Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to GCP Certificate Manager Service (Scope: Global)

This API will push certificates and their corresponding private keys to Google Cloud Platform (GCP) devices with the certificate manager service.

Before You Begin

Before attempting to push a certificate to a GCP device with the certificate manager service through AppViewX, ensure the following:

- GCP devices with the certificate manager service should be added in AppViewX.
- The devices should be in **Managed** state.

Request Structure

Endpoint:	/certificate/pushToDevice
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/pushToDevice?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Request Parameters

Name	Description
sessionId *Header*	(Mandatory) Session ID received after login **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Request Parameters (continued)

Name	Description
	Constraints: Required if **username** and **password** are not provided.
username *Header*	AppViewX login username **Type**: String **Constraints**: Required if **sessionId** is not provided.
password *Header*	AppViewX login password **Type**: String **Constraints**: Required if **sessionId** is not provided.
Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: certificateDetails
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: Certificate Manager
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed **Type**: String **Possible value(s)**: push and bind, push only
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateName	(Mandatory) Name of the certificate being pushed **Type**: String
isNewCertificate	(Optional) Specify if the certificate being pushed is a new certificate or an existing certificate that is being replaced **Type**: Boolean **Possible value(s)**: true, false
region	(Optional) Scope of the certificate being pushed **Type**: String **Possible value(s)**: • Global (Certificate is available for use across all regions within a GCP project) • Regional (Certificate is limited to a specific region within a GCP project)
certificateDescription	(Optional) Additional details related to the certificate being pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: String
profileFilterSelection	Specific profile type where the certificate will be applied **Type**: String **Possible value(s)**: Certificate Manager
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file. Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
	Type: Boolean **Possible value(s)**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error **Type**: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>> **Possible remediation**: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to GCP Classic Certificates Service (Scope: Regional)

This API will push certificates and their corresponding private keys to Google Cloud Platform (GCP) devices with the classic certificates service.

Content-Type *Header*	Specifies the nature of the data in the payload **Type**: String
gwsource *Query*	Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the post request **Type**: Payload

Payload

Payload

Name	Description
generalInformation	(Mandatory) General details related to the push operation **Type**: generalInformation
certificateID	(Mandatory) Unique identifier of the certificate to be pushed
certificateDetails	(Mandatory) Details of the certificate to be pushed **Type**: certificateDetails
pushDetails	(Mandatory) Details for certificate management after the push operation **Type**: pushDetails
selectedProfiles	(Mandatory) Actual profile details of services to which where we are trying to push/bind the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String **Possible value(s)**: Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: Azure
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: Classic Certificates
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed **Type**: String **Possible value(s)**: push and bind, push only
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateName	(Mandatory) Name of the certificate being pushed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Type: String
isNewCertificate	(Optional) Specify if the certificate being pushed is a new certificate or an existing certificate that is being replaced **Type**: Boolean **Possible value(s)**: true, false
region	(Optional) Scope of the certificate being pushed **Type**: String **Possible value(s)**: • Global (Certificate is available for use across all regions within a GCP project) • Regional (Certificate is limited to a specific region within a GCP project)
certificateDescription	(Optional) Additional details related to the certificate being pushed **Type**: String
profileFilterSelection	Specific profile type where the certificate will be applied **Type**: String **Possible value(s)**: Classic Certificates
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible value(s)**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
		Possible remediation: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.
500 Internal Server Error	**avx-common-011**	Error while processing

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Push Certificates to GCP Load Balancer Service (via Classic Certificates)

This API will push certificates and their corresponding private keys to Google Cloud Platform (GCP) devices with the load balancer service.

Before You Begin

Before attempting to push a certificate to a GCP device with the load balancer service through AppViewX, ensure the following:

- GCP devices with the load balancer service should be added in AppViewX.
- The devices should be in **Managed** state.

generalInformation

Name	Description
category	(Mandatory) Device type of the target system to which the certificate will be pushed **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

generalInformation (continued)

Name	Description
	Possible value(s): Cloud
vendor	(Mandatory) Cloud device vendor **Type**: String **Possible value(s)**: GCP
profileFilterSelection	(Mandatory) Service type to which the certificate will be pushed **Type**: String **Possible value(s)**: LB
name	Name given to the connector that will be created to push the certificate to the cloud device **Type**: String
profileType	(Mandatory) Type/category of the profile being used to determine how the certificate is managed after it is pushed **Type**: String **Possible value(s)**: push and bind, push only
description	Additional details related to the certificate being pushed, the connector for pushing the certificate. **Type**: String

certificateDetails

Name	Description
certificateLocation	(Mandatory) Certificate upload location **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

certificateDetails (continued)

Name	Description
	Possible value(s): • Classic Certificates (Upload your certificate and private key directly to the load balancer's configuration.) • Certificate Manager (Reference certificates managed by Certificate Manager in your load balancer configuration.)
certificateName	(Mandatory) Name of the certificate being pushed **Type**: String
isNewCertificate	(Optional) Specify if the certificate being pushed is a new certificate or an existing certificate that is being replaced **Type**: Boolean **Possible value(s)**: true, false
certificateDescription	(Optional) Additional details related to the certificate being pushed **Type**: String
profileFilterSelection	Specific profile type where the certificate will be applied **Type**: String **Possible value(s)**: LB
certificateTags	(Optional) Key-value pair attributes to add additional details about the certificate **Type**: String

pushDetails

Name	Description
scriptLocation	(Mandatory) Select the location of the script file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

pushDetails (continued)

Name	Description
	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. **Type**: String **Possible Values**: **appviewx** and **device**
preValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
postValidationScriptPath	(Mandatory if **scriptLocation** is **device**) Location of the script that will be executed before the certificate is pushed to the target system **Type**: String
pushAutomatically	Automatically push certificate to the target system, after it is renewed/reissued **Type**: Boolean **Possible value(s)**: • 1: Yes • 0: No

Response Structure

Response Structure

Name	Description
response	Contains the response attributes for the push request **Type**: response
message	Success message of the action or failure description in case of error

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response. Will be non-null for failure response. **Type**: String
tags	More info in case of failure response

Response

Name	Description
requestId	Request ID for push action for the application connector **Type**: String
connectorId	ID of the application connector for pushing the certificate **Type**: String

Status Codes

Status Codes

HTTP Status code	appStatusCode	Message and Possible Remediation
202 Accepted	**NA**	1 connector(s) saved and push operation has been triggered.
401 Unauthorized	**AVX_GW_003**	Authentication failed, reason - Invalid Credentials **Possible remediation**: Ensure that valid **username** and **password** or valid **sessionId** is provided as the header param.
400 Bad Request	**MANDATORY_FIELD_MISSING**	Mandatory field is missing or invalid - <<field name>>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes (continued)

HTTP Status code	appStatusCode	Message and Possible Remediation
		Possible remediation: Check and ensure that valid value is provided for <<field name>> field in the request.
404 Not Found	**NO_RECORDS_FOUND**	No matching records found - certificate not found. **Possible remediation**: Please provide correct value for the field **certificateId**.
400 Bad Request	**INVALID_REQUEST**	selectedProfiles are already available in the specified certificate. **Possible remediation**: Please provide a different value for the field **selectedProfiles**.
417 Expectation failed	**CERT-APP-0016**	Connector with profiles {} already exists. **Possible remediation**: Profile connector already exists for the selected certificate. Please change the **certificateId** or delete the existing connector.
500 Internal Server Error	**avx-common-011**	Error while processing

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Automation Workflows API

This guide includes comprehensive documentation on the APIs that can be used for executing different CERT+ Automation workflows.

- Enroll Certificate and Download
- Easy Certificate Provisioning
- Enroll Certificate and Push
- Enroll Certificate with ServiceNow
- Enroll Certificate and Push with ServiceNow Integration
- Renew Certificate and Push

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Renew Certificate with ServiceNow Integration
- Renew Certificate and Push With ServiceNow Integration
- Regenerate Certificate - With New CSR
- Get Request Summary/Log

Enroll Certificate and Download

This API is used to create and download certificates based on the certificate group.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-submit-request
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-submit-request?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Type: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
cert_category	(Mandatory) Specifies the certificate category **Type**: String **Possible Values**: Server, Client
certificate_group	(Mandatory) Specifies the group to which the created certificate must be tagged. **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
ca_account	(Mandatory) CA account name of certificate authority. **Type**: String
division	(Mandatory only for DigiCert CA) Division values for DigiCert **Type**: String
cert_type	(Mandatory only for DigiCert CA) Certificate type for DigiCert and Entrust CAs **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String
digicert_entrust_organization	(Mandatory only for DigiCert CA and Entrust CA) Name of the organization **Type**: String
entrust_country	(Mandatory only for Entrust CA) Country in which the organization is located **Type**: String
entrust_additional_emails	(Mandatory only for Entrust CA) Additional email addresses
validity_unit	(Mandatory) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Integer
key_type	(Mandatory only if the input method is Manual or Policy Based) Key type of the certificate **Type**: String **Possible Values**: RSA, DSA, EC
bit_length	(Mandatory only if the input method is Manual or Policy Based) Bit length of the certificate **Type**: String **Possible Values**: 4096, 2048
hash_function	(Mandatory) Hash function for the certificate **Type**: String **Possible Values**: SHA256
elliptic_curve	(Mandatory if key type is **EC**) Elliptic curve value for the certificate **Type**: String
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
ejbca_end_entity_user_name	(Mandatory only for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory only for EJBCA) Profile name of the EJBCA end entity **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
ejbca_issuer_common_name	(Mandatory only for EJBCA) Common name of the EJBCA issuer **Type**: String
ejbca_certificate_profile_name	(Mandatory only for EJBCA) Profile name associated with the EJBCA certificate **Type**: String
microsoft_enterprise_template_name	(Mandatory only for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
user_email	(Mandatory only for Microsoft Enterprise CA) Email address for sending status notificatiosn for certificate create and push **Type**: String
organization	(Mandatory for AppViewX CA, EJBCA, and Microsoft Enterprise CA) Name of the organization requesting the certificate **Type**: String
country	(Mandatory for AppViewx CA, EJBCA, Entrust CA, Digicert CA, and Microsoft Enterprise CA) Country in which the organization is located **Type**: String
digicert_postal_code	(Mandatory for DigiCert CA) Postal code of the organization requesting the certificate **Type**: String
description	(Optional) Certificate description

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
san	(Optional) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
dns_names	(Optional) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
ip_addresses	(Optional) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
organization_unit	(Optional) Organization unit requesting the certificate **Type**: String
locality	(Optional) Locality in which the organization is located **Type**: String
state	(Optional) State in which the organization is located **Type**: String
mail_address	(Optional) Email address of the organization **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false
cert_attributes	(Mandatory if **cert_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes

Certificate Attributes

Name	Description
atrribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Type: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request **Type**: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Easy Certificate Provisioning

This API is used to create an AppViewX certificate and push to a device available in the instance.

Before you begin

Before attempting to trigger these service requests, ensure that:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource	(Mandatory) Source from which the request is triggered

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Query	**Type**: String
Payload	Contains all the parameters to be sent in the request body for the put request.
Body	**Type**: Payload

Payload

Payload

Name	Description
appviewx_common_name	(Mandatory) Common name of the certificate. Fully qualified domain name (FQDN) of the server for which certificate is requested. **Type**: String
device_type	(Mandatory) Type of device to which the certificate will be pushed. Possible Values: ADC, Server. **Type**: String
push_devices	(Mandatory) Contains all push details. **Type**: Tabular
device_vendor	(Mandatory) Device vendor type based on selection of device type. Possible Values: F5, LinuxServer, Citrix. **Type**: String
device	(Mandatory) Device name for selected device_vendor. **Type**: String
linux_actions	(Mandatory only for the Linux server) Linux action for the selected device_vendor. Possible Values: Default, Create KDB label (*.kdb), Certificate Overwrite (*.kdb).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
selected_profiles	(Mandatory) Profile name for device. **Type**: String
apache_custom_push	(Mandatory only for the Apache server) Provision to opt for pushing the certificate to a custom location. Possible Values: Yes, No. **Type**: String
apache_certificate_location	(Mandatory only if **apache_custom_push** is set to **Yes**) Certificate path created by the user. **Type**: String
apache_key_location	(Mandatory only if **apache_custom_push** is set to **Yes**) Certificate Key path created by the user. **Type**: String
password	(Mandatory only if **linux_action** is set to **Default**) Password to access the KDB file. **Type**: String
appviewx_dns_names	(Optional) DNS values. (For example: www.appviewx.plus). Multiple values must be separated by comma (,). **Type**: String
email_id	(Optional) Email address of the organization. Possible values: Default value configured in the policy. **Type**: String

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Enroll Certificate and Push

This API is used to create a certificate and push it to the selected device.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-submit-request
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-submit-request?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload

Payload

Name	Description
validity_value	(Mandatory) Validity value for the certificate **Type**: String
validity_unit	(Mandatory) Unit of validity for the certificate **Type**: String **Possible values**: Days, Months, Years
user_email	(Mandatory) Email address for sending notification of the status of certificate creation and push **Type**: String
uris	(Mandatory only for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Uniform Resource Identifier for the certificate **Type**: String
upload_csr	(Mandatory only if**input_method** is **upload_csr**) CSR for the new certificate **Type**: String
state	(Optional) State in which the organization is located **Type**: String
san	(Optional) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
rfc822names	(Mandatory only for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA)Email address(es) of the user(s) to whom the certificate is issued

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
renew_before	(Mandatory only if **auto_renew** is enabled) The renewal request will be triggered prior to the expiry date as per the selected renew_before days. **Type**: String
registered_ids	(Mandatory only for Microsoft Enterprise CA and Microsoft Standalone CA) Registered id of the certificate **Type**: String
regenerate_before	(Mandatory only if **auto_regenerate** is enabled) The regenerate request will be triggered prior to the expiry date as per the selected regenerate_before days. **Type**: String
push_devices	(Mandatory) Contains all device fields **Type**: Array of attributes
othernames	(Mandatory only for Microsoft Enterprise CA and Microsoft Standalone CA) Other names for the certificate **Type**: String
organization_unit	(Optional) Organization unit requesting the certificate **Type**: String
organization	(Mandatory only for AppViewX CA, EJBCA, and Microsoft Enterprise CA) Name of the organization requesting the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
microsoft_enterprise_template_name	(Mandatory for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
mail_address	(Optional) Email address of the organization **Type**: String
locality	(Optional) Locality in which the organization is situated **Type**: String
key_type	(Mandatory only if**input_method** is Manual or Policy Based) Key type for the certificate **Type**: String **Possible values**: RSA, DSA, EC
ip_addresses	(Optional) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
input_method	(Mandatory) Certificate creation method **Type**: String **Possible values**: Manual, Policy Based, Upload CSR
hash_function	(Mandatory) Hash function for the certificate **Type**: String **Possible Values**: SHA256

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
entrust_additional_emails	(Mandatory only for the Entrust CA) Additional email address(es) **Type**: String
elliptic_curve	(Mandatory if **key_type** = **EC**) Elliptic curve value for the certificate **Type**: String
ejbca_issuer_common_name	(Mandatory for EJBCA) Common name of the EJBCA issuer **Type**: String
ejbca_end_entity_user_name	(Mandatory for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory for EJBCA) Profile name of the EJBCA end entity **Type**: String
ejbca_certificate_profile_name	(Mandatory for EJBCA) Profile name associated with the EJBCA certificate **Type**: String
dns_names	(Optional) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
division	(Mandatory only for DigiCert CA) Division values for DigiCert **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
directory_names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Directory names for the certificate **Type**: String
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
device_type	(Mandatory) Type of device to which the certificate will be pushed **Type**: String **Possible values**: ADC, Server
description	(Optional) Description of the certificate **Type**: String
country	(Optional) Country in which the organization is located **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: True, False **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.
challenge_password	(Optional) Password to access the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
certificate_group	(Mandatory) Specifies the group under which the created certificate needs to be tagged **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate **Type**: String
cert_type	(Mandatory for DigiCert CA) Cert Type values for DigiCert and Entrust **Type**: String
cert_category	(Mandatory) Specifies the certificate category **Type**: String **Possible values**: Server, Client
cert_attributes	Array of certificate attributes **Type**: Array of cert_attributes
ca_account	(Mandatory) CA account name of certificate authority **Type**: String
bit_length	(Mandatory only if**input_method** is Manual or Policy Based) Bit length for the certificate **Type**: String **Possible values**: 4096, 2048
auto_renew	(Mandatory) If enabled, renewal will be scheduled to trigger before expiry based on renew_before days. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
auto_regenerate	(Mandatory) If enabled, regenerate will be scheduled to trigger before expiry based on regenerate_before days. **Type**: String

cert_attributes

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Attributes for push_devices

Name	Description
device_vendor	(Mandatory) Device vendor type based on selection of device type **Type**: String **Possible values**: F5, LinuxServer, Citrix
device	(Mandatory) Device name for the selected device vendor **Type**: String
linux_actions	(Mandatory) Linux action for the selected device vendor **Type**: String **Possible values**: Default, Create KDB label (*.kdb), Certificate Overwrite (*.kdb)
selected_profiles	(Mandatory) Profile name for the device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices (continued)

Name	Description
	Type: String
apache_custom_new	(Mandatory for Apache devices) Provision to opt for pushing the certificate to a custom location **Type**: String **Possible values**: Yes, No
apache_certificate_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate path created by the user **Type**: String
apache_key_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate Key path created by the user **Type**: String
password	(Mandatory if **linux_actions** = **Default**) Password for accessing the KDB file **Type**: String
push_cert_type	(Mandatory) Certificate type being pushed **Type**: String

Response Structure

200 OK returns string of type application/json with the following body params:

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Type: String
appStatusCode	Application specific status code for the response Will be non-null for failure response **Type**: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request **Type**: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Status Codes

Status codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Enroll Certificate with ServiceNow

This API is used to create a certificate corresponding to the ticket raised on ServiceNow (RITM).

Before you begin

Before attempting to trigger these service requests, ensure that:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-submit-request
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-submit-request?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource	(Mandatory) Source from which the request is triggered

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
Query	**Type**: String
Payload	Contains all the parameters to be sent in the request body for the put request.
Body	**Type**: Payload

Payload

Payload

Name	Description
cert_category	(Mandatory) Specifies the certificate category **Type**: String **Possible Values**: Server, Client
certificate_group	(Mandatory) Specifies the group to which the created certificate must be tagged. **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate. **Type**: String
ca_account	(Mandatory) CA account name of certificate authority. **Type**: String
division	(Mandatory only for DigiCert CA) Division values for DigiCert **Type**: String
cert_type	(Mandatory only for DigiCert CA) Certificate type for DigiCert and Entrust CAs **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
description	(Mandatory) Certificate description **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String
san	(Mandatory) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
dns_names	(Mandatory) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
ip_addresses	(Mandatory) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
organization	(Mandatory for AppViewX CA, EJBCA, and Microsoft Enterprise CA) Name of the organization requesting the certificate **Type**: String
digicert_entrust_organization	(Mandatory only for DigiCert CA and Entrust CA) Name of the organization **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
organization_unit	(Mandatory) Organization unit requesting the certificate **Type**: String
locality	(Mandatory) Locality in which the organization is located **Type**: String
state	(Mandatory) State in which the organization is located **Type**: String
country	(Mandatory for AppViewx CA, EJBCA, Entrust CA, Digicert CA, and Microsoft Enterprise CA) Country in which the organization is located **Type**: String
entrust_country	(Mandatory only for Entrust CA) Country in which the organization is located **Type**: String
digicert_postal_code	(Mandatory for DigiCert CA) Postal code of the organization requesting the certificate **Type**: String
mail_address	(Mandatory) Email address of the organization **Type**: String
validity_unit	(Mandatory) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Integer
key_type	(Mandatory only if the input method is Manual or Policy Based) Key type of the certificate **Type**: String **Possible Values**: RSA, DSA, EC
bit_length	(Mandatory only if the input method is Manual or Policy Based) Bit length of the certificate **Type**: String **Possible Values**: 4096, 2048
elliptic_curve	(Mandatory if key type is **EC**) Elliptic curve value for the certificate **Type**: String
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
ejbca_end_entity_user_name	(Mandatory only for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory only for EJBCA) Profile name of the EJBCA end entity **Type**: String
ejbca_issuer_common_name	(Mandatory only for EJBCA) Common name of the EJBCA issuer **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
ejbca_certificate_profile_name	(Mandatory only for EJBCA) Profile name associated with the EJBCA certificate **Type**: String
entrust_additional_emails	(Mandatory only for Entrust CA) Additional email addresses
microsoft_enterprise_template_name	(Mandatory only for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.
cert_attributes	(Mandatory if **check_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes
snow_integration	(Optional) Provision to opt for ServiceNow integration **Type**: String **Possible values**: Yes, No
snow_account	(Mandatory if **snow_integration** = **Yes**) ServiceNow account **Type**: String
download_format	(Mandatory if **snow_integration** = **Yes**) Download format for certificate tyoe **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
user_email	(Optional) Email address for sending status notificatiosn for certificate create and push **Type**: String

cert_attributes

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Type: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request **Type**: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Enroll Certificate and Push with ServiceNow Integration

This API is used to create a certificate corresponding to the ticket raised on ServiceNow (RITM) and push it to the selected device.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-submit-request
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-submit-request?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
cert_category	(Mandatory) Specifies the certificate category **Type**: String **Possible Values**: Server, Client
certificate_group	(Mandatory) Specifies the group to which the created certificate must be tagged. **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate. **Type**: String
ca_account	(Mandatory) CA account name of certificate authority. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
division	(Mandatory only for DigiCert CA) Division values for DigiCert **Type**: String
description	(Mandatory) Certificate description **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String
san	(Mandatory) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
dns_names	(Mandatory) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
ip_addresses	(Mandatory) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
organization	(Mandatory for AppViewX CA, EJBCA, and Microsoft Enterprise CA) Name of the organization requesting the certificate **Type**: String
digicert_entrust_organization	(Mandatory only for DigiCert CA and Entrust CA) Name of the organization

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
organization_unit	(Mandatory) Organization unit requesting the certificate **Type**: String
locality	(Mandatory) Locality in which the organization is located **Type**: String
state	(Mandatory) State in which the organization is located **Type**: String
country	(Mandatory for AppViewx CA, EJBCA, Entrust CA, Digicert CA, and Microsoft Enterprise CA) Country in which the organization is located **Type**: String
entrust_country	(Mandatory only for Entrust CA) Country in which the organization is located **Type**: String
digicert_postal_code	(Mandatory for DigiCert CA) Postal code of the organization requesting the certificate **Type**: String
mail_address	(Optional) Email address of the organization **Type**: String
validity_unit	(Optional) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit **Type**: Integer
key_type	(Mandatory only if the input method is Manual or Policy Based) Key type of the certificate **Type**: String **Possible Values**: RSA, DSA, EC
bit_length	(Mandatory only if the input method is Manual or Policy Based) Bit length of the certificate **Type**: String **Possible Values**: 4096, 2048
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
elliptic_curve	(Mandatory if key type is **EC**) Elliptic curve value for the certificate **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.
cert_attributes	(Mandatory if **check_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
snow_integration	(Optional) Provision to opt for ServiceNow integration **Type**: String **Possible values**: Yes, No
snow_account	(Mandatory if **snow_integration** = **Yes**) ServiceNow account **Type**: String
download_format	(Mandatory if **snow_integration** = **Yes**) Download format for certificate tyoe **Type**: String
device_type	(Optional) Type of device to which the certificate will be pushed **Type**: String **Possible values**: ADC, Server
push_devices	(Optional) Contains all device fields **Type**: Array of attributes

cert_attributes

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices

Name	Description
device_vendor	(Mandatory) Device vendor type based on selection of device type **Type**: String **Possible values**: F5, LinuxServer, Citrix
device	(Mandatory) Device name for the selected device vendor **Type**: String
linux_actions	(Mandatory) Linux action for the selected device vendor **Type**: String **Possible values**: Default, Create KDB label (*.kdb), Certificate Overwrite (*.kdb)
selected_profiles	(Mandatory) Profile name for the device **Type**: String
apache_custom_new	(Mandatory for Apache devices) Provision to opt for pushing the certificate to a custom location **Type**: String **Possible values**: Yes, No
apache_certificate_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate path created by the user **Type**: String
apache_key_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate Key path created by the user **Type**: String
password	(Mandatory if **linux_actions** = **Default**) Password for accessing the KDB file

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices (continued)

Name	Description
	Type: String
push_cert_type	(Mandatory) Certificate type being pushed **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response **Type**: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
message	The message with the status and request number for the request **Type**: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
		Remediation: Ensure the workflow data is valid.
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Renew Certificate and Push

This API is used to renew a certificate based on the certificate group and certificate authority and push it to the selected device.

