Type**: Boolean **Constraint**: Value of the parameter should be **true** or **false**.
ttl *Query*	(Mandatry) The time to live (**ttl**) is a query parameter. If the total time taken surpasses this value, the response will indicate that the request is still in progress. On the other hand, if the operation completes successfully within the TTL, the response will indicate success. **Type**: Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: It must be a positive value.
Payload	Contains all the parameters to be sent in the request body for the post request.
Body	**Type**: Payload

Payload

Payload

Name	Description
csrGenerationSource	(Optional) Specifies where the CSR is to be generated. **Type**: **Possible values:**: AppViewX, Endpoint, HSM, uploadCSR. The default value is **AppViewX**
caConnectorInfo	(Mandatory) Details related to the certificate authority (CA) and the CSR parameters. **Type**: Any of the following data: • Amazon caConnectorInfo • AppViewX caConnectorInfo • DigiCert caConnectorInfo • EJBCA caConnectorInfo • Entrust caConnectorInfo • EntrustMPKI caConnectorInfo • GlobalSign caConnectorInfo • GoDaddy caConnectorInfo • Google caConnectorInfo • InCommon caConnectorInfo • LetsEncrypt caConnectorInfo • Microsoft Enterprise caConnectorInfo • Microsoft Standalone caConnectorInfo • OpenTrust caConnectorInfo

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	• Sectigo caConnectorInfo • Symantec caConnectorInfo • Trustwave caConnectorInfo
certificateGroup	Specifies the group (category) to which the newly created certificate should be assigned. **Type**: certificateGroup **Constraint**: Default certificate Group is "**Default**".
deviceDetails	(Optional) Information about the device or endpoint where the Certificate Signing Request (CSR) will be generated. **Type**: deviceDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **Endpoint**.
certificateHSMDetails	(Optional) Information about the Hardware Security Module (HSM) device. **Type**: certificateHSMDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **HSM**.
uploadCsrDetails	(Optional) Information about the CSR. **Type**: uploadCsrDetails **Constraint**: It is **mandatory** if **csrGenerationSource** is **uploadCSR**.
certificateFormat	(Mandatory) Certificate download format details **Type**: certificateFormat

certificateGroup

Name	Mandatory
name	(Optional) Specifies the group under which the created certificate needs to be tagged. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateGroup (continued)

Name	Mandatory
	Constraint: The certificate group must be present in AppViewX.

deviceDetails

Name	Mandatory
category	(Mandatory) Specifies the device category **Type**: String **Possible values**: ADC, Server, and Firewall.
vendor	(Mandatory) Name of the vendor for the chosen device. For example, **Apache** is a vendor for **Server** category. **Type**: String
deviceName	(Mandatory) Name of the device as per AppViewX Device Inventory. **Type**: String
csrFileName	(Mandatory) Name of the CSR file that is generated in the device. **Type**: String
keyFileName	(Mandatory) Name of the key file that is generated in the device. **Type**: String
attributes	(Optional) Additional attributes for the chosen device as mentioned the sub-attributes - csrLocation, tenant, and partition. **Type**:
csrLocation attributes	(Optional) The location within the device where the CSR is generated. **Type**: String **Constraint**: It is **mandatory** when **deviceDetails.category** is **Server** and the **deviceDetails.vendor** is **Tomcat**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

deviceDetails (continued)

Name	Mandatory
tenant attributes	(Optional) Name of the partition within the AVI device. **Type**: String
partition attributes	(Optional) Name of the partition within the device. **Type**: String **Constraint**: It is **mandatory** when **deviceDetails.category** is **Friewall** and the **deviceDetails.vendor** is **Fortinet**.

certificateHSMDetails

Name	Mandatory
type	(Mandatory) Type of the HSM device. **Type**: String **Possible values**: ADC and HSM.
keyReference	(Mandatory) Reference name for the key that is mapped by the HSM device. **Type**: String
hsmSettings	(Mandatory) Configuration details for the HSM device. Contains the sub-parameters vendorType and vendorSpecificSettings **Type**: List <String>
vendorTypehsmSettings	(Mandatory) Category of the vendor. **Type**: String **Possible values**: Safenet, Thales, and Fortanix.
vendorSpecificSettingshsmSettings	(Mandatory) Settings related to HSM vendor. Contains the sub-parameter moduleId

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateHSMDetails (continued)

Name	Mandatory
	Type: String
moduleId `hsmSettings. vendorSpecificSettings`	(Optional) The module id. **Type**: String **Constraints**: Applicable if **hsmSettings.vendorType** is **Thales**.
vendor	(Mandatory) The name of the vendor for the chosen device e.g., F5. **Type**: String
deviceName	(Mandatory) The name of the device as per AppViewX Device Inventory. **Type**: String

uploadCsrDetails

Name	Mandatory
category	(Mandatory) Certificate category **Type**: String **Possible values**: Server, Client, and Code Signing
csrContent	(Mandatory) The CSR content for certificate enrollment request **Type**: String

certificateFormat

Name	Mandatory
format	(Mandatory) Certificate download format. Refer to the Possible values for Certificate Download Format table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateFormat (continued)

Name	Mandatory
	Type: String
password	(Optional) The field is mandatory for some parameters (refer to the table below). **Type**: String

Possible values for Certificate Download Format

Certificate Extension	Value in the Payload	Password Required
.crt	CRT	No
.cert	CERT	No
.cer	CER	No
.pem	PEM	No
.der	DER	No
.cer	DERCER	No
.p7b	P7B	No
.p7c	P7C	No
.pk8	PK8	No
.p12	P12	Yes
.pfx	PFX	Yes
.jks	JKS	Yes

Response Structure

Response returns string of type application/json with the following body params:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
resourceId response	Identifier of the certificate record that has been created (the resourceId in the above request can be found using the search API using commonName, serial No. or other search parameters). **Type**: String
requestId response	Open work order request ID. **Type**: String
certificateContent response	Content of certificate in Base64 encoded format. **Type**: String
encodedFormat response	Certificate content encoded format. **Type**: String
certificateName response	Certificate name. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Certificate submission triggered successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	INVALID_REQUEST	Invalid request specified **Remediation**: Ensure that the payload is valid.
400 Bad Request	INVALID_CSR_GEN_SOURCE	Invalid csr generation source specified. **Remediation**: Ensure that a valid value is provided for the csrGenerationSource field in the request.
400 Bad Request	INVALID_TTL_VALUE	Please provide valid integer for **ttl**. **Remediation**: Ensure the value of **ttl** in query params is an integer.
417 Expectation failed	READ_GROUP	Group is given with read permission, so cannot perform any operation. **Remediation**: Ensure that the group associated with the certificate has read write permissions for the user.
417 Expectation Failed	CERT-GEN-0055	**orderValidityUnit** and **orderValidityUnitValue** field inside **caConnectorInfo.vendorSpecificDetails** or **validityUnit** and **validityUnitValue** is mandatory **Remediation**: Ensure valid values are assigned to the mandatory fields.
417 Expectation Failed	READ_GROUP	Group is given with read permission, so cannot perform any operation.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Renew a Certificate in Async mode

The API initiates a request to renew an existing certificate in asynchronous mode. Upon successful triggering of the renew certificate API, the response includes a resourceId. This resourceId can be utilized to trigger the search API API, retrieving the newly created certificate. Please refer to the After you are done section for steps to approve and implement the request.

Before you begin

Ensure the following before attempting to renew certificate from any CA through AppViewX:

- The CA setting should be configured in AppViewX for the CA.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/action
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId	(Mandatory) Session ID received after login.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
resourceId	(Optional) Unique Id of the certificate. (The resourceId in the above request can be found through the search API using commonName, serialNumber or other search parameters.) **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: Required if the commonName and serialNumber are not specified.
commonName	(Optional) Common name of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.
serialNumber	(Optional) Serial number of the certificate **Type**: String **Constraint**: Required if resourceId is not specified.
action	(Mandatory) Action name for the renewal. **Type**: String **Constraint**: Value should be **Renew**
challengePassword	(Optional) Base64 encoded value of challenge password **Type**: String **Constraint**: Applicable and mandatory for Symantec Certificate Authority.
validityUnit	(Optional) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days
validityUnitValue	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit **Type**: Integer
workflowType	(Optional) To renew the certificate without executing the workflow, set this to **direct**. By default, the workflow for certificate renewal is executed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Possible values**: direct

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the renewal request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	WorkOrder request Id. **Type**: String
message response	Success message - Renew action triggered successfully. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Renew action has been triggered successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	INVALID_REQUEST	Invalid request specified **Remediation**: Ensure that the payload is valid
400 Bad Request	VALIDATION_ERROR_0004	Invalid **serialNumber**. **Remediation**: Ensure that the **serialNumber** is entered correctly
400 Bad Request	VALIDATION_ERROR_0004	Invalid **resourceId**. : Ensure that the **resourceId** is entered correctly.
417 Expectation Failed	READ_GROUP	Group is given with read permission, so cannot perform any operation. **Remediation**: Ensure the group associated with the certificate must have RW permission for the user.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Trigger the request once the open work order for the certificate is completed.
417 Expectation Failed	CERT-CSR-0005	CSR submission failed. **Remediation**: Use the reissue option for this DigiCert certificate as the order for this certificate is still valid. If you still wish to renew, it will incur costs.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API. **Remediation**: Ensure the user has ACF permission to renew certificates within the specified certificate's category.
404 Not Found	NO_RECORDS_FOUND	No matching records found **Remediation**: Check and ensure that the values provided for **commonName**/ **serialNumber**/ **resourceId** are correct.
500 Internal Server Error	FAILED	Certificate Renew action failed during renewal submission due to CSR or private key is not available. **Remediation**: To renew, upload private key or CSR, or use regenerate option.
500 Internal Server Error	CANNOT_PERFORM_OPERATION	Cannot perform the specified operation. Probable cause: The specified action is not permitted for certificates in a **monitored** status..

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Change the status of the certificate from a **monitored** status to a **managed** status

Sample Request/Response

Request Payload

```
{
 "commonName":"testcert8g.appviewx.plus",
 "serialNumber":"0D:A9:2D:8C:90:BB:90:B0:CE:7D:6A:76:BF:70:75:81",
 "action":"Renew"
 }
```

Response

```
{
"response": {
"resourceId": "5f4faf3e70040d33314f1142",
"message": "Renew action triggered successfully.",
"requestId": "209"
},
"message": "Renew action has been triggered successfully",
"appStatusCode": null,
"tags": {},
"headers": null
}
```

What's next?

- Revoke a Certificate in Async mode.
- Reissue a Certificate in Async mode.

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Renew a Certificate in Sync mode

The API initiates a certificate renewal request in Sync Mode, which differs from asynchronous APIs by using two distinct parameters: "isSync" and "ttl". When "isSync" is set to true, indicating Sync Mode, it bypasses the certificate request approval policy for certificate renewal. These parameters can be applied to all the Certificate Authorities (CAs) listed in the asynchronous APIs.

Before you begin

- The user should have the ACF permission to renew certificates within the specified certificate’s category.
- The certificate to be renewed should not be in the revoked or monitored state.
- The CA connector for the certificate should be available.
- The certificate should be present in a group that has RW permission.
- There should be no open work orders available for the certificate.
- The certificate should be present in AppViewX, with either its CSR/ private key along with it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The newly renewed certificate will fall under the same group as the existing certificate.
- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/renew
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/renew?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
userName *Header*	(Mandatory) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
isSync *Query*	(Optional) The possible values are true and false. To utilize the sync API, set the value to **true** or set the value to **false** to use the async API. **Type**: Boolean **Constraint**: The value must be a boolean type: true or false.
ttl *Query*	(Optional) Time to live for a response in seconds. Default value is 300 seconds. **Type**: Integer **Constraint**: The value must be a positive integer.
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
resourceId	(Mandatory) Mongo ID of the certificate in the AppViewX database. (It refers to the resourceId field in the create certificate response.) **Type**: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory. **Note:** commonName field is optional for Code Signing certificates.
serialNumber	(Mandatory) Serial number of the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory.
certificateFormat	(Mandatory) Certificate format and access details **Type**: certificateFormat
workflowType	(Optional) To renew the certificate without executing the workflow, set this to **direct**. By default, the workflow for certificate renewal is executed. **Type**: String **Possible values**: direct

certificateFormat

Name	Description
format	(Mandatory) Certificate downloadable format. **Type**: String **Constraint**: For the possible values for the certificate download format, click here.
password	(Mandatory) The field is mandatory for some parameters. **Type**: String **Constraint**: For the possible values for the certificate download format, click here.

Possible values for certificate download format

Certificate Extension	Value in the Payload	Password Required
.crt	CRT	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Possible values for certificate download format (continued)

Certificate Extension	Value in the Payload	Password Required
.cert	CERT	No
.cer	CER	No
.pem	PEM	No
.der	DER	No
.cer	DERCER	No
.p7b	P7B	No
.p7c	P7C	No
.pk8	PK8	No
.pk12	PK12	Yes
.pfx	PFX	Yes
.jks	JKS	Yes

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request.
resourceId	Identifier of the certificate record that has been created. response **Type**: String
requestId	Open work order request ID. response **Type**: String
certificateContent	Content of certificate in Base64 encoded format. response **Type**: String
encodedFormat	Certificate content in encoded format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
response	**Type**: String
certificateName	Name of the certificate. response **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Renew action has been triggered successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	INVALID_REQUEST	Invalid request specified. **Remediation**: Ensure that the payload is valid.
400 Bad Request	VALIDATION_ERROR_0004	Invalid **serialNumber**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that the resourceId is entered correctly
400 Bad Request	VALIDATION_ERROR_0004	Invalid **resourceId** **Remediation**: Ensure that the resourceId is entered correctly
400 Bad Request	MANDATORY_FIELD_MISSING	Either **resourceId** or **commonName** & **serialNumber** are Mandatory **Remediation**: Please ensure either **resourceId** or **commonName** & **serialNumber** are entered
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - **commonName**. **Remediation**: Ensure that the **commonName** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - **serialNumber**. **Remediation**: Ensure that the **serialNumber** field is available in the request payload.
400 Bad Request	VALIDATION_ERROR_0004	Validation Failure: Field **format** does not have the expected value **Remediation**: Please ensure **format** is entered from the possible values for certificate download format.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure the user has ACF permission to renew certificates within the specified certificate's category.
404 Not Found	NO_RECORDS_FOUND	No matching records found **Remediation**: Check and ensure that the values provided for commonName/ serialNumber/ resourceId are correct
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the renew action. • There is no workOrder in progress for the specified certificate. • Certificate does not belong to read only group. • Certificate is not in the monitored status.
417 Expectation Failed	READ_GROUP	Group is given with read permission, so cannot perform any operation **Remediation**: Ensure the group associated with the certificate must have RW permission for the user.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Trigger the request once the open work order for the certificate is completed
417 Expectation Failed	CERT-GEN-0055	**orderValidityUnit** and **orderValidityUnitValue** field inside **caConnectorInfo.vendorSpecificDetails** or **validityUnit** and **validityUnitValue** is mandatory **Remediation**: Ensure valid values are assigned to the mandatory fields.
500 Internal Server Error	FAILED	Certificate Renew action failed during renewal submission due to CSR or private key is not available. **Remediation**: To renew, upload private key or CSR, or use regenerate option.
500 Internal Server Error	CANNOT_PERFORM_OPERATION	Cannot perform the specified operation. Probable Cause: The specified action is not permitted for certificates in a **monitored** status. **Remediation**: Change the status of the certificate from a **monitored** status to a **managed** status
500 Internal Server Error	FAILED	Certificate Renew action performed successfully but failed to download. Reason - Mandatory field is missing or invalid - **format** **Remediation**: Please ensure **certificateFormat.format** is entered in the payload.

- **gwsource**: Source or origin of a gateway, for example: **external**.

Revoke a Certificate in Async mode

The API initiates a request to revoke an existing certificate in asynchronous mode. Refer to the After you are done section to approve and implement the request.

Before you begin

Ensure the following before attempting to revoke a certificate from any CA through AppViewX:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/action
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type	(Mandatory) Specifies the nature of the data in the payload.

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Value of the param should be **'application/json'**
gwkey *Query*	(Mandatory) Tenant Key. It is needed only in case of multi-tenant installations and can be ignored for other type of installations. **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered (e.g. external). **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
resourceId	(Optional) Unique Id of the certificate. **Type**: String **Constraint**: Required if the commonName and serialNumber are not specified.
commonName	(Optional) Common name of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.
serialNumber	(Optional) Serial number of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
action	(Mandatory) Action name for the revocation. **Type**: String **Possible values**: Revoke
reason	(Mandatory) Reason for revocation. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the revoke request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	WorkOrder request Id. **Type**: String
message response	Success message - Revoke action triggered successfully. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Revoke action has been triggered successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - reason.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that the **reason** field is available in the request payload.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open worker for the certificate is completed.
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the revoke action. • There is no workOrder in progress for the specified certificate. • Certificate does not belong to read only group. • Certificate is not in the monitored status.

What's next?

- Reissue a Certificate in Async mode.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Revoke a Certificate in Sync mode

The API initiates a certificate revoke request in Sync Mode, which differs from asynchronous APIs by using two distinct parameters: "isSync" and "ttl". When "isSync" is set to true, indicating Sync Mode, it bypasses the certificate request approval policy for the certificate revoke. These parameters can be applied to all the Certificate Authorities (CAs) listed in the asynchronous APIs.

Before you begin

- The user should have ACF permission to revoke certificates within the specified certificate's category.
- The certificate to be renewed should not be in the revoked or monitored state.
- The CA connector for the certificate should be available.
- The certificate should be present in a group that has RW permission.
- There should be no open work orders available for the certificate.
- The certificate should be have a CRL Distribution Point.
- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/revoke
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/revoke?gwsource=external` To understand the elements of the sample URL, click here.

Headers
Content-Type: application/json

Input Parameters

Name	Description
userName *Header*	(Mandatory) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
isSync *Query*	(Mandatory) The possible values are true and false. To utilize the sync API, set the value to **true** or set the value to **false** to use the async API. **Type**: Boolean **Constraint**: The value must be a boolean type: true or false.
ttl *Query*	(Optional) Time to live for a response in seconds. Default value is 300 seconds. **Type**: Integer **Constraint**: The value must be a positive integer.
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
resourceId	(Mandatory) Unique Mongo Id of the certificate in the AppViewX database. (It refers to the 'resourceId' field in the create certificate response. It can be found through the search API using commonName, serialNunmer. or other search parameters.) **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
commonName	(Mandatory) Common name of the certificate **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory. **Note:** commonName field is optional for Code Signing certificates.
serialNumber	(Mandatory) Serial number of the certificate **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
reason	(Mandatory) Reasons for revoking the certificate **Type**: String
comments	(Mandatory) Additional comments for revoking the certificate **Type**: String **Constraint**: Comments field is mandatory for some revoke reasons alone. Refer to the valid reason for CAs table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Valid revocation reasons for CAs

Certificate Authority	Reasons	Comments Required
Entrust	Superseded	No
	Cessation of operation	No
	Affiliation changed	No
	Key compromised	Yes

Response Structure

Parameters

Name	Description
response	Contains the response attributes for the revoke request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	Open work order request ID. **Type**: String
certStatus response	Status of the certificate action request. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample Request/Response

Request Payload

```
{
 "resourceId": "5fa27b7ffee3a70235a5816d",
 "reason" :"Superseded"
 }
```

Response

```
{
 "response": {
 "resourceId": "<Certificate ID>",
 "requestId": "<Certificate WF Request ID>",
 "certStatus": "Revoked"
 },
 "message": "Certificate Revoke action executed successfully",
 "appStatusCode": "<Error Code>",
 "tags": {},
 "headers": null
 }
```

What's next?

- Reissue a Certificate in Sync mode.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Reissue a Certificate in Async mode

The API will initiate a request to reissue an existing certificate in asynchronous mode. Upon successful triggering of the "Reissue a certificate" API, the response will include a resourceId. This resourceId can be used to trigger the search API API, retrieving the newly created certificate. Please refer to the After you are done section for steps to approve and implement the request.

Before you begin

Ensure the following before attempting to renew certificate from any CA through AppViewX:

- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Payload

Payload

Name	Description
resourceId	(Mandatory) Unique Mongo Id of the certificate in the AppViewX database. (It refers to the 'resourceId' field in the create certificate response. It can be found through the search API using commonName, serialNunmer. or other search parameters.) **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory. **Note:** commonName field is optional for Code Signing certificates.
serialNumber	(Mandatory) Serial number of the certificate. **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
action	(Mandatory) Action name for the reissue **Type**: String **Possible values**: Reissue
reason	(Mandatory) Reason for reissue request **Type**: String
certificateFormat	(Mandatory) Certificate format and access details **Type**: certificateFormat
uploadCSRDetails	(Mandatory) Information related to the CSR

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: uploadCSRDetails

certificateFormat

Name	Description
format	(Mandatory) Certificate downloadable format. **Type**: String **Constraint**: For the possible values for the certificate download format, click here.
password	(Mandatory) The field is mandatory for some parameters. **Type**: String **Constraint**: For the possible values for the certificate download format, click here.

Possible values for certificate download format

Certificate Extension	Value in the Payload	Password Required
.crt	CRT	No
.cert	CERT	No
.cer	CER	No
.pem	PEM	No
.der	DER	No
.cer	DERCER	No
.p7b	P7B	No
.p7c	P7C	No
.pk8	PK8	No
.pk12	PK12	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Possible values for certificate download format (continued)