Before you begin

Before attempting to trigger these service requests, ensure that:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Payload (continued)

Name	Description
	Possible values: DNS, IP Address
dns_names	(Mandatory) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
ip_addresses	(Mandatory) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
directory_names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Directory names for the certificate **Type**: String
rfc822names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Email address(es) of the user(s) to whom the certificate is issued **Type**: String
registered_ids	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Registered ID of the certificate **Type**: String
uris	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Uniform Resource Identifier of the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
othernames	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Other names for the certificate **Type**: String
validity_unit	(Mandatory) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit **Type**: Integer
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
orderId	(Mandatory only for DigiCert CA) Order ID of the DigiCert certificate **Type**: String
ejbca_end_entity_user_name	(Mandatory only for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory only for EJBCA) Profile name of the EJBCA end entity **Type**: String
ejbca_issuer_common_name	(Mandatory only for EJBCA) Common name of the EJBCA issuer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
ejbca_certificate_profile_name	(Mandatory only for EJBCA) Profile name associated with the EJBCA certificate **Type**: String
entrust_additional_emails	(Mandatory only for Entrust CA) Additional email addresses
microsoft_enterprise_template_name	(Mandatory only for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.
cert_attributes	(Mandatory if **check_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
user_email	(Optional) Email address for sending status notificatiosn for certificate create and push **Type**: String
push_devices	(Mandatory) Contains all device fields

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: Array of attributes

cert_attributes

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Attributes for push_devices

Name	Description
device_vendor	(Mandatory) Device vendor type based on selection of device type **Type**: String **Possible values**: F5, LinuxServer, Citrix
device	(Mandatory) Device name for the selected device vendor **Type**: String
linux_actions	(Mandatory) Linux action for the selected device vendor **Type**: String **Possible values**: Default, Create KDB label (*.kdb), Certificate Overwrite (*.kdb)
selected_profiles	(Mandatory) Profile name for the device **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices (continued)

Name	Description
apache_custom_new	(Mandatory for Apache devices) Provision to opt for pushing the certificate to a custom location **Type**: String **Possible values**: Yes, No
apache_certificate_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate path created by the user **Type**: String
apache_key_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate Key path created by the user **Type**: String
password	(Mandatory if **linux_actions** = **Default**) Password for accessing the KDB file **Type**: String
push_cert_type	(Mandatory) Certificate type being pushed **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response Structure (continued)

Name	Description
	Will be non-null for failure response **Type**: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request **Type**: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Renew Certificate with ServiceNow Integration

This API is used to renew a certificate based on the certificate group and certificate authority and attach the renewed certificate to the ServiceNow ticket.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-submit-request
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-submit-request?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Required if sessionId is not provided.
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the put request. **Type**: Payload

Payload

Payload

Name	Description
category	(Mandatory) Specifies the certificate category **Type**: String **Possible Values**: Server, Client
group_name	(Mandatory) Specifies the group to which the created certificate must be tagged. **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate. **Type**: String
ca_account	(Mandatory) Account name of the selected CA
serial number	(Mandatory) Serial number of the certificate **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
san_type	(Mandatory) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
dNSNames	(Mandatory) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
iPAddresses	(Mandatory) IP values **Type**: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
directory_names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Directory names for the certificate **Type**: String
uniformResourceIdentifiers	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Uniform Resource Identifier for the certificate **Type**: String
registered_ids	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Registered ID of the certificate **Type**: String
othernames	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Other names for the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
validity	(Mandatory) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit **Type**: Integer
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
cert_attributes	(Mandatory if **check_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
user_email	(Optional) Email address for sending status notificatiosn for certificate create and push **Type**: String
email_ID	(Optional) Email address of the organization requesting the certificate **Type**: String
snow_integration	(Optional) Provision to opt for ServiceNow integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Possible values**: Yes, No
ritm	(Mandatory if **snow_integration** = **Yes**) RITM ticket number of the ServiceNow ticket **Type**: String
snow_account	(Mandatory if **snow_integration** = **Yes**) ServiceNow account **Type**: String
download_format	(Mandatory if **snow_integration** = **Yes**) Download format for certificate tyoe **Type**: String
show_validity	(Optional) Hidden field inside the form. **Type**: String

Attribute details

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Attributes for push_devices

Name	Description
device_vendor	(Mandatory) Device vendor type based on selection of device type

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices (continued)

Name	Description
	Type: String **Possible values**: F5, LinuxServer, Citrix
device	(Mandatory) Device name for the selected device vendor **Type**: String
linux_actions	(Mandatory) Linux action for the selected device vendor **Type**: String **Possible values**: Default, Create KDB label (*.kdb), Certificate Overwrite (*.kdb)
selected_profiles	(Mandatory) Profile name for the device **Type**: String
apache_custom_new	(Mandatory for Apache devices) Provision to opt for pushing the certificate to a custom location **Type**: String **Possible values**: Yes, No
apache_certificate_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate path created by the user **Type**: String
apache_key_location	(Mandatory if **apache_custom_new** = **Yes**) Certificate Key path created by the user **Type**: String
password	(Mandatory if **linux_actions** = **Default**) Password for accessing the KDB file **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attributes for push_devices (continued)

Name	Description
push_cert_type	(Mandatory) Certificate type being pushed **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response **Type**: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
	Type: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

Understanding the sample URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Renew Certificate and Push With ServiceNow Integration

This API is used to renew a certificate based on the certificate group and certificate authority, push it to a device, and attach the renewed certificate to the ServiceNow ticket.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Payload

Payload

Name	Description
cert_category	(Mandatory) Specifies the certificate category **Type**: String **Possible Values**: Server, Client
certificate_group	(Mandatory) Specifies the group to which the created certificate must be tagged. **Type**: String
certificate_authority	(Mandatory) Name of the certificate authority that will issue the certificate. **Type**: String
serial number	(Mandatory) Serial number of the certificate **Type**: String
common_name	(Mandatory) Common name of the certificate **Type**: String
san	(Mandatory) Subject Alternative Name of the certificate **Type**: String **Possible values**: DNS, IP Address
dns_names	(Mandatory) DNS values **Type**: String **Example**: www.appviewx.com **Constraints**: Multiple values must be separated by a comma (,).
ip_addresses	(Mandatory) IP values

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String **Example**: 192.16x.xx.x **Constraints**: Multiple values must be separated by a comma (,).
directory_names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Directory names for the certificate **Type**: String
rfc822names	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Email address(es) of the user(s) to whom the certificate is issued **Type**: String
uris	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Uniform Resource Identifier for the certificate **Type**: String
registered_ids	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Registered ID of the certificate **Type**: String
othernames	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Other names for the certificate **Type**: String
validity_unit	(Mandatory) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
validity_value	(Mandatory if validityUnit has been specified) Number of units of the time specified as the validity unit **Type**: Integer
hash_function	(Mandatory) Hash function for the certificate **Type**: String **Possible Values**: SHA256
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
orderId	(Mandatory only for DigiCert CA) Order ID of the DigiCert certificate **Type**: String
ejbca_end_entity_user_name	(Mandatory only for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory only for EJBCA) Profile name of the EJBCA end entity **Type**: String
ejbca_issuer_common_name	(Mandatory only for EJBCA) Common name of the EJBCA issuer **Type**: String
ejbca_certificate_profile_name	(Mandatory only for EJBCA) Profile name associated with the EJBCA certificate **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
entrust_additional_emails	(Mandatory only for Entrust CA) Additional email addresses
microsoft_enterprise_template_name	(Mandatory only for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
user_email	(Optional) Email address for sending status notificatiosn for certificate create and push **Type**: String
snow_integration	(Optional) Provision to opt for ServiceNow integration **Type**: String **Possible values**: Yes, No
ritm	(Mandatory if **snow_integration** = **Yes**) RITM ticket number of the ServiceNow ticket **Type**: String
snow_account	(Mandatory if **snow_integration** = **Yes**) ServiceNow account **Type**: String
download_format	(Mandatory if **snow_integration** = **Yes**) Download format for certificate tyoe **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Regenerate Certificate - With New CSR

This API is used to regenerate a certificate with a new CSR.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

uris	(Mandatory for EJBCA, Microsoft Enterprise CA, and Microsoft Standalone CA) Uniform Resource Identifier for the certificate **Type**: String
registered_ids	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Registered ID of the certificate **Type**: String
othernames	(Mandatory for Microsoft Enterprise CA and Microsoft Standalone CA) Other names for the certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
organization	(Mandatory for AppViewX CA, EJBCA, and Microsoft Enterprise CA) Name of the organization requesting the certificate **Type**: String
organization_unit	(Mandatory) Organization unit requesting the certificate **Type**: String
locality	(Mandatory) Locality in which the organization is located **Type**: String
state	(Optional) State in which the organization is located **Type**: String
country	(Mandatory for AppViewx CA, EJBCA, Entrust CA, Digicert CA, and Microsoft Enterprise CA) Country in which the organization is located **Type**: String
mail_address	(Mandatory) Email address of the organization **Type**: String
challenge_password	(Optional) Password to access the certificate **Type**: String
validity_unit	(Optional) Unit of time for the certificate's validity period **Type**: String **Possible values**: years, months, days

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
validity_value	(Mandatory if **validityUnit** has been specified) Number of units of the time specified as the validity unit **Type**: Integer
key_type	(Mandatory only if the input method is Manual or Policy Based) Key type of the certificate **Type**: String **Possible Values**: RSA, DSA, EC
bit_length	(Mandatory only if the input method is Manual or Policy Based) Bit length of the certificate **Type**: String **Possible Values**: 4096, 2048
hash_function	(Optional) Hash function for the certificate **Type**: String **Possible Values**: SHA256
digicert_server_type	(Mandatory only for DigiCert CA) DigiCert server type value **Type**: String
ejbca_end_entity_user_name	(Mandatory only for EJBCA) User name of the EJBCA end entity **Type**: String
ejbca_end_entity_profile_name	(Mandatory only for EJBCA) Profile name of the EJBCA end entity **Type**: String
ejbca_issuer_common_name	(Mandatory only for EJBCA) Common name of the EJBCA issuer

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Type: String
ejbca_certificate_profile_name	(Mandatory only for EJBCA) Profile name associated with the EJBCA certificate **Type**: String
entrust_additional_emails	(Mandatory only for Entrust CA) Additional email addresses
microsoft_enterprise_template_name	(Mandatory only for Microsoft Enterprise CA) Template name for Microsoft Enterprise **Type**: String
user_email	(Optional) Email address for sending status notificatiosn for certificate create and push **Type**: String
check_attribute	(Optional) Certificate attribute values **Type**: String **Possible values**: true, false **Constraints**: The **certificates_attributes** field will be passed only if **check_attribute** = **true**.
cert_attributes	(Mandatory if **check_attributes** = **true**) Certificate attribute settings **Type**: Array of certificate attributes

Attribute details

Name	Description
attribute	(Optional) Certificate attribute name **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Attribute details (continued)

Name	Description
attribute_value	(Optional) Corresponding certificate attribute value **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Response
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response **Type**: String
tags	More information in case of a failure response **Type**: NA

Response

Name	Description
requestId	Unique identifier for the request **Type**: String
workflowVersion	Version of the workflow **Type**: String
message	The message with the status and request number for the request

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Response (continued)

Name	Description
	Type: String
status	Status of the request **Type**: String
stausCode	Status code for the request **Type**: String
requestType	Request type **Type**: String
workorderId	The ID of the work order for the request If there is no workorder, the value will be 0. **Type**: String

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Success **Remediation**: NA
400 Bad Request	avx-common-028	Invalid/ Incorrect payload **Remediation**: Check and ensure if a valid value is given in the request payload field - input.
401 Unauthorized	WORKFLOW_1679	User is not authorized. **Remediation**: Ensure that logged-in user is authorized to access the workflow.
404 Not Found	engine-db-015	Workflow not found. **Remediation**: Ensure the workflow data is valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HTTP Code	appStatusCode	Response Message
409 Conflict	WORKFLOW_1475	Given workflow is not in enabled state. **Remediation**: Enable the workflow.
500 Internal Server Error	WORKFLOW_1617	Invalid form data. Please provide all mandatory data **Remediation**: Ensure a valid value is given in the request payload field - input.
500 Internal Server Error	NA	Error while processing **Remediation**: NA

References

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.
  - **HostName**: A human-readable label assigned to a device (host) on a network

    The hostname will be included in the endpoint URL for an on-prem deployment.
  - **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

    The tenant name will be included in the endpoint URL for a SaaS deployment.
- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**
- **avxapi**: Path parameter value (static) that is part of the endpoint's URL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Get Request Summary/Log

After you are done submitting a workflow you can get the request summary/logs details of a particular workflow request. The execution details of the workflow can be viewed from these logs.

Before you begin

Before attempting to trigger these service requests, ensure that:

- The workflow is enabled.

> **Note:** For more information on how to enable a workflow, refer the section on Managing Certificates using Automation Workflows.

- The API user has the necessary RBAC permissions to trigger the workflow. You can check this in the **Platform** module under **IDENTITY** > **Role** > **Authorized functions**.

Request Structure

Endpoint:	/visualworkflow-request-logs
Type:	GET
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/visualworkflow-request-logs?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Input Parameters

Name	Description
sessionId *Header*	(Mandatory, if **username** and **password** are not provided) Session ID received after login. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
username *Header*	(Mandatory if **sessionId** is not provided) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory if **sessionId** is not provided) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
gwsource *Query*	(Mandatory) Source from which the request is triggered **Type**: String
ids *Query*	Request ID **Type**: String

Response Structure

Response Structure

Name	Description
response	Contains the response params for the search object request. **Type**: Key-value pair
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response Will be non-null for failure response **Type**: String
tags	More information in case of a failure response

Input Parameters

Name	Description
sessionId *Header*	(Mandatory) Session Id received after login. **Type**: String **Constraint**: Required if username and password are not provided.
username *Header*	(Mandatory) AppViewX login username. **Type**: String **Constraint**: Required if sessionId is not provided.
password *Header*	(Mandatory) AppViewX login password. **Type**: String **Constraint**: Required if sessionId is not provided.
Content-Type *Header*	(Mandatory) Specifies the nature of the data in the payload. **Type**: String **Constraint**: Value of the parameter should be **'application/json'**.
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the POST request. **Type**: Payload

Payload

Name	Description
data	(Mandatory) Contains the action data. **Type**: String
task_action	(Mandatory) Action to be performed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
data	**Type**: Number **Constraint**: Values are **1** for approve and **2** for reject.
header	(Mandatory) Contains the request details. **Type**: String
request_id	Id of the request. header **Type**: String
workorder_id	Id of the workorder. header **Type**: String **Constraint**: Value should be **0**.
task_id	Id of the task to be performed. header **Type**: String **Constraint**: Value should be **review_1**.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the approve request.
requestId	Request id for approve action for the application connector. response **Type**: String
message	Success message of the action or a failure description in case of an error. response **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Parameters (continued)

Name	Description
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Request submitted to workflow engine for processing workflow request 14.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
404 Not Found	engine-db-011	Request not found. **Remediation**: Ensure that a valid value is provided for the request_id field in the request.

Sample Request/Response

Request Payload

```
{
 "data": {
 "task_action": 1
 },
 "header": {
 "request_id": "14",
 "workorder_id": "0",
 "task_id": "review_1"
```

```
}
}
```

Response

```
{
"response": {
"message": "Request submitted to workflow engine for processing workflow request 14",
"requestId": "14"
},
"message": "Success",
"appStatusCode": null,
"tags": {},
"headers": null
}
```

Implement a Request

The implement request API implements the request for the certificate.

Request Structure

Endpoint:	/certificate/workorder/update
Type:	POST
Sample URL:	`https://<IP/HostName/TenantName>:<GWPORT>/avxapi/certificate/workorder/update?gwsource=external` To understand the elements of the sample URL, click here.
Headers	
Content-Type:	application/json

Understanding the sample URL

- **IP/HostName/TenantName**: Replace with the actual IP address, hostname, or tenant name based on the specific configuration in AppViewX.
  - **IP**: A unique identifier assigned to each device connected to a computer network that uses the Internet Protocol for communication

    The IP address will be included in the endpoint URL for an on-prem deployment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **HostName**: A human-readable label assigned to a device (host) on a network

  The hostname will be included in the endpoint URL for an on-prem deployment.

- **TenantName**: An identifier label for a tenant given to indicate which tenant's data the API request will access/modify

  The tenant name will be included in the endpoint URL for a SaaS deployment.

- **GWPORT**: AppViewX gateway port

  A gateway port refers to a network port through which data is sent and received to communicate with a gateway in an on-prem deployment.

  Example: **31443**

- **avxapi**: Path parameter value (static) that is part of the endpoint's URL
- **Endpoint**: Endpoint of the API, for example: **execute-hook**
- **gwsource**: Source or origin of a gateway, for example: **external**.

Input Parameters

Name	Description
sessionId	(Mandatory) Session Id received after login.
Header	**Type**: String
	Constraint: Required if username and password are not provided.
username	(Mandatory) AppViewX login username.
Header	**Type**: String
	Constraint: Required if sessionId is not provided.
password	(Mandatory) AppViewX login password.
Header	**Type**: String
	Constraint: Required if sessionId is not provided.
Content-Type	(Mandatory) Specifies the nature of the data in the payload.
Header	**Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Input Parameters (continued)

Name	Description
	Constraint: Value of the parameter should be **'application/json'**
gwkey *Query*	(Mandatory) Tenant Key. This is needed only in case of multi-tenant installations and can disregarded for other types of installations. **Type**: String
gwsource *Query*	(Mandatory) Source from which the request is triggered. (E.g. external) **Type**: String
Payload *Body*	Contains all the parameters to be sent in the request body for the POST request. **Type**: Payload

Payload

Name	Description
data	(Mandatory) Contains the action data. **Type**: String
task_action data	(Mandatory) Action to be performed. **Type**: Number **Constraint**: Values are **1** for approve and **2** for reject.
header	(Mandatory) Contains the request details. **Type**: String
request_id header	Id of the request. **Type**: String
workorder_id header	Id of the workorder. **Type**: String

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Payload (continued)

Name	Description
	Constraint: Value should be **0**.
task_id `header`	Id of the task to be performed. **Type**: String **Constraint**: Value should be **review_1**.

Response Structure

Response returns string of type application/json with the following body parameters:

Parameters

Name	Description
response	Contains the response attributes for the implement request.
requestId `response`	Request id for implement action for the application connector. **Type**: String
message `response`	Success message of the action or a failure description in case of an error. **Type**: String
message	Success message or failure description in case of error. **Type**: String
appStatusCode	Application specific status code for the response. It is a non-null value for a failure response. **Type**: String
tags	Additional information in case of failure response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Status Codes

HTTP Code	appStatusCode	Response Message
200 OK	NA	Request submitted to workflow engine for processing workflow request 14.
401 Unauthorized	AVX_GW_003	Authentication failed, reason - Invalid Credentials. **Remediation**: Ensure that valid username and password or valid sessionId is provided as header parameters.
404 Not Found	engine-db-011	Request not found. **Remediation**: Ensure that a valid value is provided for the request_id field in the request.

Sample Request/Response

Request Payload

```
{
 "data": {
 "task_action": 1
 },
 "header": {
 "request_id": "14",
 "workorder_id": "0",
 "task_id": "review_2"
 }
 }
```

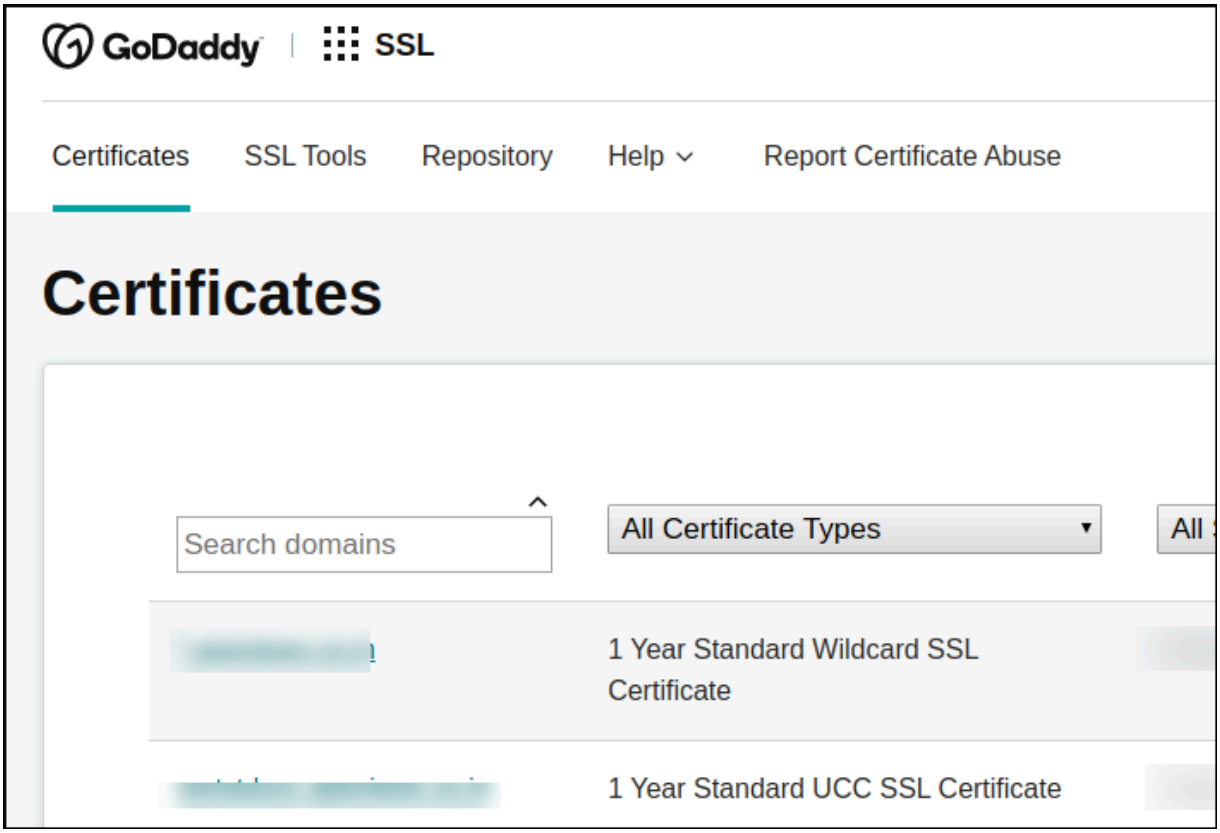
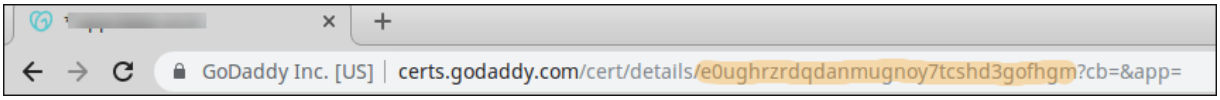
Retrieving the certificate ID (order ID) from the Go Daddy Portal

1. Login to your GoDaddy account.
2. Navigate to **My Account** > **SSL Certificates**.
   Here you can see the list of certificates created via this GoDaddy account.