Certificate Extension	Value in the Payload	Password Required
.pfx	PFX	Yes
.jks	JKS	Yes

uploadCSRDetails

Name	Description
category	(Mandatory) Certificate category. **Type**: String **Constraint**: Possible values - **Server**, **Client**, or **Code Signing**.
csrContent	(Mandatory) The CSR content for certificate enrollment request **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the reissue request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	Work order request Id. **Type**: String
message response	Success message - Reissue action triggered successfully. **Type**: String
message	Success message or failure description in case of error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - reason. **Remediation**: Ensure that the **reason** field is available in the request payload.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open workOrder for the certificate is completed.
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the reissue action. • There is no workOrder in progress for the specified certificate. • Certificate does not belong to read only group. • Certificate is not in the monitored status.

```

What's next?

- Revoke a Certificate in Sync mode.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Regenerate a Certificate in Async mode

The API will initiate a request to regenerate an existing certificate in asynchronous mode. Upon successful triggering of the "Regenerate a certificate" API, the response will include a resourceId. This resourceId can be used to trigger the search API API, retrieving the newly created certificate. Please refer to the After you are done section for steps to approve and implement the request.

Before you begin

Ensure the following before attempting to regenerate certificate from any CA through AppViewX:

- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/action
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.

Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
userName *Header*	(Mandatory only if **sessionID** is not provided) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: The value must be **application/json**.
gwkey *Query*	(Mandatory) Tenant Key. This is required only for multi-tenant installations and can be disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
resourceId	(Mandatory) Unique Id of the certificate. **Type**: String **Constraint**: Required if the commonName and serialNumber are not specified.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified. **Note:** commonName field is optional for Code Signing certificates.
serialNumber	(Mandatory) Serial number of the certificate. **Type**: String **Constraint**: Required if resourceId is not specified.
action	(Mandatory) Action name for the regenerate request. **Type**: String **Constraint**: Value should be **Regenerate**.
reason	(Mandatory) Reason for regenerate request. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the regenerate request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	Work order request Id. **Type**: String
message response	Success message - Regenerate action triggered successfully. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Regenerate action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - reason. **Remediation**: Ensure that the **reason** field is available in the request payload.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open workOrder for the certificate is completed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the regenerate action. • There is no workOrder in progress for the specified certificate. • Certificate does not belong to read only group. • Certificate is not in the monitored status.
417 Expectation Failed	READ_GROUP	Group is assigned read permission, hence cannot perform any operation.
500 Internal Server Error	CANNOT_PERFORM_OPERATION	Cannot perform the specified action because it is not permitted for certificates in the **Monitored** state. **Remediation**: Change the certificate state to **Managed**.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Regenerate a Certificate in Sync mode

The API initiates a certificate regenerate request in Sync Mode, which differs from asynchronous APIs by using two distinct parameters: "isSync" and "ttl". When "isSync" is set to true, indicating Sync Mode, it bypasses the certificate request approval policy for the certificate regenerate. These parameters can be applied to all the Certificate Authorities (CAs) listed in the asynchronous APIs.

Before you begin

- The user should have ACF permission to regenerate the certificate under the associated certificate category.
- The group associated with the certificate must have RW permission.
- The certificate to be regenerated should not be in the monitored state.
- The CA connector for the certificate should be available.
- The certificate should be present in a group that has RW permission.
- There should be no open work orders available for the certificate.
- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/regenerate
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/regenerate?gwsource=external&isSync=true&ttl=300` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraint**: Required if username and password are not provided.
userName *Header*	(Mandatory only if **sessionID** is not provided) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
isSync *Query*	(Optional) The possible values are true and false. To utilize the sync API, set the value to **true** or set the value to **false** to use the async API. **Type**: Boolean **Constraint**: The value must be a boolean type: true or false.
ttl *Query*	(Optional) Time to live for a response in seconds. Default value is 300 seconds. **Type**: Integer **Constraint**: The value must be a positive integer.
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
resourceId	(Mandatory) Mongo Id of the certificate in the AppViewX database. (It refers to the 'resourceId' field in the create certificate response. It can be found through the search API using commonName, serialNumber. or other search parameters.) **Type**: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory. **Note:** commonName field is optional for Code Signing certificates.
serialNumber	(Mandatory) Serial number of the certificate. **Type**: String **Constraint**: Either resourceId or serialNumber and commonName is mandatory.
certificateFormat	(Mandatory) Configuration for downloading the certificate **Type**: certificateFormat

certificateFormat

Name	Description
format	(Mandatory) Certificate download format. **Type**: String **Constraint**: Refer to the possible values here.
password	(Mandatory) The field is mandatory for some parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateFormat (continued)

Name	Description
	Type: String **Constraint**: Refer to the possible values here.

Possible values for certificate download format

Certificate Extension	Value in the Payload	Password Required
.crt	CRT	No
.cert	CERT	No
.cer	CER	No
.pem	PEM	No
.der	DER	No
.cer	DERCER	No
.p7b	P7B	No
.p7c	P7C	No
.pk8	PK8	No
.p12	P12	Yes
.pfx	PFX	Yes
.jks	JKS	Yes

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the regenerate request.
resourceId	Identifier of the certificate record that has been created.
response	**Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
requestId response	Open work order request ID. **Type**: String
certificateContent response	Content of certificate in Base64 encoded format. **Type**: String
encodedFormat response	Certificate content encoded format. **Type**: String
certificateName response	Name of the Certificate. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 OK	null	Certificate regenerate action performed successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		sessionId is provided as header parameters.
400 Bad Request	INVALID_REQUEST	Invalid request specified **Remediation**: Ensure that the payload is valid
400 Bad Request	VALIDATION_ERROR_0004	Invalid **serialNumber**. **Remediation**: Ensure that the **serialNumber** is entered correctly
400 Bad Request	VALIDATION_ERROR_0004	Invalid **resourceId**. **Remediation**: Ensure that the **resourceId** is entered correctly.
400 Bad Request	MANDATORY_FIELD_MISSING	Either **resourceId** or **commonName** & **serialNumber** are Mandatory **Remediation**: Please ensure either **resourceId** or **commonName** & **serialNumber** are entered
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - **commonName** **Remediation**: Please ensure **commonName** is entered in the payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - **serialNumber** **Remediation**: Please ensure **serialNumber** is entered in the payload.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
400 Bad Request	VALIDATION_ERROR_0004	Validation Failure: Field **format** does not have the expected value. **Remediation**: Please ensure **format** is entered from the possible values for certificate download format.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API. **Remediation**: Ensure the user has ACF permission to reissue certificates within the specified certificate's category.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for **commonName**/ **serialNumber**/ **resourceId** are correct.
417 Expectation Failed	READ_GROUP	Group is given with read permission, so cannot perform any operation. **Remediation**: Ensure the group associated with the certificate must have RW permission for the user.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open work order for the certificate is completed.
500 Internal Server Error	CANNOT_PERFORM_OPERATION	Cannot perform the specified operation. Probable cause: The specified action

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		is not permitted for certificates in a **monitored** status. **Remediation**: Change the status of the certificate from a **monitored** status to a **managed** status
500 Internal Server Error	FAILED	Certificate regenerate action performed successfully but failed to download. Reason - Mandatory field is missing or invalid - **format** **Remediation**: Please ensure **certificateFormat.format** is entered in the payload
500 Internal Server Error	avx-common-011	Error while processing

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Suspend a Certificate

The API initiates a request to suspend an existing certificate. Refer to the After you are done section to approve and implement the request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

Ensure the following before attempting to renew certificate from any CA through AppViewX:

- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
resourceId	(Mandatory) Unique Id of the certificate. **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
commonName	(Mandatory) Common name of the certificate. **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.
serialNumber	(Mandatory) Serial number of the certificate. **Type**: String **Constraint**: Common name and either resourceId or serialNumber is mandatory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
action	(Mandatory) Action to triggered with the request **Type**: String **Constraint**: Value should be **Suspend**
reason	(Mandatory) Reason for the suspend request **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the suspend certificate request.
resourceId response	Identifier of the certificate record that has been created. **Type**: String
requestId response	WorkOrder request Id. **Type**: String
message response	Success message - Suspend action triggered successfully. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Suspend action has been triggered successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName/ serialNumber/ resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - reason.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that the **reason** field is available in the request payload.
417 Expectation Failed	OPEN_WORK_ORDERS_FOUND	Since requested certificate's work order is in progress, cannot initiate another action. **Remediation**: Trigger the request once the open work order for the certificate is completed.
406 Not Acceptable	CERT-VWF-0006	Life cycle action is unsupported by CA or another work order is in progress or certificate belongs to read group or is in Monitored status. **Remediation**: Ensure the following: • The CA supports the suspend action. • There is no workOrder in progress for the specified certificate. • Certificate does not belong to read only group. • Certificate is not in the monitored status.

Reinstate a Certificate

The API initiates a request to reinstate a suspended certificate. Refer to the After you are done section to Approve and Implement the request.

Before you begin

Ensure the following before attempting to reinstate a certificate from any CA through AppViewX:

- The CA must configured in AppViewX from the Certificate Authority page.
- Connectivity to the CA via the chosen setting should be working correctly.
- Approval:
  - **Approval is not required:** Enable this mode by setting the **Certificate Requests Need Approval?** flag to false in the certificate policy.
  - **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/action

- **gwsource**: Source or origin of a gateway, for example: **external**.

Search/Get Certificate Inventory

The API enables users to search for one or more certificates based on the provided searchable inputs. It returns full details of the matching certificate(s).

Before you begin

- The user should have the ACF permission to view the inventory associated with the searched certificate(s).
- The field referenced in the search input must already be populated for the relevant certificates.
- The group associated with the relevant certificates should at least have read access.

Request Structure

Endpoint:	/certificate/search
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/search?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session Id received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
input	(Mandatory) Search parameters such as keyword or free text search.
category input	(Optional) Specifies the certificate category A comma-separated list of multiple values can also be provided, to search for certificates across categories. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values: • Server (default) • Client • Code signing • Device • Root CA • Intermediate CA
resourceId	(Optional) Id of the certificate.
input	**Type**: String
freeSearch	(Optional) Key for free text search
input	Search will be performed on all cert fields based on the free text input provided.
	Type: String
keywordSearch	(Optional) Search by certificate attributes based on the predefined key words.
input	**Type**: String
subject:o	(Optional) Subject organization name
input. keywordSearch	**Type**: String
subject:ou	(Optional) Subject organization unit
input. keywordSearch	**Type**: String
subject:cn	(Optional) Subject common name
input. keywordSearch	**Type**: String
subject:l	(Optional) Subject location
input. keywordSearch	**Type**: String
subject:st	(Optional) Subject state

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
input. keywordSearch	**Type**: String
subject:c	(Optional) Subject country
input. keywordSearch	**Type**: String
certversion	(Optional) Certificate version
input. keywordSearch	**Type**: String
certserialno	(Optional) Certificate serial number
input. keywordSearch	**Type**: String
	Constraint: Serial number of the certificate to be specified in the same format as in example- 1C:DB:14:3D:5C:98:EC:00:D0:C1:D1:63:78:B4:AA:42
certissuer	(Optional) Issuer common name
input. keywordSearch	**Type**: String
certstatus	(Optional) Certificate status
input. keywordSearch	**Type**: String
	Possible values: Managed, New Certificate, Monitored, Discovered
certgroup	(Optional) Certificate group.
input. keywordSearch	**Type**: String
expirydate	(Optional) Certificate expiry date in the MM/DD/YYYY format
input. keywordSearch	For example, 03/26/2022
	Type: String
expiryyear	(Optional) Certificate expiry year in the YYYY format
input. keywordSearch	For example, 2022

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
expirymonth input. keywordSearch	(Optional) Certificate expiry month in the MM format For example, 03 **Type**: String
discoverysource input. keywordSearch	(Optional) Discovery source for the relevant certificates For example, the device name or the CA setting name If a CA setting is to be specified, it should be entered in the following format: **<<CA name>>::<<CA setting name>>**. For example, **EJBCA:: Setting1**. **Type**: String
ca input. keywordSearch	(Optional) Certificate Authority name **Type**: String
application input. keywordSearch	(Optional) CA name / Auto-enrollment protocol name / device vendor name **Type**: String **Constraint**: This input is applicable only for certificates that were discovered from a CA/a device and certificates that were enrolled using auto enrollment protocols. **Possible values for auto enrollment protocols**: SCEP, EST, ACME, SCEP_MS_INTUNE
issuer input. keywordSearch	(Optional) Issuer common name **Type**: String **Constraint**: Ensure that the entered value is obtained from the AppViewX certificate inventory or the certificate data, so a discrepancy/mismatch can be avoided.
hash	(Optional) Hash function

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
input. keywordSearch	**Type**: String **Possible values**: SHA160, SHA224, SHA256, SHA384, SHA512
key	(Optional) Key type
input. keywordSearch	**Type**: String **Possible values**: RSA, EC, DSA
keylength	(Optional) Bit length depending on the key type chosen
input. keywordSearch	Input value to be obtained from the defined CA policy. **Type**: String
caSettings	(Optional) CA setting name
input. keywordSearch	Input value to be obtained from the defined CA policy. **Type**: String
ellipticcurve	(Optional) Elliptic curve name
input. keywordSearch	Input value to be obtained from the defined CA policy. **Type**: String
filter	(Mandatory) Pagination and sort parameters for the search
start	(Optional) Start index from which the response has to be displayed
filter	For example, if the search results must skip the first 100 and show results from value no.101, the value of this parameter will be **101**. **Type**: Integer **Default value**: 0

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
max filter	(Optional) The number of entries from the start index to be displayed E.g., if the response is expected to have skipped the first 100 and show the next 50, then the start index has to be 101 and max has to be 50. For example, if the search results must display 50 values from the start index, the value of this parameter will be **50**. **Type**: Integer **Default value**: 100
sortOrder filter	(Optional) Sorting order for the search results **Type**: String **Possible**: asc (default), desc
sortColumn filter	(Optional) Column name for sorting **Type**: String **Default value**: _id

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes
response response	Contains the inventory response attributes
objects response.response	Certificate metadata **Type**: Array of Certificate json
totalRecords	Total number of records matching the search criteria

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
`response.response`	**Type**: String
obtainedRecords `response.response`	Number of records fetched for the query **Type**: String
obtainedRecordRange `response.response`	Index of the records fetched
start `response.response.obtainedRecordRange`	Start index of the fetched records **Type**: String
end `response.response.obtainedRecordRange`	End index of the fetched records **Type**: String
message `response`	Success or failure message **Type**: String
message	If matching records are found for the search query: **Matching results found for the given input.** If no records are available for the search query: **No matching records found for the given input.** **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Matching records are found for the search query. Success message **Matching results found for the given input.** is displayed.
404 Not Found	NA	No mtaching records found for the search query The message **No matching records found for the given input.** is displayed.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as the header parameter.
400 Bad Request	INVALID_REQUEST	Invalid sort order value **Remediation**: Ensure that a valid value is provided for `sortOrder`.
400 Bad Request	INVALID_REQUEST	Invalid request specified **Possible Causes**: • Either **filter** is not available or the filter value is invalid in the payload. • Value provided for **filter.max** is invalid. **Remediation**: Ensure that valid filter values are provided.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Add Certificate Attributes

The add certificates attributes API initiates the addition of various attributes like name, label, etc. to the certificate.

Before you begin

- The user has the ACF permission to add certificate attributes.
- A certificate attribute with the specified name and label combination should not already exist.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/attribute
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/attribute?gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. It consists of an array of attributes listed below. The array cannot be empty; a minimum of one entry must be present. **Type**: Payload

Payload

Payload

Name	Description
name	(Mandatory) The name of the custom attribute. **Type**: String **Constraint**: Must not start with special characters. No special characters except -, _ are allowed.
label	(Mandatory) The label to be shown on the UI for the custom attribute. **Type**: String **Constraint**: Must not start with special characters. No special characters except -, _ are allowed.
value	(Optional) Default value for the attribute. **Type**: String
mandatory	(Optional) Indicates whether the attribute is mandatory or optional. **Type**: Boolean
helpInfo	(Optional) Help information about the field. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response attributes.
successfullFields response	List of fields that have been added successfully. **Type**: Array of CertificateGenericField
failedFields response	List of fields that have not been added successfully. **Type**: Array of CertificateGenericField
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
200 Accepted	NA	The response messages are as follows: • If all fields are added - **Certificate attribute added successfully** • If the addition of some fields have failed - **Certificate attribute added successfully. Failed fields are [<<failed field names>>]** • If the addition of all fields failed - **Certificate attribute addition failed.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation Validate the inputs based on the following failure reasons: • Name or label are not provided for the failed field. • Value provided for the name or label does not meet the expected pattern. • Attributes with the provided name already exists.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - payload. **Remediation**: Payload array cannot be empty. At least one attribute must be provided.
400 Bad Request	avx-common-028	Invalid / Incorrect payload. **Remediation**: Check and ensure that the values provided for all the fields in the payload are accurate.

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Add Multiple Certificate Attributes

This API will let you add multiple certificates attributes for a certificate based on the certificate UUID or the resource ID.

Before you begin

- The user has the ACF permission to add certificate attributes.
- Certificate attributes with the specified name and label combination should not already exist.

Request Structure

Endpoint:	/certificate/attributeValues
Type:	POST

Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. It consists of an array of attributes listed below. The array cannot be empty; a minimum of one entry must be present. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
certAttributes	(Mandatory) A nested JSON that contains the key-value pairs for the attributes to be added for the certificate **Type**: JSON **Constraint**: Attribute name and value should not contain invalid (HTML and XML) characters.
resourceId	(Mandatory if **certificateUuid** is not provided) Unique identifier associated with the certificate **Type**: String **Note:** It is recommended to use the resource ID since the use of certificate UUID will be deprecated in the future.
certificateUuid	(Mandatory if **resourceId** is not provided) Unique Identifier assigned to the certificate **Type**: String **Note:** It is recommended to use the resource ID since the use of certificate UUID will be deprecated in the future.
action	(Mandatory) Action to be performed by executing this API **Type**: String **Possible value**: add
category	(Optional) Certificate category **Type**: String **Constraints**: Parameter value cannot be **CA**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure

Success Response

200 OK Response with message	Certificate attributes saved to certificate successfully
Response content-Type:	application/json

Response Parameters

Name	Description
response	Response for the add request
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response

Status Codes

HTTP Code	appStatusCode	Message and Possible remediation
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field is missing or has invalid value.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Message and Possible remediation
		Possible remediation: Ensure that the mandatory field specified in the error message is present in the payload and is assigned an accepted value.
400 Bad Request	AVX-VLDN-001	Mandatory field is missing or has invalid value. **Possible remediation**: Ensure that the mandatory field specified in the error message is present in the payload and is assigned an accepted value.
404 Not Found	CERT-INV-0021	Certificate(s) for the given resource ID/certificate UUID are unavailable in the certificate inventory. **Possible remediation**: Ensure that there is a corresponding certifcate for the given resource ID/certificate UUID.
404 Not Found	AVX-VLDN-001	Either the certificate UUID or resource ID should be present in the request. **Possible remediation**: Ensure that a valid resource ID/certificate UUID is present in the request.
403 Forbidden	CERT-ACF-0058	User does not have relevant permission to perform this action. **Possible remediation**: Ensure that the user has the required ACF

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Message and Possible remediation
		permissions to export certificates for a given module.
403 Forbidden	ACF_GW_005	User does not have access to the targeted API **Possible remediation**: Ensure that the user has the required ACF permissions to export certificates for a given module.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Update Certificate Attributes

The update certificates attributes API initiates a request to update the existing certificate attributes.

Before you begin

- The user should have the ACF permission to modify certificate attributes.
- The certificate attribute with the specified name and label combination should already exist.

Request Structure

Endpoint:	/certificate/attribute

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/attribute?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. The array cannot be empty; a minimum of one entry must be present.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Type: Payload

Payload

Payload

Name	Description
name	(Mandatory) The name of the custom attribute. **Type**: String **Constraint**: Must not start with special characters. No special characters except -, _ are allowed.
label	(Mandatory) The label to be shown on the UI for the custom attribute. **Type**: String **Constraint**: Must not start with special characters. No special characters except -, _ are allowed.
value	(Optional) Default value for the attribute. **Type**: String
mandatory	(Optional) Indicates whether the attribute is mandatory or optional. **Type**: Boolean
helpInfo	(Optional) Help information about the field. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

updateCertAttrResponse

Name	Description
updatedGenericFields response	List of fields updated **Type**: Array of CertificateGenericField
failedGenericFields response	List of fields that could not be updated successfully **Type**: Array of CertificateGenericField
addedGenericFields response	List of new fields added **Type**: Array of CertificateGenericField

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Certificate attribute updated successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - payload. **Remediation**: Payload array cannot be empty. At least one attribute must be provided.
400 Bad Request	avx-common-028	Invalid / Incorrect payload. **Remediation**: Check and ensure that the values provided for all the fields in the payload are accurate.

Sample Request/Response

Request Payload

```
[
{
"name": "approver",

Headers
Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
name *Query*	(Mandatory) Name of the certificate attribute that has to be deleted. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Message indicating whether the field has been successfully deleted or not. **Message**: *Deleted Successfully - [approver1]. Failed to delete - []*
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Certificate attribute deleted successfully.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the value provided for the name query parameter is accurate.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that the name query parameter is available in the request.

Sample Request/Response

Request Payload

No payload for DELETE request.

Response

```
{
 "response": "Deleted Successfully - [approver2]. Failed to delete - []",
 "message": "Certificate attribute deleted successfully",
 "appStatusCode": null,
 "tags": {},
 "headers": null
}
```

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Delete Multiple Certificate Attributes

This API will let you delete multiple certificate attributes present for a certificate based on the certificate UUID or the resource ID.

Before you begin

- The user should have the ACF permission to modify certificate attributes.
- The certificate attributes with the specified name and label combination should already exist.

Request Structure

Endpoint:	/certificate/attributeValues
Type:	DELETE
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/attributeValues?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Possible values**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. It consists of an array of attributes listed below. The array cannot be empty; a minimum of one entry must be present. **Type**: Payload

Payload

Payload

Name	Description
certAttributes	(Mandatory) List of attributes to be deleted **Type**: JSON

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: • Each attribute in this list should be present in the AppViewX certificate attribute settings. • Attribute name and value should not contain invalid (HTML and XML) characters.
resourceId	(Mandatory if **certificateUuid** is not provided) Unique identifier associated with the certificate **Type**: String **Note:** It is recommended to use the resource ID since the use of certificate UUID will be deprecated in the future.
certificateUuid	(Mandatory if **resourceId** is not provided) Unique Identifier assigned to the certificate **Type**: String **Note:** It is recommended to use the resource ID since the use of certificate UUID will be deprecated in the future.
category	(Optional) Certificate category **Type**: String **Constraints**: Parameter value cannot be **CA**.

Response Structure

Success Response

200 OK Response with message	Certificate attributes saved to certificate successfully

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Success Response (continued)

Response content-Type:	application/json

Response Parameters

Name	Description
response	Contains the response attributes for the delete request
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response

Status Codes

HTTP Code	appStatusCode	Message and Possible remediation
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field is missing or has invalid value. **Possible remediation**: Ensure that the mandatory field specified in the error message is present in the payload and is assigned an accepted value.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Message and Possible remediation
400 Bad Request	AVX-VLDN-001	Mandatory field is missing or has invalid value. **Possible remediation**: Ensure that the mandatory field specified in the error message is present in the payload and is assigned an accepted value.
404 Not Found	CERT-INV-0021	Certificate(s) for the given resource ID/certificate UUID are unavailable in the certificate inventory. **Possible remediation**: Ensure that there is a corresponding certifcate for the given resource ID/certificate UUID.
404 Not Found	AVX-VLDN-001	Either the certificate UUID or resource ID should be present in the request. **Possible remediation**: Ensure that a valid resource ID/certificate UUID is present in the request.
403 Forbidden	CERT-ACF-0058	User does not have relevant permission to perform this action. **Possible remediation**: Ensure that the user has the required ACF permissions to export certificates for a given module.
403 Forbidden	ACF_GW_005	User does not have access to the targeted API **Possible remediation**: Ensure that the user has the required ACF permissions to export certificates for a given module.
417 Expectation Failed	CERT-FV-001	Invalid query param found for <Query Param>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Message and Possible remediation
		Possible remediation: Ensure that the mandatory field specified in the error message is present in the query and is assigned an accepted value.

Sample Request/Response

Sample Request

Delete request will not have any payload. It will have query params.

```
/certificate/attributeValues?ttl=300&gwkey=f000ca01&gwsource=api&resourceId=6618c4573d3dd048316c4593&certificateUuid=08bd683de4fe75c3a611032201ea212fbe72f3f2&certattributes=test1,test2&category=server
```

Sample Response

```
{
    "response": null,
    "message": "Certificate attributes  are deleted successfully and certificate attributes test2, test1 are not attached with certificate",
    "appStatusCode": null,
    "tags": {},
    "headers": null
}
```

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Bulk Add/Update Certificate Attributes

This API allows you to add or update one or more certificate attributes for one or multiple certificates in a single API request.

Before you Begin

- Ensure that the user has the required permissions to add and update certificate attributes.

Request Structure

Endpoint:	/certificate/attributeValues
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/attributeValues?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (for example, external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the PUT request. **Type**: Payload

Payload

Payload

Name	Description
resourceIds	(Mandatory if `resourceIdList` is not specified) Resource ID of the certificate for which the attributes in the payload have to be added and/or updated The `resourceIds` parameter is used when one or more attributes have to be added an/or updated for a single certificate. Certificate resources IDs can be retrieved using the /certificate/search API.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Note:** It is recommended that `resourceIdList` is used instead of `resourceIds` because `resourceIds` will be deprecated soon.
resourceIdList	(Mandatory if `resourceIds` is not specified) Comma-separated list of resource IDs of all certificates for which the attributes in the payload have to be added and/or updated The `resourceIdList` parameter is used when one or more attributes have to be added and/or updated for multiple certificates. **Type**: Array
attributeValues	(Mandatory) A nested JSON containing the key-value attribute pairs to added and/or updated for the specified certificate(s) The key represents the attribute name and the value is the value being assigned to the specified attribute. **Type**: JSON **Constraints**: • The value of the date attribute should be in the GMT time zone. • The certificate attribute name and value should be assigned valid values as defined in the product.

Response Structure

Success Response

200 OK Response with the message: Certificate attribute updated successfully.

Response content-type: application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters

Name	Description
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

Status Codes

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason: Invalid credentials **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field missing or invalid value **Remediation**: Ensure that the missing mandatory field, as specified in the error response, is included in the payload and is assigned a valid value.
400 Bad Request	RESOURCE_ID_EMPTY	Either both the `resourceIds`and `resourceIdList` parameters are not

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		specified or do not have a value assigned. **Remediation**: Ensure that either one of the parameters, `resourceIds` and `resourceIdList`, is specified and is not empty.
400 Bad Request	CertAttributeBulkError-020	Invalid date format **Remediation**: Ensure that the value for the date attribute is a valid format, such as **MM/dd/yyyy**, **yyyy-MM-dd**, **dd-MM-yyyy** or one of the ISO 8601 formats (like **MM/dd/yyyy HH:mm** or **MM/dd/yyyy HH:mm:ss**) .
404 Bad Request	INVALID_REQUEST	Both `resourceIds` and `resourceIdList` are specified in the payload. **Remediation**: Only of the two parameters, `resourceIds` and `resourceIdList`, must be specified at a time.
403 Forbidden	CERT-ACF-0058	User does not have the required permissions for performing this action. **Remediation**: Ensure that the user has all the requisite permissions for

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		adding/updating certificate attributes.
403 Forbidden	ACF-GW-005	User does not have access to the target API. **Remediation**: Ensure that the user has the requisite ACF permissions to add and update certificate attributes.
404 Not Found	RESOURCE_ID_NOT_AVAILABLE_OR_PERMISSION_DENIED	• One or more of the resource IDs specified are unavailable. • User does not have the permission to add and update the certificate attributes for certificates with the specified resource IDs. **Remediation**: Ensure that all resource IDs specified in the payload are valid (have a corresponding certificate) and that the user has all the requisite permissions to add and update the attributes.
417 Expectation Failed	CERT_ATTRIBUTE_NOT_AVAILABLE	The specified certificate attribute is not defined in the AppViewX product. **Remediation**: Ensure that the certificate attribute

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		name is already defined in the AppViewX product.
417 Expectation Failed	CERT_ATTRIBUTE_NOT_AVAILABLE	Certificate attribute value is invalid. **Remediation**: Ensure that the new certificate attribute value provided is a valid value for that attribute.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Fetch List of Server Devices

This API will fetch the list of server devices onboarded in AppViewX based on the status and vendor specified.