3. Click on the certificate for which you require the order ID.
   In the URL framed you can see the order ID.



4. Use this order ID in our AppViewX CA connector as shown below:
   a. Click on edit in CA connector options.
   b. Find for Order Id in vendor specific fields.
   c. Input the order id obtained from CA portal and update the connector.
   d. Resubmit the failed request.

Troubleshooting the Windows Agent Setup

Overview

This section helps you troubleshoot the common problems that you might encounter when using Windows Agent Setup. Effective troubleshooting documents depend on the availability of useful, detailed information. This guide will give more troubleshooting processes on Windows Agent Setup. It helps you understand the importance of installing a validator and the method to do so.

Installing a Validator

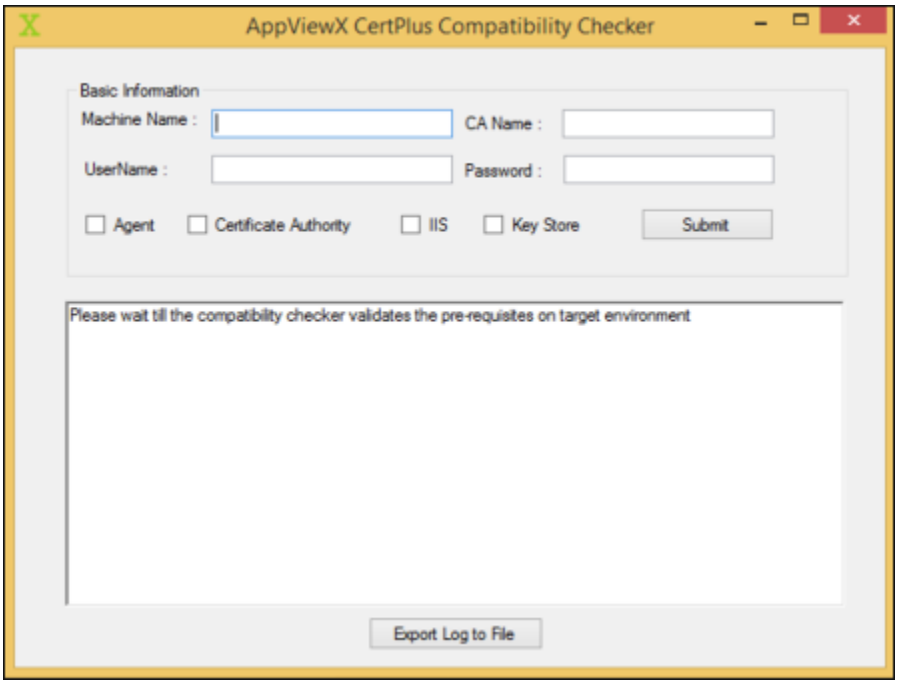
Validator analyzes an Agent and validates all the prerequisites before installing an agent. It is also used to troubleshoot any issue that occurs in the managed machines that run on a network. Before installing AppViewX gateway and the certificates, make sure you have downloaded the validator to either the Downloads folder or to the Desktop in your local environment.

1. Click the AppViewX.CertPlus.Validator.exe file to open the application for validation.
2. In the AppViewX CertPlus Validator screen that opens enter all the mandatory fields in the Basic Information section to proceed.
3. Select the Agent, Certificate Authority, IIS, and Non-IIS checkbox depending on what you want to validate and manage in the target machine.

• Based on the checkboxes you selected, the fields that are mandatory will be highlighted in Red color.
• The CA Name is required only if the Certificate Authority check box is selected.

Click Submit and the results are displayed as shown in the following image:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- AppViewX CertPlus Compatibility Checker is used for troubleshooting or validating the prerequisites as part of Windows Agent Installation. It comprises the following fields:

Name	Description	Condition
Machine Name	The name of the target machine must be validated. It is a hostname.	Mandatory field
CA Name	The name of the CA in the CA config.	Mandatory only when a CA is selected
User Name	User Name to be used for validating the target machine. It is in the format "username@domainname".	Mandatory field
Password	The password corresponding to the provided user name.	Mandatory field

Options

- User can select single or multiple options based on the installation/ troubleshooting criteria:
- Agent: Select this option if we need to install an agent in the target machine which is configured in the "Machine Name". It will validate the prerequisites which are required for Agent Installation
- Certificate Authority: Select this option if we need to validate the Certificate Authority related functionality. The CA Name is mandatory only in this case. Use the certutil -dump command to get the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Name. In the output of certutil command use-value in the "Server" as the Machine Name and use "Name" as the CA Name.

- Based on the example below the machine Name is win3.avxdevlab.net and CA Name is avxdevlab-WIN3-CA-no-space.
- IIS: Select this option if we need to validate the IIS sites related functionality.

Validations

Validate	Agent	CA	IIS	Keystore
User	Yes	Yes	Yes	Yes
.Net framework	Yes	Yes	Yes	Yes
Powershell	Yes	Yes	Yes	Yes
CertUtil	Yes	Yes	No	No
Certadm.dll	Yes	Yes	No	No
netsh	Yes	No	No	No
RPC	Yes	Yes	Yes	Yes
WinRM	Yes	Yes	Yes	Yes
WMI	Yes	Yes	Yes	Yes
IIS	No	No	Yes	No

- **KeyStore**: Select this option if you need to add to validate only the Microsoft Certificate Store related functionality

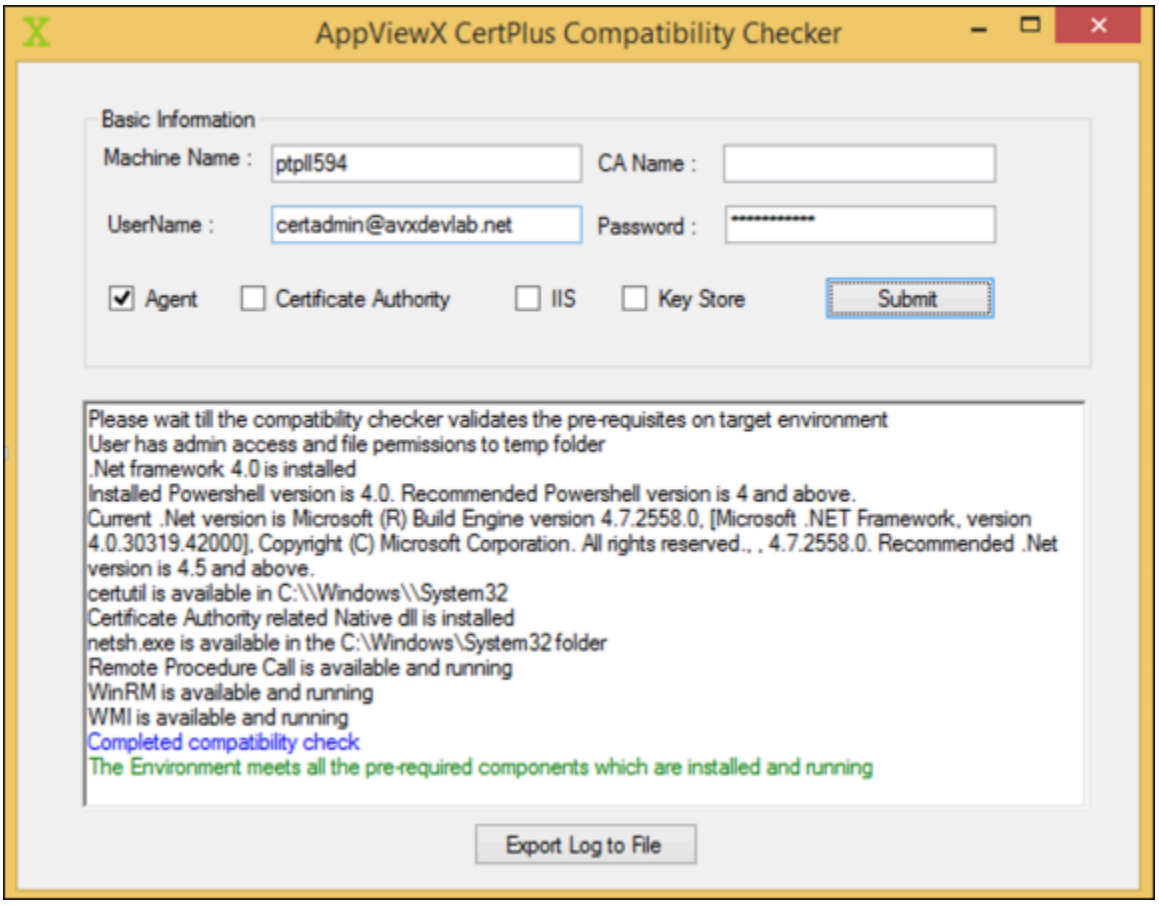
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. User Access: It will validate by connecting to the target machine with the specified username and password and check if it has admin access.
2. .Net Framework: It will check if .Net framework 4.5+ is installed and will display the current .Net framework version.
3. Powershell version: It will check if Powershell is installed and will display the current Powershell version
4. CertUtil: It will check if certutil component is available. This is used to get the CA name and the corresponding templates.
5. CertAdm.dll: This is the native component used to access the CA and will check if this component is available in the C:WindowsSystem32 folder. Sometimes, while trying to access this component during the verification it will return an error and hence, a manual check must be performed.
6. netsh.exe: This is used to bind the certificate to the installed agent port (8999).
7. RPC service: The remote procedure call service must be running to perform all the remote operations and it will validate if the service is installed and running on the target machine.
8. WinRM service: Windows Remote Management service is required for the Powershell execution and it will validate if the service is installed and running on the target machine.
9. WMI service: Windows Management Instrumentation service is required for WMI and Powershell execution and it will validate if the service is installed and running on the target machine.
10. IIS: It will check if the IIS server is installed and identify the current IIS version.

Color Codes during the Execution

- **Black**: Success information and output
- **Red**: An error or warning, must take corrective action based on the prerequisite document in case of any issues
- **Blue**: Completion of the validation process
- **Green**: Complete process is successful

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Export Log to File: This is used for exporting the validation summary into a log file.

Steps to test gateway installation:

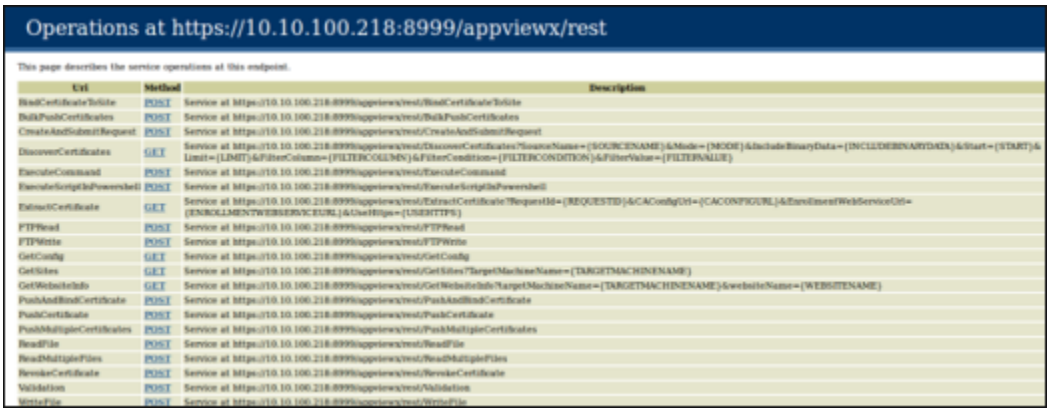
To test the installation, go to the following URL:

https://localhost:8999/appviewx/

`https://<IP/Hostname>:<Port>/appviewx/rest/help` (Needs the certificate to be on the store/ browser)

For example, https://xx.xx.xx.xx:8999/appviewx/rest/help

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



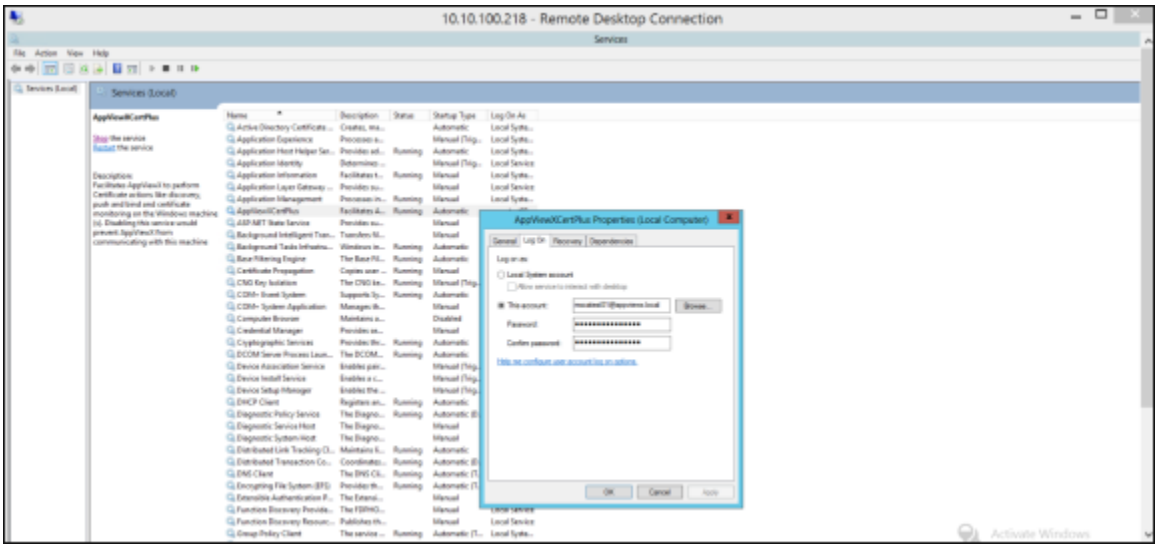
- The above page confirms the accessibility and installation of the service.
- In case, a different client authentication certificate is being used, ensure that the CRL mentioned in the certificate is reachable from the AppViewX Windows gateway hosting server.
- Go to **AppViewX>> Settings>> Certificate** to register the gateway with AppViewX.
- Register the gateway with the URL format as follows: `https://<IP/Hostname>:<Port>/appviewx`

For example, https://xx.xx.xx.xx:8999/appviewx

Modify Agent services with the service Account The Windows gateway agent can be installed using a service account or an admin account.

- If the customer has a policy that states that the service account cannot be part of the administrator group or that the service account is only a part of the user group, then:
  - The gateway agent service is installed using an admin account.
  - The installed agent service is updated with the service account details in services.msc. Add the account in the properties of the AppViewXCert Plus service.
  - Services.msc -> AppViewXCert Plus -> Right click (Properties) -> LogOn .> Update the user account in the format of username@domainname.
  - Refer to the following image.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- In this case, the following command has to be executed from the PowerShell:

Netsh http add urlacl url=https://+:8999/appviewx/user=appviewx.localmscatest01

- In the above command, the value for user = <domainserviceaccount> and the URL must be changed respectively.
- Once this is done, stop and start the AppViewXCertPlus Service in services.msc.

Windows Gateway Errors and Solutions

Error	Solution
767cf2b6-bfc3-45a0-9490-a95cf841e693: Connecting to remote server <machine name> failed with the following error message : WinRM cannot process the request. The following error occurred while using Kerberos authentication: The computer <name> is unknown to Kerberos. Verify that the computer exists on the network, that the name provided is spelled correctly, and that	• This issue occurs with Powershell remoting as it uses Kerberos authentication. • In the agent machine, start the command prompt as an administrator and execute the command `setspn -s http/machinename domainusername`. • This will work in the environments where Kerberos authentication and an AD domain are set up. • If no kerberos authentication is set up, then the communication must be done through WMI.

Troubleshooting Certificate Group

Issues in Creating/Updating a Group

Error Message	Possible Cause	Possible Solution
Given parent group is not present in AppViewX.	The parent group provided by the user does not exist in AppViewX.	Check if the group exists in the given parent group name.
Group already exists with the given name	Another group with the same name already exists.	Group name should be unique.
Missing user information.	User information is not available in the request.	Provide valid user information in the request.
Permission restricted to this group to edit/delete.	Given group has only read permission.	Change the group permission as RW to update the group.
Parent name and group name should not be same. Kindly change the parent name.	Parent group name and group name are the same in the given request.	Change the group name in the request.
You don't have access to this group.	Users do not have permission for a given group.	Change the group permission as RW to update the group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Failed to update certificate group.	AppViewX is not able to update the group details.	DB may not be accessible during that time.
Given child group is not present in AppViewX.	The Child group provided by the user is not available in AppViewX.	Check if the group is available in the given child group name.
Certificate policy updation failed while updating certificate group.	AppViewX is not able to update the group details in policy.	DB may not be accessible during that time.

Issues in Deleting a Group

Error Message	Possible Cause	Possible Solution
Default group cannot be deleted.	The user is trying to delete the default group provided by AppViewX.	AppViewX allows users to delete only user-defined groups.
Permission restricted to this group to edit/ delete.	Given group has only read permission.	Change the group permission as RW to update the group.
Given parent group is not present in AppViewX.	The parent group provided by the user is not available in AppViewX.	Check if the group is available in the given parent group name.
You don't have access to this group.	Users do not have permission for a given group.	Change the group permission as RW to update the group.
Given child group is not present in AppViewX.	The child group provided by the user is not available in AppViewX.	Check if the group is available in the given child group name.
Failed to delete certificate groups since it is not available. Those groups are <GroupNames>	Given groups are not available in AppViewX.	Check and provide a valid group name to delete.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Assigning/Unassigning Certificates to a Group

Error Message	Possible Cause	Possible Solution
You don't have access to this group.	Users do not have permission for a given group.	Change the group permission as RW to update the group.
The operation cannot be completed as <count> selected certificate(s) are in Read-Only access groups	Some of the selected certificates are in groups that have “read-only” permission for the user.	Remove the certificates that have “read-only” permission or Change the group permissions to “RW”.
Group name cannot be empty.	Group is given as empty in the request.	Groupname should not be empty. Give a valid group name.
Certificate uuid either empty/ invalid.	Certificate UUID is not given in the request.	Provide a valid certificate UUIDs to perform the action.

Troubleshooting Certificate Policy

This section of the guide will help you troubleshoot the common problems that you might encounter while dealing with Certificate Policy actions like creating or updating or deleting.

Issues in Creating/Updating a Policy

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
[group] Groups are already assigned to another policy or doesn't exist	The group may be associated with some other policy. Group may not be available in AppViewX.	Check if the group is associated with some other policy. Check if the group is available in AppViewX.
At least one ECDSA curve should be selected for each EC bitlength	ECDSA curve details are not provided in the request.	It is mandatory to give at least one ECDSA curve for each EC bit length.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Failed to fetch the policy.	AppViewX is not able to fetch policy details from DB.	DB may not be accessible during that time. Please retry the operation.
Policy already exists with the given name.	Policy name already exists in the inventory.	Policy names should be unique.
Failed to update certificate policy information.	AppViewX is not able to update policy details from DB.	DB may not be accessible during that time. Please retry the operation.
Given child group is not present in AppViewX.	The Child group provided by the user is not available in AppViewX.	Check if the group is available in the given child group name.
Certificate policy updation failed while updating certificate group.	AppViewX is not able to update the group details in policy.	DB may not be accessible during that time.

Issues in Deleting a Policy

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Default policy cannot be deleted.	The user is trying to delete the default policy provided by AppViewX.	AppViewX allows users to delete only user-defined policies.
Mandatory field is missing or invalid - policyNames	The field policyNames is not provided with any values in the request.	Check if the policyNames field is available and has values in the request.
Failed to delete certificate policy information.	AppViewX is not able to delete the policy.	DB may not be accessible during that time. Please retry the operation.

Troubleshooting Certificate Reports Configuration

This section of the guide helps you troubleshoot the common problems that you might encounter while configuring various certificate reports like validation status reports, summary reports, count by issuer reports.

Issues in Configuring the Validation Status Report

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
FQDN cannot be null or empty.	The FQDN value provided is either null or empty.	Provide a valid FQDN value.
Certificate network discovery plugin may not be enabled. Contact AppViewX support team.	The plugin avx_vendor_cert_network_discovery is not enabled.	Enable avx_vendor_cert_network_discovery plugin.
Certificate network discovery plugin may be in not running state.	The plugin avx_vendor_cert_network_discovery may be in the “Not Running” state.	Start avx_vendor_cert_network_discovery plugin and try again.
IP <ipPort> is invalid	Given IP port is not valid.	Check and provide a valid IP port.
Invalid FQDN.	AppViewX is not able to access the given FQDN.	Check if the FQDN is valid and whether AppViewX has access to the FQDN.
Missing user information.	User information is not available in the request.	Provide a valid session-id or username and password in the request.

Issues in Configuring the Certificate Summary Report

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Cert report settings name already exists, Please verify.	The report settings name provided is already taken.	Report settings name should be unique.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Unable to schedule report generation, skipping to add/update the settings.	AppViewX is not able to add/ update the scheduler job in crontab.	1. Provide valid cron settings. 2. DB may not be reachable, try after some time.

Issues in Configuring the Count by Issuer Report

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Cert report settings name already exists, Please verify.	The report settings name provided is already taken.	Report settings name should be unique.
Unable to schedule report generation, skipping to add/update the settings.	AppViewX is not able to add/ update the scheduler job in crontab.	1. Provide a valid cron setting. 2. DB may not be reachable, try after some time.

Troubleshooting Configuration of Workflow

This section of the guide helps you troubleshoot the problems encountered while configuring workflow.

Issues in Configuring a Workflow

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Csr submission failed. User is not authorized.	No permission for the workflow related to that action.	Check if the user has permission for the action workflow in Accounts>Resources.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Certificate <action>failed. User is not authorized.	No permission for the workflow related to that action.	Check if the user has permission for the action workflow in Accounts>Resources.

Troubleshooting Truststore Bundle Deployment

Linux Server Bulk Push

Work Order Failure

Error Message	Possible Cause	Possible Solution
Error occurred while changing the file ownership : chown: invalid user: <username:username>	Invalid username for the chown action	Provide a valid username.
Error occurred while changing the file ownership : chown: invalid group: <usergroup:usergroup>	Invalid user group for the chown action	Provide a valid user group.
Unable to upload certificate content to the target server	Permission to access the path to push is not granted.	Provide the required permission for the path to push.
Bulk Push failed - com.appviewx.connector.ssh.SSHExcep tion: net.schmizz.sshj.userauth.UserAuthException: Exhausted available authentication methods	Device is not in the managed state	Onboard device in the server inventory with the **Managed** status.
Password given doesn't match with existing JKS certificate file	Invalid jks certificate file password	Provide a valid keystore password.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Work Order Success

Error Message	Possible Cause	Possible Solution
Skipping push operation since no valid certificates are found in the request.	Expired/ Revoked certificates selected for the bulk push operation	Provide valid certificates for the bulk push operation.

ADC F5 Bulk Push

Failure cases in Bulk Push F5

Error Message	Possible Cause	Possible Solution
Please provide information as required.	Possible causes can include: • Process name field is empty. • Process name field contains restricted special characters. • Chain file or bundle name is empty. • Selected devices are empty.	• Ensure no empty values are provided. • Process name can only include alphanumeric characters, spaces, and the following special characters: #,.,-,_ • Chain or bundle name can only include alphanumeric characters, spaces, and the following special characters: .,-,_
java.lang.Exception: {"code":400,"message":"01070712:3: Access check failed for (/Common/default.crt).","errorStack":[],"apiError":3}	Chain file or bundle name is entered as “default/ca-bundle/ca-bundle 1/ca-bundle 2”.	Edit the bulk push entry and modify the chain file or bundle name to enter a value that is not in the default bundle in the F5 device.