Before You Begin

Before attempting to fetch this list, ensure the following:

- Devices should be added in the server device inventory.
- Users should have permission of **Platform** > **Asset Management** > **Device Inventory** > **Servers**.
- Users should have read permission to the added devices.

Endpoint:	/certificates/devices/servers
Type:	GET
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificates/devices/servers?vendor=Apache&status=Managed&page=3&limit=4&gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId or **auth token** *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password **Type**: String
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String **Possible values**: application/json
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
	Type: Payload

Payload

Payload

Name	Description
vendor	(Optional) Name of the server device vendor **Type**: Sting **Possible values**: For the full list of supported server device vendors, click here.
page	(Optional) Starting page in the inventory to being the search **Type**: Integer **Default value**: 1 **Constraints**: Only positive integer values allowed
limit	(Optional) Maximum number of records to be fetched (beginning from the starting **page**) **Type**: Integer **Default value**: 100 **Constraints**: • Only positive integer values allowed • Maximum limit value: 100
Status	(Optional) Device status value to be included in the search query **Type**: String **Constraints**: The status should be a valid value.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values: • Unresolved • Failed • InProgress • Managed • Queued

Response Structure

Success Response

200 OK response with the list of devices from the device inventory

Response content-type: application/json

Response Parameters

Name	Description
response	Contains the response attributes for the fetch request **Type**: response
message	Success message of the action or failure description (in case of error) **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

response

Name	Description
credentialType	Authentication mechanism used by AppViewX to access and managed privileged accounts **Type**: String **Possible values**: Manual entry, Credential list-AppViewX, SSH, etc.
hostName	Unique name assigned to identify the device within the network **Type**: String
operatingSystemType	Operating system installed on the device **Type**: String
fqdn	IP address/Fully Qualified Domain Name of the device within the network **Type**: String
dataCenter	Data center where the device is hosted **Type**: String
port	Communication port of the device **Type**: Integer
vendor	Name of the device vendor **Type**: String
name	Device name used in AppViewX **Type**: String
certSyncStatus	Certificate parsing status **Type**: String
version	Device version number

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

response (continued)

Name	Description
	Type: String
status	Device status in AppViewX **Type**: String **Possible values**: Managed, Failed, Unresolved, etc.

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
403 Forbidden	CERT-ACF-0058	User does not have access to the targeted API **Possible remediation**: Ensure that the user has the required ACF permissions to export certificates for a given module.
407 Proxy Authentication Required	AVX_GW_011	Session validation failed; reason: Session information is missing **Possible remediation**: Provide correct authentication parameters.
400 Bad Request	MISC_VAL_005	Invalid query param for 'xxx' **Possible remediation**: Ensure that the field mentioned in the error message is assigned an accepted value.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Download a Certificate

The download certificate API can download a certificate in PEM format. If desired, the user can also request the certificate to be downloaded along with the key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

- The user should have the ACF permission to download the certificate within the specified certificate's category.
- A certificate with the resource ID specified for deletion should already exist.
- The group associated with the certificate should at least have the R permission.

Request Structure

Endpoint:	/certificate/download
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/download?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource	(Mandatory) Source from which the request is triggered. (E.g. external)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Query	**Type**: String
resourceId	(Mandatory) Unique Id of the certificate to be downloaded.
Query	**Type**: String
keyRequired	(Optional) Indicates whether the private key needs to be downloaded.
Query	**Type**: Boolean
isCACertificate	(Optional) Indicates whether the certificate being downloaded is a CA certificate.
Query	**Type**: Boolean

Response Structure

Status Code:	200 OK
Error Response:	The error response will have the parameters described below.
Headers	
Content-Type:	application/octet-stream

Error response parameters

Name	Description
message	Failure description. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	null	The attachment of the **.pem** type certificate.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Ensure that the value provided for resourceId parameter refers to the id of an existing certificate.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - resourceId. **Remediation**: Ensure that the resourceId parameter is available in query parameter.
417 Expectation Failed	NOT_A_VALID_CERT	Invalid certificate. **Remediation**: Certificates that have not yet been issued cannot be downloaded. Ensure that the resourceId refers to the certificate that has been issued.
417 Expectation Failed	CERT-KEY-0006	Private key access is restricted in <<Default>> policy. **Remediation**: Retry downloading the certificate after enabling the flag **Enable Access to Private Key** in the Certificate Policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample Response

The downloaded file is a **pem** file and the content of the downloaded file is as mentioned in the example below:

```

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Download a Certificate by Format

The download certificate by format API initiates a request to download a certificate in the requested format. The user can request the private key to be downloaded in the specified format as well. The key can be requested with or without encryption. Additionally, the user can specify whether the complete certificate chain needs to be downloaded.

Before you begin

- The user should have the ACF permission to download the certificate within the specified certificate's category.
- A certificate with the resource ID (or the common name and serial number combination) specified for deletion should already exist.
- The group associated with the certificate should at least have the R permission.

Request Structure

Endpoint:	/certificate/download/format
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/download/format?gwsource=external` To understand the elements of the sample URL, click here.
Headers

Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	The payload contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
format	(Mandatory) The format of the certificate to be downloaded. **Type**: String **Constraint**: The possible certificate formats are - **CRT**, **CERT**, **CER**, **PEM**, **DER**, **DERCER**, **P7B**, **P7C**, **PK8**, **P12**, **PFX**, and **JKS**.
password	(Optional) Password for the certificate. It is applicable for the following certificate formats: **P12**, **PFX**, **JKS**, and **PK8**. (Mandatory) Password is mandatory for the following certificate formats: **P12**, **PFX**, and **JKS**. **Type**: String
commonName	(Mandatory if resourceId is not provided) Common name of the certificate. **Type**: String
serialNumber	(Mandatory) Serial number of the certificate to be downloaded **Type**: String
resourceId	(Mandatory if commonName and serialNumber are not provided) Certificate ID to download the certificate content **Type**: String
isChainRequired	(Optional) Indicates whether to download the complete certificate chain or only the end certificate. **Type**: Boolean
isKeyEncryptionRequired	(Optional) Indicates whether the private key should be encrypted using a password.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Boolean **Constraint**: This is applicable for PK8 format. If the value is **true**, • Ensure that the certificate policy allows private key access. • The password must be provided in the request payload.

Response Structure

Status Code:	200 OK
Error Response:	The error response will have the parameters described below.
Headers	
Content-Type:	application/octet-stream

Error response parameters

Name	Description
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	null	The attachment of the **.pem** type certificate.
404 Not Found	NO_RECORDS_FOUND	No matching records found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that the value provided for commonName and serialNumber pertain to that of a valid existing certificate.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field>> **Remediation**: Ensure that the **<<field>>** is available in the request payload.
400 Bad Request	INVALID_FORMAT	Invalid format specified. **Remediation**: Ensure that a valid value is provided in the format field of the request.
417 Expectation Failed	NOT_A_VALID_CERT	Invalid certificate. **Remediation**: Certificates that have not yet been issued cannot be downloaded. Ensure that the resourceId refers to the certificate that has been issued.
417 Expectation Failed	CERT-KEY-0006	Private key access is restricted in <<Default>> policy. **Remediation**: Retry downloading the certificate after enabling the flag

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Enable Access to Private Key in the Certificate Policy.
417 Expectation Failed	CERT-HLST-0007	Failed to download as the given extension is not supported. **Remediation**: Ensure that a valid value is provided for the format field in the request.
417 Expectation Failed	PASSWORD_FORMAT_WRONG	Password must have at least eight characters and contain at least one lowercase letter, one uppercase letter, one numeric digit, and one special character. **Remediation**: Password provided in the request payload must have at least eight characters and contain at least one lowercase letter, one uppercase letter, one numeric digit, and one special character.

Sample Request/Response

Request Payload

```
{
"commonName" : "testcert7a.appviewx.com",
"serialNumber" : "07:2B:84:01:27:5A:77:63:38:C8:72:09:BE:CD:1F:D9:78:BA:BD",
"format" : "P12",
"password":"Password@123",
"isChainRequired":true,
"isKeyEncryptionRequired":false
}
```

Response

File is downloaded in the requested format.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Download Private Key of a Certificate

The download private key of a certificate API downloads the private key of a certificate in the password protected PEM format.

Before you begin

- The user should have the ACF permission to download the private key within the specified certificate’s category.
- A certificate with the UUID specified for deletion should already exist.
- Private key access should be enabled under the certificate policy of the associated certificate group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/privatekey/download
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/privatekey/download?gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**

Payload

Payload

Name	Description
uuId	(Mandatory) Universally Unique Identifier (UUID) of the certificate of which the private key is to be downloaded **Type**: String
password	(Optional) Password for encrypting the private key in the response. **Type**: String

Response Structure

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
privateKeyPemEncoded	Private key of certificate in password encrypted pem. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
success	**True** if download is successful and **False** if error in downloading. **Type**: Boolean
tags	Additional information in case of failure response.

response

Name	Description
status	Status of the download request **Type**: String
zipFileName	Name of the zipped file that contains the downloaded private key **Type**: String
certContents	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
privateKeyPemEncoded	Private key of certificate in password encrypted pem. **Type**: String
success	**True** if download is successful and **False** if error in downloading. **Type**: Boolean
log	Additional information in case of failure response

Status Codes

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-GEN-0015	Field cannot be null/empty. **Remediation**: Ensure the mandatory fields have valid value in the request. It should not be null or empty.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-KEY-0006	Private key access is restricted in <policy> policy. **Remediation**: Enable private key access in the mentioned policy.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid. **Remediation**: Ensure all the mandatory fields have valid value in the request.
500 Internal Server Error	CERT-GEN-0027	Certificate private key download failed.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Common Response Objects

This page contains fields that are used in APIs for add, update, and get certificate attributes. These fields are grouped together here because they are common to these APIs.

Parameters for CertificateGenericField

Name	Description
_id	Unique identifier for the attribute. **Type**: String
name	Name of the attribute. **Type**: String
type	Type of the attribute. **Type**: String
value	Default value for the attribute. **Type**: String
label	Label to be shown in the UI for the custom attribute. **Type**: String
searchKey	Keyword for searching the certificate based on the attribute. **Type**: String
mandatory	Indicates whether the attribute is mandatory or optional. **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters for CertificateGenericField (continued)

Name	Description
category	The category of the attribute will always be "certAttributes" for certificate attributes. **Type**: String
helpInfo	Help information about the field. **Type**: String

Push and Bind Certificate to a Firewall Profile

The push and bind certificate to a firewall profile API uploads the certificate and its private keys to the firewall profile and links them to the server profiles. Refer to After you are done section to Approve and Implement the request.

Before you Begin

Ensure the following before attempting to push and bind certificate to a firewall profile through AppViewX:

- Firewall devices must be configured in AppViewX.
- The devices should be in the Managed state.
- **Approval is not required:** Enable this mode by setting the ‘Certificate Requests Need Approval?’ flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
certificateId	(Mandatory) Resource id of the certificate. **Type**: String
selectedProfiles	(Mandatory) Firewall profile id. **Type**: String **Constraint**: If the profile connector is specified then certificate is **pushed** and **bound** to the profile, but if a default connector is specified then the certificate is only **pushed**.
certificateDetails	(Mandatory) Certificate details for the Firewall devices. **Type**: Any of the following type (as per the firewall device) - Refer the Fortinet certificate details OR PaloAlto certificate details tables respectively.
pushDetails	(Optional) Other push details **Type**: pushDetails

Fortinet certificate details

Name	Description
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the firewall device. **Type**: String **Constraint**: Value should be **PEM-.pem**.
certificateName	(Mandatory) Certificate name i.e. the name in which the certificate is to be pushed to the firewall device. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fortinet certificate details (continued)

Name	Description
	Constraint: The certificate file name should not start and end with special characters except @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . It should not be the same as intermediate file name and CA file name.
privateKeyPassword	(Optional) Password for the private key pushed to the firewall device. **Type**: String
pushRootAndIntermediateCertificates	(Mandatory) Indicates whether the Root and Intermediate certificate are to be pushed to the firewall device. **Type**: Boolean **Constraint**: The value is either true or false.
rootCertificateFileName	(Mandatory) Root certificate name i.e. the name in which the root certificate is to be pushed to the firewall device. **Type**: String **Constraint**: The root certificate name should not start and end with special characters. No special characters except !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . and should not be the same as certificate file name and CA file name.
intermediateCertificateFileName	(Mandatory) Intermediate certificate name i.e. the name in which the intermediate certificate is to be pushed to the firewall device. **Type**: String (multiple values) **Constraint**: The intermediate certificate name should not start and end with special characters. No special characters except !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >,

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fortinet certificate details (continued)

Name	Description
	(,), ;, . and should not be the same as certificate file name and CA file name.

PaloAlto certificate details

Name	Description
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the firewall device. **Type**: String **Constraint**: Value should be **PEM-.pem** or **PKCS12-.p12**.
certificateName	(Mandatory) Certificate name i.e. the name in which the certificate is to be pushed to the firewall device. **Type**: String **Constraint**: The certificate file name should not start and end with special characters except @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . It should not be the same as intermediate file name and CA file name.
pushRootAndIntermediateCertificates	(Mandatory) Indicates whether the Root and Intermediate certificate are to be pushed to the firewall device. **Type**: Boolean **Constraint**: The value is either true or false.
rootCertificateFileName	(Mandatory) Root certificate name i.e. the name in which the root certificate is to be pushed to the firewall device. **Type**: String **Constraint**: The root certificate name should not start and end with special characters. No special characters except !,

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

PaloAlto certificate details (continued)

Name	Description
	@, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . and should not be the same as certificate file name and CA file name.
intermediateCertificateFileName	(Mandatory) Intermediate certificate name i.e. the name in which the intermediate certificate is to be pushed to the firewall device. **Type**: String (multiple values) **Constraint**: The intermediate certificate name should not start and end with special characters. No special characters except !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . and should not be the same as certificate file name and CA file name.

pushDetails

Name	Description
preValidationScriptPath	(Optional) Location of the pre push script. **Type**: String
postValidationScriptPath	(Optional) Location of the post push script. **Type**: String
overwrite	(Optional) Indicates whether the certificate needs to be overwritten if already available. **Type**: Boolean
pushAutomatically	(Optional) Indicates whether the certificate needs to be pushed automatically when renewed. **Type**: Boolean

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

response

Name	Description
requestId	Request ID for push action for the application connector. **Type**: String
connectorId	Application connector ID. **Type**: String

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	The selectedProfiles parameter is already available in the specified certificate. **Remediation**: Provide a different value for the selectedProfiles field.
404 Not Found	NO_RECORDS_FOUND	No matching records found - certificate not found. **Remediation**: Provide a correct value for the field certificateId.
417 Expectation failed	FIELD_VALUE_INVALID	Invalid value - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
417 Expectation failed	CERT-APP-0016	Connector with profiles {} already exists. **Remediation**: A profile connector is already available for the selected certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Change the certificateId or delete the existing connector.
500 Internal Server Error	avx-common-011	Error while processing.

Rollback Certificate to Firewall Profile

The rollback certificate to a firewall profile API rolls back the certificate and its private keys to the firewall profile and links them to the server profiles. Refer to the After you are done section to Approve and Implement the request.

Before you begin

Ensure the following before attempting to rollback certificate to a firewall profile through AppViewX:

- Firewall devices must be configured in AppViewX.
- The devices should be in Managed state.
- **Approval is not required:** Enable this mode by setting the 'Certificate Requests Need Approval?' flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/rollback
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.
Headers

Get Available Server Profiles

The get available server profiles API fetches the available profile details for the particular server device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

Ensure the following before attempting to fetch available profiles for a particular server device through AppViewX:

- Server devices must be configured in AppViewX.
- The devices should be in Managed state.

Request Structure

Endpoint:	/certificate/profiles
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external&category=Server&vendor=<Vendor_Name>` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
category *Query*	(Mandatory) It specifies the device category. **Type**: String **Constraint**: Required if sessionId is not provided.
vendor *Query*	Vendor for the chosen device. For example, **Apache** is a vendor for the Server category. It is a mandatory field. **Type**: String
certificateUuid *Query*	Uuid of the certificate. **Type**: String
deviceName *Query*	Name of the device as per AppViewX Device Inventory. **Type**: String
inventory *Query*	Name of AppViewX inventory where the certificate is present.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the fetch profiles request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
objects	List of available device profile Ids.
response	**Type**: String
totalRecords	Total number of profiles fetched.
response	**Type**: Integer
obtainedRecords	Total number of profiles fetched.
response	**Type**: Integer
obtainedRecordRange	Range of record retrieved
response	**Type**: Object
start	Start index of the record range retrieved
response.obtainedRecordRange	**Type**: Integer
end	End index of the record range retrieved
response.obtainedRecordRange	**Type**: Integer
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	<<No. of profile Ids>> record(s) found

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	The mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Provide correct values for all the fields.
500 Internal Server Error	avx-common-011	Error while processing.

Push and Bind Certificate to a Server Profile

The push and bind certificate to a server profile API uploads the certificate and its private keys to the server device and links them to the server profiles. Refer to After you are done section to Approve and Implement the request.

Before you Begin

Ensure the following before attempting to push and bind certificate to a firewall profile through AppViewX:

- Server devices must be configured in AppViewX.
- The devices should be in Managed state.
- **Approval is not required:** Enable this mode by setting the 'Certificate Requests Need Approval?' flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username	(Mandatory) AppViewX login username.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwkey *Query*	(Mandatory) Tenant Key. This is needed only in case of multi-tenant installations and can disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
certificateId	(Mandatory) Resource id of the certificate. **Type**: String
selectedProfiles	(Mandatory) Server profile id.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Constraint**: If the profile connector is specified then certificate is **pushed** and **bound** to the profile, but if a default connector is specified then the certificate is only **pushed**.
certificateDetails	(Mandatory) Certificate details for the Firewall devices. **Type**: Any of the following type (as per the server device) - Refer the following: • Certificate details for IIS Server • Certificate details for Microsoft PC Server • Certificate details for Microsoft Server • Certificate details for Apache Linux Server • Certificate details for Tomcat Server • Certificate details for Weblogic Server • Certificate details for Websphere Server • Certificate details for IPlanet Server
pushDetails	(Optional) Other push details.
preValidationScriptPath pushDetails	(Optional) Location of the pre push script. **Type**: String
postValidationScriptPath pushDetails	(Optional) Location of the post push script. **Type**: String
overwrite pushDetails	(Optional) Indicates whether the certificate needs to be overwritten if already available. **Type**: Boolean **Constraint**: Enabled by default for IIS vendor.
pushAutomatically	(Optional) Indicates whether the certificate needs to be pushed automatically when renewed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
pushDetails	**Type**: Boolean

Certificate details for IIS Server

Name	Description
locationType	(Mandatory) Specifies whether the certificate should be uploaded to the certificate store or the centralized file system. **Type**: String **Constraints**: The allowed values are **Certificate store** or **File system**.
keyStoreLocation	(Mandatory) When the locationType "Certificate store" is chosen, the keyStoreLocation determines the sub-store under which the certificate should be uploaded. **Type**: String **Constraints**: The allowed values are **Personal** or **Web Hosting**.
certificateLocation	(Optional) When the locationType "File system" is chosen, the certificateLocation specifies the actual folder location where the PFX file should be placed. **Type**: String **Constraints**: It is applicable only if the IIS server is managed with the centralized "file system". If the certificateLocation is left blank, the location specified during IIS server device addition is taken as the location.
certificateFileName	(Mandatory) The "certificate friendly name" under which the certificate should be stored in the Certificate store. In the case of a file system, it is the "certificate file name" with which the certificate should be stored in the file system. **Type**: String

Certificate details for IIS Server (continued)

Name	Description
	Constraints: The certificate file name should not start and end with special characters except @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, .
bindType	(Optional) Specifies whether the binding type is Update certificate binding only, Create new site binding, or Update site binding (port, hostname, SNI). **Type**: String **Constraints**: It is applicable for locationType as "Certificate store". The allowed values are **Update certificate only**, **Update site binding**, and **Create new site binding**.
IsSNIEnabled	(Optional) The Server Name Indication option to be mapped in IIS site binding. **Type**: Boolean **Constraints**: It is applicable when bindType is **Update site binding** or **Create new site binding**. It is also applicable for IIS versions >= 8.0.
hostName	(Optional) The hostname of the server that has to be updated in the site binding. **Type**: String **Constraints**: It is applicable when bindType is **Update site binding** or **Create new site binding**.
port	(Optional) The server port number that has to be updated in the site binding. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for IIS Server (continued)

Name	Description
	Constraints: • It is applicable when bindType is **Update site binding** or **Create new site binding**. • This field is **mandatory** for for bindType **Create new site binding**. • The allowed values are between 1-65535.
pushRootAndIntermediateCertificates	(Mandatory) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean

Certificate details for Microsoft PC Server

Name	Description
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the server device. **Type**: String **Constraints**: The allowed values are **PKCS12-.pfx**.
certificateFileName	(Mandatory) The "certificate friendly name" under which the certificate should be stored in the Certificate store. **Type**: String **Constraints**: The certificate file name should not start and end with special characters except @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, .
pfxPassword	(Mandatory) The temporary password used during a certificate push. **Type**: String **Constraints**: The value must be base64 encoded.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Microsoft PC Server (continued)

Name	Description
pushRootAndIntermediateCertificates	(Mandatory) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean

Certificate details for Microsoft Server

Name	Description
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the server device. **Type**: String **Constraints**: The possible values are **PEM-.crt**, **PEM-.cer**, **PEM-.pem**, **DER-.cer**, **DER-.der**, **JKS-.jks**, **PKCS7-.p7b**, **PKCS7-.p7c**, **PKCS12-.p12**, and **PKCS12-.pfx**.
pushLocation	(Mandatory) The folder location in which certificate and private key are pushed. **Type**: String
certificateFileName	(Mandatory) A user-defined file name for pushing the certificate into the Microsoft server. **Type**: String **Constraints**: The file name must be suffixed with the certificate format to be pushed e.g.: test.appviewx.com.pfx.
privateKeyFileName	(Mandatory) A user-defined file name for pushing the certificate into the Microsoft server. **Type**: String **Constraints**: The file name must be suffixed with the certificate format to be pushed, e.g.: test.appviewx.com.key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Microsoft Server (continued)

Name	Description
	It is only applicable for types **PEM-.crt**, **PEM-.cer**, **PEM-.pem**, **DER-.cer**, **DER-.der**, **PKCS7-.p7b**, and **PKCS7-.p7c**.
pfxPassword	(Optional) The password of pfx/p12 file. **Type**: String **Constraints**: The value must be base64 encoded. It is only applicable for types **PKCS12-pfx**, and **PKCS-p12**.
aliasName	(Optional) The end entity certificate alias name for the jks file. **Type**: String **Constraints**: It is only applicable for **JKS-.jks**certificate type.
keyStorePassword	(Optional) The jks file password. **Type**: String **Constraints**: The value must be base64 encoded. It is only applicable for types **PKCS12-pfx**, and **PKCS-p12**.
privateKeyPassword	(Optional) The private key entry password for the jks file. **Type**: String **Constraints**: The value must be base64 encoded. It is only applicable for types **PKCS12-pfx**, and **PKCS-p12**.
pushRootAndIntermediateCertificates	(Mandatory) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean **Constraints**:
rootCertificateFileName	(Mandatory) A user-defined file name for pushing the root certificate into the Microsoft server. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Microsoft Server (continued)

Name	Description
	Constraints: The root certificate file name should not begin or end with special characters. The special characters allowed are !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . The root certificate file name should also be different from both the CA file name and the intermediate certificate file name.
intermediateCertificateFileName	(Mandatory) A user-defined file name for pushing the intermediate certificate into the Microsoft server. **Type**: String **Constraints**: The intermediate certificate file name should not begin or end with special characters. The special characters allowed are !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . The intermediate certificate file name should also be different from both the certificate file name and the CA file name.

Certificate details for Apache (Linux) Server

Name	Description
isManualPush	(Optional) If selected, users can customize the certificate and key push locations. **Type**: Boolean
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the server device. **Type**: String **Constraints**: The possible values are **PEM-.crt**, **PEM-.cer**, and **PEM-.pem**.
certificateLocation	(Mandatory) User-defined location (including the directory name and file name) for the certificate to be pushed **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Apache (Linux) Server (continued)

Name	Description
	Constraints: The certificate file name should not begin or end with special characters except -, ., _. The CA file name should also be different from both the CA file name and the intermediate certificate file name.
keyLocation	(Mandatory) User defined location, including both, the directory and file name, for pushing the keys into the Tomcat Linux server **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. . The private key file name should be same as the certificateFileName.
isRestartRequired	(Optional) Option to restart the service after the push operation. **Type**: Boolean
pushRootAndIntermediateCertificates	(Mandatory) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
trustLocation	(Mandatory) A user-defined directory for pushing the root and intermediate certificate into the Apache server. **Type**: String **Constraints**: The root certificate file name should not begin or end with special characters. The special characters allowed are !, @, #, $, %, ^, &, _, {, }, [,], |, :, <, >, (,), ;, . The CA file name should also be different from both the certificate file name and the CA file name.
rootCertificateFileName	(Optional) A user-defined file name for pushing the root certificate into the Apache server. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Apache (Linux) Server (continued)

Name	Description
	Constraints: Mandatory when "pushRootAndIntermediateCertificates" is true. The root certificate file or bundle name should not begin or end with special characters. The special characters allowed are -, _, .. The root certificate file name should also be different from the certificate and intermediate certificate file name.
intermediateCertificateFileName	(Optional) A user-defined file name for pushing the intermediate certificate into the Apache server. **Type**: String **Constraints**: Mandatory when "pushRootAndIntermediateCertificates" is true. The intermediate certificate file or bundle name should not begin or end with special characters. The special characters allowed are -, _, .. The intermediate certificate file name should also be different from the certificate and root certificate file name.
privateKeyInDevice	(Optional) Determines whether users need to push the private key into the device. **Type**: Boolean

Certificate details for Tomcat (Linux) Server

Name	Description
certificateType	(Mandatory) Certificate type i.e. the format in which the certificate is to be pushed to the server device. **Type**: String **Constraints**: The possible values are **PEM-.crt**, **PEM-.cer**, **PEM-.pem**, and **JKS-.jks**.
certificateLocation	(Mandatory) User-defined location (including the directory name and file name) for the certificate to be pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Tomcat (Linux) Server (continued)

Name	Description
	Type: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The CA file name should also be different from both the CA file name and the intermediate certificate file name.
keyLocation	(Mandatory) User defined location, including both, the directory and file name, for pushing the keys into the Tomcat Linux server **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. . The private key file name should be same as the certificateFileName.
keyStoreLocation	(Mandatory) A user-defined store location for pushing the keys and certificates into the Tomcat server. **Type**: String **Constraints**: It is applicable for certificate type **JKS-.jks**. Enter the keystore location with the extension as **.jks** or **.keystore**.
keyStorePassword	(Mandatory) The .jks file password. **Type**: String **Constraints**: It is applicable for certificate type **JKS-.jks**.
aliasName	(Optional) The end entity certificate alias name for the jks file. **Type**: String **Constraints**: It is applicable for certificate type **JKS-.jks**.
privateKeyInDevice	(Optional) Determines whether the private key needs to be pushed to the device. **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Tomcat (Linux) Server (continued)

Name	Description
	Constraints: It is applicable for certificate type **JKS-.jks**.
privateKeyLocation	(Optional) A user-defined directory for pushing the private keys into the Tomcat server. **Type**: String **Constraints**: It is mandatory if “privateKeyInDevice” is true and is applicable only for certificate type **JKS-.jks**.
pushRootAndIntermediateCertificates	(Optional) Determines whether the root and intermediate certificate needs to be pushed to the device. **Type**: Boolean **Constraints**: It is applicable for all certificate types.
rootCertificateFileName	(Optional) A user-defined file name for pushing the root certificate into the Tomcat server. **Type**: String **Constraints**: Mandatory when “pushRootAndIntermediateCertificates” is true. The root certificate file or bundle name should not begin or end with special characters except -, _, .. The root certificate file name should also be different from the certificate and intermediate certificate file name.
intermediateCertificateFileName	(Optional) A user-defined file name for pushing the intermediate certificate into the Apache server. **Type**: String **Constraints**: Mandatory when “pushRootAndIntermediateCertificates” is true. The intermediate certificate file or bundle name should not begin or end with special characters except -, _, .. The intermediate certificate

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes.
requestId response	Request Id for push action for the application connector. **Type**: String
connectorId response	Application connector Id. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	selectedProfiles parameter is already available in the specified certificate. **Remediation**: Provide a different value for the selectedProfiles field.
404 Not Found	NO_RECORDS_FOUND	No matching records found - certificate not found. **Remediation**: Provide a correct value for the field certificateId.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	FIELD_VALUE_INVALID	Invalid value - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
417 Expectation failed	CERT-APP-0016	Connector with profiles {} already exists. **Remediation**: A profile connector is already available for the selected certificate. Change the certificateId or delete the existing connector.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Request/Response

Request Payload