Troubleshooting Auto-Enrolment Protocols

This section of the guide helps you to troubleshoot the various issues encountered by you while using different protocol functionalities. The different protocols covered are ACME, EST, MsIntune SCEP, and SCEP. If the problem still remains unresolved please send a request to Technical Support by opening a

Troubleshooting for ACME

Overview

This section helps you troubleshoot the common problems that you might encounter when using ACME functionalities like setting addition, checking communication, enrollment, and revocation.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Supported ACME Client

• Certbot

• Cert manager

Issues in ACME setting addition and check the settings

Issues in ACME Setting Addition

1. Log in to **AppViewX** application with valid credentials.
2. From the left pane, expand the **menu** and click **CERT+**.
   The **Server Certificate** page is displayed.
3. From the left pane, expand **Administration**, select **Auto Enrollment**.
4. Click **ACME**.
   The **Auto Enrollment ACME** page is displayed.
5. Click **Add**.
6. After settings are added, click **Check** to see the validity.

Error Messages

Error Message	Possible Cause	Possible Solution
Agent name already added. Please enter a different name..	An ACME setting with the same name already exists in ACME Page.	Check the ACME Setting name, it should be unique.
1. This field should not be null or empty 2. Mandatory Field(s) - <Field name> is/are empty	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.
ACME setting is invalid - Agent ip is not reachable	The ACME agent IP and port provided might not be accessible from the AppViewX node.	Please check the IP port provided so that it can be pingable from the AppViewX node.
ACME setting is invalid - Policy is not associated to the provided group	The policy selected might be associated with some other group that is not selected.	Please check whether the selected policy and group are associated with one another.

Issues in Auto Enrolling Certificate via ACME

Note: From the client machine hit the auto-enroll call using AppViewX ACME server URL which is displayed on the ACME setting page.

Error Message	Possible Cause	Possible Solution
No agent settings found for the provided agent ip address (OR)	The provided agent IP or agent name is not found in the ACME settings.	Check for the agent IP and agent name in the client machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Agent settings is not found		
Unable to perform ACME account creation/updation operation	ACME is already present or the account is not proper in the client machine.	1. Check whether the account is proper in the client machine. 2. Delete the acme accounts in the client machine and retry.
Unable to perform ACME challenge creation operation	Challenge verification failed before enrolling the certificate.	1. Check for the option selected in the ACME setting if it's HTTP or DNS. 2. Check for the reachability of URL for HTTP challenge verification.
HTTP authentication failed due to invalid parameters provided.	The HTTP authentication parameters provided must be invalid	1. Check for passwords in BASIC authentication. 2. Check for the nonce and other parameters in DIGACME parameters.
Unable to perform ACME order finalize operation	This phase is used to obtain the CSR and submit it.	1. Check for the input CSR in the request. 2. Check whether the CSR submission is successful in AppViewX.
Unable to obtain the enrolled certificate	The certificate might not be present for the provided transaction id.	Check if the certificate is enrolled or not in AppViewX inventory.
Unable to establish connection with ACME server.	There might be an issue with reaching the AppViewX ACME agent IP from the client.	Check whether the ACME agent IP is reachable from the client machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
		Check whether the ACME agent IP is open and can be accessible.
Group policy does not have the given hash function	The requACMEed hash function in the CSR parameters may not be available in the selected policy.	1. Navigate to the policy page. 2. Select the CA used in the ACME setting. 3. In the hash function field include the **requACMEed** and missing hash functions. 4. Save the CA details and update the policy.
Unable to submit the CSR request to certificate authority	Failure due to specific CA functionality.	Check in the logs and failed Work order for the reason of submission failure.
Unable to submit the CSR request to certificate authority - For MSCA	There might be an error in work order log - “**Denied due to policy module**”	Check for the bit length in the CSR parameters, if it's lesser than or equal to 1024 then increase that in the CSR.
CSR parameters already exists	There might be another CSR already present in the inventory for which certificates would not have been issued.	1. Delete the previous CSR present in inventory and try enrolling. 2. Connect database and update the entry as below: `"db.cert_metadata.update({"_id" : "DO_CSR_PARAMS_UNIQUENESS_CHECK"}, {$set:{"constant":"no"}})"` **Note:** This would allow multiple CSR’s with the same parameters in the certificate inventory.

Issues in EST setting addition and check the settings

Issues in EST setting Addition

1. Log in to **AppViewX** application with valid credentials.
2. From the left pane, expand the **menu** and click **CERT+**.
   The **Server Certificate** page is displayed.
3. From the left pane, expand **Administration**, select **Auto Enrollment**.
4. Click **EST**.
   The **Auto Enrollment EST** page is displayed.
5. Click **Add**.
6. After settings are added, click **Check** to see the validity.

Error Messages

Error Message	Possible Cause	Possible Solution
Agent name already added. Please enter a different name..	An EST setting with the same name already exists on EST Page.	Check the EST Setting name, it should be unique.
1. This field should not be null or empty. 2. Mandatory Field(s) - <Field name> is/are empty.	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.
EST setting is invalid - Agent ip is not reachable	The EST agent IP and port provided might not be accessible from the AppViewX node.	Please check the IP port provided so that it can be pingable from the AppViewX node.
EST setting is invalid - Certificate does not belong to the selected CA.	The issuer certificate provided does not belong to the CA which is selected.	Please check whether the selected issuer certificate belongs to the CA which was selected earlier.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in auto-enrolling certificate via EST

Note: From the client machine hit the auto-enroll call using AppViewX EST server URL which is displayed on the EST setting page.

Error Message	Possible Cause	Possible Solution
No agent settings found for the provided agent ip address (OR) Agent settings is not found	The provided agent IP or agent name is not found in the EST settings.	Check for the agent IP and agent name in the client machine.
Client certificate authentication failed since no client certificate content is obtained	The client certificate is not set in the enroll request from the client machine	1. Check whether the client certificate and key are set in the enroll certificate request. 2. If the provided certificate is pfx or pkcs12 certificate check whether the provided password is correct.
Provided client certificate is not valid.	The provided client certificate might be Expired or Revoked.	Provide a Valid certificate in the enrollment request.
HTTP authentication failed due to invalid parameters provided.	The HTTP authentication parameters provided must be invalid.	1. Check for password in BASIC authentication. 2. Check for nonce and other parameters in DIGEST parameters.
CA certificate is not found	The issuer certificate of the selected "server certificate" might have been deleted or the server certificate has been deleted.	Check for the issuer certificate and its issuer certificate available in the inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Unable to establish connection with EST server.	There might be an issue with reaching the AppViewX EST agent IP from the client.	Check whether the EST agent IP is reachable from the client machine. Check whether the EST agent IP is open and can be accessible.
Group policy does not have the given hash function	The requested hash function in the CSR parameters may not be available in the selected policy.	1. Navigate to the policy page. 2. Select the CA used in the EST setting. 3. In the hash function field include the requested and missing hash functions. 4. Save the CA details and update the policy.
Unable to submit the CSR request to certificate authority	Failure due to specific CA functionality.	Check in the logs and failed Work order for the reason of submission failure.
Unable to submit the CSR request to certificate authority - For MSCA	There might be an error in the work order log - “Denied due to policy module”.	Check for the bit length in the CSR parameters, if it is lesser than or equal to 1024 then increase that in the CSR.
CSR parameters already exists	There might be another CSR already present in the inventory for which certificates would not have been issued.	1. Delete the previous CSR present in inventory and try enrolling again. 2. Connect database and update the entry as given below: "db.cert_metadata.update({"_id" : "DO_CSR_PARAMS_UNIQUENESS_CHECK"}, {$set:{"constant":"no"}})" **Note:** This would allow multiple CSR’s with the same parameters in the certificate inventory.

Issues in obtaining CA certificate via EST

Note: From the client machine hit the get ca certificate call using AppViewX EST server URL which is displayed on the EST setting page.

Error Message	Possible Cause	Possible Solution
No agent settings found for the provided agent ip address (OR) Agent settings is not found	The provided agent IP or agent name is not found in the EST settings.	Check for the agent IP and agent name in the client machine.
Client certificate authentication failed since no client certificate content is obtained	The client certificate is not set in the get ca request from the client machine.	1. Check whether the client certificate and key are set in the “get ca certificate request”. 2. If the provided certificate is pfx or pkcs12 certificate check whether the provided password is correct.
Provided client certificate is not valid.	The provided client certificate might be Expired or Revoked.	Provide a valid certificate in the **get ca cert request**.
HTTP authentication failed due to invalid parameters provided.	The HTTP authentication parameters provided must be invalid.	1. Check for password in BASIC authentication. 2. Check for nonce and other parameters in DIGEST parameters.
CA certificate is not found	The issuer certificate of the selected "server certificate" might have been deleted or the server certificate has been deleted.	Check for the issuer certificate and its issuer certificate available in the inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Unable to establish connection with EST server.	There might be an issue with reaching the AppViewX EST agent IP from the client.	Check whether the EST agent IP is reachable from the client machine. Check whether the EST agent IP is open and can be accessible.

Issues in auto re-enrolling certificate via EST

Note: Note: From the client machine hit the auto re-enroll call using AppViewX EST server URL which is displayed on the EST setting page.

Error Message	Possible Cause	Possible Solution
No agent settings found for the provided agent ip address (OR) Agent settings is not found	The provided agent IP or agent name is not found in the EST settings.	Check for the agent IP and agent name in the client machine.
Client certificate authentication failed since no client certificate content is obtained	The client certificate is not set in the re-enroll request from the client machine	1. Check whether the client certificate and key is set in the re-enroll certificate request. 2. If the provided certificate is pfx or pkcs12 certificate check whether the provided password is correct.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Provided client certificate is not valid.	The provided client certificate might be Expired or Revoked.	Provide a Valid certificate in the re-enroll request.
HTTP authentication failed due to invalid parameters provided.	The HTTP authentication parameters provided must be invalid.	1. Check for password in BASIC authentication. 2. Check for nonce and other parameters in DIGEST parameters.
CA certificate is not found	The issuer certificate of the selected "server certificate" might have been deleted or the server certificate has been deleted.	Check for the issuer certificate and its issuer certificate available in the inventory.
Unable to establish connection with EST server.	There might be an issue with reaching the AppViewX EST agent IP from the client.	Check whether the EST agent IP is reachable from the client machine. Check whether the EST agent IP is open and can be accessible.
Group policy does not have the given hash function	The requested hash function in the CSR parameters may not be available in the selected policy.	1. Navigate to the policy page. 2. Select the CA used in the EST setting. 3. In the hash function field include the requested and missing hash functions. 4. Save the CA details and update the policy.
Unable to submit the CSR request to certificate authority	Failure due to specific CA functionality.	Check in logs and in failed Work order for the reason why submission got failed.
Unable to submit the CSR request to	There might be an error in the work order log - “**Denied due to policy module**”.	Check for the bit length in the CSR parameters, if its lesser than or equal to 1024 then increase that in the CSR.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
certificate authority - For MSCA		
CSR parameters already exists	There might be another CSR already present in the inventory for which certificates would not have been issued.	1. Delete the previous CSR present in inventory and try enrolling. 2. Connect database and update the entry as mentioned below: "db.cert_metadata.update({"_id" : "DO_CSR_PARAMS_UNIQUENESS_CHECK"}, {$set:{"constant":"no"}})" **Note:** This would allow multiple CSR's with the same parameters in the certificate inventory.
Enrolled Certificate is not found	While renewing the enrolled certificate, the enrolled certificate might not be present in certificate inventory.	1. Check if the enrolled cert is present in certificate inventory. 2. Check if the enrolled certificate provided in "renew request" is a valid one and is enrolled already in AppViewX. 3. If the enrolled certificate is not present in inventory, check if the authentication cert is in cert inventory.

Troubleshooting for MsIntune SCEP

Overview

This section helps you troubleshoot the common problems that you might encounter when using MSIntune SCEP functionalities like setting addition and certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in MSIntune SCEP setting addition and validating the settings

Issues in the MSIntune SCEP Settings

1. Log in to **AppViewX** application with valid credentials.
2. From the left pane, expand the **menu** and click **CERT+**.
   The **Server Certificate** page is displayed.
3. From the left pane, expand **Administration**, select **Auto Enrollment**.
4. Click **MsIntune**.
   The **Auto Enrollment MsIntune** page is displayed.
5. Click **Add**.
6. After settings are added, click **Check** to see the validity.

Error Messages

Error Message	Possible Cause	Possible Solution
Agent ip is not reachable	The MS Intune SCEP agent IP and specified port may not be reachable from the AppViewX node.	Validate and ensure that the agent IP/Port is reachable.
Certificate does not belong to the selected CA.	The server certificate provided in the agent setting does not belong to the CA which is selected.	Please check whether the selected server certificate belongs to the CA which was selected earlier.
CA setting connection is in Failed status	The connection status of the chosen CA setting chosen in the agent setting failed.	Check the specified CA setting and make necessary changes to make it valid.

Issues in auto enrolling certificate via MS Intune SCEP

Note:

1. From the client machine, enroll for the certificate using Company Portal application.
2. Newly enrolled certificate should be available in the AppViewX CERT+ Inventory. If the new certificate is not available in the AppViewX CERT+ Inventory, even after 5 minutes from triggering the request from the device, then logon to the CLI and verify the logs for avx_vendor_cert_intune_agent plugin.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Following errors may appear in the logs:

Error Message	Possible Cause	Possible Solution
Unable to submit the CSR request to certificate authority	Request might have failed due to a specific error from CA	Verify the vendor logs to see if there is any CA specific error.
CSR parameters already exists	There might be another CSR already present in the inventory for which certificates would not have been issued.	1. Delete the previous CSR present in inventory and try enrolling. 2. Connect database and update the entry given below: "db.cert_metadata.update({"_id" : "DO_CSR_PARAMS_UNIQUENESS_CHECK"},{$set: {"constant":"no"}})" **Note:** This would allow multiple CSR's with the same parameters in the certificate inventory.
Challenge in PKCS#10 request (Transaction ID: <<transactionID>>) is not valid. Certificate enrollment will not be processed.	Challenge password validation with Microsoft Intune has failed. Possible reasons - 1. Connectivity issue with Microsoft Intune. 2. Intune credentials configured in agent settings might be incorrect.	1. Validate the internet access in the AppViewX server. 2. Check and correct the Intune Client Id/Tenant Id/Client Secret configured in the MS Intune agent setting.
No error message but enrollment request does not get triggered after	A mismatch between the CA certificate configured in the MS Intune Agent setting and	Verify and ensure that the root and intermediate CA certificates of the Server certificate available in the AppViewX MS Intune agent setting match with

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
the getCACert call from the client device.	that configured in the Intune portal.	the Root and Intermediate certificates configured in the MS Intune portal (Azure) SCEP profile.

Troubleshooting for SCEP

Overview

This section helps you troubleshoot the common problems that you might encounter when using SCEP functionalities like setting addition, enrolment, and obtaining.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Supported SCEP Client

• SSCEP client

• Cisco Routers

• Mobileiron Cloud portal

Issues in SCEP setting addition and check the settings

Issues in the SCEP Settings

1. Log in to **AppViewX** application with valid credentials.
2. From the left pane, expand the **menu** and click **CERT+**.
   The **Server Certificate** page is displayed.
3. From the left pane, expand **Administration**, select **Auto Enrollment**.
4. Click **SCEP**.
   The **Auto Enrollment SCEP** page is displayed.
5. Click **Add**.
6. After settings are added, click **Check** to see the validity.

Error Messages

Error Message	Possible Cause	Possible Solution
Agent name already added. Please enter a different name..	A SCEP setting with the same name already exists on SCEP Page.	Check the SCEP Setting name, it should be unique.
1. This field should not be null or empty. 2. Mandatory Field(s) - <Field name> is/are empty.	Some of the mandatory fields are missing or invalid.	Add all the valid information in the mandatory section.
SCEP setting is invalid - Agent ip is not reachable	The SCEP agent IP and port provided might not be accessible from the AppViewX node.	Please check the IP port provided so that it can be pingable from the AppViewX node.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
SCEP setting is invalid - Certificate does not belong to the selected CA.	The server certificate provided does not belong to the CA which is selected.	Please check whether the selected server certificate belongs to the CA which was selected earlier.

Issues in Auto Enrolling certificate via SCEP

Note: From the client machine hit the auto-enroll call using AppvViewX SCEP server URL which is displayed on the SCEP setting page.

Error Message	Possible Cause	Possible Solution
No agent settings found for the provided agent ip address (OR) Agent settings is not found	The provided agent IP or agent name is not found in the SCEP settings.	Check for the agent IP and agent name in the client machine.
Unable to establish connection with SCEP server.	There might be an issue with reaching the AppViewX SCEP agent IP from the client.	Check whether the SCEP agent IP is reachable from the client machine. Check whether the SCEP agent IP is open and can be accessible.
Group policy does not have the given hash function	The requested hash function in the CSR parameters may not be available in the selected policy.	1. Navigate to the policy page. 2. Select the CA used in the SCEP setting. 3. In the hash function field include the requested and missing hash functions. 4. Save the CA details and update the policy.
Unable to submit the CSR request to certificate authority	Failure due to specific CA functionality.	Check the reason for submission failure in logs and failed Work order.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Unable to submit the CSR request to certificate authority - For MSCA	There might be an error in the work order log - “**Denied due to policy module**”.	Check for the bit length in the CSR parameters, if it's lesser than or equal to 1024 then increase it in the CSR.
CSR parameters already exists	There might be another CSR already present in the inventory for which certificates would not have been issued.	1. Delete the previous CSR present in inventory and try enrolling again. 2. Connect database and update the entry as mentioned below: "db.cert_metadata.update({"_id" : "DO_CSR_PARAMS_UNIQUENESS_CHECK"}, {$set:{"constant":"no"}})" **Note:** This would allow multiple CSR’s with the same parameters in the certificate inventory.

Issues in Obtaining CA certificate via SCEP

Troubleshooting AWS, CLOUD

This section of the guide will help you tackle the various issues that arise while using the functionalities of CLOUD services. If the problem still remains unresolved please send a request to Technical Support by opening a case with the AppViewX Technical Services team. You can open a case from helpcenter.AppViewX.com or send an email to help@AppViewX.com.

Issues in Server Addition using AppViewX GUI

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	Provided credential is invalid.	1. Provide valid Access Key. 2. Provide valid Secret Key.
Provide valid account name	Account name can be duplicate or not as per standard.	1. Provide unique name for account name. 2. Account name can be alphanumeric and can also have period (.) in it.
Details Incorrect	Provide mandatory fields.	Enter mandatory fields like 1. Account Number 2. Access Key 3. Secret Key 4. Data Center 5. Services 6. Regions

Issues in Fetch Regions

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	The provided credential is invalid.	1. Provide valid Access Key. 2. Provide a valid Secret key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Discovery in ACM

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or the length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device from which to discover certificates.

Issues in Push and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, such as in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	Userdoes not have required permissions to push to the device.	Retry after getting the access for required action.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	Provided certificate is not a valid certificate.	Push a valid certificate.
Push failed as there exists another certificate with commonName	Certificate with same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.

Troubleshooting for AWS IAM

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for ACM & IAM service like server addition using AppViewX, fetch, certificate discovery & certificate push.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Issues in Server Addition using AppViewX GUI

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	Provided credential is invalid.	1. Provide valid Access Key. 2. Provide valid Secret Key.
Provide valid account name	Account name can be duplicate or not as per standard.	1. Provide unique name for account name. 2. Account name can be alphanumeric and can also have period (.) in it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Details Incorrect	Provide mandatory fields.	Enter mandatory fields like 1. Account Number 2. Access Key 3. Secret Key 4. Data Center 5. Services 6. Regions

Issues in Fetch Regions

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	The provided credential is invalid.	1. Provide valid Access Key. 2. Provide a valid Secret key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Discovery in IAM

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or the length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device from which to discover certificates.

Issues in Push and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, such as in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	Userdoes not have required permissions to push to the device.	Retry after getting the access for required action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	Provided certificate is not a valid certificate.	Push a valid certificate.
Push failed as there exists another certificate with commonName	Certificate with same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.

Troubleshooting AWS CloudFront

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for CloudFront service. This guide will give more troubleshooting processes on certificate discovery & certificate push.

iPad	iOS	1024 X 768

Issues in Azure Cloud Addition using AppViewX GUI

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Cloud account already exists.	A Cloud Account with the same name exists in inventory.	Check the Account name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Azure Cloud

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Authentication to the Azure	Subscription ID, Tenant ID	Login to Azure portal and get all the valid IDs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
cloud inventory is Failed	Client ID and Client secret of the Azure cloud account are incorrect. Check each of the provided ID is valid and active.	
Found 0 Key vault services	No Keyvault instances running for the provided Subscription ID.	Login to Azure portal and check if the Subscription ID has required permission to access the Keyvault instances.
Found 0 Application Gateway services	No Application Gateway instances running for the provided Subscription ID.	Login to Azure portal and check if the Subscription ID has required permission to access the Application Gateway instances.
Found 0 Virtual machine services	No Virtual Machine instances running for the provided Subscription ID.	Login to Azure portal and check if the Subscription ID has required permission to access the Virtual machine instances.

Issues in Accessing Azure Cloud

Access Issues might be reproduced when communicating with Azure cloud account, while discovering or fetching the services. These errors can be collected either from logs, API responses, or in the status field for that particular server.

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Connection timeout	Internet / Proxy connection is not provided from the AppViewX node. Firewall settings blocking the REST API request.	Login to AppViewX portal and provide proxy details in Menu->Settings->General->Proxy and Check Firewall settings.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution

No Keyvault instances are discovered	Subscription ID doesn't have an appropriate role to access the Azure services.	Check if the following role is assigned for the provided subscription ID in Azure cloud account.
		{
		"properties": {
		"roleName": "AppViewX_KeyVault_Role",
		"description": "",
		"assignableScopes": [
		"/subscriptions/f2689969- 42f6-4fb5-b3be-e3a02e33751c"
		],
		"permissions": [
		{
		"actions": [
		"Microsoft.KeyVault/vaults/read"
		],
		"notActions": [
		],
		"dataActions": [
		"Microsoft.KeyVault/vaults/certificates/import/action",
		"Microsoft.KeyVault/vaults/certificates/create/action",
		"Microsoft.KeyVault/vaults/certificates/update/action",
		"Microsoft.KeyVault/vaults/certificates/read"
		],
		"notDataActions": [
		]
		}
		]
		}}

No Keyvault instances are discovered	Azure Keyvault doesn’t have certificate Get/List permissions in access policies.	Login to Azure portal and navigate to Azure KeyVault -> Access policies and check if the Certificate management Operations has Get and List permissions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
No Keyvault instances are discovered	Azure Keyvault Networking blocking the certificate discovery.	Login to Azure portal and navigate to Azure KeyVault -> Networking and check if the If IP is allowed to access the Keyvault in Firewalls and virtual networks.

Issues in Managed Cloud

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Unmanaged Cloud

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) in an unmanaged state before performing action.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) in an unmanaged/in-progress state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Fetch Config

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Authentication to the Azure cloud inventory is Failed	Subscription ID, Tenant ID Client ID and Client secret of the azure cloud account is incorrect.	Login to Azure portal and get all the valid IDs. Check if each of the provided ID is valid and active.

Issues in Certificate Discovery

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a devices	No cloud account is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Discovery Status Failed	Check internet /Proxy connection is provided in AppViewX node.	Login to AppViewX portal and provide proxy details in Menu->Settings->General->Proxy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
No Certificates discovered from Azure KeyVault	Keyvault instance is not discovered from Azure cloud account.	Check device status in device addition page for Azure keyvault, if we have a Keyvault instance discovered count.
No Certificates discovered from Azure KeyVault	Azure Keyvault doesn't have certificate Get/List permissions in access policies	Login to azure portal and navigate to Azure KeyVault -> Access policies and check the Certificate management Operations having Get and List permissions (refer below snapshot)
No Certificates discovered from Azure KeyVault	Azure Keyvault Networking blocking the certificate discovery	Login to Azure portal and navigate to Azure KeyVault -> Networking and check the Firewalls and virtual networks If IP is allowed to access the Keyvault. (refer below snapshot)

Issues in Certificate Import

Error messages

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages (continued)

Error Message	Possible Cause	Possible Solution
	and not completed. 3. AppConnector might not be in sync.	3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in the enabled state.	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages (continued)

Error Message	Possible Cause	Possible Solution
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate push failed. Error is, jdk.nashorn.internal.runtime.Undefined	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Certificate push failed	Check internet /Proxy connection is provided in AppViewX node.	Login to AppViewX portal and provide proxy details in Menu->Settings->General->Proxy.
{"code":"Forbidden","message":"The user, group or application 'appid=d6dde692-94d9-4a9c-8bd4-77782d22b0ef;oid=669e113f-0651-4bb5-9698-cd4e863e1ee9;numgroups=0;iss=https://sts.windows.net/e5f90d85-3cdf-457d-a611-1aca82b0843b/' does not have Certificates import permission on key vault 'keyvault-type-1;location=eastus'. For help resolving this issue, please see https://go.microsoft.com/fwlink/?linkid=2125287","innererror": {"code":"ForbiddenByPolicy"}}	Azure Keyvault instance doesn't have certificate Import permissions in access policies. Issues in Cloud Addition using AppViewX UI - AWS

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Cloud account already exists.	A cloud account with the same Account name already exists in the inventory.	Check the Account name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.
Please provide valid credentials	The credentials provided are invalid/ has no access to fetch regions	Provide valid credentials/ credentials with needed access

Issues in Cloud Addition using AppViewX UI - Azure, GCP

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Cloud account already exists.	A cloud account with the same Account name already exists in inventory.	Check the Account name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Communicating to Cloud accounts

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Authentication to the Azure cloud inventory is Failed	Credentials provided are invalid/ credentials do not have the required access.	Validate the credentials and Check if credentials are provided required access.
Failed to communicate with GCP	Unable to connect to the endpoint.	Check if the node can reach the endpoint via proxy/internet as configured.
Failed to communicate with <SERVICE> through region <REGIONS>.	Credentials do not have required access	Provide credentials the required access

Issues in Managed Cloud Account

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	The device cannot be managed because it is already in the managed state.	Unmanage the device(s) before performing the action.

Issues in Unmanaged Cloud Account

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	The device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) before performing the action.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in a managed state.	Manage the device(s) in an unmanaged/in-progress state before performing an action.

Issue in Discovery

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. The Discovery name is not given or the length is less than 2 characters. 2. The interval between batches info is missing when the execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates.

Troubleshooting Server, Firewalls, WAF, and Rapid SB Connectors

This section of the guide will help you tackle the issues encountered while using the functionalities of servers, firewalls, WAF, and Rapid SB Connectors. It deals with common functionalities of these devices at the beginning of each guide and the rest of the guide deals with functionalities of specific devices. If the problem still remains unresolved please send a request to Technical Support by opening a case with the AppViewX Technical Services team. You can open a case from helpcenter.AppViewX.com or send an email to help@AppViewX.com.

Issues in Device Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating with the Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device ip/fqdn as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Access list for the device cannot be empty.	Credentials not provided for SSH communication.	Provide valid credentials for SSH communication.
Username cannot be null or empty.	Username is not provided or is empty.	Provide a valid username.
The Password cannot be null or empty.	Password is not provided or is empty.	Provide a valid password.
Key cannot be null or empty.	Key is not provided or is empty.	Provide a valid SSH key.
Ip is not reachable/invalid.	Invalid credentials	Kindly check the credentials provided.
	IP is not reachable	Kindly check if IP is pingable or not and make it up and running.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	IP is blocked by the firewall	Kindly check firewall settings.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Communication Failed	Username or password may be invalid	Check and provide the correct username and password.
java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods.	Authentication Failure	Provide correct credentials for authentication. Make sure SSH is enabled on the given server.
Linux rest agent communication failed.	Rest agent running on the destination machine might be down.	Please check the status of the rest agent in the destination machine.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Issues in Access

Access Issues occur while communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or the status field of that server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.
Permission denied for file/location.	File might not be present in the avx environment.	Check whether someone deleted the file from AppViewX environment.
	user might not have permission to read in the given source location.	Verify if read permission is given for the location.
	Device communication might not be established when service has started.	Verify the device connection and restart the service.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Parsing apache configuration failed.	Configuration file might be corrupted/ empty.	Verify if the configuration file is correct.
	AppViewX is not able to read/ parse the Config files from the server.	Check if the server has proper config files related to Apache Server and AppViewX has proper read permissions.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not entered or the length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device to discover certificates from.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Barracuda WAF

This section helps you deal with the various issues faced by you during the use of Barracuda WAF functionalities.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Device communication failed	1. The given credential is incorrect. 2. The given IP/FQDN and Port may be incorrect. 3. Device not reachable.	1. Check and input the correct credential. 2. Check and input the correct IP/FQDN and Port. 3. Ensure the device is up and accessible.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible. 2. No valid certificates available.	1. Ensure target device is up and running. 2. Check the device has valid certificate files.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Push failed due to invalid certificate	Push failed when pushing a certificate without key.	Ensure the certificate matches with the key associated in the device on pushing without the key file.
Device is not in managed state	Device is not available in “managed list”.	Please check the device status in device inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Cisco ASA Firewall

This section will guide you to overcome the various issues faced by you during the use of Firewall Cisco ASA and its various functionalities.

Issues in Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	Interfaces are not associated with any trustpoints.	Kindly ensure the interfaces are bounded with required trustpoints. Command to verify SSL-config: show running-config SSL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Certificate push failed due to Unsupported bit length.Please provide valid one.	Unsupported bit length.	Kindly ensure the bit length of certificate is supported by ciscoASA
Cert push got failed due to ERROR: Import PKCS12 operation failed	Issues in creating trustpoints	Kindly ensure that the trust points get created successfully.

Issues in Certificate Bind

Error Message	Possible Cause	Possible Solution
Certificate bind failed due to invalid interface name or error while communicating with device.	Invalid trustpoint.	Kindly ensure the trustpoint is available on the device.

Troubleshooting Cisco CallManager

This section will guide you to overcome the various issues faced by you during the use of Cisco CallManager and its various functionalities.

Issues in Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A Cisco CallManager device exists in inventory with the same name.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <hostname name> has failed.	1. Device unreachable. 2. Invalid credential. 3. Invalid port.	1. Kindly check if the given IP/FQDN is reachable. 2. Kindly check the credentials provided. 3. Kindly check the port and firewall settings.
Cisco Tomcat service is not active	Cisco Tomcat service is not in an up and running state.	Kindly restart the Cisco Tomcat Service. Command to verify the status of services is: utils service list

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	Required Services may not be in an up and running state.	Please ensure the supported services are up and running state and services are associated with SSL configs. Services supported by AppViewX : Cisco tomcat Command to verify the status of services is: utils service list

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CUCM CSR gen command failed	Command execution may fail.	Kindly ensure all CSR gen commands are executed properly.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Cert push got failed due to Error while importing server certificate.	1. The certificate should be issued from CSR generated by device. 2. CUCM will not allow to push the same cert again.	1. Kindly ensure the certificate issued by the CSR generated from Device.CUCM will not support to push any other certs. 2. CUCM will delete the CSR information from the device on successful cert push. Kindly ensure you are pushing the newly issued certificate and respective CSR information for the same should be available in the device.
Cert push got failed due to Error while importing trust certificate.	CA/Intermediate cert with the same name may already exist in the device.	AppViewX will not overwrite the existing CA configurations. Kindly delete/rename the old certificates to proceed with push.

Issues in Certificate Bind

Error Message	Possible Cause	Possible Solution
Cert bind got failed.Cause : Service restart failure.	Connection timeout or Invalid Services	Kindly check if the device is in a reachable state to execute the command.

Troubleshooting Common Functionality of Servers

This section helps you troubleshoot the common problems that you might encounter when dealing with the common functionality of servers. The guide will give more troubleshooting processes on issues encountered during handling of devices like addition using import option, adding to credential list, including the server in managed servers, unmanaging the server or server export.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device Addition using Import Option

Error Message	Possible Cause	Possible Solution
Invalid file type. Please select a valid file format (csv / xlsx / xls).	File type uploaded is not in expected format.	Supported file types are csv/xls/xlsx only. Check for the uploaded file extension.
Maximum five files allowed, please delete any completed file.	In the file history of the import page maximum 5 files can be maintained.	Delete any of the parsed/completed files to upload a new one.

Issues in Credential List Addition

Issues in the Server Unmanage Functionality

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) in an unmanaged state before performing action.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) in an unmanaged/in-progress state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in the Server Manage functionality

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Server Export

Error Message	Possible Cause	Possible Solution
Exception while exporting	General failure - Unable to create file on the local system due to permission issue.	Provide access to be able to create the file on the local system. (For example, check the directory where it is trying to export and give access to AppViewX for that directory.)
	Unable to fetch device list from the database.	Make sure the database is running and has correct data.

Troubleshooting Data Power Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with the Data Power server.

Issues in Data Power Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Data power Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Domain fetch has failed.	Domain not configured in Data Power	Check manually if domains are configured.

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching domains. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Rest communication failed	Unable to access the Rest APIs exposed by Data Power	Login via Postman to check if the APIs are accessible

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “**Discover By**” section.	Select at least one device to discover certificates from.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate Push failed	User has restricted access to the store to push the certificate in the application connector	Kindly ensure the user has access to the store to push the certificates to.

Troubleshooting F5 WAF

This section helps you troubleshoot the common problems that you might encounter when using the F5 WAF functionalities. This guide will give more troubleshooting processes on F5 WAF certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with F5 WAF.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
Failed to fetch partitions from the device	Partition fetch failed.	1. Check the device partitions. 2. Please check the associated error message.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not given or length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device to discover certificates from.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
Failed to fetch partitions from the device	Partition fetch failed.	1. Check the device partitions. 2. Please check the error message associated.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Authentication failed for the device	Invalid credentials specified for the device	Provide valid credentials for the device.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.
CSR Generation using HSM on this device version is not supported.	Version not supported.	Please use the supported version device to create CSR using HSM. Supported versions are v13 and v12.
1) CSR content unavailable in device 2) Requested CSR is not available in device 3) Csr could not be fetched	CSR content unavailable on device.	For some reasons CSR creation has failed, please check the logs to reproduce.
CSR already exists in this scope with the same Key reference name	The name is already used on the device.	Please use a different name.
Csr generation is device failed	CSR generation has failed.	CSR generation has failed. Please refer to the associated error message.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Thales HSM is not installed in the device. Please install and try again.	Thales is not installed in the device.	Please install Thales HSM and try again.
Invalid module. Please specify the valid module and try again.	Invalid module specified.	Specify a valid module and try again.
The CSR <name> was not found in the device.	CSR content is not available in the name specified.	Please check the name in the CA connector.
NetHSM private key is not available/installed in device	NetHSM private key is not available/installed in the device.	Please install NetHSM private key on the device.

Issues in F5 WAF Backup, Push, Bind, and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state.	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.
Invalid profile type	Specified profile type is not supported.	Please use client-SSL or server-SSL.
Certificate fetch failed	Certificate fetch failed.	Check the error message associated to know more about the problem.
Certificate already exists	Certificate is already available with the same.	Either change the name or enable overwrite in the application connector.
Key already exists	Key is already available with the same.	Either change the name of the key or enable overwrite in the application connector.
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than the current time.	Only valid certificates only can be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Fortigate Firewall

This section helps you troubleshoot the common problems that you might encounter when using the Fortigate firewall in CERT+ functionalities. This guide will give more troubleshooting processes on Fortigate firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Fortigate firewall.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Error occurred in command execution - <Error message>	Error occurred in command execution	Command execution has failed. Please refer to the error message associated with this.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not given or length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device to discover certificates from.
Error occurred in command execution - <Error message>	Error occurred in command execution.	Command execution has failed. Please refer to the associated error message.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.
Unsupported Key type provided	Unsupported key type is selected.	Please select RSA or EC.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Csr name exists in the device, and cannot be overwritten.	Name is already used in the device.	Please use a different name.
Csr generation is device failed	CSR generation has failed.	CSR generation has failed. Please refer to the associated error message.

Issues in Fortigate Firewall Backup, Push, Bind and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state.	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate content is mandatory parameter	Certificate content should be available.	Please specify certificate content in the request.
Intermed certificate content is mandatory for pushing CA certificate	Intermediate certificate content should be available.	Please specify intermediate certificate content in the request.
Root certificate content is mandatory for pushing CA certificate	Root certificate content should be available.	Please specify root certificate content in the request.
Certificate name is mandatory parameter	Certificate file name is mandatory.	Please specify the certificate file name in the connector.
Profile details are missing in Application connector	Profile details are missing.	Please specify profile details in the request.
Private key password is mandatory parameter	Private key password is mandatory.	Specify private key password in the connector.
Given certificate name does not exist in a device with a private key. Certificate with private key should exist either in device or AppViewX	Private key not available in the certificate.	Certificate should be pushed with the private key to bind with the profile.
Root certificate name already exists in ca store, Cannot overwrite until Overwrite is enabled in Connector	Overwrite is not enabled in the application connector.	Enable overwrite option in the application connector.
Intermediate certificate with name: <name> already exists in ca store, Cannot overwrite until Overwrite is enabled in Connector	Overwrite is not enabled in the application connector.	Enable overwrite option in the application connector.
Certificate name already exists in inventory, Cannot overwrite until Overwrite is enabled in Profile connector	Certificate with the same name already exists on the device.	Please change the certificate name or enable overwrite in the application connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than the current time.	Only valid certificates can be pushed.

Troubleshooting HP ILO

This section will guide you to overcome the various issues faced by you during the use of HP ILO and its various functionalities.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <ip/ fqdn> has failed.	IP/FQDN provided is not reachable. Credentials not valid.	Check if the provided IP/FQDN is correct Check if the provided username and password for device addition is correct The HPILO python package is not installed properly in AppViewX VM.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	ILO portal is not up and running Network issues in reaching the portal	Kindly ensure the ILO web portal is up and running. Kindly ensure a proper identity certificate is associated with the web portal

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution

CSR generation failed.
 	
`03/01/2021 20:59:45 - CSR creation in device failed due to File /tmp/certconnectors/script_16197_287072988142466.py, line 1, in <module>`
 	
`import hpilo;ilo = hpilo.Ilo('ilo.AppViewX.net', 'administrator', '19160456');print (ilo.certificate_signing_request(common_name='mtestilo1'));`
 	
IloGeneratingCSR: The iLO subsystem is currently generating a Certificate Signing Request(CSR), run script after 10 minutes or more to receive the CSR.
 	
03/01/2021 20:59:45 - CSR Submission Failed
	1. Input parameters might not be valid for the CSR request.
	2. Multiple CSR requests might be triggered within a short span of time.
		Kindly ensure the CSR parameters are configured properly.
		
		Kindly ensure multiple CSR requests are not submitted to the same device in any mode.
		
		Kindly ensure we keep at least 15mins interval between CSR request submission else the response for the previous request is triggered before submitting the next request.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution

Certificate Push failed
 	
`03/02/2021 10:39:49 - ILO cert push failed due to File /tmp/certconnectors/script_87672_336277286169629.py, line 1, in <module>`
 	
`--> 1 import hpilo;ilo = hpilo.Ilo('ilo.AppViewX.net', 'administrator', '19160456');print (ilo.import_certificate('''-----BEGIN CERTIFICATE-----`
 	
IloError: Invalid certificate common name
	Certificate is not generated with CSR from device	Kindly ensure the certificate is signed with a CSR request generated from the target device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
03/02/2021 10:39:49 - Push Task Failed		

Troubleshooting IBMClient Linux

This section will guide you to overcome the various issues faced by you during the use of IBMClient Linux and its various functionalities.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <hostname> failed	Gateway agent not reachable. Device not reachable from the gateway agent GSKit is not installed on any given device.	Ensure gateway is configured properly and the APIs are accessible from AppViewX. Ensure device and gateway agent are in the same domain and device is accessible from gateway agent. Please ensure GSKit is installed properly.
Communication to <hostname> failed Device version fetch has failed.	Hostname or Credentials configured is wrong	Ensure hostname and the device credentials configured while device addition is valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	No valid KDB/keystore files available in the given path.	Ensure the given certificate location has a valid KDB/keystore and KDB/keystore has certs.
Discovery completed successfully. (with 0 certs even if valid certs exist in given path)	1. Respective Keystores password is not added in Password Vault to parse certs. 2. User may not have read permission to parse certs	1. Please enter the password of keystores in the Password Vault to parse certs. 2. Please ensure the user has appropriate permission to read files.

Issues in CSR Generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Certificate Push failed. Or Push got failed due to User has no permission for the given location to perform the operation	User has restricted access to the path configured to push the certificate in the application connector	Please ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	“Private key in Device” is enabled in application connector, but key is not available on device.	Ensure to enable “Private key in Device” attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push Failed due to KDB push got failed.	Target KDB file does not exist in the device.	Ensure the target KDB file, for which certificate push configured is available and has read/write access.
1. Private key should not be empty/null. 2. Push failed due to Failure while importing certificate into keystore due to either wrong password or tampered keystore.	Trying to push certs without a keyfile.	Please ensure the certificate to be pushed has a private key file. Or if key file exists in device please select privateKeyInDevice option.

Troubleshooting IBMClient Windows

This document will guide you to overcome the various issues faced by you during the use of IBMClient Windows and its various functionalities.

Issues in Server Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <hostname> failed	Gateway agent not reachable.	Ensure gateway is configured properly and the APIs are accessible from AppViewX.
	Device not reachable from the gateway agent	Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	GSKit is not installed on any given device.	Please ensure GSKit is installed properly.
Communication to <hostname> failed Device version fetch has failed.	Hostname or Credentials configured is wrong	Ensure hostname and the device credentials configured while device addition is valid.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	No valid KDB/keystore files available in the given path.	Ensure the given certificate location has a valid KDB/keystore and KDB/keystore has certs.
Discovery completed successfully. (with 0 certs even if valid certs exist in given path)	1. Respective Keystores password is not added in Password Vault to parse certs. 2. User may not have read permission to parse certs	1. Please enter the password of keystores in the Password Vault to parse certs. 2. Please ensure the user has appropriate permission to read files.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
1. Failure response obtained on consuming REST API. 2. CSR submission failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
1. Push Failed. CTGSK3026W The key file "D:/mtest/mtest.kdb" does not exist or cannot be read. 2. Push got failed due to Windows Gateway Error Response : a693c520-940d-478a-8aed-7c06c3a707c2: No path found	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
Push Failed due to KDB push failed.	Target KDB file does not exist in the device	Ensure the target KDB file, for which certificate push configured is available and has read/write access.
Private key is not available. Failing the push	Trying to push certificates without a keyfile.	Please ensure the certificate to be pushed has a private key file Or if key file exists in device please select privateKeyInDevice option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Imperva WAF

This section will guide you to overcome the various issues faced by you during the use of Imperva WAF and its various functionalities.

Issues in Communicating to Imperva

Error Message	Possible Cause	Possible Solution
Communication to <ip> has failed	Invalid credentials Imperva WAF is down.	Please check if the correct Imperva credentials are provided. Please login to the SecureSphere console to check if Imperva is running.
Connection timeout	Internet / Proxy connection is not provided from AppViewX node. Firewall settings blocking the REST API request	Login to AppViewX portal and provide proxy details in Menu->Settings->General->Proxy and Check Firewall settings

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <ip> has failed	Invalid credentials Imperva WAF is down.	Please check if a correct Imperva credentials are provided Please login to the SecureSphere to check if Imperva is running.
Device has 0 sites.	No sites configured in Imperva.	Please login to the SecureSphere to check if Sites are configured.
Device has 0 Server Group	No Server Groups configured in Imperva.	Please login to the SecureSphere to check if Server Groups are configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device has 0 Services	No Services configured in Imperva	Please login to the SecureSphere to check if Services are configured.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a devices	No WAF account is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Discovery Status Failed	Check if internet /Proxy connection is provided in AppViewX node.	Login to AppViewX portal and provide proxy details in Menu->Settings->General->Proxy.
No Certificates discovered from Imperva WAF	SSL Certificates are not discovered from Imperva due to API restrictions. Imperva Rest API doesn't allow the public Certificate String in the API responses. Only Certificate attributes like common name, signature, Expiry date and Issuer details are captured.	Check with AppViewX PM team / SME for more details

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issue in Push and Rollback

Error Message	Possible Cause	Possible Solution
An item with this name already exists - please select a different name	SSLKeyName should be unique.	Kindly ensure to provide a unique name in “Certificate File Name” field on Connector page.
Site not found	Unable to find the site to push the certificate	Please login to SecureSphere to check if the Site is available.
Server Group not found	Unable to find the Server Group to push the certificate	Please login to SecureSphere to check if the Server Group is available.
Services not found	Unable to find the Service to push the certificate	Please login to SecureSphere to check if the Service is available.

Troubleshooting Linux JBoss Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities.This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Linux JBoss server.

Issues in Linux JBoss Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Communicating to Linux JBoss Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is either null or empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Communication to <ip/fqdn> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct password and click Save.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable	Check manually by establishing an SSH session to the target device with the provided IP/FQDN.
Communication to <IP/FQDN> has failed.	Problem with port configuration	Check if the configured port in the device addition page is correct.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Caused by: java.net.ConnectException: Connection refused (Connection refused) Possible Remediations: 1. Kindly check the SSH Port configurations. 2. Kindly check the firewall settings		
Communication to <IP/FQDN> has failed. Caused by: java.io.IOException: Key exchange was not finished, connection is closed.	Problem with SSH key handshake	Request to check the ciphers, key and HMACs configured in the target device and ensure AppViewX SSH-plugin supports the same
<IP/FQDN> has 0 JBoss instance(s)	No JBoss server running in the target device,	Login via SSH to the target device and execute the below command to check the status of the JBoss server “ps -ef | grep jboss”.

Issues in Accessing the Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Permission denied for file/ location.	File might not be present in the avx environment. User might not have permission to read in the given source location. Device communication might not be established when service has started.	Check whether someone deleted the file from AppViewX environment. Verify if read permission is given for the location. Verify the device connection and restart the service.

Issues in Credential List

Error Message	Possible Cause	Possible Solution
Invalid details	Mandatory credential details are missing.	Provide all the mandatory details to store the credential.
credentials already exist.	Credential List with the same name already exists.	Provide a unique name to each credential list.
Invalid file format. Accepted formats are .pem and .txt	The Identity Key file uploaded is not having the correct format.	Provide key file with correct format (.pem or .txt)

Issues in Managed Server

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Unmanaged Server

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) in an unmanaged state before performing action.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) in an unmanaged/in-progress state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Import Server

Error Message	Possible Cause	Possible Solution
Invalid file type. Please select a valid file format (csv / xlsx / xls).	File type uploaded is not in expected format.	Supported file types are CSV/Xls/xlsx only. Check for the extension of the uploaded file.
Maximum five files allowed, please delete any completed file.	Maximum of 5 files can be maintained in file history of import page.	Delete any of the parsed/completed files to upload a new one.

Issues in Export Server

Error Message	Possible Cause	Possible Solution
Exception while exporting	General failure - Unable to create file on the local system due to permission issue.	Provide access to be able to create the file on the local system. (e.g. check the directory where it is trying to export and give access to AppViewX for that directory)
	Unable to fetch device list from the database.	Make sure the database is running and has correct data.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed.	Device communication has failed due to invalid credentials / SSH Port	Verify the input details and check device status error messages in the Issues in Communicating to Linux JBoss Server section.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have the required permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct “connectorId” if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector, but key is not available in device.	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR generate option from Device.