```
{
 "certificateDetails": {
 "certificateType": "PEM-.pem",

References

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Rollback Certificate to Server Profile

The rollback certificate to a server profile API rolls back the certificate and its private keys to the server profile and links them to the server profiles. Refer to the After you are done section to Approve and Implement the request.

Before you begin

Ensure the following before attempting to rollback certificate to a server profile through AppViewX:

- Server devices must be configured in AppViewX.
- The devices should be in Managed state.
- **Approval is not required:** Enable this mode by setting the ‘Certificate Requests Need Approval?’ flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/rollback
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/rollback?gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
autoApproval *Query*	(Mandatory) Indicates whether the auto-approval is needed for the action. **Type**: String **Constraint**: Value of the parameter should be **yes**.
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
applicationConnectorIds	(Mandatory) Application connector id. **Type**: List <String>

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes.
requestId response	Request Id for rollback action for the application connector. **Type**: String
connectorId response	Application connector Id. **Type**: String
message	Success message or failure description in case of error. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	App connector rollback action initiated for 1 connector(s).
202 Accepted	NA	Operation cannot be completed for one or more devices as the 'Resource' allocated to you does not have write permission. **Remediation**: Ensure that users have access to the device.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	FIELD_VALUE_INVALID	Invalid value - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
417 Expectation failed	CERT-APP-0012	Application connector ids cannot be empty. **Remediation**: Please provide value for the field applicationConnectorIds.
417 Expectation failed	ERR_APPLICATION_CONNECTOR_LIST_RETRIVAL	Unable to retrieve connector information. **Remediation**: Connector may not be available. Please provide correct value for the field applicationConnectorIds.
417 Expectation failed	ERR_APP_CONNECTORS_NOT_FOUND	Application connector(s) not found. **Remediation**: Connector may not be available. Please provide correct value for the field applicationConnectorIds.
417 Expectation failed	ERR_INITIALIZE_ROLLBACK_REQUEST	Unable to initialize rollback request.
500 Internal Server Error	avx-common-011	Error while processing

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Delete Certificate using UUID

The delete certificate using UUID API deletes the certificates using the Universal Unique Identifier (UUID). The UUID is a unique id for each certificate. This id remains the same even if the certificate is generated numerous times. It is generated based on certain attributes and properties of the certificate.

Request Structure

Endpoint:	/certificate/delete
Type:	DELETE
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/delete?gwsource=external&commonName={commonName}&serialNumber={serialNumber}` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username	(Mandatory) AppViewX login username.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwkey *Query*	(Mandatory) Tenant Key. This is needed only in case of multi-tenant installations and can disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
certIds	(Mandatory) Format required. **Type**: Array **Constraint**: Uuid of the certificate to be deleted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure

Error Response Parameters

Name	Description
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-CA-0047	Cert Ids cannot be empty. **Remediation**: Provide UUIDs in the request to delete certificates.
417 Expectation failed	CERT-HLST-0019	The operation cannot be completed as {} selected certificate(s) are in Read-Only access groups. **Remediation**: Change the permissions in the required access group.
400 Not Found	CERT-INV-0021	Requested certificate is not available in the inventory. **Remediation**: Provide uuids that are available in the inventory.
500 Internal Server Error	CERT-GEN-0028	Certificate Limit Exceed. **Remediation**: Cannot delete more than 100 certificates.

Sample Request/Response

Request Payload

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Discover Certificates from Firewall

The API will discover certificates and it's private keys from the firewall device.

Before you begin

Ensure the following before attempting to discover a certificate from a particular firewall device through AppViewX:

- Firewall devices should be added in AppViewX.
- The device should be in Managed state.

Request Structure

Endpoint:	/certificate/discovery/instance
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/action?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String **Possible values:**: ONDEMAND, SCHEDULED
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: String **Constraint**: Not mandatory if the field **rbacRuleProcessRequired** is **true**
source	(Mandatory) Source of the certificates. **Type**: String **Possible values:**: Value should be **FIREWALL**.
certStatus	(Mandatory) Specifies the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: Managed, Monitored, or None. If "None", then certificates will not be moved to certificate inventory.
targetList	(Mandatory) Name of the devices where the certificates need to be discovered. **Type**: List of String **Constraint**: Device names which are added already need to be specified.
coolingPeriod	(Mandatory) Indicates whether the discovery is sequential or parallel. 0 is for sequential, whereas 1< indicates parallel. **Type**: Integer
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: Rule name which is added already need to be specified.
rbacRuleProcessRequired	(Optional) Determines whether Rbac rule process is required. **Type**: Boolean (true or false) **Constraint**: If "true", then new certificates will be tagged under the group specified in the rule.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message response	Success message of the action or failure description in case of error. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: Object
header	HTTP headers associated with the response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1. **Remediation**: Provide a correct value in the field coolingPeriod.
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String **Possible values:**: ONDEMAND

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String
source	(Mandatory) Network source to discover certificates from **Type**: String **Important**: The values are case-sensitive. **Possible value(s):**: IPRANGE, SUBNET, URL
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String **Constraint**: Rule name which is added already need to be specified.
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: MANAGED, MONITERED, NONE (the values are case sensitive) **Important**: The values are case-sensitive. If **certStatus** = **NONE**, the discovered certificates will not be moved to certificate inventory.
rbacRuleProcessRequired	(Optional) Specify whether RBAC rule process is required. **Type**: Boolean (true or false) **Constraint**: If this is set to **true**, new certificates will be tagged under the group specified in the rule.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: domainList
domainList	(Mandatory) List of the domains to be scanned. **Type**: String
occuranceType	(Mandatory) Occurrence frequency **Type**: String **Possible values:**: DAILY, WEEKLY, MONTHLY, YEARLY
neverEnds	(Mandatory) Specify if the discovery should be a never ending occurrence **Type**: Boolean **Possible value(s):**: true, false
startDate	(Mandatory if **discoveryType** = **SCHEDULED**) Start date for the scheduled network discovery scan **Type**: Long
timeZone	(Mandatory if **discoveryType** = **SCHEDULED**) Time zone in which the scheduled network discovery scan will be triggered **Type**: String **Possible values:**: Possible values for time zone
endDate	(Optional - Applicable for discoveryType = SCHEDULED). End date for the scheduled network discovery scan. **Type**: Long
endAfterNoOfOccurances	(Optional - Applicable for discoveryType = SCHEDULED). Number of occurrences after which the scheduled network discovery scan is ended.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Integer
occuranceDays	(Optional - Applicable for discoveryType = SCHEDULED AND occuranceType = WEEKLY). List of days of week in which the scheduled discovery to be triggered. **Type**: List **Possible Value**: MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY, SUNDAY **Default Value**: MONDAY

Note: If endAfterNoOfOccurances is null or 0, and endDate is null, and neverEnds is either null or false, then neverEnds will be automatically set to true.

Payload-DomainList

Name	Description
domainName	(Mandatory) domain name for the CT Log discovery.\ **Type**: String
dataCenter	(Mandatory) The data center for the domain. **Type**: String **Constraint**: The provided dataCenter must be available.

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message response	Success message of the action or failure description in case of error. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object
header	HTTP headers associated with the response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1. **Remediation**: Provide a correct value in the field coolingPeriod.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Request/Response

Sample Request

```
{
    "discoveryType": "ONDEMAND",
    "name": "on_demand_network",
    "description": "on_demand_network desc",
    "source": "NETWORK",
    "groupName": "Default",
    "networkList" : [
"BLR_network"
    ],
    "certStatus": "NONE",
    "rbacRuleProcessRequired" : false,
    "associatedRule": "ignore_revoked_certs"
}
```

Sample Request

```
{
    "discoveryType": "SCHEDULED",
    "name": "scheduled_network",
    "description": "scheduled_network desc",
    "source": "NETWORK",
    "groupName": "Default",
    "networkList" : [
        "BLR_network"
    ],
    "certStatus": "MANAGED",
    "rbacRuleProcessRequired" : false,
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  "associatedRule": "ignore_revoked_certs",
  "occuranceType": "WEEKLY",
  "occuranceDays": ["TUESDAY", "WEDNESDAY"],
  "neverEnds": true,
  "startDate": 1749555000000,
  "hostNames": "appviewx.com",
  "passiveMode": false,
  "fullScanAfterNumberOfPassiveDiscoveries": 0,
  "timeZone":"Asia/Calcutta"
}
```

Sample Response

```
{
  "response": {
     "discoveryName": "on_demand_network",
     "message": "Discovery history details added successfully with discovery id 683d53800b80a91c95bee4da, and discovery operation has been triggered."
  },
  "message": "Discovery history details added successfully with discovery id 683d53800b80a91c95bee4da, and discovery operation has been triggered.",
  "appStatusCode": null,
  "tags": {},
  "headers": null
}
```

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Discover Certificates from Network

- Discover Certificates from Subnet
- Discover Certificates from IP Range
- Discover Certificates from URL
- Discover Certificates from Network

Discover Certificates from Subnet

The API will discover certificates and their private keys from a subnet.

Before you begin

Ensure that the target IP addresses for the network scan are reachable.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/discovery/instance
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Payload	Contains all the parameters to be sent in the request body for the post request.
Body	**Type**: Payload

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String **Possible values:**: ONDEMAND, SCHEDULED
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String
source	(Mandatory) Network source to discover certificates from **Type**: String **Possible value(s):**: IPRANGE, SUBNET, URL
executeBatchesSequentially	(Optional) Specify if the discovey operation for batches must be executed sequentially **Type**: Boolean **Possible value(s):**: true, false
coolingPeriod	(Mandatory) Indicates whether the discovery is sequential or parallel. **Type**: Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible value(s):: • 0 (for parallel discovery) • 1 < (for sequential discovery) **Note:** 1 is not a valid value for this parameter.
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String **Constraint**: Rule name which is added already need to be specified.
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: MANAGED, MONITERED, NONE (the values are case sensitive) If **certStatus** = **NONE**, the discovered certificates will not be moved to certificate inventory.
rbacRuleProcessRequired	(Optional) Specify whether RBAC rule process is required. **Type**: Boolean (true or false) **Constraint**: If this is set to **true**, new certificates will be tagged under the group specified in the rule.
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: String
category	(Mandatory) Certificate category **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values:: server, client, code-signing
subnets	(Mandatory) Details of the subnet to be scanned **Type**: subnets
occuranceType	(Mandatory) Occurrence frequency **Type**: String **Possible values:**: DAILY, WEEKLY, MONTHLY, YEARLY
neverEnds	(Mandatory) Specify if the discovery should be a never ending occurrence **Type**: Boolean **Possible value(s):**: true, false
startDate	(Mandatory if **discoveryType** = **SCHEDULED**) Start date for the scheduled network discovery scan **Type**: Long
timeZone	(Mandatory if **discoveryType** = **SCHEDULED**) Time zone in which the scheduled network discovery scan will be triggered **Type**: String **Possible values:**: Possible values for time zone

Payload-Subnets

Name	Description
subnetwork	(Mandatory) Subnet in CIDR notation **Type**: String
ports	(Mandatory) Target ports to scan **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload-Subnets (continued)

Name	Description
	Possible value(s):: all, comma-separated list of individual ports to be scanned
batchSeperationConstant	(Mandatory) Subnet mask for specifying the subnet division for scanning **Type**: String
dataCenter	(Mandatory) Data center where the subnet is located **Type**: String
hostNames	(Mandatory) SNI hostname to be used while retrieving the certificate **Type**: Array
tlsVersions	(Optional) List of TLS versions to be used while communicating with the IP(s) for certificate retrieval **Type**: Array
standardPorts	(Optional) Specify if only standard ports must be scanned **Type**: Boolean **Possible value(s):**: true, false

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message	Success message of the action or failure description in case of error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
response	**Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object
header	HTTP headers associated with the response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1. **Remediation**: Provide a correct value in the field coolingPeriod.
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Discover Certificates from IP Range

The API will discover certificates and their private keys from an IP range.

Before you begin

Ensure that the target IP addresses for the network scan are reachable.

Request Structure

Endpoint:	/certificate/discovery/instance
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values:: ONDEMAND, SCHEDULED
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String
source	(Mandatory) Network source to discover certificates from **Type**: String **Possible value(s):**: IPRANGE, SUBNET, URL
executeBatchesSequentially	(Optional) Specify if the discovey operation for batches must be executed sequentially **Type**: Boolean **Possible value(s):**: true, false
coolingPeriod	(Mandatory) Indicates whether the discovery is sequential or parallel. **Type**: Integer **Possible value(s):**: • 0 (for parallel discovery) • 1 < (for sequential discovery) **Note:** 1 is not a valid value for this parameter.
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String **Constraint**: Rule name which is added already need to be specified.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: MANAGED, MONITERED, NONE (the values are case sensitive) If **certStatus** = **NONE**, the discovered certificates will not be moved to certificate inventory.
rbacRuleProcessRequired	(Optional) Specify whether RBAC rule process is required. **Type**: Boolean (true or false) **Constraint**: If this is set to **true**, new certificates will be tagged under the group specified in the rule.
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: String
category	(Mandatory) Certificate category **Type**: String **Possible values:**: server, client, code-signing
ipRanges	(Mandatory) Details of the network IP range to be scanned **Type**: ipRanges
occuranceType	(Mandatory) Occurrence frequency **Type**: String **Possible values:**: DAILY, WEEKLY, MONTHLY, YEARLY
neverEnds	(Mandatory) Specify if the discovery should be a never ending occurrence **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible value(s):: true, false
startDate	(Mandatory if **discoveryType** = **SCHEDULED**) Start date for the scheduled network discovery scan **Type**: Long
timeZone	(Mandatory if **discoveryType** = **SCHEDULED**) Time zone in which the scheduled network discovery scan will be triggered **Type**: String **Possible values:**: Possible values for time zone

Payload-ipRanges

Name	Description
startIp	(Mandatory) Starting IP address of the IP range to be scanned for certificate discovery **Type**: String
endIp	(Mandatory) Ending IP address of the IP range to be scanned for certificate discovery **Type**: String
ports	(Mandatory) Target ports to scan **Type**: String **Possible value(s):**: all, comma-separated list of individual ports to be scanned
batchSeperationConstant	(Mandatory) Numerical constant **Type**: String **Possible value(s):**: 0-256
dataCenter	(Mandatory) Data center where the subnet is located

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload-ipRanges (continued)

Name	Description
	Type: String
hostNames	(Mandatory) SNI hostname to be used while retrieving the certificate **Type**: Array
tlsVersions	(Optional) List of TLS versions to be used while communicating with the IP(s) for certificate retrieval **Type**: Array
standardPorts	(Optional) Specify if only standard ports must be scanned **Type**: Boolean **Possible value(s):**: true, false

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message response	Success message of the action or failure description in case of error. **Type**: String
message	Success message or failure description in case of error. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object
header	HTTP headers associated with the response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1. **Remediation**: Provide a correct value in the field coolingPeriod.
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The hostname will be included in the endpoint URL for an on-prem deployment.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Discover Certificates from URL

The API will discover certificates and their private keys from an HTTPS URL.

Before you begin

Ensure that the target IP addresses for the network scan are reachable.

Request Structure

Endpoint:	/certificate/discovery/instance
Type:	POST
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?gwsource=external

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To understand the elements of the sample URL, click here.
Headers
Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String **Possible values:**: ONDEMAND, SCHEDULED
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String
source	(Mandatory) Network source to discover certificates from **Type**: String **Possible value(s):**: IPRANGE, SUBNET, URL
executeBatchesSequentially	(Optional) Specify if the discovey operation for batches must be executed sequentially **Type**: Boolean **Possible value(s):**: true, false
coolingPeriod	(Mandatory) Indicates whether the discovery is sequential or parallel. **Type**: Integer **Possible value(s):**: • 0 (for parallel discovery) • 1 < (for sequential discovery) **Note:** 1 is not a valid value for this parameter.
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Constraint**: Rule name which is added already need to be specified.
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: MANAGED, MONITERED, NONE (the values are case sensitive) If **certStatus** = **NONE**, the discovered certificates will not be moved to certificate inventory.
rbacRuleProcessRequired	(Optional) Specify whether RBAC rule process is required. **Type**: Boolean (true or false) **Constraint**: If this is set to **true**, new certificates will be tagged under the group specified in the rule.
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: String
category	(Mandatory) Certificate category **Type**: String **Possible values:**: server, client, code-signing
urls	(Mandatory) Details of the HTTPS URL to be scanned **Type**: urls
occuranceType	(Mandatory) Occurrence frequency **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values:: DAILY, WEEKLY, MONTHLY, YEARLY
neverEnds	(Mandatory) Specify if the discovery should be a never ending occurrence **Type**: Boolean **Possible value(s):**: true, false
startDate	(Mandatory if **discoveryType** = **SCHEDULED**) Start date for the scheduled network discovery scan **Type**: Long
timeZone	(Mandatory if **discoveryType** = **SCHEDULED**) Time zone in which the scheduled network discovery scan will be triggered **Type**: String **Possible values:**: Possible values for time zone

Payload-urls

Name	Description
url	(Mandatory) HTTPS URL to be scanned for certificate discovery **Type**: String
ports	(Mandatory) Target ports to scan **Type**: String **Possible value(s):**: all, comma-separated list of individual ports to be scanned
dataCenter	(Mandatory) Data center where the subnet is located **Type**: String
hostNames	(Mandatory) SNI hostname to be used while retrieving the certificate **Type**: Array

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload-urls (continued)

Name	Description
tlsVersions	(Optional) List of TLS versions to be used while communicating with the IP(s) for certificate retrieval **Type**: Array

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message response	Success message of the action or failure description in case of error. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object
header	HTTP headers associated with the response. **Type**: Object

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>> **Remediation**: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Provide a correct value in the field coolingPeriod.
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Discover Certificates from Network

The API will discover certificates and their private keys from a network.

Before you begin

Ensure that the provided networks are valid.

Request Structure

Endpoint:	/certificate/discovery/instance
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?gwsource=external` To understand the elements of the sample URL, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Headers
Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
discoveryType	(Mandatory) Type of the discovery. **Type**: String **Possible values:**: ONDEMAND
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
description	(Optional) Description of the discovery request. **Type**: String
source	(Mandatory) Network source to discover certificates from **Type**: String **Important**: The values are case-sensitive. **Possible value(s):**: IPRANGE, SUBNET, URL
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String **Possible value(s):**: Rule name which is added already need to be specified.
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible value(s)**: MANAGED, MONITORED, or NONE. If "None", then certificates will not be moved to certificate inventory.
associatedRule	(Optional) Name of the rule to be associated with the discovered certificates. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: Rule name which is added already need to be specified.
certStatus	(Mandatory) Specify the certificate status to be maintained in the inventory after discovering the certificates. **Type**: String **Possible values:**: MANAGED, MONITERED, NONE (the values are case sensitive) **Important**: The values are case-sensitive. If **certStatus** = **NONE**, the discovered certificates will not be moved to certificate inventory.
rbacRuleProcessRequired	(Optional) Specify whether RBAC rule process is required. **Type**: Boolean (true or false) **Constraint**: If this is set to **true**, new certificates will be tagged under the group specified in the rule.
groupName	(Mandatory) Specifies the group under which the discovered certificate needs to be tagged. **Type**: String
networkList	(Mandatory) List of the networks to be scanned. **Type**: String
category	(Mandatory) Certificate category **Type**: String **Possible values:**: server, client, code-signing
occuranceType	(Mandatory) Occurrence frequency **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values:: DAILY, WEEKLY, MONTHLY, YEARLY
neverEnds	(Mandatory) Specify if the discovery should be a never ending occurrence **Type**: Boolean **Possible value(s):**: true, false
startDate	(Mandatory if **discoveryType** = **SCHEDULED**) Start date for the scheduled network discovery scan **Type**: Long
timeZone	(Mandatory if **discoveryType** = **SCHEDULED**) Time zone in which the scheduled network discovery scan will be triggered **Type**: String **Possible values:**: Possible values for time zone
endDate	(Optional - Applicable for discoveryType = SCHEDULED). End date for the scheduled network discovery scan. **Type**: Long
endAfterNoOfOccurances	(Optional - Applicable for discoveryType = SCHEDULED). Number of occurrences after which the scheduled network discovery scan is ended. **Type**: Integer
occuranceDays	(Optional - Applicable for discoveryType = SCHEDULED AND occuranceType = WEEKLY). List of days of week in which the scheduled discovery to be triggered. **Type**: List **Possible Value**: MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY, SUNDAY **Default Value**: MONDAY

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
hostNames	(Optional) Comma separated sni host names. **Type**: String
passiveMode	(Optional - Applicable for discoveryType = SCHEDULED). If passiveMode is true; Discover certificates from IPs and ports from which certificates were discovered previously. **Type**: Boolean **Default value**: False
fullScanAfterNumberOfPassiveDiscoveries	(Optional - Applicable for discoveryType = SCHEDULED AND passiveMode = true). The number of passive discoveries after which full scan needs to be run. **Type**: Integer **Default value**: 0

Note: If endAfterNoOfOccurances is null or 0, and endDate is null, and neverEnds is either null or false, then neverEnds will be automatically set to true.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request. **Type**: Object
discoveryName response	Name of the discovery request created. **Type**: String
message	Success message of the action or failure description in case of error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
response	**Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null for failure response. **Type**: String
tags	Additional information in case of a failure response. **Type**: Object
header	HTTP headers associated with the response. **Type**: Object

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Discovery history details added successfully with discovery id<value>, and discovery operation has been triggered.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that a valid value is provided for the <<field name>> field in the request.
400 Bad Request	INVALID_REQUEST	Target list not found. **Remediation**: Ensure that a valid value is provided for the targetList field in the request.
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: Provide a different Discovery name.
417 Expectation failed	GROUP_NOT_FOUND	Specified certificate group is not found. **Remediation**: Ensure that valid value is provided for the groupName section in the request.
417 Expectation failed	FIELD_VALUE_INVALID	Cooling period should be 0 or greater than 1. **Remediation**: Provide a correct value in the field coolingPeriod.
417 Expectation failed	FIELD_VALUE_INVALID	Discovery Type should be ONDEMAND or SCHEDULED. **Remediation**: Provide a correct value in the field discoveryType.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Response

```
{
  "response": {
     "discoveryName": "on_demand_network",
     "message": "Discovery history details added successfully with discovery id 683d53800b80a91c95bee4da, and discovery operation has been triggered."
  },
  "message": "Discovery history details added successfully with discovery id 683d53800b80a91c95bee4da, and discovery operation has been triggered.",
  "appStatusCode": null,
  "tags": {},
  "headers": null
}
```

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Network Discovery Configuration

This API is used to list a specific network discovery configuration.