Troubleshooting for Microsoft Enterprise CA Issues

This section helps you troubleshoot the common problems that you might encounter when using functionalities like setting addition, certificate enrollment, renewal, revocation, suspension, reinstation, discovery, and other actions associated with Microsoft Enterprise.

Issues in Configuring Microsoft Enterprise CA and Fetch CAs

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to save CA settings CA Settings name already exists.	A CA setting with the same name for Microsoft Enterprise already	Check the CA Setting name, it should be unique.

Issues in Discovering Microsoft Enterprise certificates

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to establish connection with CA	1. The configured CA details may be incorrect. 2. Proxy details may not be configured. 3. AppViewX may not be able to reach CA.	1. Check the CA details configured on the CA settings page. 2. Check whether proxy details are configured in proxy settings. 3. Check whether network access is available.
Empty response received from windows gateway.	1. CA certificate stores may have mixed type certificates. 2. Client certificate may be wrong.	1. Enable custom client authentication or Check Local Machine's Root certificate store should have Root certificates only and Intermediate certificate store should have Intermediate certificates only. 2. Check whether the client certificate is valid.

Troubleshooting Microsoft Tomcat

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Microsoft Tomcat server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Microsoft Tomcat Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Tomcat Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct details and click Save.
Communication to <Hostname> has failed due to Error while communicating via windows agent service	Windows agent provided is not reachable	Check Windows agent is Up and running and update the valid agent in the device addition page.
Parsing for PTPLD178 completed. 0 ports parsed.	Invalid Tomcat	Login manually into the windows server and find the Tomcat

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Server path	installation directory path and provide the same path in Server path attribute of tomcat device addition page
Error on fetching Tomcat instance, config fetch process failed due to df9cbf67-e1af-4d8c-8a7c-fe88bb83e0b3: PowerShell ScriptExecution Error in PTPLD178 : Cannot find path 'C:\tmp_1615504487924.tmp' because it does not exist.	Invalid Server path	Login manually into the windows server and find the Tomcat installation directory path and provide the same path in Server path attribute of tomcat device addition page

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Permission denied for file/location.	1. File might not be present in the avx environment. 2. user might not have permission to read in the given source location 3.Device communication might not be established when service has started.	1.Check whether someone deleted the file from AppViewX environment. 2. Verify if read permission is given for the location. 3.Verify the device connection and restart the service.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Hostname / Username /	Verify the input details and check for device status error messages in the Issues in Communicating to Tomcat Server section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Password of the device added might be wrong.	

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e. in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/ write access to the path configured in application connector to certificate push.
Certificate push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	"Private key in Device" is enabled in application connector and also private key is available in the certificate	Ensure "Private key in Device" attribute in application connector is unchecked.
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector, but key is not available in device.	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Troubleshooting MQServer Linux

This section will guide you to overcome the various issues faced by you during the use of MQServer Linux and its various functionalities.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <ip/fqdn> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	Password of the device added could be wrong.	Click on the device name on the Inventory Page. Update the correct password and click Save.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable	Check manually by establishing an SSH session to the target device with the provided IP/FQDN.
Communication to <IP/FQDN> has failed. Caused by: java.net.ConnectException: Connection refused (Connection refused) Possible Remediations: 1. Kindly check the SSH Port configurations. 2. Kindly check the firewall settings	Problem with port configuration	Check if the configured port in the device addition page is correct.
Device communication (02/24/2021 05:07:25 PM) Failure	MQ is not configured in the target device	Check if MQ server is configured in the target device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Communication to 192.168.133.31 has failed Device Version (02/24/2021 05:07:25 PM) Failure Device version fetch has failed		Check MQ toolkit is installed in the target device
Device communication (02/24/2021 06:12:50 PM) Failure Communication to 192.168.133.30 has failed. Caused by: java.io.IOException: Key exchange was not finished, connection is closed.	Problem with SSH key handshake	Request to check the ciphers, key and HMacs configured in the target device and ensure AppViewX SSH-plugin supports the same

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	MQServer QManager is not up and running.	1. Login to the target device 2. Switch to user which has mqm group access 3. start the QManager Command: `strmqm <qname>`
Received failed response from batch	No valid KDB files available in the path configured to the QManager	Ensure the path configured in QManager has valid KDB files and KDB has certs. Command to find path:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
		`echo "DIS QMGR SSLKEYR" | runmqsc`

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	“Private key in Device” is enabled in application connector, but key is not available in device.	Ensure to enable “Private key in Device” attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.
Push Failed due to KDB push got failed.	Target KDB file does not exist in the device	Ensure the target KDB file, for which certificate push configured is available and has read/write access.

Troubleshooting MQServer Windows

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with MQServer Windows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <hostname> failed	Gateway agent not reachable. Device not reachable from the gateway agent	Ensure gateway is configured properly and the APIs are accessible from AppViewX. Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.
Communication to <hostname> failed Device version fetch has failed.	Hostname or Credentials configured is wrong	Ensure hostname and the device credentials configured while device addition is valid.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	MQServer QManager is not up and running.	1. Login to the target device 2. Switch to user which has mqm group access 3. start the QManager Command: strmqm <qname>
Received failed response from batch	No valid KDB files available in the path configured to the QManager	Ensure the path configured in QManager has valid KDB files and KDB has certs. Command to find path: echo "DIS QMGR SSLKEYR" | runmqsc.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
Failure response obtained on consuming REST API. CSR submission failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Push Failed. CTGSK3026W The key file "D:/mtest/mtest.kdb" does not exist or cannot be read.	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
Push Failed due to KDB push got failed.	Target KDB file does not exist in the device	Ensure the target KDB file, for which certificate push configured is available and has read/write access.

Troubleshooting MS SQL Windows

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback and other actions associated with MS SQL Windows.

Issues in Communicating to MS SQL

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Gateway agent not reachable.	Ensure gateway is configured properly and the APIs are accessible from AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Device not reachable from the gateway agent	Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.
Communication to <hostname> has failed	Hostname or Credentials configured is wrong	Ensure hostname and the device credentials configured while device addition is valid.
Device version fetch has failed.	MSSQLSERVER service instance is down	Restart the MSSQLSERVER instance
Device version fetch has failed.	Command not supported by MS SQL version	Execute the version command SQLCMD -Q 'SELECT @@VERSION;' -t 3 in the CLI of the device to check if it returns version response

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Gateway agent not reachable. Device not reachable from the gateway agent	Ensure gateway is configured properly and the APIs are accessible from AppViewX. Ensure device and gateway agent are in the same domain and device is accessible from gateway agent.
PTPLD178 has 0 instances.	No installed MS SQL instances. Installed instances are not up and running.	Execute (get-itemproperty 'HKLM:\\SOFTWARE\\Microsoft\ \Microsoft SQL Server').InstalledInstances in the device as a powershell script and check if it returns the MS SQL instances

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issue in Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	No valid certificates in store that are binded to the MS SQL instances.	Ensure the certificates are binded to a MS SQL instance.

Issue in CSR generation

Error Message	Possible Cause	Possible Solution
CSR Submission Failed	User may have restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issue in Push and Rollback

Error Message	Possible Cause	Possible Solution
Error while pushing certificate in Device : <device name>.PrivateKey not available.	Private key is not available to parse certs.	Kindly ensure to push certs with private key.If privatekey is available in device please select privateKeyInDevice option.
Error: “/LOCAL_MACHINE/ CertificateAuthority” does not exist	CertificateAuthority Store is removed from the Store	Create a CertificateAuthority store.

Troubleshooting Nginx Server

This section helps you troubleshoot the common problems that you might encounter when using certificate Nginx Server functionalities.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Communication to <IP> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	1. Given credentials	1. Check and input

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	are incorrect. 2. Given IP may be incorrect. 3. Device not reachable	the correct credential. 2. Check and input the correct IP 3. Ensure device is up and accessible

Issues in Certificate Directory

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible 2. No valid certificates available	1. Ensure target device is up and running 2. Check the device has valid certificate files

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	1.Kindly ensure the user configured for device addition has read/write access to the path configured. 2. For sudo user, Please check the access elevation configured in device addition

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Failure during push operation to the server Nginx due to Private key should not be empty or null.Please provide valid key to proceed push.	Private key not available in push request certificate	Please ensure the private key is available in request
Pivatekey In device configured. But key content is available with the certificate from AppViewX.. So failing push request.	Trying to push a certificate with key when the “Private key in device” enabled	Ensure the push certificate has no key when “Private key in device” is enabled.
Privatekey not exists in device.	Private key file not available in the given key location when “Private key in device” is enabled	Ensure the target device has key file in the given location
Push failed since cannot write-into/create location(s)	User does not have permission to perform the operation	1.Ensure the user has permission. 2.For sudo user, please check the access elevation value given in device addition
Device is not in managed state	Device is not available in managed	Please check the device status in device inventory

Troubleshooting NginxPlus ADC

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with NginxPlus ADC.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible 2. No valid certificates available	1. Ensure target device is up and running 2. Check the device has valid certificate files

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Private key should not be empty or null.	Private key not available in push request certificate	Please ensure the private key is available in request
Pivate key In device configured. But key content is available with the certificate from AppViewX.So failing push request.	Trying to push a certificate with key when the “Private key in device” enabled	Ensure the push certificate has no key when “Private key in device” is enabled.
Privatekey not exists in device.	Private key file not available in the given key location when “Private key in device” is enabled	Ensure the target device has key file in the given location
Push failed since cannot write-into/create location(s)	User does not have permission to perform the operation	Ensure the user has permission.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device is not in managed state	Device is not available in managed	Please check the device status in device inventory

Troubleshooting Paloalto Firewall

This section helps you troubleshoot the common problems that you might encounter while using Paloalto firewall functionalities. This guide will give more troubleshooting processes on Paloalto firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Paloalto firewall.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.
Unsupported Key type provided	Unsupported key type is selected.	Please select RSA or EC.
Csr generation is device failed	CSR generation has failed.	CSR generation has failed. Please refer to the associated error message.
Invalid parameter for number of bits Csr generation is device failed	Selected EC bit length may not be supported by Paloalto.	Please select valid bit length supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name not given or length less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.

Issues in Backup, Push, Bind and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.
Certificate <cert name> is not a valid reference	Private key not available in the certificate or the certificate is not in the required partition to bind.	Certificate should be pushed with the private key to bind with the profile.
Creating local certificate file failed	Unable to create the folder in EXPORT_DIRECTORY.	Please check whether the user has permission to create a folder or file in EXPORT_DIRECTORY in AppViewX.
Certificate name already exists in inventory, Cannot overwrite until Overwrite is enabled in Profile connector	Certificate with the same name already exists on the device.	Please change the certificate name or enable overwrite in the application connector.
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than current time.	Only valid certificates can be pushed.

Troubleshooting Panorama Firewall

This document helps you troubleshoot the common problems that you might encounter when using the Panorama firewall functionalities. This guide will give more troubleshooting processes on Panorama firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Panorama firewall.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid	Provide valid credentials

Issues in Panorama Firewall Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not given or the length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid	Provide valid credentials

Issues in Panorama Firewall CSR Generation

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid	Provide valid credentials
Unsupported Key type provided	Unsupported key type is selected	Please select RSA or EC
Csr generation is device failed	CSR generation is failed	CSR generation has failed. Please refer to the error message associated with this
1) Invalid parameter for number of bits	Selected EC bit length may not be supported by panorama	Please select valid bit length supported

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
2) Csr generation is device failed		

Issues in Panorama Firewall Backup, Push, Bind, and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state.	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate <cert name> is not a valid reference	Private key not available in the certificate or the certificate is not in the required partition to bind.	Certificate should be pushed with private key to bind with the profile
Creating local certificate file failed	Unable to create the folder in EXPORT_DIRECTORY.	Please check whether the user has permission to create a folder or file in EXPORT_DIRECTORY in AppViewX.
Certificate name already exists in inventory, Cannot overwrite until Overwrite is enabled in Profile connector	Certificate with the same name already exists on the device.	Please change the certificate name or enable overwrite in the application connector.
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than current time.	Currently, valid certificates only can be pushed.

Troubleshooting Check point Firewall

This document helps you troubleshoot the common problems that you might encounter when using the Check point firewall functionalities. This guide will give more troubleshooting processes on Check point firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Check point firewall.

Issues when device goes to unresolved state after on-boarding

The device might have entered an unresolved state due to connectivity issues from the AppViewX installed node or CC node. In such cases, please follow the steps below:

1. Attempt to establish an SSH connection from the AppViewX installed node or CC node to the Check point server.
2. Verify if there is proper connectivity between the nodes and the Check point server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues when device goes to failed state with version failure

When a device enters a failed state with version check failure, it typically indicates that the system is unable to retrieve the version information from the Check point SMS server.

1. Login to the Check point SMS server via CLI using the credentials configured in AppViewX.
2. Attempt to enter expert mode. The user should be able to switch to expert mode.
   • Verify the expert password provided during on-boarding is correct.
   • Confirm expert mode privileges are granted for the user account.
3. Once in expert mode, execute the following command: **`fwm ver`**. This command should confirm the server is indeed a Check point SMS server and display the version details of the server.
   Sample expected output:

```
This is Check Point Security Management Server R81.20 - Build 440
```

Troubleshooting RabbitMQ Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. Effective troubleshooting documents depend on the availability of useful, detailed information. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with RabbitMQ server.

Issues in RabbitMQ Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to RabbitMQ Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Communication to <ip/fqdn> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	Password of the device added might be wrong.	Click on the device name on the Inventory Page. Update the correct password and click Save.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable	Check manually by establishing an SSH session to the target device with the provided IP/FQDN.
Communication to <IP/FQDN> has failed. Caused by: java.net.ConnectException: Connection refused (Connection refused) Possible Remediations:	Problem with port configuration	Check if the configured port in the device addition page is correct.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
1. Kindly check the SSH Port configurations. 2. Kindly check the firewall settings		
Communication to <IP/FQDN> has failed. Caused by: java.io.IOException: Key exchange was not finished, connection is closed.	Problem with SSH key handshake	Request to check the ciphers, key and HMacs configured in the target device and ensure AppViewX SSH-plugin supports the same
Device version fetch has failed.	Config path is incorrect / No RabbitMQ instances running in the target device	Check manually by establishing an SSH session to the target device and check RabbitMQ installations and find a valid configuration path and update the same in the device addition page.

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files (/etc/rabbitmq/rabbitmq.config). These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Custom Config Location	For default installation, The config location path is / etc/rabbitmq/rabbitmq. config, if any custom location is provided check the valid rabbitmq config file exists in that location	Login via SSH to the target device and check the “rabbitmq” installations and valid configuration file location path
Permission denied for file/ location.	1. File might not be present in the avx environment. 2. user might not have permission to read in the given source location	1.Check whether someone deleted the file from AppViewX environment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	3.Device communication might not be established when service has started.	2. Verify if read permission is given for the location. 3.Verify the device connection and restart the service.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed.	Device communication has failed due to invalid credentials / SSH Port	Verify the input details and check for device status error messages in the Issues in Communicating to RabbitMQ Server section.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or the length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector, but key is not available on device.	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Troubleshooting Rapid SB Server Inventory

This document will help you troubleshoot the issues faced during the use of the functionalities of Rapid SB connectors server inventory. It begins by troubleshooting the common functionalities and then goes on to handle the issues peculiar to various Rapid SB connectors Servers.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.
Permission denied for file/location.	1. File might not be present in the avx environment. 2. user might not have permission to read in the given source location 3.Device communication might not be established when service has started.	1.Check whether someone deleted the file from AppViewX environment. 2. Verify if read permission is given for the location. 3.Verify the device connection and restart the service.

Issues in Credential List

Error Message	Possible Cause	Possible Solution
Invalid details	Mandatory credential details are missing.	Provide all the mandatory details to store the credential.
credentials already exist.	Credential List with the same name already exists.	Provide a unique name to each credential list.
Invalid file format. Accepted formats are .pem and .txt	The Identity Key file uploaded is not having the correct format.	Provide key file with correct format (.pem or .txt)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Managed Server

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Unmanaged Server

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) in an unmanaged state before performing action.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) in an unmanaged/in-progress state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Import Server

Error Message	Possible Cause	Possible Solution
Invalid file type. Please select a valid file format (csv / xlsx / xls).	File type uploaded is not in an expected format.	Supported file types are CSV/Xls/ xlsx only. Check for the uploaded file extension.
Maximum five files allowed, please delete any completed file.	In the file history of the import page maximum of 5 files can only be maintained.	Delete any of the parsed/completed files to upload a new one.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Export Server

Error Message	Possible Cause	Possible Solution
Exception while exporting	1.General failure - Unable to create file on the local system due to permission issue. 2.Unable to fetch device list from the database.	1. Provide access to be able to create the file on the local system. (For example, check the directory where it is trying to export and give access to AppViewX for that directory.) 2. Make sure the database is running and has correct data.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “**Discover By**” section.	Select at least one device to discover certificates from.

Troubleshooting Rapid SB Linux Server

This section helps you troubleshoot the common problems that you might encounter while using certificate server functionalities for Linux servers. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Linux servers.

Issues in Linux Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Linux Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can contain only alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Communication to <ip/fqdn> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	Password of the device added might be wrong.	Click on the device name on the Inventory Page. Update the correct password and click Save.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable.	Check manually by establishing a SSH session to the target device with the provided IP/FQDN.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed. Caused by: java.net.ConnectException: Connection refused (Connection refused) Possible Remediations: 1. Kindly check the SSH Port configurations. 2. Kindly check the firewall settings	Problem with port configuration.	Check if the configured port in the device addition page is correct.
Communication to <IP/FQDN> has failed. Caused by: java.io.IOException: Key exchange was not finished, connection is closed.	Problem with SSH key handshake.	Request to check the ciphers, key and HMacs configured in the target device and ensure AppViewX SSH-plugin supports the same.

Issues in Accessing the Server

Issues with accessing servers can occur while communicating with servers or discovering or fetching configuration files. These errors can be collected either from logs, API responses or can be seen in the status field for that particular server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.
Permission denied for file/ location.	1. File might not be present in the avx environment. 2. User might not have permission to read in the given source location. 3. Device communication might not be established when service has started.	1. Check whether someone deleted the file from AppViewX environment. 2. Verify if read permission is given for the location. 3. Verify the device connection and restart the service.

Issues in Credential List

Error Message	Possible Cause	Possible Solution
Invalid details	Mandatory credential details are missing.	Provide all the mandatory details to store the credential.
credentials already exist.	Credential List with the same name already exists.	Provide a unique name to each credential list.
Invalid file format. Accepted formats are .pem and .txt	The Identity Key file uploaded does not have the correct format.	Provide key file with correct format (.pem or .txt)

Issues in Managed Server

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Unmanaged Server

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) that is in unmanaged state before unmanaging it again.
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) that is in an unmanaged/inprogress state before unmanaging it again.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an inprogress state.	Wait for the device to be resolved to a state before performing action.

Issues in Import Server

Error Message	Possible Cause	Possible Solution
Invalid file type. Please select a valid file format (csv / xlsx / xls).	File type uploaded is not in expected format.	Supported file types are csv/xls/xlsx only. Check for the uploaded file extension.
Maximum five files allowed, please delete any completed file.	In file history of import page maximum 5 files can only be maintained.	Delete any of the parsed/completed files to upload a new one.

Issues in Export Server

Error Message	Possible Cause	Possible Solution
Exception while exporting	1. General failure - Unable to create file on the local system due to permission issue. 2. Unable to fetch device list from the database.	1. Provide access to be able to create the file on the local system. (For example, check the directory where it is trying to export and give access to AppViewX for that directory.) 2. Make sure the database is running and has correct data.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed.	Device communication has failed due invalid credentials / SSH Port.	Verify the input details and check device status error messages in the Issues in Communicating to Linux Server section.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector, but key is not available in device.	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Troubleshooting Tomcat Linux

This document helps you troubleshoot the common problems that you might encounter when using Tomcat Linux functionalities. This guide will give more troubleshooting processes on issues related to the Tomcat Linux server. The issues are device addition, communication to the server, CSR generation, access to the server, fetch configuration, discovery along with push and rollback.

Issues in Device Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Device name accepts '-' , '_' , '.' , '*' , '|' , '!' and space only, with min 2 and max 64 characters.	Server name is not valid.	Provide a server name with min 2 and max 64 characters with only the allowed characters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Communicating to the server

Error Message	Possible Cause	Possible Solution
Failed to make the ssh connection with the given IP.	Given IP may not be connected to the network.	Validate whether username and password given during device addition are valid.
	Username/Password provided may be incorrect.	Ensure given IP is connected to the network.
	SFTP port is not open for SSH communication.	Open given port for the SSH communication.
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Access list for the device cannot be empty.	Credentials not provided for SSH communication.	Provide valid credentials for SSH communication.
Username cannot be null or empty.	Username is not provided or is empty.	Provide a valid username.
The Password cannot be null or empty.	Password is not provided or is empty.	Provide a valid password.
Key cannot be null or empty.	Key is not provided or is empty.	Provide a valid SSH key.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Device does not belong to Tomcat Server.	Device does not have any running tomcat instances.	Start any tomcat server in the device.
Failed to make ssh connection.	Target device may not be connected to the network.	Validate whether username and password given during device addition are valid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Username/Password provided may be incorrect.	Ensure the target device is connected to the network.
	The User may not have permission to execute the command.	Provide permission for the user to execute \"ps -ef\" command.
Linux rest agent communication failed	Rest agent installed in the device might not be running.	Install AppViewX Rest agent in device.
	The Client certificate installed in AppViewX might not be valid.	Install valid client certificate in AppViewX.
	Rest agent port might not be open for communication.	Ensure port is open for communication.
Error while decrypting password.	Password invalid for decryption key.	Check if the password matches with the decryption key.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
CSR Generation Failed.	Given CSR Location is not available in device.	Provide a valid path to store CSR and key.
	User does not have read/write permission for the location.	Ensure the user has read/write permission to the given location.
	“Openssl” package is not installed	Install “Openssl” package in the device
	The User does not have permission to execute “Openssl” commands.	Provide permission for user to execute “Openssl” commands

Issues in Access

Access Issues might occur when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or the status field of that server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
File Download Failed.	User or User group does not have read/write permission for server.xml in device.	Provide read/write permission for user in device

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
XML Parsing Failure	FileName provided might not be a valid XML file.	Ensure the provided filename is a valid XML file.
File Download Failed.	server.xml is not found in the specified directory.	Ensure server.xml is present in the conf directory.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
File Not Found	server.xml is not present in the specified directory.	Ensure server.xml is present in the conf directory.
	SSL certificate or key file parsed from configuration file is not present in the specified directory.	Ensure parsed certificate or key file is present in the directory specified in server.xml
JKS Parsing Failure	Password for Keystore file may not be present in server.xml	Password given in server.xml might be incorrect.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Push failed.	Creating local certificate files failed while Backup.	Provide required access to AppViewX to create local files

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate Push Failure	Invalid certificate, key, or trust location is given.	Provide the valid certificate, key, or trust location while adding an application connector.
Bind Failed as the SSL is disabled for the port	SSL is disabled for the given port on the server.	Kindly enable SSL for the port on the server.
KeyStore creation failed	Unable to create the Keystore locally.	Provide required access to AppViewX to create local files

Troubleshooting Weblogic Linux

This section helps you troubleshoot the common problems that you might encounter when using Weblogic Linux functionalities. This guide will give more troubleshooting processes on issues related to Weblogic Linux server. The issues are device addition, communication to the server, CSR generation, fetch configuration, discovery along with push and rollback.

Issues in Device Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Weblogic Linux

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Access list for device cannot be empty.	Access list provided is empty	Provide a valid access list to communicate with the device.
Username cannot be null or empty.	Username is null or empty.	Provide a valid username to communicate with the device.
Password cannot be null or empty.	Password is null or empty.	Provide a valid password to communicate with the device.
Key cannot be null or empty.	Key is null or empty.	Provide a valid key to communicate with the device.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches with the key.
Failed to connect to the server.	Credentials to communicate with the device may be invalid.	Check and provide the proper credentials to communicate with the device.
No weblogic process is running	Weblogic processes running on the destination machine might be down.	Kindly check the status of the Weblogic process running in the destination machine.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Domain-registry.xml is not accessible in the given path.	Given path may be invalid or AppViewX does not have	Please enter a valid path or Check permissions to access the file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	permission to access the file in the path.	
Config file parsing failed.	1. Configuration file might be corrupted/ empty. 2. AppViewX is not able to read/ parse the Config files from the server.	1. Verify if the configuration file is correct. 2. Check if the server has proper config files related to the Weblogic server and AppViewX has proper read permissions.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not entered or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Exception while fetching key and location details from request.	Certificate location details provided during the server addition might be wrong.	Check and provide the valid certificate location during server addition.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Error while establishing SSH connection.	AppViewX is not able to establish a SSH connection using the given credentials.	Provide valid credentials to communicate with the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Error occurred while creating conf file to create csr.	AppViewX is not able to create a conf file in the export directory.	Check if AppViewX export directory has write permissions.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Error while establishing SSH connection.	AppViewX is not able to establish a SSH connection using the given credentials.	Provide valid credentials to communicate with the device.
Unable to parse configuration to fetch currently associated data.	AppViewX may not be able to fetch and parse the content of the certificate which is already associated.	Check if AppViewX has permissions for fetching the existing certificate content.
No server certificate is found	AppViewX may not be able to fetch and parse the content of the certificate which is already associated.	Check if AppViewX has permissions for fetching the existing certificate content.
Exception while downloading trust store / Exception while parsing certificate	AppViewX is not able to download the trust store from the server.	Check if AppViewX has permission to download the trust store from the device.
Certificate and/or key missing	Certificate provided in the push request might be invalid.	Check if the certificate that is being pushed is valid.
Unsupported Key Algorithm	Key algorithm of the certificate is not supported by the server.	Provide a valid key algorithm that is

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
		supported by Weblogic servers.
Push cannot be performed automatically for the Keystore type 'DemoIdentityAndDemoTrust'. Kindly customize the keystore locations in the connector.	Customize push location not provided during push operation.	Provide a location to push the certificate inside the server.
Parsing a certificate is failed	Certificate content might be invalid.	Check the certificate content.
Exception while writing file to avx local.	AppViewX may not have access to the local/export directory.	Check if AppViewX has permission for the local/export directory.
Certificate push is failed.	Invalid location provided. User is not having permission to push file to the location.	Check the location provided is valid. Check if the user has permission to access the location.
Unable to perform Bind for the server.	Server may not be running in the given address and port.	Check if the server is running in the given port and listen address
Unable to open edit session for the server.	AppViewX is not able to communicate with the server.	Check if the server is up and running and the server credentials are valid.
Unable to perform edit for the server.	AppViewX is not able to communicate with the server.	Check if the server is up and running and the server credentials are valid.
Unable to save the current changes made to the server.	AppViewX is not able to communicate with the server.	Check if the server is up and running and the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
		server credentials are valid.
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state. Previous work order is in progress and not completed. AppConnector might not be in sync.	Push to device after certificate has been retrieved from CA. Initiate push after previous work order is finished. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state.	Enable the push/ rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Troubleshooting Websphere Linux

This section helps you troubleshoot the common problems that you might encounter when using Websphere Linux functionalities. This guide will give more troubleshooting processes on issues related to Websphere Linux server. The issues are device addition, communication to the server, CSR generation, fetch configuration, discovery along with push and rollback.

Issues in Device Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might either be missing or might be invalid.	Add all the valid information in the mandatory section.
WSadmin User name and WSadmin Password should not be empty	WSadmin username or password might be empty.	Add the valid WSadmin username and password.
Kindly add at least one WSadmin detail before saving.	WSadmin details are not added.	Add at least a single WS admin details.

Issues in Communicating to Apache Linux

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Access list for device cannot be empty.	Access list provided is empty	Provide a valid access list to communicate with the device.
Username cannot be null or empty.	Username is null or empty.	Provide a valid username to communicate with the device.
Password cannot be null or empty.	Password is null or empty.	Provide a valid password to communicate with the device.
Key cannot be null or empty.	Key is null or empty.	Provide a valid key to communicate with the device.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches with the key.
Service account user not found.	Credentials to communicate with the device may be invalid.	Check and provide the proper credentials to communicate with the device.
Authentication failure using Service account.	Credentials to communicate with the device may be invalid.	Check and provide the proper credentials to communicate with the device.
Ip does not belongs to Websphere	Destination machine might not have the required configuration for a Websphere application server.	Please check if the machine has Websphere configurations available in the destination machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Service account user not found.	Credentials to communicate with the device may be invalid.	Check and provide proper credentials to communicate with the device.
Authentication failure using Service account.	Credentials to communicate with the device may be invalid.	Check and provide proper credentials to communicate with the device.
Permission denied to installation path.	AppViewX may not have the permission for the installation path.	Check if AppViewX has permission to access the installation path.
Invalid Credentials.	Invalid Credentials given for installation path.	Check if credentials have access to the installation path.
Permission denied	User does not have provision to access the installation path.	Check if AppViewX has permission to access the installation path.
Invalid installation path	Installation path does not exist.	Check if the installation path provided is a valid one.
Wsadmin objects unavailable	Wsadmin objects are unavailable	Check if the configurations related to WS are available in the destination machine.
security.xml file read operation failed	security.xml is not accessible in the given path.	Check if there is permission to access the file.
Config file parsing failed.	Configuration file might be corrupted/ empty.	Verify if the configuration file is correct.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not entered or its length is less than 2 characters.	Enter a valid name with a minimum of 2 characters. Provide a time interval between batches in minutes.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Interval between batches info. is missing when execution type is sequential.	
Please select a device	No device is selected in the “Discover By “section.	Select at least one device to discover certificates from.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Service account user not found.	Credentials to communicate with the device may be invalid.	Check and provide the proper credentials to communicate with the device.
Authentication failure using Service account.	Credentials to communicate with the device may be invalid.	Check and provide the proper credentials to communicate with the device.
Permission denied to installation path.	AppViewX may not have the necessary permission for the installation path.	Check if AppViewX has permission to access the installation path.
Invalid Credentials.	Invalid Credentials are given to installation path.	Check if credentials have access to the installation path.
Permission denied	User does not have provision to access the installation path.	Check if AppViewX has permission to access the installation path.
Invalid installation path	Installation path does not exist.	Check the installation path provided is a valid one.
Wsadmin objects unavailable	Wsadmin objects unavailable	Check if the configurations related to WS are available in the destination machine.
security.xml file read operation failed	security.xml is not accessible in the given path.	Check for valid permission to access the file.
Config file parsing failed.	Configuration file might be corrupted/ empty.	Verify if the configuration file is correct.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Error while establishing SSH connection.	AppViewX is not able to establish a SSH connection using the given credentials.	Check and provide valid credentials to communicate with the device.
Error occurred while creating conf file to create csr.	AppViewX is not able to create a conf file in the export directory.	Check if AppViewX export directory has write permissions.
Invalid key type specified in the request	Given key type might not be supported in the target machine.	Provide valid key type.
CSR and Private key has been failed.	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
security.xml file read operation failed	AppViewX may not be able to read security.xml of the profile.	Check if AppViewX has permissions to read security.xml of the profile.
Config file parsing failed	Configuration file might be corrupted/ empty.	Verify if the configuration file is correct.
Insufficient information to fetch backup data available in the server.	Configuration files fetched from the server may not have sufficient information.	Check if the config file has all the information related to server configuration.
Unsupported bit length	Bit length is not supported by the server.	Provide a valid bit length that is supported by Websphere server.
Unsupported Key Algorithm	Key algorithm of the certificate is not supported by the server.	Provide a valid key algorithm that is supported by Websphere servers.
Creating local certificate file failed - <Detailed Message>	AppViewX is not able to create file in a temporary folder.	Check the detailed message to determine the remedy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Server certificate is not available to push.	Server certificate location may be invalid.	Check if the trust store location is available.
Private Key doesnot exists for certificate	Private key may not be available for the certificate.	Check if the private key for the certificate is available.
Private key parsing failed for the certificate.	Private key may be a invalid one.	Check if the private key is valid.
Writing of converted certificate related files into file in AppViewX local directory is failed.	AppViewX may not have permission to write a file in the export directory.	Check if AppViewX has proper permissions for the export directory.
Certificate created date is earlier than server present time	The starting of certificate validity period is earlier than the servers present time.	The starting of certificate validity period should match with the server's time. It should be greater than the server's present time.
Unsupported Type	Certificate format is not supported by the server.	Check for the supported certificate formats.
Error found in wsadmin response	The WSadmin console may not be working on the server.	Kindly check WSadmin console is properly working or not
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Troubleshooting Websphere Windows

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Websphere Windows.

Issues in Server Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Connecting to remote server ptpld123 failed with the following error message : The user name or password is incorrect. For more information, see the about_Remote_Troubleshooting Help topic.	Invalid hostname/ Invalid credential	Kindly check if the given host is reachable. Kindly provide valid credentials and update the device details.
Communication to <host> failed.	Windows Agent is not reachable or down	Kindly check if windows agent configured and in running state.
Websphere version fetch has failed	Websphere setup is not available/not configured in given device	Kindly validate is Websphere configured properly

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch.	1. No valid keystore files available in the given path. 2. Users don't have access for the configured location/file. 3. Web Server or WAS console is not active.	1. Kindly Ensure the given certificate location has a valid cert. 2. Kindly ensure users have proper access privilege to read certs. 3. Kindly ensure WebServer is in up and running state .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR Submission Failed	User may have restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Error while pushing certificate into device.	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
Error while pushing certificate into device : Websphere due to Unsupported bit length:4096.	Websphere will support bitlength up to 2048.	Kindly ensure the certificate issued is compatible with the Websphere.
Error while pushing certificate into device : Websphere due to Unsupported Key Algorithm:DSA	Unsupported key Algorithm.	Kindly ensure the certificate issued is compatible with the Websphere.
Error while pushing certificate in Device : <device name>.PrivateKey not available.	Private key is not available to parse certs.	Kindly ensure to push certs with private key. If privatekey is available in the device please select privateKeyInDevice option.

Troubleshooting Windows Apache Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Windows Apache server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Device communication failed	1. Given credential is incorrect. 2. Windows agent may not be working. 3. Device not reachable 4.Hostname value is in-correct	1. Check and input the correct credential. 2. Check and input the correct hostname value 3. Ensure the device is reachable 4. Ensure windows agent is working for communication mode gateway 5. When the communication mode selected is SSM, Ensure SSM details given are correct

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible 2. No valid certificates available	1. Ensure target device is up and running 2. Check the device has valid certificate files

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Push failed due to Private key is not available. Failing the push	Private key not available in push request certificate	Please ensure the private key is available in request
Push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	Trying to push a certificate with key when the “Private key in device” enabled	Ensure the push certificate has no key when “Private key in device” is enabled.
Push failed due to Private key is not available in device. Failing the push	Private key file not available in the given key location when “Private key in device” is enabled	Ensure the target device has key file in the given location
Push failed since cannot write-into/create location(s)	User does not have the permission to perform the operation	1.Ensure the user has permission. 2.For sudo user, please check the access elevation value given in device addition
Device is not in managed state	Device is not available in managed	Please check the device status in device inventory

Troubleshooting Windows JBoss Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. Effective troubleshooting documents depend on the availability of useful, detailed information. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Windows JBoss server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Windows JBoss Server Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Windows JBoss Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct details and click Save.
Communication to <Hostname> has failed due to Error while communicating via windows agent service	Windows agent provided is not reachable	Check Windows agent is Up and running and update the valid agent in the device addition page.
Error on fetching JBoss instance, config fetch process failed due to No configuration file found. Check installation directory path.	Provided installation directory path does not have JBoss configuration files like server.xml / standalone.xml	Login manually into the windows server and find the installation directory path which has the JBoss configuration files (server.xml or standalone.xml) and provide the same directory path in JBoss device addition page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Error on fetching JBoss instance, config fetch process failed due to df9cbf67-e1af-4d8c-8a7c-fe88bb83e0b3: PowerShell ScriptExecution Error in PTPLD178 : Cannot find path 'C:\tmp_1615504487924.tmp' because it does not exist.	Invalid installation directory path	Login manually into the windows server and find the installation directory path which has the JBoss configuration files (server.xml or standalone.xml) and provide the same directory path in JBoss device addition page.

JBoss version fetch is failed	No JBoss server running in the target device / something wrong in the JBoss installation	Login manually into the windows server and find the
		JBoss server bin directory and run the below command to validate the JBoss version
		For JBoss 4.0.5
		`<JBoss_server_Directory>/bin/run.bat -V`
		For JBoss 6.4 and 7.0
		`<JBoss_server_Directory>/bin/standalone.bat -V`
		Currently only JBoss 4.0.5, 6.4 and 7.0 versions are supported in AppViewX.

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Permission denied for file/location.	1. File might not be present in the environment. 2. User might not have permission to read in the given source location. 3. Device communication might not be established when service has started.	1. Check whether someone deleted the file from the environment. 2. Verify if read permission is given for the location. 3. Verify the device connection and restart the service.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Verify the input details and check for device status error messages in the Issues in Communicating to Windows JBoss Server section.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/ write access to the path configured in application connector to certificate push.
Certificate push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	"Private key in Device" is enabled in application connector and also private key is available in the certificate	Ensure to uncheck "Private key in Device" attribute in application connector
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector,	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the

Error Message	Possible Cause	Possible Solution
	but key is not available in device.	certificate is generated using CSR gen option from Device.

Troubleshooting Windows Weblogic Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Windows Weblogic server.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Device communication failed	1. The given credential is incorrect. 2. Device not reachable 3.Hostname value is incorrect	1. Check and input the correct credential. 2. Check and input the correct hostname value 3. Ensure the device is reachable
Error while communicating via windows agent service	Windows agent not reachable	Ensure windows agent is running and it's accessible
Version fetch failed and Fetch weblogic instance failed	Given “Weblogic Installation directory” is in-correct	Check and ensure the given installation path is correct

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible 2. No valid certificates available	1. Ensure target device is up and running 2. Check the device has valid certificate files

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	1.Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Private key is not available. Failing the push	Private key not available in push request certificate	Please ensure the private key is available in request
Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	Trying to push a certificate with key when the “Private key in device” enabled	Ensure the push certificate has no key when “Private key in device” is enabled.
Private key is not available in device. Failing the push	Private key file not available in the given key location when “Private key in device” is enabled	Ensure the target device has key file in the given location
Push failed since cannot write-into/create location(s)	User does not have permission to perform the operation	1.Ensure the user has permission. 2.For sudo user, please check the access elevation value given in device addition
Device is not in managed state	Device is not available in managed	Please check the device status in device inventory

Chapter 6: Key Use Cases

- Automating CLM for Akamai CPS
- Automating CLM for Apache (Linux)
- Automating CLM for Apache (Windows)
- Automating CLM for Tomcat (Linux)
- Automating CLM for Tomcat (Windows)
- Automating CLM for JBoss
- Automating CLM for Linux
- Automating CLM for Windows Environment
- Automating CLM for Microsoft IIS
- Automating CLM for Firewall
- Automating CLM for Palo Alto
- Automating CLM for CheckPoint
- Automating CLM for F5 Devices
- Automating CLM for Citrix Devices
- Automating CLM for AWS Resources
- Automating CLM for Microsoft Azure Resources
- Automating CLM for Microsoft SQL
- AppViewX Integration with MDM devices

Automating CLM for Akamai CPS

The Akamai CPS (Certificate Provisioning System) provides the full lifecycle management of SSL/TLS certificates for Akamai Secure Delivery Network applications.

Prerequisites

- Follow Create authentication credentials to generate client token, client secret, and access token required to authenticate to Akamai CPS.
- To enable this API, choose the **Certificate Provisioning System** API service, and set the access level to **READ-WRITE**.
- Ensure your API credentials have the following grants: **CPS** and **Contracts-API_Contracts**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The user must have **Access to the Property Manager API (PAPI)**.
- Ensure the user's **PAPI access level** is set to **READ** to allow read operations through the API.

Onboarding Akamai CPS Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **+ (Add)** icon.
4. Select **Akamai** from the Vendors list.
   The **Akamai** server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned:

Server Details - Field Description Table

Field	Description
***Server name**	Enter a unique name for server.
***IP address/ FQDN**	Enter a valid IP address or FQDN for device communication and integration with the Akamai CPS.
Data center	Choose the desired data center.
Proxy required	Select the checkbox to enable the secure proxy service.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter details as mentioned below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Field	Description
***Client token**	Enter the client token as provided by the vendor.
***Client secret**	Enter the client secret as provided by the vendor.
***Access token**	Enter the access token as provided by the vendor.
***API Version**	Enter the value, example cps/v2. (The same value is provided as the placeholder.)
**: Mandatory fields*	

7. Click **Save**.
   The Akamai CPS device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to (**Menu**) > **CERT+** >**ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Configuring Device Settings

During enrollment using server device as endpoint, Akamai has a long list of details that are mandatorily required for the enrollment request. Adding these fields along with the CSR parameters will make the enrollment form too big with many details to be filled out. As these are fixed values and only have to be filled once, the other mandatory fields are made available in the global device settings page. The details

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

saved on the global setting page are based on the combination of the fields **Validation Type**, **Secure Network**, and **Vendor Certificate Type** that are available on the enrollment page.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the (**Device Settings**) icon.
4. Select **Akamai** from the Vendors list.
   The Akamai Vendor Specific Details configuration screen is displayed.
5. Enter the fields in the respective sections as described:

Filed descriptions for the Vendor Specific Details page

Field	Description
General Information	
***Validation Type**	Select a validation type from the dropdown list for the endpoint. The default value is **Third-party**.
***Secure Network**	This filed helps identify the type of deployment network. Select the secure network from the dropdown list for the endpoint. The default value is **Standard TLS**.
***Vendor Certificate Type**	Denotes the domain and organization validation type. Select a vendor certificate type from the dropdown list for the endpoint. The default value is **Third-party**.
Organization Information	
***Name**	Enter the organization's name.
***Address**	Enter the organization's address.
***Country**	Enter the organization's country code.
***City/Municipality**	Enter the organization's city or municipality.
***State/Province**	Enter the organization's state or province.
***Zip/Postal Code**	Enter the organization's zip or postal code.
***Phone Number**	Enter the organization's phone number.
Admin Contact Information	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	Enter the administrator's first name
***Last Name**	Enter the administrator's last name
***Phone Number**	Enter the administrator's phone number
***Email**	Enter the administrator's email
Tech Contact Information	
***First Name**	Enter the technical contact's first name
***Last Name**	Enter the technical contact's last name
***Phone Number**	Enter the technical contact's phone number
***Email**	Enter the technical contact's email
*: *Mandatory fields*	

6. Click **Update**.
   The vendor details are saved successfully.

Enrolling Server Certificates

Prerequisite

- Before proceeding with the endpoint enrollment for Akamai CPS, the **Device Settings** configuration is a must.

Note:

- The product supports the enrollment and deployment of certificates for a **single stack**. The **CSR content** is generated based on the key type selected on the enrollment page.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. Specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. Specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** • This value can exceed the certificate's validity in case of short-lived certificates. • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
***Certificate Type**	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for DigiCert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a CA+RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Select **Browse** and navigate to the location of your CSR file, and click **Open**.. b. Click **Upload**. • **HSM**: **Note:** This option is not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given, in an HSM device: a. Under **CSR Generation**, select **HSM**. b. Fields for gathering your HSM-related inputs are displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
To generate the private key and the CSR, enter the following details:
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>*Device Type</td><td>From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated:
• HSM Devices
• ADC Devices</td></tr>
<tr><td>*Vendors</td><td> Note: This field is applicable only when Device Type = ADC Devices.</td></tr>
<tr><td>*Devices</td><td>From the dropdown list, select the required HSM/ ADC device.
 Note: This field is populated based on the Device Type and Vendors selected.</td></tr>
<tr><td>*Key Handler Name</td><td> Note: This field is applicable only when Device Type = HSM Devices.
Enter the key handler name.</td></tr>
<tr><td>*Key Reference Name</td><td> Note: This field is applicable only when Device Type = ADC Devices.
Enter the key reference name.</td></tr>
</table>
• End Point:
Note: This option is disabled when Certificate Authority = Google and CSC Global.
</td></tr>
</table>

<tr><td>*Vendor Certificate Type</td><td>This field is auto-populated if you have configured device settings.</td></tr>
</table></td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
*: Mandatory fields	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. For the certificate being enrolled, enter the **CSR Parameters**.

> **Note:** For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except underscore (_) and hyphen (-).
Subject Alternative Name	From the dropdown list, select the Subject Alternative Name category for the certificate being enrolled. In the corresponding field(s) displayed for the selection made, enter the required values. **Note:** • Multiple values must be separated by a comma. • After enrollment, the cumulative count of SANs is displayed in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** For renewal of the certificate being enrolled, country name is required.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you've uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, provide the organization-specific values for both the certificate attributes and the custom attributes required by the issuing CA to be included with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

   Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** This field is displayed only when a CA setting with a registration authority is selected for certificate enrollment. Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

    Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding Application Connector

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.
***Vendor**	From the dropdown list, select **Akamai CPS**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Akamai CPS server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Type	From the dropdown list, select the file type of the certificate to be pushed. For Akamai CPS, by default, the **PEM (*.pem)** certificate is selected and the dropdown list is non-editable.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on the end device, select this checkbox. For Akamai CPS, this feature is enabled by default and the field is non-editable.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For Akamai CPS, this feature is enabled by default and the field is non-editable.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing Server Certificates to Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:**
> - The **Push to Device** option is displayed only after an application connector is added to certificate.
> - Certificate deployment to the staging environment is only currently supported.
> - **Renewal of existing enrollments** with updated certificates is also **not supported** at this time.

The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.

Automating CLM for Apache (Linux)

Apache on Linux Servers is a widely used configuration for hosting websites and applications due to its open-source nature and strong performance. Linux offers a stable and secure environment, allowing

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Apache to run efficiently and be customized to meet specific needs. The combination benefits from extensive community support, regular updates, and a wide range of available modules. Linux's command-line interface facilitates powerful management and automation of Apache. This setup is often used in LAMP stacks, making it a popular choice for dynamic web hosting.

Prerequisites

1. Ensure that application/service users have the appropriate read/write permission to perform the CLM actions on the server device, if the access elevation is selected as **None**.
   When the access elevation is **sudo** or **dzdo**, all the commands used to perform the CLM operations will be executed with sudo or dzdo.
2. Verify that the commands needing sudo or dzdo access have been enabled on the server.
3. Ensure that the following packages are installed to facilitate device addition:
   • sudo/dzdo (optional, as per the access elevation selected)
   • timeout
   • base64
4. Ensure that the target IP address is accessible from the cloud connector and the port is open.
5. Make sure that the language setting for the Apache Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
6. Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
7. SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
8. Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.
9. Verify the existence of **httpd.conf** file in the system by scanning from root directory. Use the command: find / -name “httpd.conf”.
10. Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing Apache server installed on the Windows machines).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Apache Linux

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Linux** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select the **Apache** radio button.
***Server name**	Enter the name of the designated Linux server.
***IP address/ FQDN**	Enter the IP address of the Apache Server or its fully qualified domain name (FQDN) that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the Apache server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache server device.