Understanding the Sample URL

- **IP/HostName/TenantName:** Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
- **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication.

  The IP address will be included in the endpoint URL for an on-prem deployment.
- **HostName**: A human-readable label assigned to a device (host) on a network.

  The hostname will be included in the endpoint URL for an on-prem deployment.
- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify.

  The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT:** AppViewX gateway port.

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: 31443.
  - **avxapi**:Path parameter value (static) that is part of the endpoint's URL
  - **Endpoint**:Endpoint of the API, for example: execute-hook
  - **gwsource**:Source or origin of a gateway, for example: external.
- Create a Network
- Get a Network

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• List a Network
• Update a Network
• Delete a Network

Create a Network

The API creates a network entry in discovery configuration based on the payload.

.

Before you Begin

• The user should have permission to create/modify network entries.

Request Structure

Endpoint:	/certificate/discovery/networks
Type:	POST
Action:	network-create
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
username *Header*	(Mandatory) Username for logging in to AppViewX. **Type**: String
password *Header*	(Mandatory) Password for logging in to AppViewX. **Type**: String
Content-Type	(Mandatory) Payload content-type with application/json value. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) Source from which the request is triggered. (For example. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
name	(Mandatory) name of the network entry. **Type**: String **Constraint**: • Name must be at least 3 characters • Name cannot exceed 255 characters • Name cannot start with special characters or numbers • Name must not have the special characters (<, >, &, %, ', "). **Recommanded**: It is recommended to not use the following special characters: (<, >, (,), $, &, |, /, `, [,], {, }, ?, ;, ~ , !, %, ', ", \).
description	(Optional) description for the network entry. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraints: • Description cannot exceed 500 characters. • Description must not have '<' character.
settings	(Mandatory) network setting that needs to be associated with the network entry. **Note:** The provided network settings must be available. **Type**: String
networks	(Mandatory) The list of network endpoints that are included in the network entry. **Type**: networks
network	(Mandatory) network to be added in the network entry. **Note:** Can have IP range, subnet, individual IP. **Type**: String
dataCenter	(Mandatory) dataCenter for the network. **Note:** The provided data center must be available. **Type**: String
sniHostname	(Optional) comma separated SNI Hostnames for the network. **Type**: String **Constraint**: sniHostname must not have '<' character

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response for the group creation operation **Type**: Boolean
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Sample Request/Response

Sample Request

```
{
  "name": "BLR_network",
  "description": "network to be added",
  "settings": "Default",
  "networks": [
    {
      "network": "192.168.220.120",
      "dataCenter": "absecon",
      "sniHostname": "appviewx.com"
    }
  ]
}
```

Sample Response

```
{
  "response": "Success",
  "message": "Successfully created the network",
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  "appStatusCode": null,
  "tags": {},
  "headers": null
}
```

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Get a Network

The API gets the network entry in discovery configuration from the id or name.

.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you Begin

• The user should have permission to view network entries.

Request Structure

Endpoint:	/certificate/discovery/networks
Type:	GET
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/networks?id=<id>&gwsource=external https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/networks?name=<name>&gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
username *Header*	(Mandatory) Username for logging in to AppViewX. **Type**: String
password *Header*	(Mandatory) Password for logging in to AppViewX. **Type**: String
Content-Type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) Source from which the request is triggered. (For example. external) **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains the response for the group creation operation **Type**: Boolean
id	Unique identifier for the network entry. **Type**: String
name	Name of the network entry. **Type**: String
description	Description of the network entry. **Type**: String
status	Status of the network entry. **Type**: Boolean
readOnly	Read only access for the network entry. **Type**: Boolean
createdDate	Creation date of the network entry. **Type**: Long
updatedDate	Updation date of the network entry. **Type**: Long
createdBy	User who created the network entry. **Type**: String
updatedBy	User who updated the network entry. **Type**: String
settings	Network setting associated with the network entry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
networks	List of network endpoints. **Type**: networks
network	Network endpoint (IP, Subnet, and IP range). **Type**: String
status	Status of the network endpoint. **Type**: String
dataCenter	Datacenter for the the network endpoint. **Type**: String
sniHostname	SNI hostname for the network endpoint. **Type**: String
uniqueId	Unique id for the network endpoint. **Type**: Long
scheduledDiscovery	List of scheduled discovery names done with the network entry. **Type**: List
onDemandDiscovery	List of ondemand discovery names done with the network entry. **Type**: List
dataCenter	List of datacenter for the network entry. **Type**: List
message	Success message or failure description in case of error. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Sample Request/Response

Sample Request

No payload for GET request.

Sample Response

```

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

List a Network

The API lists the network entries in discovery configuration based on the payload.

.

Before you Begin

- The user should have permission to view network entries.

Request Structure

Endpoint:	/certificate/discovery/networks
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
username *Header*	(Mandatory) Username for logging in to AppViewX. **Type**: String
password	(Mandatory) Password for logging in to AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String
Content-Type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) Source from which the request is triggered. (For example. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
start	(Optional) Specifies the zero-based index of the first item to return. **Type**: Integer **Constraint**: start must not be negative **Default**: Zero (0).
max	(Optional) Specifies the maximum number of items to return. **Type**: Integer **Constraints**: max must not be negative **Default**: 100 (if the provided value exceeds 100).
filter	(Optional) Free text search to filter the list of networks. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
sortColumn	(Optional) Specifies the field by which to sort the results. **Type**: String **Possible Value(s)**: "name", "description", "scheduledDiscovery", "onDemandDiscovery", "dataCenter", "settings" **Default**: name
sortOrder	(Optional) Defines the sort direction. **Type**: String **Possible Value(s)**: Must be one of “asc” or “desc”.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response for the group creation operation **Type**: Boolean
search	The search string entered in the “filter” field of payload. **Type**: String
totalRecords	The total network entries present in the database for the free text search filter. **Type**: long
data	Contains the list of network entries. **Type**: List
id	Unique identifier for the network entry. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
name	Name of the network entry. **Type**: String
description	Description of the network entry. **Type**: String
status	Status of the network entry. **Type**: Boolean
readOnly	Read only access for the network entry. **Type**: Boolean
createdDate	Creation date of the network entry. **Type**: Long
updatedDate	Updation date of the network entry. **Type**: Long
createdBy	User who created the network entry. **Type**: String
updatedBy	User who updated the network entry. **Type**: String
settings	Network setting associated with the network entry. **Type**: String
scheduledDiscovery	List of scheduled discovery names done with the network entry. **Type**: List
onDemandDiscovery	List of ondemand discovery names done with the network entry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: List
dataCenter	List of datacenter for the network entry. **Type**: List
executionTime	Indicates the time at which the execution was triggered. **Type**: Long
iTotalDisplayRecords	The total network entries present in the database for the free text search filter. **Type**: Long
message	Success message or failure description in case of error. **Failure:** Returns the Failure message **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

networks	(Optional) The list of network endpoints that needs to be updated in the network entry. **Type**: networks
network	(Mandatory) network to be added in the network entry. **Note:** Can have ip range, subnet, individual IP. **Type**: String
dataCenter	(Mandatory) dataCenter for the network. **Note:** The provided data center must be available. **Type**: String
sniHostname	(Optional) comma separated SNI Hostnames for the network. **Type**: String **Constraints:** sniHostname must not have '<' character.

Payload-Networks

Payload

Name	Description
network	(Mandatory) network to be added in the network entry. **Note:** Can have ip range, subnet, individual IP. **Type**: String
dataCenter	(Mandatory) dataCenter for the network. **Note:** The provided data center must be available. **Type**: String
sniHostname	(Optional) comma separated SNI Hostnames for the network. **Type**: String **Constraints:** sniHostname must not have '<' character.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response for the group creation operation **Type**: Boolean
message	Success message or failure description in case of error. **Failure:** Returns the Failure message **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Sample Request/Response

Sample Request

```
{
  "id": "683c3b3c0b80a91c95bea325",
  "description": "",
  "settings": "Default",
  "status": true,
  "networks": [
    {
      "network": "192.168.220.120",
      "dataCenter": "absecon",
      "sniHostname": "appviewx.com"
    }
  ]
}
```

Sample Response

```
{
  "response": "Success",
  "message": "Successfully updated the network",
  "appStatusCode": null,
  "tags": {},
  "headers": null
}
```

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Delete a Network

The API deletes the network entries in discovery configuration based on the list of ids.

.

Before you Begin

- The user should have permission to view network entries.

Request Structure

Endpoint:	/certificate/discovery/networks

Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
username *Header*	(Mandatory) Username for logging in to AppViewX. **Type**: String
password *Header*	(Mandatory) Password for logging in to AppViewX. **Type**: String
Content-Type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) Source from which the request is triggered. (For example. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
ids	(Mandatory) list of network ids, that needs to be deleted

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: list

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Returns “Success” on successful updation of network. **Type**: Boolean
message	Returns “Network(s) deleted successfully”. **Failure:** Returns the Failure message **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Fetch Single Certificate Discovery

This API is used to list a specific discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

• The user should have the ACF permission to view the certificate discovery.

Request Structure

Endpoint:	/certificate/discovery/instance?discoveryName=<name>
Type:	GET
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?discoveryName=<name>&gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraints**: Required if **username** and **password** are not provided.
userName *Header*	(Mandatory) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes.
id response	Unique identifier for the discovery object. **Type:** String
name response	Name of the discovery instance. **Type:** String
type response	Type of discovery such as e.g.: On-demand, Scheduled, Managed. **Type:** String
source response	Source of the discovery eg: IP range, Upload, etc. **Type:** String
syncStatus response	Status indicating whether the certificate is managed or monitored. **Type:** String
groupName response	Group name of the discovery instance under which it is categorized. **Type:** String
dicoverCount response	Count of discovered certificates. **Type:** Integer
passwordCertCountresponse	Count of certificates that are protected by a password. **Type:** Integer
encryptedPrivateKeyCount response	Count of certificates with encrypted private keys. **Type:** Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
mergedCount response	Total number of merged certificates during the discovery process. **Type:** Integer
status response	Overall status of the discovery instance. Eg: success, failure or in-progress **Type:** String
statusMessage response	Message providing additional information about the status of the discovery process. **Type:** String
passiveMode response	X **Type:** Boolean (true/false)
startTime response	Time when the discovery instance was initiated (DD/MM/YY HH:MM). **Type:** Date/time
endTime response	Time when the discovery completed (DD/MM/YY HH:MM). **Type:** Date/time
associatedRule response	Discovery rule associated with the discovery instance. **Type:** String
discoverAllCerts response	Determines if all certificates were discovered. **Type:** Boolean (true/false)
customDirectoryNames response	Custom directory names specified for the discovery instance. **Type:** String
totalCertCount	Total number of certificates discovered in the instance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
response	**Type:** Integer
filters response	Specifies the criteria for simplifying the discovery process. **Type:** Object
startDate response.filters	Start date for filtering the discovery instance. **Type:** Date/time
endDate response.filters	End date for filtering the discovery instance. **Type:** Date/time
discoverBy response.filters	Method or criteria used to discover the certificates. **Type:** String
caNames response.filters	List of Certificate Authority names from which certificates are discovered (If **discoverBy** field value is **CA**). **Type:** List of String
regions response.filters	Regions considered during the discovery process. **Type:** List of String
vendorSpecificConditions response.filters	Conditions specific to the vendor for the discovery process. **Type:** Object
certStatus response.filters.vendorSpecificConditions	List of certificate statuses to filter by. **Type:** List of String
certTypes response.filters.vendorSpecificConditions	List of certificate types to filter by. **Type:** List of String
message	Displays the number of records found if success or a failure message.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String
tags	Additional information in case of failure response.
headers	HTTP headers associated with the response. **Type:** String

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Accepted.
400 Bad Request	ERR_DISC_DISCOVERY_HISTORY_RETRIVAL	Error while retrieving discovery history. **Remediation**: Discovery name passed in the request should be present in the database.
400 Bad Request	NO_RECORDS_FOUND	No matching records found. **Remediation**: Discovery name passed in the request should be present in the system.
417 Expectation failed	MANDATORY_QUERY_PARAM_MISSING	Mandatory query param is missing or invalid. **Remediation**: The parameter <discoveryName> must be present in the URL request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	CERT-FV-001	Invalid query param found for discoveryName. **Remediation**: The discoveryName value should be a minimum of 2 characters.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Request/Response

Request Payload

No payload for GET request.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Fetch Certificate Discovery Results **by Discovery Name**

The API enables users to fetch the discovered certificates from a particular discovery instance using the discovery name.

Before you begin

- The user should have the ACF permission to view the certificate discovery.

Request Structure

Endpoint:	/certificate/discovery/instance?discoveryName=<name>
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?discoveryName=<name>&gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId	(Mandatory) Session ID received after login.
Header	**Type**: String **Constraints**: Required if **username** and **password** are not provided.
userName	(Mandatory) Username that is configured in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Header	**Type**: String
password	(Mandatory) Password of that user.
Header	**Type**: String
content-type	(Mandatory) Payload content-type with application/json value.
Header	**Type**: String **Constraint**: The value must be **application/json**.
gwsource	(Mandatory) The source from which the request is triggered, e.g., external.
Query	**Type**: String
Payload*Body*	Contains all the parameters to be sent in the request body for the post request.
	Type: Payload

Payload

Payload

Name	Description
name	(Mandatory) Name of the discovery instance to be created. **Type**: String
searchTextValue	(Optional) Query the fetched results based on the provided search value.
startIndex	(Optional) specify the start index from where the certificate data has to be fetched.
sortColumn	(Optional) specifies the column on which the sort has to be applied.
sortOrder	(Optional) specifies the sort order to be applied. **Constraint:** Possible values : 1, -1, asc, desc
maxSize	(Optional) specifies the maximum number of results that can be retrieved.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint : Possible values in the range 1 to 1000.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes. **Type:** A JSON object
search	null
totalRecords	Total number of records in the specified discoveryInstance.
data	Certificate metadata. **Type**: Array of Certificate json String
autoSuggest	null
executionTime	Execution time of the request.
iTotalDisplayRecords	Total number of records in the specified discoveryInstance.
message	If matching records are found for the search query - null. If no records are available for the search query - No matching records found. **Type:** String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Accepted.
400 Bad Request	ERR_DISC_DISCOVERY_HISTORY_RETRIVAL	Error while retrieving discovery history. **Remediation**: Discovery name passed in the request should be present in the database.
400 Bad Request	NO_RECORDS_FOUND	No matching records found. **Remediation**: Discovery name passed in the request should be present in the system.
417 Expectation failed	MANDATORY_QUERY_PARAM_MISSING	Mandatory query param is missing or invalid. **Remediation**: The parameter <discoveryName> must be present in the URL request.
417 Expectation failed	CERT-FV-001	Invalid query param found for discoveryName. **Remediation**: The discoveryName value should be a minimum of 2 characters.
500 Internal Server Error	avx-common-011	Error while processing.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fetch Devices Discovered During a Network Scan

The API enables users to fetch the discovered devices from a particular discovery instance (Network Scan) using the discovery name.

Before you begin

- The user should have the ACF permission to view the certificate discovery.

Request Structure

Endpoint:	/certificate/discovery/devicesList
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/devicesList?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String
userName *Header*	(Mandatory) Username for logging in to AppViewX. **Type**: String
password *Header*	(Mandatory) Password for logging in to AppViewX. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload*Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
name	(Mandatory) Name of the discovery instance created. **Type**: String
searchTextValue	(Optional) Query the fetched results based on the provided search value.
sortColumn	(Optional) specifies the column on which the sort has to be applied.
sortOrder	(Optional) specifies the sort order to be applied. **Constraint:** Possible values : 1, -1, asc, desc
maxSize	(Optional) specifies the maximum number of results that can be retrieved. **Constraint :** Possible values in the range 1 to 100.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes. **Type:** A JSON object

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
search	null
totalRecords	Total number of records in the specified discoveryInstance.
data	Device metadata. **Type**: Array of Device Data json
autoSuggest	null
executionTime	Execution time of the request.
iTotalDisplayRecords	Total number of records in the specified discoveryInstance.
message	If matching records are found for the search query - null. If no records are available for the search query - No matching records found. **Type:** String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	null	Response contains the device data of the specified discovery instance.
400 Bad Request	INVALID_REQUEST	Invalid request specified - <reason>. **Remediation**: Ensure that the payload/query param is valid and the <reason> is handled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password is provided as header parameters.
403 Forbidden	AVX_GW_005	The user does not have view permission to the Discovery.
404 Not Found	MSG_DISC_DISCOVERY_NAME_NOTFOUND	Discovery name: <Discovery Name> not available. **Remediation**: Check whether the discoveryName provided is valid and is present.
407 Proxy Authentication Required	AVX_GW_011	Session validation failed, reason - Session information is missing. **Remediation**: Ensure the headers are correctly mentioned with correct authentication information.
500 Internal Server Error	MSG_DISC_DISCOVERY_NAME_NULLOREMPTY	Discovery name: Null or Empty. **Remediation**: Ensure the discoveryName parameter is not empty or null in the payload/query param.

Sample Request/Response

Request Payload

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Fetch Cipher–TLS Version Mapping from Discovery Execution

The API enables users to fetch cipher–TLS version mappings for each discovery execution, along with metadata such as discovery execution ID, start and end times, and target endpoints. This is applicable for Discovery Types, IPRANGE, SUBNET, and NETWORK.

Before you begin

- The user should have `DISCOVERY_CREATE_EDIT` as ACF permission.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/discovery/instance?discoveryName=<name>
Type:	GET
Sample URL:	https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/instance?discoveryName=<name>&gwsource=external To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraints**: Required if **username** and **password** are not provided.
userName *Header*	(Mandatory) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Header*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
discoveryName*Header*	(Mandatory) Name of the discovery instance. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
skip*Header*	(Optional) skip is from which the response has to be available. For example, if the response has to skip the first 100 and show the next 50, then the start index has to be 101. **Type**: Integer **Constraint**: Default value is 0.
limit*Header*	(Optional) The number of entries from the start index to be made available. For example, if the response is expected to have skipped the first 100 and show the next 50, then the start index has to be 101 and max has to be 50. **Type**: Integer **Constraint**: Default value is 100 and max value is 100.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes. **Type:** A JSON object
vulnerabilityRecords	Vulnerability Records. **Type:** Array
columnHeader	null
data	Certificate metadata. **Type**: Array of Certificate json String
totalRecords	Total Number Records available for this discovery. Help while doing pagination until you fetch all records.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
executionTime	Execution time of the request.
iTotalDisplayRecords	Total number of records in the specified discoveryInstance.
headers	null
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String
tags	null
response	Contains the response attributes. **Type**: JSON object
vulnerabilityRecords	List of vulnerability records for each scanned IP/port. **Type**: Array
ip	IP address of the scanned endpoint. **Type**: String
port	Port number used for scanning. **Type**: Integer
cipherSuites	Map of cipher names with their strength levels, with ::TLS version suffix. **Type**: Object
sslCiphers	List of individual cipher objects. **Type**: Array
name	Name of the cipher suite. **Type**: String
strength	Security strength classification (for example, HIGH, UNKNOWN).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
protocolVersion	TLS protocol version (for example, TLSv1.2, TLSv1.3). **Type**: String
tlsSslVersions	TLS versions and their overall security rating. **Type**: Object
cipherFetchStatus	Status of the cipher fetching operation. **Type**: String
hostName	Resolved hostname (if available). **Type**: String or null
group	null
certificateUuid	null
message	Any messages returned for the endpoint. **Type**: Array of Strings
cvss	null
columnHeader	null
totalRecords	Total number of vulnerability records available for this discovery. Useful for pagination. **Type**: Integer
executionTime	Time taken to execute the request.
iTotalDisplayRecords	Total number of vulnerability records available for this discovery. Useful for pagination. **Type**: Integer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
discoveryEndTime	End Time of Discovery in GMT. **Type**: String
headers	null
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Metadata or upstream error tags. **Type**: Object
message	Error message (if any). **Type**: String or null

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Accepted.
400 Bad Request	ERR_DISC_DISCOVERY_HISTORY_RETRIVAL	Error while retrieving discovery history. **Remediation**: Discovery name passed in the request should be present in the database.
400 Bad Request	NO_RECORDS_FOUND	No matching records found. **Remediation**: Discovery name passed in the request should be present in the system.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
417 Expectation failed	MANDATORY_QUERY_PARAM_MISSING	Mandatory query param is missing or invalid. **Remediation**: The parameter <discoveryName> must be present in the URL request.
417 Expectation failed	CERT-FV-001	Invalid query param found for discoveryName. **Remediation**: The discoveryName value should be a minimum of 2 characters.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Request/Response

Request Payload

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Delete Certificate Discovery

This API is used to delete discoveries.

Request Structure

Endpoint:	/cert-discovery-history-delete
Type:	PUT
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/cert-discovery-history-delete?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId	(Mandatory) Session ID received after login.
Header	**Type**: String
	Constraints: Required if **username** and **password** are not provided.
userName	(Mandatory) Username that is configured in AppViewX.
Header	**Type**: String
password	(Mandatory) Password of that user.
Header	**Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload (Refer **Payload** table below)

Payload

Payload

Name	Description
NA	(Mandatory) Discovery IDs **Type**: Array of String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the enrollment request.
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Success.
400 Bad Request	AVX-VLDTN-001	Invalid payload data. **Remediation**: Ensure the payload is correct or meets the validation rules specified by the validation protocol.
400 Bad Request	MSG_DISC_DISCOVERY_NOTFOUND	Discovery details not available. **Remediation**: The discovery ID must be valid or present in the database.
500 Internal Server Error	avx-common-011	Error while processing.

Sample Request/Response

Request Payload

```
["507f1f77bcf86cd799439011", "507f1f77bcf86cd799439022", "507f1f77bcf86cd799439033"]
```

Response

```
{
"response": "success",
"message": null,
"appStatusCode": null,
"tags": null
}
```

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Upload Multiple Certificates to the Inventory

This API is used to upload multiple certificates to the AppViewX certificate inventory in a single upload operation.

Before you begin

- The user should have the ACF permission to create/edit/rediscover/replay under certificate discovery.
- The certificate group name that will be specified in the payload should have RW permissions.
- The discovery name should be unique.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	certificate/discovery/upload
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/discovery/upload?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraints**: Required if **username** and **password** are not provided.
userName *Header*	(Mandatory) Username that is configured in AppViewX. **Type**: String
password *Header*	(Mandatory) Password of that user. **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *payload*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload (Refer **Payload** table below)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
discoveryName	(Mandatory) Name of the discovery instance. **Type**: String
certificateCategory	(Optional) Certificate category **Type**: String **Possible Values**: Server, Client, Code Signing, Server and Client, Device, Root, Intermediate, Others
groupName	(Mandatory) Name of the group to which the certificate belongs. **Type**: String
status	(Optional) Status indicating whether the certificate is managed or monitored. **Type**: String **Possible Values**: Managed, Monitored
uploadContent	(Mandatory) Details of the certificate to be uploaded. **Type**: uploadContent

uploadContent Parameters

Name	Description
fileContent	(Mandatory) Content of the file in byte array format for the certificate to be uploaded. **Type:** byte array
fileName	(Mandatory) Name of the file. **Type:** String
password	(Optional) Password associated with the file (depending on the file type).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

uploadContent Parameters (continued)

Name	Description
	Type: String
keyToDecrypt	(Optional) Key to decrypt the password if it is encrypted. **Type:** String
certID	(Mandatory) Certificate ID. **Type:** String
woID	(Mandatory) Work order ID (to be sent at NA). **Type:** String
certificateCategory	(Optional) Category of the certificate. **Type:** String
certificateAuthority	(Optional) Certificate Authority **Type:** String
comments	(Optional) Additional comments. **Type:** String
groupName	(Optional) Name of the group to which the certificate belongs. **Type:** String
proxyRequired	(Optional) Determines if a proxy is required. **Type:** Boolean (true/false)
dataCenter	(Optional) Name of the datacenter where the API is to be executed. **Type:** String
caId	(Optional) Certificate authority ID. **Type:** String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

uploadContent Parameters (continued)

Name	Description
avxStatus	(Optional) Status indicating whether the certificate is managed or monitored. **Type:** String **Possible values:** Managed, Monitored
enrollmentMethod	(Optional) Method used for certificate enrollment. **Type:** String **Possible Values:** SCEP, EST, ACME, SCEP_MS_INTUNE, MS_PROXY/WAEP
kubeService	(Optional) Name of the Kubernetes service. **Type:** String **Possible Values:** cert-orchestrator, appviewx-signer, appviewx-infra-orchestrator, appviewx-csi-provider
metadata	(Optional) A key-value pair of metadata info. **Type:** Map<String,Object>
isValid	(Optional) Determines if the certificate is valid. **Type:** Boolean (true/false)
encodedPassword	(Optional) The base-64 encoded password value. **Type:** String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: response
message	Displays the number of records found if success or a failure message. **Type:** String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String
tags	Additional information in case of failure response.
headers	HTTP headers associated with the response. **Type:** String

response

Name	Description
discoverId	ID assigned to the discovery instance **Type:** response

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	Accepted.
400 Bad Request	AVX-VLDTN-001	Invalid payload data. **Remediation**: Ensure the payload is correct or meets the validation rules specified by the validation protocol.
400 Bad Request	INVALID_GROUP_NAME	groupName is Invalid or the user does not have enough permission for the specified group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: The group name should be valid and have the required permissions.
400 Bad Request	MSG_DISC_HISTORY_UNIQUE_NAME	Discovery name already exists. Please specify different Discovery name. **Remediation**: The discovery name should be unique.
500 Internal Server Error	avx-common-011	Internal Server Error.

Sample Request/Response

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Upload Server Certificate to the Inventory

This API is used to upload a single server certificate to the AppViewX server certificate inventory.

Before you begin

- The user has the ACF permission to upload a certificate within the uploaded certificate's category.

Request Structure

Endpoint:	/cert-upload-server-certificate
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/cert-upload-server-certificate?gwsource=external` To understand the elements of the sample URL, click here.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraints**: Required if **username** and **password** are not provided.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
username	(Mandatory) Username that is configured in AppViewX.
Header	**Type**: String
password	(Mandatory) Password of that user.
Header	**Type**: String
content-type	(Mandatory) Payload content-type with application/json value.
Header	**Type**: String
	Constraint: The value must be **application/json**.
gwsource	(Mandatory) The source from which the request is triggered, e.g., external.
Query	**Type**: String
Payload	Contains all the parameters to be sent in the request body for the post request.
payload	**Type**: Payload (Refer **Payload** table below)

Payload

Payload

Name	Description
groupName	(Optional) Group associated with the certificate.
	Type: String
fileName	(Mandatory) Name of the certificate file that has to be uploaded.
	Type: String
fileContent	(Mandatory) Certificate file data encoded and uploaded as a raw binary stream.
	Type: byte[]
certificateCategory	(Optional) Certificate category.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Possible values**: Server **Constraints**: Parameter value cannot be **CA**.
wold	(Mandatory) ID of the work order for the upload request. **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Error Response Parameters

Name	Description
response	Contains the response attributes.
message	Success message of the action or failure description in case of an error. **Type:** String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type:** String
tags	Additional information in case of failure response.

Name	Description
message	Success message or failure description in case of error. **Type:** String
uuid	Uuid of the uploaded certificate. **Type:** String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
commonName	Common name of the uploaded certificate. **Type:** String
category	Category of the uploaded certificate. **Type:** String
id	Unique identifier of the certificate. **Type:** String
avxStatus	Status of the certificate in Appviewx. (Managed, Monitored, Discovered) **Type:** String

Status Codes

HTTP Code	appStatusCode	Response Message
200 Success	NA	Certificate uploaded successfully.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field is missing or invalid - value. **Remediation**: Ensure that the mandatory field specified in the error message is present in the payload and has the accepted value.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameter.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API. **Remediation**: Ensure that the given user has the proper ACF permissions to upload a certificate.
500 Internal Server Error	avx-common-011	Internal Server Error.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
groupName *Header*	(Mandatory) Name of the certificate group whose details have to be retrieved
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

response

Name	Description
name	Name of the group who details have been retrieved **Type**: String
displayName	Display name configured for the group **Type**: String
description	Description of the certificate group **Type**: String
applicationID	Organization ID associated with the group **Type**: String
policyName	Certificate policy associated with the group **Type**: String
groupBusinessInfo	Details of the business unit associated with the group **Type**: groupBusinessInfo

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

response (continued)

Name	Description
groupLevelCertConfig	Configuration details for the certificates associated with this group **Type**: groupLevelCertConfig

groupBusinessInfo

Name	Description
contactName	Contact of the associated business unit's contact person
firstName	First name of the associated business unit's contact person
lastName	Last name of the associated business unit's contact person
phoneNumber	Phone number of the associated business unit's contact person
lobName	Name of the business unit associated with the certificate group
costCenter	Code/label of the cost center associated with the certificate group
environmentName	Business unit environment associated with the certificate group
inventoryNumber	Inventory tracking number for the certificate group
email	Email address of the associated business unit's contact person

groupLevelCertConfig

Name	Description
autoPushFlag	Indicates whether certificates assigned to this group will be automatically pushed to the target endpoint upon renewal/regeneration
groupOverrideFlag	Indicates if the group level settings for auto renewal/regeneration will override the certificate level settings
connectorStatusToSkip	Indicates if application connector cloning (after certificate renewal, regeneration, and resissue) is enabled
autoRenewConfig	Indicates the auto renewal-related configuration details for this certificate group **Type**: autoRenewConfig
autoRegenerateConfig	Indicates the auto regeneration-related configuration details for this certificate group

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

groupLevelCertConfig (continued)

Name	Description
	Type: autoRegenerateConfig
parentGroup	Name of the parent certificate group under which the new certificate group is created
deleteRestricted	Indicates if this certificate group can be deleted
_id	Unique identifier assigned to the certificate group

autoRenewConfig

Name	Description
renewBefore	For the certificates associated with this group, indicates how many days prior to a certificate's expiry the renewal process will start
autoRenewalFlag	Indicates if auto renewal is enabled for the certificates associated with this group
approvalRequiredFlag	Indicates if approval is required before certificate renewal is triggered

autoRegenerateConfig

Name	Description
regenerateBefore	For the certificates associated with this group, indicates how many days prior to a certificate's expiry the regeneration process will start
autoRegenerateFlag	Indicates if auto regeneration is enabled for the certificates associated with this group
approvalRequiredFlag	Indicates if approval is required before certificate regeneration is triggered

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Deletion action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
404 Not Found	CERT-GRP-0003	Group information not available **Remediation**: Ensure that the group information provided in the request is correct. If the issue still persists, contact AppViewX support.
500 Internal server error	CERT-GRP-0005	Error occurred while fetching the certificate group.

Name	Description
name	(Mandatory) Name for the new certificate group **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
displayName	(Optional) Display name for the new certificate group **Type**: String
description	(Optional) Additional details related to the new certificate group **Type**: String
applicationID	(Optional) Organization ID that must be associated with the new group **Type**: String
parentGroup	(Optional) Name of the parent certificate group under which the new certificate group will be created **Type**: String
policyName	(Mandatory) Certificate policy that must be associated with the new group **Type**: String
groupBusinessInfo	(Optional) Details of the business unit that must be associated with the new group **Type**: groupBusinessInfo
groupLevelCertConfig	(Optional) Configuration details for the certificates that will be associated with this group **Type**: groupLevelCertConfig

groupBusinessInfo

Name	Description
contactName	(Optional) Contact of the associated business unit's contact person **Type**: String
firstName	(Optional) First name of the associated business unit's contact person

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

groupBusinessInfo (continued)

Name	Description
	Type: String
lastName	(Optional) Last name of the associated business unit's contact person **Type**: String
phoneNumber	(Optional) Phone number of the associated business unit's contact person **Type**: String
lobName	(Optional) Name of the business unit associated with the certificate group **Type**: String
costCenter	(Optional) Code/label of the cost center associated with the certificate group **Type**: String
environmentName	(Optional) Business unit environment associated with the certificate group **Type**: String
inventoryNumber	(Optional) Inventory tracking number for the certificate group **Type**: String
email	(Optional) Email address of the associated business unit's contact person **Type**: String

groupLevelCertConfig

Name	Description
autoPushFlag	(Optional) Specify if certificates assigned to this group will be automatically pushed to the target endpoint upon renewal/regeneration **Type**: Boolean
groupOverrideFlag	(Optional) Specify if the group level settings for auto renewal/regeneration will override the certificate level settings

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

groupLevelCertConfig (continued)

Name	Description
	Type: Boolean
autoRenewConfig	(Optional) Specify the auto renewal-related configuration details for this certificate group **Type**: autoRenewConfig
autoRegenerateConfig	(Optional) Specify the auto regeneration-related configuration details for this certificate group **Type**: autoRegenerateConfig

autoRenewConfig

Name	Description
renewBefore	(Mandatory if **autoRenewalFlag** is enabled) For the certificates associated with this group, indicates how many days prior to a certificate's expiry the renewal process will start **Type**: Integer
autoRenewalFlag	(optional) Specify if auto renewal must be enabled for the certificates associated with this group **Type**: Boolean
approvalRequiredFlag	(Optional) Indicates if approval is required before certificate renewal is triggered **Type**: Boolean

autoRegenerateConfig

Name	Description
regenerateBefore	(Mandatory if **autoRegenerateFlag** is enabled) For the certificates associated with this group, indicates how many days prior to a certificate's expiry the regeneration process will start

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

autoRegenerateConfig (continued)

Name	Description
	Type: Integer
autoRegenerateFlag	(optional) Specify if auto regeneration must be enabled for the certificates associated with this group **Type**: Boolean
approvalRequiredFlag	(Optional) Indicates if approval is required before certificate regeneration is triggered **Type**: Boolean

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response for the group creation operation **Type**: Boolean
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Reissue action has been triggered successfully

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason: Invalid credentials **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
400 Bad Request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Update a Certificate Group

This API is used to modify the configuration of an existing certificate group.

Before you Begin

- The user should have the required ACF permissions to modify the certificate group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Structure

Endpoint:	/certificate/group
Type:	PUT
Action:	certificate-group-update
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if **sessionId** is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
name	(Mandatory) Name of the certificate group to be updated **Type**: String
displayName	(Optional) Display name assigned to the certificate group **Type**: String
description	(Optional) Additional details related to the certificate group **Type**: String
applicationID	(Optional) Organization ID that associated with the certificate group **Type**: String
parentGroup	(Optional) Name of the parent certificate group associated with the certificate group that is to be updated **Type**: String
policyName	(Mandatory) Certificate policy associated with the group **Type**: String
groupBusinessInfo	(Optional) Details of the business unit associated with the group **Type**: groupBusinessInfo
groupLevelCertConfig	(Optional) Configuration details for the certificates associated with the group

autoRegenerateConfig

Name	Description
regenerateBefore	(Mandatory if **autoRegenerateFlag** is enabled) For the certificates associated with this group, indicates how many days prior to a certificate's expiry the regeneration process will start **Type**: Integer
autoRegenerateFlag	(optional) Specify if auto regeneration must be enabled for the certificates associated with this group **Type**: Boolean
approvalRequiredFlag	(Optional) Indicates if approval is required before certificate regeneration is triggered **Type**: Boolean

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response for the group update operation **Type**: Boolean
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Update action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId. **Remediation**: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
417 Expectation failed	CERT-GRP-0001	Group already exists with the given name **Remediation**: Ensure that the group name is unique and not a duplicate of an existing group.
417 Expectation failed	CERT-GRP-0010	Default group can be associated with the default policy only

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: For the default group, set **policyName** to the default policy only.
417 Expectation failed	CERT_0010	Parent name and group name cannot be the same. **Remediation**: Correct the updated group name.
400 Bad request	CERT-PLCY-0009	Policy name is invalid. **Remediation**: Ensure that the policy name is valid.

Assigning ACL Permissions for Resources

This API manages ACL (Access Control List) permissions for a resource by assigning or revoking access rights for user groups.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you Begin

- The user must have admin privileges or specific ACL management permissions to modify the access control settings.

Request Structure

Endpoint:	resource/certificate/group
Type:	POST
Action:	cert-acl-save-permissions
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/resource/certificate/group?resourceName=<resourceName>&gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if **sessionId** is not provided.
Content-Type	(Mandatory) Specifies the nature of the data in the payload

Input Parameters (continued)

Name	Description
Header	**Type**: String **Constraint**: Value of the parameter should be **'application/json'**
resourceName *Header*	(Mandatory) Name of the resource for which the ACL permissions are to be modified **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the POST request. **Type**: Payload

Payload

Payload

Name	Description
assignedObjects	(Optional) Array of user groups and the specific access permissions granted to each **Type**: assignedObjects
unAssignedObjects	(Optional) Array of user groups and the specific access permissions to be revoked from each **Type**: unAssignedObjects

assignedObjects

Name	Description
accessMode	(Mandatory) Level of access to be granted to the group **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

assignedObjects (continued)

Name	Description
	Possible values: **R** (Read-only access), **RW** (Read-Write access)
groupName	(Mandatory) Name of the certificate group being assigned the specified access permissions **Type**: String

unAssignedObjects

Name	Description
accessMode	(Mandatory) Level of access to be revoked from the group **Type**: String **Possible values**: **R** (Read-only access), **RW** (Read-Write access)
groupName	(Mandatory) Name of the certificate group from which the specified access permissions have to be revoked **Type**: String

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
tags	Additional information in case of failure response.

response

Name	Description
httpStatusCode	HTTP status code indicating the outcome of the API request.
message	Success message or failure description in case of error.
data	Additional data related to the API response, if applicable
totalCount	Total number of certificate groups affected

Status codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	Deletion action has been triggered successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
404 Not Found	NO_RECORDS_FOUND	No matching records found. **Remediation**: Check and ensure that the values provided for commonName / serialNumber / resourceId are correct.
400 Bad Request	INVALID_REQUEST	Please give valid common name and serial number or resourceId.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Provide a valid commonName and serialNumber or resourceId.
400 Bad Request	INVALID_REQUEST	Please provide a valid action. **Remediation**: Provide a valid action.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - action. **Remediation**: Ensure that the **action** field is available in the request payload.
404 Not Found	CERT-GRP-0003	Groups not found in inventory **Remediation**: Ensure that the group name provided in the request is correct. If the issue still persists, contact AppViewX support.
400 Bad Request	VALIDATION_ERROR_0004	Validation Failure: Field 'accessMode' does not have the expected value **Remediation**: Ensure that **accessMode** has the correct access permission values.

Sample Request/Response

Sample Request

```
{
  "assignedObjects": [

- **HostName**: A human-readable label assigned to a device (host) on a network

  The hostname will be included in the endpoint URL for an on-prem deployment.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Trigger Profile Sync for Devices

The API initiates the synchronization process for the device profile specified in the payload. Profile synchronization can be triggered for only one device at a time.

Before you begin

- The user should have the ACF permission to view the job scheduler settings.
- The device to be synced should be present in Appviewx and in **Managed** state.
- The user should have **R** or **RW** permission to the device specified.

Request Structure

Endpoint:	/certificate/profiles/sync
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/profiles/sync?gwsource=external` To understand the elements of the sample URL, click here.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory only if **sessionID** is not provided) Username for logging in to AppViewX **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password for logging in to AppViewX **Type**: String
Content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
deviceName	(Mandatory) Name of the device for which the profile synchronization must be triggered **Type**: String **Constraint**:
syncType	(Optional) Type of data or configurations to be synchronized for the specified device **Type**: List **Constraint**: Currently, only **profiles** is supported, which ensure that all device profiles, for the specified device, are updated. `syncType = profiles` is also the default value. **Future Support**: Additional sync types may be introduced in the future to support other device-related data and configurations.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the profile sync **Type**: response
message	Success message or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
	Type: String
tags	Additional information in case of failure response

response

Name	Description
deviceName	Name of the device for which the profile sync has been triggered
category	Category of the device for which the profile sync has been triggered
deviceProfiles	List of profiles associated with the specified device **Type**: deviceProfiles
certificateList	List of certificates associated with the specified device
trustedCertificateList	List of trusted certificates associated with the specified device
applicationConnectors	List of application connectors associated with the specified device
deviceWithFailureMessage	Details of sync failures
alerts	List of alerts configured for the device

deviceProfiles

Name	Description
profileId	Unique identifier for the device profile
vendor	Name of the device vendor
deviceName	User friendly name assigned to the device
vendorCategory	Category of the device vendor
profileIdentifierForView	Identifier used for displaying the profile
profileDisplayOrder	Order in which the profile attributes will be displayed
connectorType	Type of the application connector associated with the device profile (profile connector or default connector)
applications	List of applications associated with the device profile

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

deviceProfiles (continued)

Name	Description
hollisticViewData	Holistic list of profile attributes **Type**: holisticViewData
overviewData	Summary of profile details
inventoryData	Inventory-related profile data
vendorProperties	Additional device vendor-specific details **Type**: vendorProperties

hollisticViewData

Name	Description
partition	Device partition assigned to the profile
profileName	Name of the profile
SSL Type	SSL type of the profile

vendorProperties

Name	Description
partition	Name of the partition associated with the device
partitionNameWithoutPath	Name of the partition without path formatting
iAppProfile	Indicates if this profile is an iApp-managed profile

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	null	200 OK Response with the device profiles information
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	AVX-VLDTN-001	Invalid payload data **Remediation**: Ensure that the input values mentioned in the payload are valid.
400 Bad Request	INVALID_REQUEST	Invalid request specified. **Remediation**: Ensure that the payload is valid.
404 Not Found	ERR_DEVICE_UNAVAILABLE	Given device is not available **Remediation**: Ensure that the device specified is available in the inventory.
417 Expectation Failed	ERR_DEVICE_STATUS	Sync is not supported for device with status: Inprogress **Remediation**: Ensure that the device specified is managed.
403 Forbidden	USER_DOES_NOT_HAVE_PERMISSION	The user does not have R or RW permission to the device to perform the sync. **Remediation**: Ensure that the user has the requisite permissions.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

List Certificates with Application Connector Details

This API is used to fetch the complete list of certificates in the inventory along with the corresponding application connector details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you Begin

- The user should have the following ACF permissions:

  CERT+ > **Certificate Inventory** > {Certificate_Type}> **View inventory**

  Here, {Certificate_Type}: Server, Client and Code signing

Request Structure

Endpoint:	certificate/list
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/list?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory only if **sessionID** is not provided) Username for logging in to AppViewX **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password for logging in to AppViewX **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
nextPageToken	(Optional; not required for fetching the first set of results) Reference point for fetching the subsequent set of list of certificates, with application connector details, that the user has access to The **certificate/list** API fetches only a limited set of results on each execution. The **nextPageToken** paramter is used as a reference point to continue fetching the next set of results. The **nextPageToken** value returned in the API's response can be used in the next request payload. **Type**: String
searchOptions	(Optional) Additional criteria to filter the search results

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: searchOptions

searchOptions

Name	Description
limit	(Optional) Number of records to be fetched in the response **Type**: Integer **Default value**: 100 **Constraints**: The value should be a valid integer <= 1000. If limit > 1000, the value is capped at 1000.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response

Name	Description
data	Certificate details **Type**: data
nextPageToken	A continuation token for fetching the next batch of certificate details

data

Name	Description
commonName	Certificate common name
serialNumber	Serial number of the certificate
issuerCommonName	Common name of the issuing Certificate Authority
status	Status of the certificate
associatedObjects	Applications, services, or systems where the certificate is being used or linked
discoverySources	Source from where the certificate was certificate
subjectOrganization	Name of the organization that requested the certificate
subjectOrganizationUnit	Name of the business unit within the organization that requested the certificate
subjectLocality	Locality of the organization that requested the certificate
subjectState	State in which the organization that requested the certificate is located
subjectCountry	Country in which the organization that requested the certificate is located
issuerOrganization	Organization name of the issuing Certificate Authority
issuerOrganizationUnit	Buisiness unit name of the issuing Certificate Authority
issuerLocality	Locality of the issuing Certificate Authority

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
issuerState	State in which the issuing Certificate Authority is located
issuerCountry	Country in which the issuing Certificate Authority is located
version	Certificate version
validFrom	Starting date of the certificate's validity period
validTo	Ending date of the certificate's validity period
firstDiscoveryDate	Timestamp the certificate was first discovered
lastBeforeDiscoveryDate	Timestamp of the previous discovery before the most recent one
lastDiscoveryDate	Timestamp of the latest discovery
firstDiscoveryDateStr	Timestamp the certificate was first discovered
lastBeforeDiscoveryDateStr	Timestamp of the previous discovery before the most recent one
validFor	Certificate validity period
keyAlgorithmAndSize	Algorithm and key size used for private key encryption
signatureAlgorithm	Details of the signing algorithm used
signatureHashAlgorithm	Details of the hash algorithm used
keyUsage	Defines permitted uses of the certificate
extendedKeyUsage	Defines additional usage of the certificate
basicConstraints	Defines if the certificate is a CA certificate or an end certificate For a CA certificate, it also specifies how many certificates can be present below in the certficate chain
group	Certificate group mapped to this certificate
subjectAlternativeNames	Subject Alternative Names (SAN) for the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
complianceStatus	Indicates if the certificate complies with the associated policies
applications	List of installed profiles containing the certificate
policyIdentifiers	Unique identifiers of the policies associated with the certificate
expiryStatus	Indicates if the certificate is expired or not
permission	Permissions granted to the certificate
category	Certificate category
uuid	Unique identifier assigned to the certificate
id	Resource ID
certificateAuthority	Issuing certificate authority
authorityKeyIdentifier	Provides the key identifier of the Issuing CA certificate that signed the SSL certificate
subjectKeyIdentifier	Identifier of the certificate itself, specified within the certificate
issuerSerialNumber	Serial number assigned to the issuing Certificate Authority
authorityInfoAccess	Provides information on how to access resources related to the certificate's issuer, such as the issuer's certificate or OCSP responder for revocation checks
certificatePolicies	Certificate policies associated with the certificate
crlDistributionPoints	URL of the Certificate Revocation List
thumbprintAlgorithm	A mathematical process that generates a unique, fixed-size "fingerprint" or digest of a certificate's data, used for verification and identification
thumbPrint	A unique identifier for a certificate, generated by a hash function (like SHA-1 or SHA-256) from the certificate's data, used for verification and identification

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
type	Certificate type
certAttributes	A nested JSON that contains the key-value pairs for the attributes added for the certificate
customAttributes	Attributes with additional certificate metadata details
issuingTemplate	A set of policies and rules that a Certification Authority (CA) uses to guide how it handles certificate requests, including parameters like validity period, encryption, and signature requirements
csrGenerationSource	Source of the certificate CSR generation
certificateHSMDetails	Details of the HSM used for CSR generation
deviceDetails	Details of the device on which the certificate was discovered
csrAvailable	Indicates if valid CSR is available for the certificate
enhancedSANTypes	Subject alternative names (SAN) for the certificate
autoRenewDate	Date of certificate auto renewal
autoRegenDate	Date of certificate auto regeneration
missingParamsForAutoRenew	Missing parameters obstructing certificate auto renewal
caConnectorName	Name of the application connector associated with the certificate
caSettingName	Name of the CASetting created in AppViewX for the chosen certificate authority
suspendedCertificate	Flag indicated if certificate is suspended or not
comments	Additional details related to the certificate
mailAddress	Email address of the organization requesting the certificate
streetAddress	Street address of the organization requesting the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
postalCode	Postal code address of the organization requesting the certificate
publicKeyModulus	Part of the public key used for encryption and signature verification, specifically the modulus value in the RSA algorithm
requestIds	IDs of the workflows associated with the certificate
orderId	Order ID of the certificate
publicKey	Public key associated with the certificate
ellipticCurve	If the keyType chosen is EC, then the ellipticCurve is specified depending on the bit length selected
issuedByRootCertificate	Indicates if certificate was issued directly by a root certificate
cumulativeSanCount	Number of SANs assigned to the certfiicate
caCertificateType	Certificate type used by the Certificate Authority
subject	Certificate subject
discoveryTypes	Discovery scan type used for discovering the certificate
certLifeCycleAction	Last CLM action performed
certLifeCycleActionTimestamp	Timestamp of the last CLM action performed
customExtensions	Any specific OIDs configured for the certficate
deviceNames	Devices for which the certificate has application connectors present
deviceProfiles	Device profiles for which the certificate has application connectors present
certSyncStatus	Provision to manage certificates after discovery
applicationCount	Number of applications associated with the certificate
applicationConnectors	Details of the application connectors associated with the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
applicationConnectorId *applicationConnectors*	Unique identifier assigned to the application connector
vendorConnectorId *applicationConnectors*	Unique identifier assigned to the vendor of the device the certificate is being pushed to
generalInformation *applicationConnectors*	General details related to the application connector
deviceProfile *generalInformation*	Profile details of the device the certificate will be pushed to
vendor *generalInformation*	Name of the vendor of the device the certificate is being pushed to
name *generalInformation*	Name of the application connector
description *generalInformation*	Additional details related to the application connector
certSyncStatus *generalInformation*	Indicates the provision to manage certificates after discovery
category *generalInformation*	Category of the vendor of the device to which the certificate is being pushed
deviceName *generalInformation*	User friendly name assigned to the device to which the certificate is being pushed
certificateDetails	Certificate details associated with the device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

data (continued)

Name	Description
applicationConnectors	
pushDetails *applicationConnectors*	Configuration details related to pushing the certificate
securePush *pushDetails*	Indicates if secure push is enabled This option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.
connectorType *pushDetails*	Indicates if the connector is associated with a profile or is a default connector (not associated with a profile)
pushAutomatically *pushDetails*	Indicates if auto push is enabled for the certificate
overwrite *pushDetails*	Indicates if the overwrite option is enabled for the certificate The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed.
privatekeyAvaliable	Indicates if the certificate private key is available

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	null	Response with the list of certificates (100 default and upto 1000 based on limit set) and their app connector details

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Invalid **nextPageToken** **Remediation**: Invalid **nextPageToken**. Please ensure the correct **nextPageToken** is sent.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API **Remediation**: • Ensure that the given user has the proper ACF permissions to add comments to the respective certificates. • For the respective role mapped to the user check under - **CERT +>** > {Certificate_Type} > **View Inventory**. {Certificate_Type}: Server, Client and Code signing
403 Forbidden	CERT-ACF-0058	User does not have relevant permission to perform this action. **Remediation**: Ensure the given user has the proper ACF permissions for the respective certificate category (categories: server, client, and code signing).

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

List Certificate Groups

This API is used to fetch the list of certificate groups the specified user has access to.

Before you Begin

- The user should have the following ACF permissions:
  - **CERT+** > **Group**
  - **Policy** > **Group** >**View Group**

Request Structure

Endpoint:	certificategroup/list
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificategroup/list?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String **Constraint**: Required if username and password are not provided.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
username *Header*	(Mandatory only if **sessionID** is not provided) Username for logging in to AppViewX **Type**: String
password *Header*	(Mandatory only if **sessionID** is not provided) Password for logging in to AppViewX **Type**: String
content-type *Header*	(Mandatory) Payload content-type with application/json value. **Type**: String **Constraint**: The value must be **application/json**.
gwsource *Query*	(Mandatory) The source from which the request is triggered, e.g., external. **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
nextPageToken	(Optional; not required for fetching the first set of results) Reference point for fetching the subsequent set of certificate groups the user has access to The **certificategroup/list** API fetches only a limited set of results on each execution. The **nextPageToken** paramter

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	is used as a reference point to continue fetching the next set of results. The **nextPageToken** value returned in the API's response can be used in the next request payload. **Type**: String
searchOptions	(Optional) Additional criteria to filter the search results **Type**: searchOptions

searchOptions

Name	Description
limit	(Optional) Number of records to be fetched in the response **Type**: Integer **Default value**: 100 **Constraints**: The value should be a valid integer <= 1000. If limit > 1000, the value is capped at 1000.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes **Type**: response
message	Success message or failure description in case of error. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Response

Name	Description
data	Details of the certificate groups the user has access to
name *data*	Name of the certificate group
displayName *data*	User friendly name assigned to the certificate group
description *data*	Additional details related to the certificate group
appID *data*	Organization ID associated with the certificate group
policyName *data*	Certificate policy associated with the group
appPolicyName *data*	
permission *data*	Access permissions assigned to the certificate group

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
groupBusinessInfo *data*	Details of the business unit associated with the certificate group
contactName *groupBusinessInfo*	Contact of the associated business unit's contact person
firstName *groupBusinessInfo*	First name of the associated business unit's contact person
lastName *groupBusinessInfo*	Last name of the associated business unit's contact person
phoneNumber *groupBusinessInfo*	Phone number of the associated business unit's contact person
lobName *groupBusinessInfo*	Name of the business unit associated with the certificate group
costCenter *groupBusinessInfo*	Code/label of the cost center associated with the certificate group
environmentName *groupBusinessInfo*	Business unit environment associated with the certificate group
inventoryNumber *groupBusinessInfo*	Inventory tracking number for the certificate group
email *groupBusinessInfo*	Email address of the associated business unit's contact person
keywordSet	Keywords associated with the listed certificate group

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
data	
groupLevelCertConfig *data*	Configuration details for the certificates that will be associated with the group
autoPushNeededAfterRenewReissue *groupLevelCertConfig*	Indicates if certificates associated with this group will be automatically pushed after they are renewed/reissued
isGroupOverrideEnabled *groupLevelCertConfig*	Indicates if the group level settings for auto renewal/ regeneration will override the certificate level settings
appConnectorSyncStatusListToDelete *groupLevelCertConfig*	List of application connectors to be deleted
autoRenewConfig *groupLevelCertConfig*	Specifies the auto renewal-related configuration details for this certificate group
renewBefore *autoRenewConfig*	For the certificates associated with this group, indicates how many days prior to a certificate's expiry the renewal process will start
autoRenewal *autoRenewConfig*	Indicates if auto renewal is enabled for the certificates associated with this group
manuallyTriggered *autoRenewConfig*	Specifies if the renewal process requires manual triggering
approvalRequiredForAutoRenew *autoRenewConfig*	Indicates if approval is required before certificate renewal is triggered
autoRegenerateConfig *groupLevelCertConfig*	Indicates the auto regeneration-related configuration details for this certificate group

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
reportingTo *data*	Indicates the business entity this certificate group reports to
reportingPath *data*	Indicates the group hierarchy structure
updateChild *data*	Indicates if child groups have to be updated
reportedBy *data*	Gives information about who reported this group
deleteRestricted *data*	Indicates if this certificate group can be deleted
_id *data*	Unique identifier assigned to the certificate group
nextPageToken	A continuation token for fetching the next batch of certificate groups

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	null	List of certificate groups fetched successfully
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or a valid

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		sessionId is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Invalid **nextPageToken** **Remediation**: Invalid **nextPageToken**. Please ensure the correct **nextPageToken** is sent.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API **Remediation**: • Ensure that the given user has the proper ACF permissions to add comments to the respective certificates. • For the respective role mapped to the user check under - **CERT+**> > **Groups and Policy** > **Group** > **View Group**.

Sample Request/Response

Request Payload (initial request)

```
{
"searchOptions" :{"limit":1000}
}

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Use Insights to Create a Centralized CERT+ Dashboard

This API is used to fetch data from the existing Insights reports and visualize it on a CERT+ centralized dashboard. This will allow tenants to view all the data for an individual tenant in a single pane.

With this API, data from the following widgets/reports can be consumed for the visualization on the centralized dashboard:

- CERT+ → Insights → Summary → CryptoScore widget (Including the score and horizontal bars with severity)
- CERT+ → Insights → Google 90-day → Google 90 Day Score (Including the score and horizontal bars with severity)
- CERT+ → Insights → Google 90-day → Non-Standard Certificates (Only numbers for each block, not drill down)
- CERT+ → Insights → Risk & Crypto → Non-Standard Certificates (Only numbers for each block, not drill down)
- CERT+ → Insights → Operation → CLM action trend (Data for Daily, Weekly, Monthly, Quarterly, Yearly)

Before you Begin

- Ensure that the user has the required permissions to access the Insights reports.
- Ensure that the user has the required permissions to execute this API.

Request Structure

Endpoint:	/insights-report
Type:	GET
Action:	insights-report
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/insights-report?reportName=<REPORT_NAME>&groupName=<GROUP_NAME>&periodicity=<Periodocity>&isSync=true&gwsource=external` To understand the elements of the sample URL, click here.
Headers

Content-Type: application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (for example, external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the PUT request. **Type**: Payload

Payload

Payload

Name	Description
reportName	(Mandatory) Report types that have to be fetched for the centralized dashboard **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Possible values (one from the following): • CryptoScore:summary • Google90DayScore:summary • Google90DayScore:non-standard-certificate-count • OperationReport:clm-action-trend • CryptoRiskReport:non-standard-certificate-count
groupName	(Optional) Name of the certificate group for filtering the report data to be fetched **Type**: String **Deafult value**: All certificate groups mapped to the logged in user
periodicity	(Mandatory only for the **OperationReport:clm-action-trend** report type) Time interval for filtering the report data to be fetched **Type**: String **Possible values**(one of the following): • yearly • quarterly • monthly • weekly • daily

Response Structure for the Crypto Score Summary Report

Response Parameters

Name	Description
reports	Object containing report details **Type**: reports
message	Success or failure description **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

reports

Name	Description
name	Report name as specified in the payload
score	A numerical representation that indicates the overall compliance status or risk level
metrics	An object containing a detailed breakdown of the individual parameters for each severity level that contributes to the overall score **Type**: metrics
lastExecutedTime	Timestamp of when the report was last generated

metrics

Name	Description
severity	Risk level category assigned to classify the impact of the issues detected
count	Total no. of certificates that fall under the specified severity level
label	Display label assigned to the severity level
percent	Percentage of certificates that fall under the specified severity level

Response Structure for the Google 90 Day Score Summary Report

Response Parameters

Name	Description
reports	Object containing the report details

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
	Type: reports
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

reports

Name	Description
name	Report name as specified in the payload
score	A numerical representation that indicates the overall compliance status or risk level
metrics	An object containing a detailed breakdown of the individual parameters for each severity level that contributes to the overall score **Type**: metrics
category	A qualitative label to represent the overall score range of the report

metrics

Name	Description
summary	An object containing the detailed breakdown of the individual parameters for each severity level that contributes to the overall score **Type**: summary
total	Total number of certificates evaluated in the report, across severity levels

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

metrics (continued)

Name	Description
non-standard	Number of certificates that are non-compliant to the cryptographic and policy guidelines

summary

Name	Description
severity	Risk level category assigned to classify the impact of the issues detected
count	Total no. of certificates that fall under the specified severity level
label	Display label assigned to the severity level
percent	Percentage of certificates that fall under the specified severity level

Response Structure for the Google 90 Day Non Standard Certificate Count Report

Response Parameters

Name	Description
reports	Object containing the report details **Type**: reports
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

reports

Name	Description
name	Report name as specified in the payload
count	Total number of non standard certificates evaluated in the report

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

reports (continued)

Name	Description
executionTime	Timestamp of when the report was last generated
chartData	An object containing categorized counts of non-standard certificates, grouped by compliance issues **Type**: chartData

chartData

Name	Description
unknownCA	Total number of certificates issued by CAs that are not recognized or trusted
rootCAIssued	Total number of certificates issued by a root CA
sanMismatch	Total number of certificates with Subject Alternative Name (SAN) entries that do not match the domain or resource they're deployed on
unAssociated	Total number of certificates that are not associated with an endpoint
selfSigned	Total number of certificates that are signed by the issuing CA
wildcard	Total number of certificates that use wildcard domains

Response Structure for the Risk & Crypto Non Standard Certificate Count Report

Response Parameters

Name	Description
reports	Object containing the report details **Type**: reports
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
tags	Additional information for the failure response

reports

Name	Description
name	Report name as specified in the payload
count	Total number of non standard certificates evaluated in the report
executionTime	Timestamp of when the report was last generated
chartData	An object containing categorized counts of non-standard certificates, grouped by compliance issues **Type**: chartData

chartData

Name	Description
unknownCA	Total number of certificates issued by CAs that are not recognized or trusted
rootCAIssued	Total number of certificates issued by a root CA
sanMismatch	Total number of certificates with Subject Alternative Name (SAN) entries that do not match the domain or resource they're deployed on
unAssociated	Total number of certificates that are not associated with an endpoint
selfSigned	Total number of certificates that are signed by the issuing CA
wildcard	Total number of certificates that use wildcard domains

Response Structure for the Operation CLM Action Trend Report

Response Parameters

Name	Description
reports	Object containing the report details **Type**: reports

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

reports

Name	Description
name	Report name as specified in the payload
periodicity	Time interval used for filtering the data evaluated by the report
dataList	Object containing timestamped data points and the corresponding count of certificates on which the specified CLM action was performed, collected over the defined periodicity **Type**: dataList

dataList

Name	Description
values	Object containing timestamped data points and certificate index number **Type**: values
action	CLM action used for grouping the data points over the given periodicity

values

Name	Description
x	Timestamp of the action performed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

values (continued)

Name	Description
y	Number of certificates on which the CLM action was executed at the specified timestamp

Status Codes

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason: Invalid credentials **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field missing or invalid value **Remediation**: Ensure that the missing mandatory field, as specified in the error response, is included in the payload and is assigned a valid value.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API. **Remediation**: Ensure that the user has all the requisite ACF permissions to assign certificates to the group.
403 Forbidden	CERT-REPORT_1015	User does not have access to the certificate group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure that • the certificate group exists in the database • the user has access to the certificate group
417 Expectation Failed	CERT-FV-001	Invalid query parameter **Remediation**: Ensure that the query does not contain an invalid parameter or an invalid value assigned to a valid parameter.
417 Expectation Failed	CERT-FV-001	Null/empty value assigned to a query paramter **Remediation**: Ensure that no query parameters are assigned null/empty values.
417 Expectation Failed	CERT-FV-001	The periodicity parameter is included in the query for a non-compatible report type. **Remediation**: The periodicity parameter is applicable only for the OperationReport:clm-action-trend report.

Sample Request/Response for the Crypto Score Summary Report

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Assign Certificates to a Group

This API is used to assign one or multiple certificates to an existing certificate group.

Certificate groups simplify certificate lifecycle management, access control, and policy enforcement for certificates.

Before you Begin

- Ensure that the user has the required permissions for the group to which the certificate currently belongs.
- Ensure that the target certificate group exists.
- Ensure that the user has the required permissions to assign certificates to the target certificate group (to which the certificates will be assigned).

Request Structure

Endpoint:	/certificate/group/assign
Type:	PUT
Action:	certificate-group-assign
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group/assign?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (for example, external) **Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the PUT request. **Type**: Payload

Payload

Payload

Name	Description
groupName	(Mandatory) Name of the certificate group to which the certificates have to be assigned **Type**: String
resourceIds	(Mandatory) Comma-separated list of the resource IDs of all certificates that have to be assigned to the above-mentioned certificate group The resources IDs can be retrieved using the /certificate/search API. **Type**: List **Constraints**: Ensure that all certificates belong to the same certificate category.
comment	(Optional) Additional details related to the certificate assignment

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Constraints**: • Maximum character limit is 255. • Special characters and HTML tags are invalid values.

Response Structure

Success Response

200 OK Response with the message: Group assign action successfully performed.

Response content-type: application/json

Response Parameters

Name	Description
message	Success or failure description **Type**: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

Status Codes

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason: Invalid credentials **Remediation**: Ensure that valid username and password or a valid

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		sessionId is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field missing or invalid value **Remediation**: Ensure that the missing mandatory field, as specified in the error response, is included in the payload and is assigned a valid value.
400 Bad Request	VALIDATION_ERROR_0004	`comment` exceeds the 255-character limit. **Remediation**: Ensure that the text entered as comments in the payload is less than or equal to 255 characters.
400 Bad Request	CERT-GEN-0033	Invalid characters in the comments. **Remediation**: Ensure that the text entered as comments in the payload does not have any special characters or HTML tags.
403 Forbidden	AVX_GW_005	User does not have access to the targeted API. **Remediation**: Ensure that the user has all the requisite ACF permissions to assign certificates to the group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		To enable this, go to (**Menu**) > **CERT+** > **Groups & Policies** > **Group** > **Assign Group**.
403 Forbidden	CERT-ACL-0006	Access denied since user does not have all the requisite permissions to update certificates. **Remediation**: Ensure that the user has all the required ACL resource permissions for assigning the certificates.
403 Forbidden	CERT-ACF-0058	User does not have the relevant permissions to perform this action. **Remediation**: Ensure that the user has the required permissions for updating the required certificate category.
403 Forbidden	CERTIFICATE_BELONG_GROUP_PERMISSION_DENIED	User does not have RW permission for the certificate group to which the certificate already belongs. **Remediation**: Ensure that the user has RW permission for the certificate groups to which all certificates, the resource IDs of which have been listed in the payload, currently belong.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
403 Forbidden	ACF_NOT_AVAILABLE_FOR_SERVER_CERT	User does not have view permission for the server certificate inventory. **Remediation**: Ensure that the user has all the required ACF permissions for viewing the server certificate inventory.
403 Forbidden	ACF_NOT_AVAILABLE_FOR_CLIENT_CERT	User does not have view permission for the client certificate inventory. **Remediation**: Ensure that the user has all the required ACF permissions for viewing the client certificate inventory.
403 Forbidden	ACF_NOT_AVAILABLE_FOR_CODE_SIGNING_CERT	User does not have view permission for the code signing certificate inventory. **Remediation**: Ensure that the user has all the required ACF permissions for viewing the code signing certificate inventory.
404 Not Found	GROUP_NOT_FOUND_OR_PERMISSION_DENIED	The certificate group name mentioned in the payload does not exist or the user does not have RW permission to the group. **Remediation**: Ensure that the certificate group

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Unassign Certificates from a Group

This API is used to unassign one or multiple certificates from an existing certificate group. The unassigned certificates are then assigned to the default certificate group.

Before you Begin

- Ensure the user has the required permissions for accessing the default certificate group.
- Ensure that the user has the required permissions for the group to which the certificate currently belongs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that the certificate/certificates is/are already assigned to the certificate group.
- Ensure that the user has the required ACF permissions to unassign certificates from the certificate group.

Request Structure

Endpoint:	/certificate/group/unassign
Type:	PUT
Action:	certificate-group-unassign
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/group/unassign?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory if **username** and **password** are not provided) Session ID received after login **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username **Type**: String
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource	(Mandatory) Source from which the request is triggered. (for example, external)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Query	**Type**: String
Payload *Body*	Contains all the parameters to be included in the request body for the PUT request. **Type**: Payload

Payload

Payload

Name	Description
resourceIds	(Mandatory) Comma-separated list of the resource IDs of all certificates that have to be unassigned The resources IDs can be retrieved using the /certificate/search API. **Type**: List
comment	(Optional) Additional details related to the certificate assignment **Type**: String **Constraints**: • Maximum character limit is 255. • Special characters and HTML tags are invalid values.

Response Structure

Success Response

200 OK Response with the message: Group unassign action successfully performed.

Response content-type: application/json

Response Parameters

Name	Description
message	Success or failure description

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response It is a non-null value for a failure response. **Type**: String
tags	Additional information for the failure response

Status Codes

HTTP Code	appStatusCode	Response Message
401 Unauthorized	AVX_GW_003	Authentication failed, reason: Invalid credentials **Remediation**: Ensure that valid username and password or a valid sessionId is provided as header parameters.
400 Bad Request	VALIDATION_ERROR_0004	Mandatory field missing or invalid value **Remediation**: Ensure that the missing mandatory field, as specified in the error response, is included in the payload and is assigned a valid value.
400 Bad Request	VALIDATION_ERROR_0004	`comment` exceeds the 255-character limit.

ADC+ API (for CERT+)

- Push and Bind Certificate to ADC Devices
- Push and Bind Certificate to ADC Profile
- Rollback Certificate to ADC profile

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Push and Bind Certificate to ADC Devices

This API initiates a push of the certificate to ADC devices [F5, Citrix, AVI, A10, AmazonELB, NginxPlus, HAProxy] and bind it to a profile or virtual server depending on the ADC device.

Before you begin

Ensure the following before attempting to push a certificate to a particular ADC device through AppViewX:

- ADC devices must be configured in AppViewX.
- The device should be in the Managed state.
- A valid certificate should be used to push the certificate.
- Profiles or virtual servers should be available. This can be fetched using **Fetch Available Profiles API** (refer section below).

Fetch available profiles API

Endpoint:	/certificate/profiles
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/profiles?category=ADC&vendor=F5&deviceName=F5_device&gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Details - Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Details - Parameters (continued)

Name	Description
	Constraint: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
category *Query*	(Mandatory) Specifies the device category. **Type**: String **Possible values**: ADC, Server, and Firewall.
vendor *Query*	(Mandatory) Vendor for the chosen device. For example, **F5** is a vendor for the ADC category. **Type**: String **Possible values**: F5, Citrix, AVI, A10, AmazonELB, NginxPlus, and HAProxy.
certificateUuid *Query*	(Mandatory) Resource id of the certificate. **Type**: String **Constraints**: This can be obtained from search API.
deviceName *Query*	(Mandatory) Name of the device as per AppViewX Device Inventory. **Type**: String
inventory	(Mandatory) Name of AppViewX inventory where the certificate is present.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Details - Parameters (continued)

Name	Description
Query	**Type**: String **Possible values**: Server, Client, Code Signing, and Device.

Response Parameters

Name	Description
response	Contains the following response attributes for the fetch profiles request: objects, totalRecords, obtainedRecords, and obtainedRecordRange. **Type**: List of Objects
objects	List of available device profile Ids. response **Type**: List of String
totalRecords	Total number of profiles fetched. response **Type**: Integer
obtainedRecords	Total number of profiles fetched. response **Type**: Integer
obtainedRecordRange	Range of record found. response **Type**: Object
message	Success message of the action or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Response

Input Parameters (continued)

Name	Description
ttl *Query*	(Mandatry) The time to live (**ttl**) is a query parameter. If the total time taken surpasses this value, the response will indicate that the request is still in progress. On the other hand, if the operation completes successfully within the TTL, the response will indicate success. **Type**: Integer
Payload	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
certificateId	(Mandatory) Resource id of the certificate. **Type**: String **Constraint**: Optional if the Uuid of the certificate is present.
certificateUuid	(Optional) Certificate UUid **Type**: String **Constraint**: Mandatory only if certificateId is not present.
selectedProfiles	(Mandatory) ADC device profile id. **Type**: List of String **Constraint**: These can be obtained from Fetch Available Profiles API. • If a Profile connector is specified, then the certificate will be pushed and bound to the profile. • If a Default connector specified, then the certificate will be only pushed.
certificateDetails	(Mandatory) Certificate details for the server devices to be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Any of the following server devices: • Certificate details for F5 • Certificate details for Citrix • Certificate details for AVI • Certificate details for A10 • Certificate details for AmazonELB • Certificate details for NignixPlus • Certificate details for HAProxy

Certificate details for F5

Name	Description
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.crt
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into an F5 device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the CA file name and intermediate certificate file name.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into an F5 device. **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for F5 (continued)

Name	Description
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
rootCertificateFileName	(Optional) A user defined file name for pushing the intermediate and root certificates into in a F5 device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Intermediate file or bundle name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Request Payload

```
{
 "certificateUuid": "9eb94a53963d1ae326dbf4cda6077f55baa8476e",
 "selectedProfiles": [
 "device_name:@default:@clientssl"
 ],
 "certificateDetails": {
 "certificateFileName": "test123.crt",
 "certificateType": "PEM-.crt",
 "privateKeyFileName": "test123.key",
 "pushRootAndIntermediateCertificates": true,
 "rootCertificateFileName": "test123_root.crt"
 }
 }
```

Certificate details for Citrix

Name	Description
certificateType	(Mandatory) Type of the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Citrix (continued)

Name	Description
	Type: String **Possible Certificate types**: PEM-.crt, PEM-.cer, PEM-.pem, DER-.der, and DER-.cer
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into the Citrix device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into the Citrix device. **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
rootCertificateFileName	(Optional) A user-defined file name for pushing the root certificate into the Citrix device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Root file name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Citrix (continued)

Name	Description
sniCert	(Optional) Enables the SNI push for certificate. **Type**: Boolean
sniStatus	(Optional) Enables SNI in the virtual server. **Type**: Boolean

Request Payload

```
{
"certificateUuid": "9eb94a53963d1ae326dbf4cda6077f55baa8476e",
"selectedProfiles": [
"device_name:@default:@sslvs"
],
"certificateDetails": {
"certificateFileName": "test123.crt",
"certificateKeyPairName": "test123",
"certificateType": "PEM-.crt",
"intermediateCertificateFileName": [
"test123_inter.crt"
],
"privateKeyFileName": "test123.key",
"pushRootAndIntermediateCertificates": true,
"rootCertificateFileName": "test123_root.crt",
"sniCert": "false",
"sniStatus": "false"
}
}
```

Certificate details for AVI

Name	Mandatory
certificateType	(Mandatory) Type of the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for AVI (continued)

Name	Mandatory
	Possible Certificate types: PEM-.pem
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into the AVI device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into the AVI device. **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
intermediateCertificateFileNames	(Optional) A user-defined file name for pushing the intermediate certificate into the AVI device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Intermediate file or bundle name should not begin and end with special

Certificate details for AVI (continued)

Name	Mandatory
	characters except -, _, .. It should not be the same as the certificate file name.
rootCertificateFileName	(Optional) A user-defined file name for pushing the root certificate into the AVI device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Root file name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Request Payload

```
{
 "certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
 "selectedProfiles":[
 "device_name:@serverssl-insecure-compatible:@Common"
 ],
 "certificateDetails":{
 “certificateType”:”PEM-.pem”,
 "certificateFileName":"certificate_push.pem",
 "privateKeyFileName":"certificate_push.key",
 "pushRootAndIntermediateCertificates": true,
 “intermediateCertificateFileNames”:[”test_cert_inter.crt”],
 "rootCertificateFileName": "test_cert_ca.crt"
 }
 }
```

Certificate details for A10

Name	Mandatory
certificateType	(Mandatory) Type of the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for A10 (continued)

Name	Mandatory
	Type: String **Possible Certificate types**: PEM-.pem, PEM-.crt, PEM-.cer, DER-.der, DER-.cer, PKCS#7-.p7b, PKCS#7-.p7c, PKCS#7-.p12, and PKCS#7-.pfx
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into the A10 device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into the A10 device. **Type**: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.
pfxPassword	(Optional) Password for the **pfx** and **pkcs12** file type. It is **mandatory** only if the certificate file type is **.pfx** or **.pkcs12**. **Type**: Boolean **Constraints**: The password should be Base64 encoded.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for A10 (continued)

Name	Mandatory
intermediateCertificateFileNames	(Optional) A user-defined file name for pushing the intermediate certificate into the A10 device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Intermediate file or bundle name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Request payload for non pfx and p12 cert types

```
{ "certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
        "selectedProfiles":[ "device_name:@serverssl-insecure-compatible:@Common" ],
        "certificateDetails":{ “certificateType”:”PEM-.crt”,
        "certificateFileName":"certificate_push.crt",
        "privateKeyFileName":"certificate_push.key", "pushRootAndIntermediateCertificates":
        true, "intermediateCertificateFileNames":[ "test_cert_ca.crt"] } }
```

Request payload for pfx and p12 cert types

```
{
"certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
 "selectedProfiles":[
 "device_name:@serverssl-insecure-compatible:@Common"
 ],
 "certificateDetails":{
 “certificateType”:”PKCS-.pfx”,
 "certificateFileName":"certificate_push.pfx",
 "pushRootAndIntermediateCertificates": true,
 "intermediateCertificateFileNames":[ “test_cert_ca.crt"],
 “pfxPassword”:”cGFzc3dvcmQ=”
 }
 }
```

Certificate details for AmazonELB

Name	Mandatory
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.pem
certificateLocation	(Mandatory) Location of the certificate. Values are **ACM** or **IAM**. **Type**: String
certCAReferenceId	(Optional) Reference ID to input the certificate location. It is **mandatory** if certificateLocation is **ACM**. **Type**: String **Constraints**: The special characters allowed are ('=', '/', ',', '.', '@', '-').
certificateFileName	(Optional) A user defined file name for pushing the certificate into the AmazonELB device. It is **mandatory** if certificateLocation is **IAM**. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the CA file name and intermediate certificate file name.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
Request payload if certificateLocation is ACM	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for AmazonELB (continued)

Name	Mandatory

```
{
"certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
"selectedProfiles":[
"device_name:@serverssl-insecure-compatible:@Common"
],
"certificateDetails":{
“certCAReferenceId”: "arn:aws:iam::2313:amazonELB"
“certificateLocation”: "ACM"
“certificateType”: "PEM-.pem"
“pushRootAndIntermediateCertificates”: true
}
```

Request payload if certificateLocation is IAM

```
{
"certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
"selectedProfiles":[
"device_name:@serverssl-insecure-compatible:@Common"
],
"certificateDetails":{
“certificateFileName: "sample.pem",
“certificateLocation”: "IAM",
“certificateType”: "PEM-.pem",
“pushRootAndIntermediateCertificates”: true
}
```

Certificate details for NginxPlus

Name	Mandatory
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.pem, PEM-.crt, and PEM-.cer
certificateLocation	(Mandatory) A user defined file name for pushing the certificate into the NginxPlus device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for NginxPlus (continued)

Name	Mandatory
	Type: String **Constraints**: The certificate file name should not begin and end with special characters except -, ., _. It should not be the same as CA file name and intermediate file name.
keyLocation	(Mandatory) A user defined file for pushing the key into the NginxPlus device. **Type**: String **Constraints**: The key file name should not begin and end with special characters except -, ., _. Key file name should be same as certificateFileName.
privateKeyInDevice	(Optional) Determines whether private key needs to be pushed into the device. **Type**: Boolean

Request Payload

```
{
"certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
"selectedProfiles":[
"device_name:@serverssl-insecure-compatible:@Common"
],
"certificateDetails":{
“certificateType”:”PEM-.pem”,
"certificateLocation":"/home/appviewx",
"keyLocation":"/home/appviewx",
"privateKeyInDevice": true
}
}
```

Certificate details for HAProxy

Name	Mandatory
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.pem
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into the HAProxy device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyInDevice	(Optional) Determines whether private key needs to be pushed into the device. **Type**: Boolean
privateKeyLocation	(Mandatory) A user defined file name for pushing the keys into the HAProxy device. It is **mandatory** if privateKeyInDevice is **true**. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.

Request Payload

```
{
"certificateUuid":"9eb94a53963d1ae326dbf4cda6077f55baa8476e",
"selectedProfiles":[
"device_name:@serverssl-insecure-compatible:@Common"
],
"certificateDetails":{
“certificateType”:”PEM-.pem”,
"certificateFileName":"/opt/haproxy/certificate_push.pem",
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for HAProxy (continued)

Name	Mandatory
"privateKeyLocation": true, "privateKeyLocation": "/opt/haproxy/test_cert.key" } }	

Response for Push and Bind SYNC API

Note: The response details/parameters are common for all vendor devices.

Parameters

Name	Description
response	Contains the parameters certificate, deviceProfiles, applicationConnectors, success and messages. **Type**: Object
certificate response	Details about the selected certificate which was used to push into the ADC devices **Type**: List <Object>
deviceProfiles response	Details about the device profiles to which the certificate is bound. **Type**: List <Object>
applicationConnectors response	Details about the application connectors where the push operation occurred. **Type**: List <Object>
success response	Determines whether the push operation succeeded. **Type**: Boolean
messages response	Details of the push operation. **Type**: List <String>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
message	Success or failure messages **Type**: String
appStatusCode	Application specific status code for the response. **Type**: String
tags	More info in case of failure response **Type**: Object
headers	Details of the response headers if any **Type**: Object

Sample Request/Response

Request Payload

```
{
 "applicationConnectorIds": [ "xx.xxx:@clientssl-insecure-compatible:@Common:@c46ec8a04da701721159ce0c3cf772367ade58cb" ]
 }
```

Note: Please refer to the "Request Structure" to identify the changeable values.

Response Details

```
{
 "response": {
 "certificate": <Selected Certificate>,
 "deviceProfiles": <Selected Profiles>,
 "applicationConnectors": <Application connectors with its work order status>,
 "success": <Status of the operation>,
 "messages": <Response message for the push action performed>
 },
 "message": null,
 "appStatusCode": <Error Code>,
 "tags": {},

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push and Bind Certificate to ADC Profile

The API initiates a push of the certificate along with the private keys to the ADC devices and associates them to the device profiles.

Before You Begin

Ensure the following before attempting to push a certificate to a particular ADC device through AppViewX:

- ADC devices must be configured in AppViewX.
- The device should be in the Managed state.

Fetch Available Profiles API

Endpoint:	/certificate/profiles
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/profiles?category=ADC&vendor=F5&deviceName=F5_device&gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Details - Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
category *Query*	(Mandatory) Specifies the device category. **Type**: String **Possible values**: ADC, Server, and Firewall.
vendor *Query*	(Mandatory) Vendor for the chosen device. For example, **F5** is a vendor for the ADC category. **Type**: String **Possible values**: F5, Citrix, AVI, A10, AmazonELB, NginxPlus, and HAProxy.
certificateUuid	(Mandatory) Resource id of the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Details - Parameters (continued)

Name	Description
Query	**Type**: String **Constraints**: This can be obtained from search API.
deviceName	(Mandatory) Name of the device as per AppViewX Device Inventory.
Query	**Type**: String
inventory	(Mandatory) Name of AppViewX inventory where the certificate is present.
Query	**Type**: String **Possible values**: Server, Client, Code Signing, and Device.

Response Parameters

Name	Description
response	Contains the following response attributes for the fetch profiles request: objects, totalRecords, obtainedRecords, and obtainedRecordRange.
objects	List of available device profile Ids.
response	**Type**: List of String
totalRecords	Total number of profiles fetched.
response	**Type**: Integer
obtainedRecords	Total number of profiles fetched.
response	**Type**: Integer
obtainedRecordRange	Range of record found.
response	**Type**: Object
message	Success message of the action or failure description in case of error.
	Type: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Parameters (continued)

Name	Description
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Response

```
{
 "response": {
 "objects": [
 "device_name",
 "device_name:@apm-default-serverssl:@Common",

Request Structure for Push and Bind ASYNC API

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	*https://<appviewx node ip>:<gateway port>/avxapi/certificate/pushToDevice?gwsource=external&gwkey=f000ca01*
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Value of the parameter should be **'application/json'**
gwkey *Query*	(Mandatory) Tenant Key. This is needed only in case of multi-tenant installations and can disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
certificateId	(Mandatory) Resource id of the certificate. **Type**: String **Constraint**: Optional if the Uuid of the certificate is present.
certificateUuid	(Optional) Certificate UUid **Type**: String **Constraint**: Mandatory only if certificateId is not present.
selectedProfiles	(Mandatory) ADC device profile id. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: These can be obtained from Fetch Available Profiles API • If a Profile connector is specified, then the certificate will be pushed and bound to the profile. • If a Default connector specified, then the certificate will be only pushed.
certificateDetails	(Mandatory) Certificate details for the server devices to be pushed. **Type**: Any of the following server devices: • Certificate details for F5 • Certificate details for Citrix • Certificate details for AVI • Certificate details for A10 • Certificate details for AmazonELB • Certificate details for NignixPlus • Certificate details for HAProxy

Certificate details for F5

Name	Description
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.crt
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into an F5 device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into an F5 device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for F5 (continued)

Name	Description
	Type: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
rootCertificateFileName	(Optional) A user defined file name for pushing the intermediate and root certificates into in a F5 device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Intermediate file or bundle name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Request Payload

```
{
"certificateId": "665efb67585b6b7259766f1b",
"selectedProfiles": ["F5:@shape-api-ssl:@Common"],
"certificateDetails": {
"certificateFileName": "F5testCert1.crt",
"certificateType": "PEM-.crt",
"privateKeyFileName": "F5testCert1.key",
"pushRootAndIntermediateCertificates": true,
"rootCertificateFileName": "test123_root.crt"
}
}
```

Response

Certificate details for Citrix

Name	Description
certificateType	(Mandatory) Type of the certificate **Type**: String **Possible Certificate types**: PEM-.crt, PEM-.cer, PEM-.pem, DER-.der, and DER-.cer
certificateFileName	(Mandatory) A user defined file name for pushing the certificate into the Citrix device. **Type**: String **Constraints**: The certificate file name should not begin or end with special characters except -, ., _. The certificate file name should also be different from both the root and intermediate certificate file names.
privateKeyFileName	(Mandatory) A user defined file name for pushing the keys into the Citrix device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate details for Citrix (continued)

Name	Description
	Type: String **Constraints**: The key file name should not begin or end with special characters except -, ., _. The key file name should be same as the certificateFileName.
pushRootAndIntermediateCertificates	(Optional) Determines whether both Root and Intermediate certificate needs to be pushed. **Type**: Boolean
intermediateCertificateFileName	(Optional) A user-defined file name for pushing the intermediate certificate into the Citrix device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Intermediate file or bundle name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.
rootCertificateFileName	(Optional) A user-defined file name for pushing the root certificate into the Citrix device. It is **mandatory** if **pushRootAndIntermediateCertificates = true**. **Type**: String **Constraints**: Root file name should not begin and end with special characters except -, _, .. It should not be the same as the certificate file name.

Response Structure for Push and Bind ASYNC API

Note: The response details/parameters are common for all vendor devices.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters

Name	Description
response	Contains Request id and connector id. **Type**: Object
requestId response	Request Id for push action for the application connector. **Type**: String
connectorId response	Application connector Id. **Type**: String
message	Success or failure messages **Type**: String
appStatusCode	Application specific status code for the response. **Type**: String
tags	More info in case of failure response **Type**: Object
headers	Details of the response headers if any **Type**: Object

Sample Response (common for all vendors)

```
{

"headers": null
}
```

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Rollback Certificate to ADC profile

The API initiates the rollback of a certificate to an ADC profile.

Before you begin

Ensure the following before attempting to rollback certificate to a ADC device profile through AppViewX:

- ADC devices must be configured in AppViewX.
- The device should be in the Managed state

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Approval is not required:** Enable this mode by setting the 'Certificate Requests Need Approval?' flag to false in the Certificate Policy.
- **Approval is required**: If the approval setting in the policy cannot be changed, users can approve specific requests by following the After you are done section.

Request Structure

Endpoint:	/certificate/rollback
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/rollback?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Value of the parameter should be **'application/json'**
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
autoApproval *Query*	Indicates whether the auto-approval is needed for the action. **Type**: String **Constraint**: Value of the parameter should be **yes**.
Payload *Body*	Contains all the parameters to be sent in the request body for the post request. **Type**: Payload

Payload

Payload

Name	Description
applicationConnectorIds	(Mandatory) Application connector id. **Type**: List <String>

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the rollback request
requestId response	Request Id for rollback action for the application connector. **Type**: String
connectorId	Application connector Id.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
response	**Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
202 Accepted	NA	App connector rollback action initiated for 1 connector(s).
202 Accepted	NA	Operation cannot be completed for one or more devices as the 'Resource' allocated to you does not have write permission. **Remediation**: Ensure that users have access to the device.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
400 Bad Request	MANDATORY_FIELD_MISSING	Mandatory field is missing or invalid - <<field name>>

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

MultiCloud API

- Push Certificates to ACM
- Push Certificates to IAM
- Push Certificates to ELB via ACM
- Push Certificates to ELB via IAM
- Push Certificates to Cloudfront via ACM
- Push Certificates to Cloudfront via IAM
- Push Certificates to Azure Key Vault (Certificate Location)
- Push Certificates to Azure Key Vault (Secrets Location)
- Push Certificates to Azure Application Gateway (Gateway Listener Profile | Direct upload to Application Gateway)
- Push Certificates to Azure Application Gateway (Gateway Listener Profile | Choose from Key Vault)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Push Certificates to Azure Application Gateway (Gateway SSL Profile)
- Push Certificates to Azure App Service
- Push Certificates to Azure Enterprise Application Service
- Push Certificates to Azure App Registration Service
- Push Certificates to Azure API Management Service
- Push Certificates to GCP Certificate Manager Service (Scope: Global)
- Push Certificates to GCP Certificate Manager Service (Scope: Regional)
- Push Certificates to GCP Classic Certificates Service (Scope: Global)
- Push Certificates to GCP Classic Certificates Service (Scope: Regional)
- Push Certificates to GCP Load Balancer Service (via Classic Certificates)
- Push Certificates to GCP Load Balancer Service (via Certificate Manager-Global External LB)
- Push Certificates to GCP Load Balancer Service (via Certificate Manager-Regional Internal LB)

Push Certificates to ACM

This API will push certificates and their corresponding private keys to AWS devices with the AWS Certificate Manager (ACM) service.

Before You Begin

Before attempting to push a certificate to an AWS device with the ACM service through AppViewX, ensure the following:

- AWS devices with the ACM service should be added in AppViewX
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login. **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username *Header*	AppViewX login username **Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate

generalInformation

Name	Description
category	(Mandatory) Type of the target system to which the certificate will be pushed **Type**: String **Possible values**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible values**: AWS
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Type: String **Possible values**: ACM
name	Name of the connector that will be created to push the certificate to the cloud device **Type**: String
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible values**: Server, Client, Code signing
locationType	(Optional) Location where the certificate will be stored **Type**: String
certificateFileName	(Mandatory) Name of the certificate being pushed **Type**: String
certCAReferenceId	(Mandatory) ID of the issuing Certificate Authority

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: String
pushRootAndIntermediateCertificates	(Optional) Push root and intermediate certificates along with the end certificate **Type**: Boolean **Possible values**: • 1: Yes • 0: No
defaultCertificate	(Mandatory) Name of the default certificate that will be used as a fallback option This certificate will be pushed in the event that the intended certificate cannot be pushed.
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file **Type**: String **Possible Values**: **In AppViewX** and **In Device**
preValidationScriptPath	(Optional) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
postValidationScriptPath	(Optional) Location of the script that will be executed after the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible values**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
	Type: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
417 Expectation failed	**FIELD_VALUE_INVALID**	Cooling period should be 0 or greater than 1 **Possible remediation**: Please provide the correct value in the field **coolingPeriod**.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.
500 Internal Server Error	**avx-common-011**	Error while processing

Push Certificates to ELB via ACM

This API will push certificates and their corresponding private keys to AWS devices with the Elastic Load Balancer (ELB) service.

Before You Begin

Before attempting to push a certificate to an AWS device with the ELB service through AppViewX, ensure the following:

- AWS devices with the ELB service should be added in AppViewX
- The devices should be in **Managed** state.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to ELB via IAM

This API will push certificates and their corresponding private keys to AWS devices with the Elastic Load Balancer (ELB) service.

Before You Begin

Before attempting to push a certificate to an AWS device with the ELB service through AppViewX, ensure the following:

- AWS devices with the ELB service should be added in AppViewX
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId	(Mandatory) Session ID received after login.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
Header	**Type**: String **Constraints**: Required if **username** and **password** are not provided.
username *Header*	(Mandatory) AppViewX login username **Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	(Mandatory) AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	(Mandatory) Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate

generalInformation

Name	Description
category	(Mandatory) Type of the target system to which the certificate will be pushed **Type**: String **Possible values**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible values**: AWS
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Type: String **Possible values**: ELB
name	Name of the connector that will be created to push the certificate to the cloud device **Type**: String
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible values**: Server, Client, Code signing
locationType	(Optional) Location where the certificate will be stored **Type**: String
certificateFileName	(Mandatory) Name of the certificate being pushed **Type**: String
certCAReferenceId	(Mandatory) ID of the issuing Certificate Authority

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: String
pushRootAndIntermediateCertificates	(Optional) Push root and intermediate certificates along with the end certificate **Type**: Boolean **Possible values**: • 1: Yes • 0: No
defaultCertificate	(Mandatory) Name of the default certificate that will be used as a fallback option This certificate will be pushed in the event that the intended certificate cannot be pushed.
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file **Type**: String **Possible Values**: **In AppViewX** and **In Device**
preValidationScriptPath	(Optional) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
postValidationScriptPath	(Optional) Location of the script that will be executed after the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible values**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
	Type: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
417 Expectation failed	**FIELD_VALUE_INVALID**	Cooling period should be 0 or greater than 1 **Possible remediation**: Please provide the

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to Azure Key Vault (Certificate Location)

This API will push certificates and their corresponding private keys to Microsoft Azure devices with the Key Vault service.

Before You Begin

Before attempting to push a certificate to a Azure device with the key vault service through AppViewX, ensure the following:

- Azure devices with the key vault service should be added in AppViewX.
- The devices should be in **Managed** state.

sessionId *Header*	(Mandatory) Session ID received after login **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username *Header*	AppViewX login username **Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
serviceFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: Key vault

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
name	(Mandatory) Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed **Type**: String **Possible value(s)**: push and bind, push only
description	(Optional) Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible value(s)**: Server, Client, Code signing
certificateFileName	(Mandatory) Name of the certificate being pushed **Type**: String
certificateLocation	(Optional) Key vault location where the certificate will be stored **Type**: String **Possible value(s)**: certificate
pushRootAndIntermediateCertificates	(Optional) Push root and intermediate certificates along with the end certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: Boolean **Possible value(s)**: • 1: Yes • 0: No
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
	Type: Boolean **Possible value(s)**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
500 Internal Server Error	**avx-common-011**	Error while processing

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to Azure Key Vault (Secrets Location)

This API will push certificates and their corresponding private keys to Microsoft Azure devices with the key vault service.

Before You Begin

Before attempting to push a certificate to a Azure device with the key vault service through AppViewX, ensure the following:

- Azure devices with the key vault service should be added in AppViewX.
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username	AppViewX login username

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
Header	**Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username *Header*	AppViewX login username **Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: generalInformation
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
serviceFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Possible value(s): Application Gateway
profileFilterSelection	Target profile that defines the details for integrating and pushing certificates to the target system **Type**: String **Possible value(s)**: **::Listener**
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed **Type**: String **Possible value(s)**: push and bind, push only
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible value(s)**: Server, Client, Code signing
certificateFileName	(Mandatory) Name of the certificate being pushed to the gateway **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
isNewCertificate	(Optional) Specify if the certificate being pushed to the application gateway is a new certificate or an existing certificate that is being replaced **Type**: String **Possible value(s)**: true, false
pushLocation	(Mandatory) Endpoint where the certificate will be pushed **Type**: String **Possible value(s)**: Application Gateway
keyVaultSubscriptionId	(Optional) Subscription ID of the key vault in which the certificate will stored after it is pushed **Type**: String
keyVaultName	(Optional) Name of the key vault in which the certificate will stored after it is pushed **Type**: String
useExisting	(Optional) Specify if the certificate being pushed to the key vault needs to be replaced **Type**: String **Possible value(s)**: true, false
keyVaultCertificateName	(Optional) Name assigned to the certificate after it is pushed to the key vault **Type**: String
pushRootAndIntermediateCertificates	(Optional) Push root and intermediate certificates along with the end certificate **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Possible value(s): • 1: Yes • 0: No
profileFilterSelection	Specific profile type where the certificate will be applied **Type**: String **Possible value(s)**: Gateway Listener Profile
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file. Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible value(s)**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
	Type: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
		Possible remediation: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.
500 Internal Server Error	**avx-common-011**	Error while processing

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **HostName**: A human-readable label assigned to a device (host) on a network

  The hostname will be included in the endpoint URL for an on-prem deployment.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to Azure Application Gateway (Gateway SSL Profile)

This API will push certificates and their corresponding private keys to Microsoft Azure devices with the application gateway service.

Before You Begin

Before attempting to push a certificate to a Azure device with the application gateway service through AppViewX, ensure the following:

- Azure devices with the application gateway service should be added in AppViewX.
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.

Push Certificates to Azure Enterprise Application Service

This API will push certificates and their corresponding private keys to Microsoft Azure devices with the enterprise application service.

Before You Begin

Before attempting to push a certificate to a Azure device with the enterprise application service through AppViewX, ensure the following:

- Azure devices with the enterprise application service should be added in AppViewX.
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username	AppViewX login username

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
Header	**Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
serviceFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: Enterprise Application
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Type: String **Possible value(s)**: push and bind profiles, push only profiles
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible value(s)**: Server, Client, Code signing
isActive	(Optional) Specify if the certificate being pushed should be made the active certificate for the enterprise application service. **Type**: String **Possible value(s)**: true, false
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String
additionalNotificationEmailAddress(s)	(Optional) Additional email addresses that should be notified when the certificate is pushed and/or made active **Type**: String
defaultNotificationEmailAddress	(Optional) Default email addresses that should be notified when the certificate is pushed and/or made active

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file. Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible value(s)**: • 1: Yes • 0: No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
		Possible remediation: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.
500 Internal Server Error	**avx-common-011**	Error while processing

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to Azure App Registration Service

This API will push certificates and their corresponding private keys to Microsoft Azure devices with the app registration service.

Before You Begin

Before attempting to push a certificate to a Azure device with the app registration service through AppViewX, ensure the following:

- Azure devices with the app registration service should be added in AppViewX.
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.

Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login **Type**: String **Constraints**: Required if **username** and **password** are not provided.
username	AppViewX login username

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
Header	**Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
serviceFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: Application Gateway
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Type: String **Possible value(s)**: push and bind, push only
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateType	(Mandatory) Type of the certificate that is being pushed **Type**: String **Possible value(s)**: Server, Client, Code signing
certificateFileName	(Mandatory) Name of the certificate being pushed **Type**: String
isNewCertificate	(Optional) Specify if the certificate being pushed is a new certificate or an existing certificate that is being replaced **Type**: Boolean **Possible value(s)**: true, false
pushLocation	(Mandatory) Endpoint where the certificate will be pushed **Type**: String **Possible value(s)**: Application Gateway
pushRootAndIntermediateCertificates	(Optional) Push root and intermediate certificates along with the end certificate **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Possible value(s): • 1: Yes • 0: No
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file. Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
	Possible value(s): • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.