   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - AppViewX* • *SSH* **Note:** • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - cloudAccount*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. (The field label changes to ***Account Name** if **SSM** is the communication mode)
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Access Elevation**	Select from the following:. • *sudo* - to execute with root privileges using sudo access • *dzdo* - to execute with root privileges using dzdo access **Note:** SSH key-based authentication doesn't support password enabled sudo/ dzdo.
File Upload Temp Path	This field is displayed when the *Access Elevation* = *sudo or dzdo*. Enter the temporary directory/path where certificates or keys are stored during certificate push actions. *Example*: /tmp/files **Note:** It is used as an intermediate location to store the actual keystore and then perform actions on the certificates in the keystore. The keystore is then moved back to the original location after performing the actions.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
Account number	Enter the 12-digit AWS account number. *Example*: 012345678901

8. In the **Certificate details** section, enter the details as indicated below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
Certificate location	Enter the actual directory/path where certificates are stored in the Apache server. *Example*: /cert/files
Key location	Enter the actual directory/path where keys are stored in the Apache server. *Example*: /key/files
Intermediate location	Enter the temporary or intermediate directory/path where certificates and keys are stored in the Apache server. *Example*: /inter/files

9. Click **Add**.
   Once the server is added successfully, the certificate location will be listed in the table.
10. *(optional step)* Click the (Delete) icon, if you want to delete the certificate details from the list.
11. Click **Save**.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Certificates for Apache Linux Server

Discovering Certificates for Apache

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

   Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

   Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to the Apache Linux Server

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for a Apache Linux Server

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Apache**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Apache (Linux) server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	Enter the path to the location on your local system where the certificate file to be pushed is stored.
***Key Location**	The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Service Restart	To restart the Apache service immediately after the certificate is pushed, enable this checkbox.
Suppress Heartbeat Alerts During Service Restart	Enabling this option to disable or prevent false alert triggered during Apache service. **Note:** • This field is disabled when Service Restart selected. • To view or update default setting, go to: **Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings**.
Heartbeat File Path	Specify the hearbeat file path. **Note:** This field is enabled when Suppress Heartbeat Alerts During Service Restart is checked.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.
Intermediate Location	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the path to the location on your local system where the intermediate certificate file is stored.
Root Location	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the path to the location on your local system where the root certificate file is stored.

5. Enter the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Apache Linux Server

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

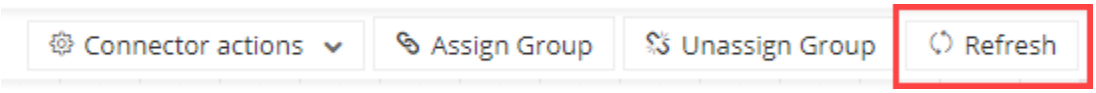
- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

d. Click **Update**.

2. To enable auto renewal for the certificate connector:

a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
The **Server Certificate** inventory is displayed.

b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
The holistic view of the selected certificate is displayed.

c. For an existing CA connector for the certificate, hover over .

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting Apache Linux

This document helps you troubleshoot the common problems that you might encounter when using Apache Linux functionalities. This guide will give more troubleshooting processes on issues related to Apache Linux server. The issues are device addition, communication to the server, CSR generation, access to server, fetch configuration, discovery along with push and rollback.

Issues in Device Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating with the Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device ip/fqdn as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Access list for the device cannot be empty.	Credentials not provided for SSH communication.	Provide valid credentials for SSH communication.
Username cannot be null or empty.	Username is not provided or is empty.	Provide a valid username.
The Password cannot be null or empty.	Password is not provided or is empty.	Provide a valid password.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Key cannot be null or empty.	Key is not provided or is empty.	Provide a valid SSH key.
Ip is not reachable/invalid.	Invalid credentials	Kindly check the credentials provided.
	IP is not reachable	Kindly check if IP is pingable or not and make it up and running.
	IP is blocked by the firewall	Kindly check firewall settings.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Communication Failed	Username or password may be invalid	Check and provide the correct username and password.
java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods.	Authentication Failure	Provide correct credentials for authentication. Make sure SSH is enabled on the given server.
Linux rest agent communication failed.	Rest agent running on the destination machine might be down.	Please check the status of the rest agent in the destination machine.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.

Issues in Access

Access Issues occur while communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or the status field of that server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.
Permission denied for file/location.	File might not be present in the avx environment.	Check whether someone deleted the file from AppViewX environment.
	user might not have permission to read in the given source location.	Verify if read permission is given for the location.
	Device communication might not be established when service has started.	Verify the device connection and restart the service.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Parsing apache configuration failed.	Configuration file might be corrupted/ empty.	Verify if the configuration file is correct.
	AppViewX is not able to read/ parse the Config files from the server.	Check if the server has proper config files related to Apache Server and AppViewX has proper read permissions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not entered or the length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device to discover certificates from.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Automating CLM for Apache (Windows)

Apache on Microsoft Windows Servers is ideal for organizations using a Windows-based infrastructure, offering robust web server capabilities with seamless integration into the Microsoft ecosystem. It works well with Windows-specific services like Active Directory and SQL Server, providing a consistent platform for enterprises. Although Apache was originally designed for Unix-like systems, it is fully compatible with Windows and runs efficiently in this environment. Windows provides a user-friendly interface for managing Apache, making it accessible to administrators familiar with Microsoft tools. This setup is commonly used for hosting websites and applications that require integration with other Windows services.

Prerequisites

1. Ensure that application/service users have the appropriate read/write permission to perform the CLM actions on the server device, if the access elevation is selected as **None**.
   When the access elevation is **sudo** or **dzdo**, all the commands used to perform the CLM operations will be executed with sudo or dzdo.
2. Verify that the commands needing sudo or dzdo access have been enabled on the server.
3. Ensure that the following packages are installed to facilitate device addition:
   - sudo/dzdo (optional, as per the access elevation selected)
   - timeout
   - base64
4. Ensure that the target IP address is accessible from the cloud connector and the port is open.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Make sure that the language setting for the Apache Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
6. Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
7. SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
8. Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.
9. Verify the existence of **httpd.conf** file in the system by scanning from root directory. Use the command: find / -name “httpd.conf”.
10. Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing Apache server installed on the Windows machines).

Onboarding Apache Windows

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Microsoft** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select the **Apache** radio button.
***Server name**	Enter the name of the designated Apache server.
***Hostname**	Enter the hostname of the Apache Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Apache server. Gateway is the preferred communication mode.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - AppViewX **Note:** If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

   If **Communication mode** = **SSM** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\Apache-Tomcat-8.5.35
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\Apache-Tomcat-8.5.35
***Region**	Enter the geographic region of the AWS instance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

8. Enter the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode **Note:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production. **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Gateway location**	From the following options, select the gateway location: • **Remote** **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

9. Click **Save**.
   The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Onboarding Certificates for Apache Linux Server

Discovering Certificates for Apache

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to Apache Windows Server Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Apache Windows

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows Apache**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Windows Apache devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	Enter the path to the location on your local system where the certificate file to be pushed is stored.
***Key Location**	The private key associated with a certificate is stored in a key file. In the **Key directory** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
Intermediate Location	Enter the path to the location on your local system where the intermediate certificate file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Root Location	Enter the path to the location on your local system where the root certificate file is stored.
Service Restart	To restart the Apache service immediately after the certificate is pushed, enable this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

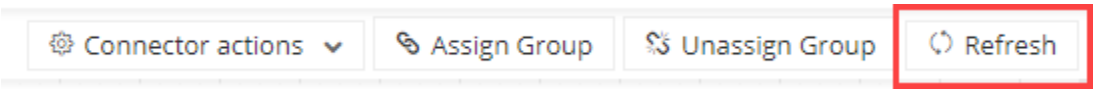
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
The **Server Certificate** inventory is displayed.

b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
The holistic view of the selected certificate is displayed.

c. For an existing CA connector for the certificate, hover over .

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting Windows Apache Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Windows Apache server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Device communication

Error Message	Possible Cause	Possible Solution
Device communication failed	1. Given credential is incorrect. 2. Windows agent may not be working. 3. Device not reachable 4.Hostname value is in-correct	1. Check and input the correct credential. 2. Check and input the correct hostname value 3. Ensure the device is reachable 4. Ensure windows agent is working for communication mode gateway 5. When the communication mode selected is SSM, Ensure SSM details given are correct

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Received failed response from batch	1. Device not running or not accessible 2. No valid certificates available	1. Ensure target device is up and running 2. Check the device has valid certificate files

Issues in CSR generation at Endpoint

Error Message	Possible Cause	Possible Solution
CSR generation got failed/User has no permission for the given location to perform the operation.	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Push

Error Message	Possible Cause	Possible Solution
Push failed due to Private key is not available. Failing the push	Private key not available in push request certificate	Please ensure the private key is available in request
Push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	Trying to push a certificate with key when the “Private key in device” enabled	Ensure the push certificate has no key when “Private key in device” is enabled.
Push failed due to Private key is not available in device. Failing the push	Private key file not available in the given key location when “Private key in device” is enabled	Ensure the target device has key file in the given location
Push failed since cannot write-into/create location(s)	User does not have the permission to perform the operation	1.Ensure the user has permission. 2.For sudo user, please check the access elevation value given in device addition
Device is not in managed state	Device is not available in managed	Please check the device status in device inventory

Automating CLM for Tomcat (Linux)

Tomcat on Linux Servers is a popular configuration for running Java-based applications, known for its open-source flexibility and robust performance. Linux provides a secure and stable environment, enabling Tomcat to operate efficiently and be tailored to specific requirements. This combination benefits from strong community support, regular security updates, and a variety of configuration options. Linux’s command-line interface simplifies the management and automation of Tomcat services. Frequently used in conjunction with other components like databases and web servers, this setup is a preferred choice for deploying dynamic enterprise applications.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- **General Prerequisites**
  - Ensure that the following packages are installed to facilitate device addition:
    - sudo/dzdo (optional, as per the access elevation selected)
    - timeout
    - base64
  - Ensure that the target IP address is accessible from the cloud connector and the port is open.
  - Make sure that the language setting for the Tomcat (Linux) Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
  - Only certificate and key files in PEM, CRT, CER, and JKS formats are detected.
  - SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
  - Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible
- **Prerequisites for Service Account Preparedness**
  - Ensure that access elevation is enabled for the service account.

    When using a service account, all command executions related to the specified use cases occur within the context of the service account. The selected access elevation is relevant only when switching to the service account using a command like:

    ```
    sudo su - serviceAccountUserName
    ```

    When configuring the service account username with access elevation, an option becomes available to enable access elevation for the service account. Enabling accesselevation allows commands to be executed with the selected elevation level.

    If disabled, commands run without access elevation. If enabled, commands are executed with the chosen access elevation and may require a password, depending on the `sudo/dzdo` settings.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If a password is required, ensure that the service account password is entered in the interface when prompted.

Note: If an SFTP connection is set up for the current user, they may not have the requisite access to the service account's directory. It is recommended to configure a dirctory path in the **File Upload Temp Path** in the UI where both the current user and the service account user have read and write access.

Onboarding Tomcat (Linux) Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Linux** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select the **Tomcat** radio button.
***Server name**	Enter the name of the designated Apache Tomcat server.
***IP address/ FQDN**	Enter the IP address of the server or its fully qualified domain name (FQDN) that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the server.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Cert Sync	Choose from any of the following: • **Managed** - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • **Monitored** - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • **Ignored** - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the server device.
   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *SSH* **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - cloudAccount* **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Service account credentials** section, enter the **Username** and **Password** for logging into the service account.
   A service account is a dedicated Linux user account created to run and manage the Tomcat application securely, with controlled access and credential management.
8. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Access Elevation**	Select from the following:. • *sudo* - to execute with root privileges using sudo access • *dzdo* - to execute with root privileges using dzdo access **Note:** SSH key-based authentication doesn't support password enabled sudo/ dzdo.
File Upload Temp Path	This field is displayed when *Access Elevation* = *sudo or dzdo*. Enter the temporary directory/path where certificates or keys are stored during certificate push actions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: /tmp/files
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
Region	Enter the geographic region of the AWS instance. *Example*: us-east-2
Instance id	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
SSM document name	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
SSM document version	Specify the version of the SSM document to be executed. *Example*: 1
S3 bucket name	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.

9. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Server path	Enter the directory/path where the application is installed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: /opt/tomcat/apache-tomcat-9.0.52

10. Click **Add**.
    Once the server is added successfully, the certificate location will be listed in the table.
11. *(optional step)* Click the (Delete) icon, if you want to delete the location details from the list.
12. Click **Save**.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the Status column.
   The status will be set to **Managed/Ignored** if the connection is successful or to **Failed/Unresolved** in case of failure.
4. From the **Status** column, click the **Managed/Ignored/Failed/Unresolved** status value.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Parsing Download Communication File**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Onboarding Certificates for Tomcat Linux Server

Discovering Certificates for Tomcat

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling Server Certificates

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to the Tomcat Linux Server

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for a Tomcat Linux Server

Prerequisites

- **SFTP** is used for the push operations. Ensure that the SFTP port is open to upload or push the certificate to the target machine.

Adding an Application Connector for Tomcat (Linux)

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Tomcat**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Tomcat devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Use Existing Configuration	If the **Use Existing Configuration** option is enabled,the existing **server.xml** file is used to create the application connector. If this option is disabled, the server configuration XML file will be overwritten with the values specified in the fields below (displayed only if this option is disabled).
***Certificate Type**	This field is displayed when **Use Existing Configuration** is not selected. From the dropdown list, select the file type of the certificate to be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Location**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **PEM (*.crt)/PEM (*.cer)/PEM (*.pem)**. This field is displayed when the **Use Existing Configuration** is disabled.
***Key Location**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **PEM (*.crt)/PEM (*.cer)/PEM (*.pem)**. The private key associated with a certificate is stored in a key file. In this field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***KeyStore Location**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***Password**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
Alias Name	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Service Restart	To restart the Tomcat service immediately after the certificate is pushed, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	This field is displayed when **Use Existing Configuration** is not selected. To push the root and intermediate certificates, along with the end certificate, select this checkbox.
***Root Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Pem (*.crt)/Pem (*.cer)/Pem (*.pem)**. Enter the path to the location on your local system where the root certificate file is stored.
***Intermediate Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Pem (*.crt)/Pem (*.cer)/Pem (*.pem)**. Enter the path to the location on your local system where the intermediate certificate file is stored.
***Truststore Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **JKS (*jks)**. For JKS certificates, the root and intermediate certificates are stored in a truststore file. In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the JKS certificate to be pushed, is stored.
***Truststore Password**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **JKS (*jks)**. Enter the password required to access the truststore file for the JKS certificate to be pushed.
***Truststore File Name**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Default JKS (*jks)**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the name of the truststore file for the JKS certificate to be pushed.

5. Enter/select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

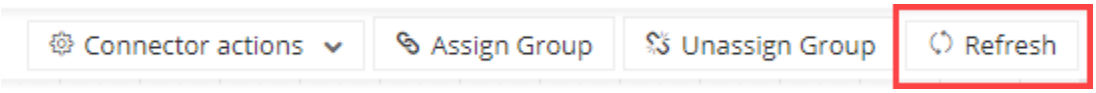
- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

d. Click **Update**.

2. To enable auto renewal for the certificate connector:

a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
The **Server Certificate** inventory is displayed.

b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
The holistic view of the selected certificate is displayed.

c. For an existing CA connector for the certificate, hover over .

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Tomcat Linux

This document helps you troubleshoot the common problems that you might encounter when using Tomcat Linux functionalities. This guide will give more troubleshooting processes on issues related to the Tomcat Linux server. The issues are device addition, communication to the server, CSR generation, access to the server, fetch configuration, discovery along with push and rollback.

Issues in Device Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Device name accepts '-' , '_' , '.' , '*' , '|' , '!' and space only, with min 2 and max 64 characters.	Server name is not valid.	Provide a server name with min 2 and max 64 characters with only the allowed characters.

Issues in Communicating to the server

Error Message	Possible Cause	Possible Solution
Failed to make the ssh connection with the given IP.	Given IP may not be connected to the network.	Validate whether username and password given during device addition are valid.
	Username/Password provided may be incorrect.	Ensure given IP is connected to the network.
	SFTP port is not open for SSH communication.	Open given port for the SSH communication.
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Access list for the device cannot be empty.	Credentials not provided for SSH communication.	Provide valid credentials for SSH communication.
Username cannot be null or empty.	Username is not provided or is empty.	Provide a valid username.
The Password cannot be null or empty.	Password is not provided or is empty.	Provide a valid password.
Key cannot be null or empty.	Key is not provided or is empty.	Provide a valid SSH key.
Password / key Mismatch or incorrect.	Unable to decrypt the password with the given key.	Provide a valid password that matches the key.
Device does not belong to Tomcat Server.	Device does not have any running tomcat instances.	Start any tomcat server in the device.
Failed to make ssh connection.	Target device may not be connected to the network.	Validate whether username and password given during device addition are valid.
	Username/Password provided may be incorrect.	Ensure the target device is connected to the network.
	The User may not have permission to execute the command.	Provide permission for the user to execute \"ps -ef\" command.
Linux rest agent communication failed	Rest agent installed in the device might not be running.	Install AppViewX Rest agent in device.
	The Client certificate installed in AppViewX might not be valid.	Install valid client certificate in AppViewX.
	Rest agent port might not be open for communication.	Ensure port is open for communication.
Error while decrypting password.	Password invalid for decryption key.	Check if the password matches with the decryption key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
CSR Generation Failed.	Given CSR Location is not available in device.	Provide a valid path to store CSR and key.
	User does not have read/write permission for the location.	Ensure the user has read/write permission to the given location.
	“Openssl” package is not installed	Install “Openssl” package in the device
	The User does not have permission to execute “Openssl” commands.	Provide permission for user to execute “Openssl” commands

Issues in Access

Access Issues might occur when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or the status field of that server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
File Download Failed.	User or User group does not have read/write permission for server.xml in device.	Provide read/write permission for user in device

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
XML Parsing Failure	FileName provided might not be a valid XML file.	Ensure the provided filename is a valid XML file.
File Download Failed.	server.xml is not found in the specified directory.	Ensure server.xml is present in the conf directory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
File Not Found	server.xml is not present in the specified directory.	Ensure server.xml is present in the conf directory.
	SSL certificate or key file parsed from configuration file is not present in the specified directory.	Ensure parsed certificate or key file is present in the directory specified in server.xml
JKS Parsing Failure	Password for Keystore file may not be present in server.xml	Password given in server.xml might be incorrect.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Push failed.	Creating local certificate files failed while Backup.	Provide required access to AppViewX to create local files
Certificate Push Failure	Invalid certificate, key, or trust location is given.	Provide the valid certificate, key, or trust location while adding an application connector.
Bind Failed as the SSL is disabled for the port	SSL is disabled for the given port on the server.	Kindly enable SSL for the port on the server.
KeyStore creation failed	Unable to create the Keystore locally.	Provide required access to AppViewX to create local files

Automating CLM for Tomcat (Windows)

Tomcat on Microsoft Windows Servers is an excellent option for organizations utilizing a Windows-based infrastructure, providing strong application server capabilities with seamless integration into the Microsoft ecosystem. It works well with Windows services such as Active Directory and SQL Server, delivering a reliable platform for enterprise applications. While Tomcat was originally designed for Unix-like systems, it is fully compatible with Windows and performs efficiently in this environment. Windows offers a graphical user interface for managing Tomcat, making it easy for administrators accustomed to Microsoft tools. This setup is often used for deploying Java applications that need integration with other Windows services.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- The Tomcat server must be in the running state. This can be validated by checking services in Windows Task Manager.
- Ensure that the target Hostname is accessible from the Windows Gateway Agent.
- The user must have the necessary permissions to access, download, and upload the **server.xml** and the certificate files associated with the configured settings. (Read and Download permissions should be granted to the user as configured.)
- The directory path containing the **server.xml** file must be specified as the **Installation Directory** during device onboarding.
- Users can manage the Tomcat installed on any drive; however, the account used to manage Tomcat in AppViewX must be configured as a **local administrator** and must have access to both the **Installation Directory** and the **server**.
- Tomcat must be present in the specified directory path, where at least one folder name should include Tomcat.
- To perform certificate discovery, SSL must be enabled on the connector for the respective service. `SSLEnabled="true"` ensures that the connector supports SSL, which is required for certificate discovery.
- Certificates located in paths without the required user permissions cannot be identified. Ensure that the certificates are either configured in the configuration files using accessible paths or update the file permissions to allow the user to access them.
- The system supports **Tomcat**, **ADManager**, and **AD Self Service Plus**. Profiles are automatically created based on the respective installation paths. During the push operation, use the **Device Selection** dropdown to choose the service and view the profiles created for it.

Onboarding Tomcat (Windows) Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Microsoft** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server Details - Field Description Table

Field	Description
***Server Type**	Select the **Tomcat** radio button.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Server name**	Enter the name of the designated Apache Tomcat server.
***Hostname**	Enter the hostname of the Apache Server.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Apache server. Gateway is the preferred communication mode.
Cert Sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache (Tomcat) server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Field	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Field	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount (when the communication mode is SSM) • All supported external vaults **Note:** • Credential Type does not suppot ssh based authentication for Microsoft devices. • If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

7. Enter the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Field	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following features: • Server addition using the **import** feature • Endpoint CSR generation
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI. **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • **Remote** **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

8. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Field	Description
Server path	Enter the directory/path where the application is installed. Tomcat ADManager & Self Service Plus has to be integrated under Windows Tomcat, so the paths can be defined as follows: • C:\<parent_folder> e.g. C:\ProgramFiles - Certificates will be discovered from Tomcat, ADManager & Self Service. • C:\ProgramFiles\Apache-Tomcat-8.5.35 - Certificates will be discovered only from Tomcat. • C:\ProgramFiles\ManageEngine\ADManager - here the certificates will be discovered only from ADManager. • C:\ProgramFiles\ManageEngine\ADSelfService - here the certificates will be discovered only from ADSelfService

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

9. Click **Add.**
   Once the server is added successfully, the path will be listed in the table.
10. *[Optional]* Click the (**Delete**) icon, if you want to delete the server path from the list.
11. Click **Save**.
    The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Onboarding Certificates for Tomcat Windows Server

Discovering Certificates for Tomcat Windows

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to the Tomcat Windows Server

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Tomcat Windows

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows Tomcat**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Windows Tomcat devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, in the **Server selection** section, from the dropdown list in **Available Devices**, select one of the following:
   - **Tomcat**: This selection displays device profiles for Tomcat. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: Tomcat: 8443 : localhost:localhost**
   - **Default**: This selection displays the push-only profiles. The bind operation is not supported.

     The profile names use the following naming convention: **WIN_DEVICE :: Default:**
   - **ADManager**: This selection displays device profiles for ADManager. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: ADManager: 8443 : localhost:localhost**
   - **ADSelfService**: This selection displays device profiles for ADSelfService. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: ADSelfService: 8443 : localhost:localhost**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Profiles are displayed based on the selection made. The **Selected devices** list is updated automatically.

4. From the profiles displayed, to select the required profiles, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Use Existing Configuration	If the **Use Existing Configuration** option is enabled, the existing **server.xml** file is used to create the application connector. If this option is disabled, the server configuration XML file will be overwritten with the values specified in the fields below (displayed only if this option is disabled).
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate directory**	Enter the path to the location on your local system where the certificate file (to be pushed to the server) is stored.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key directory**	The private key associated with a certificate is stored in a key file. In the **Key directory** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***Key File Name**	Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***KeyStore Location**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KeyStore File Name**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)**. Enter the file name of the keystore file that contains the private keys and the associated certificates. The extension **.key** is automatically populated.
***Password**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
Alias Name	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Service Restart	To restart the Windows Tomcat service immediately after the certificate is pushed, enable this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***CA File Name**	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the file name of the root certificate.
Intermediate File or Bundle Name	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the file name of the intermediate certificate.
***Truststore Location**	This field is displayed when **Certificate Type** = **JKS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. For JKS certificates, the root and intermediate certificates are stored in a truststore file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the JKS certificate to be pushed, is stored.
***Truststore Password**	This field is displayed when **Certificate Type** = **JKS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. Enter the password required to access the truststore file for the JKS certificate to be pushed.
***Truststore File Name**	This field is displayed when **Certificate Type** = **Default KS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. Enter the name of the truststore file for the JKS certificate to be pushed.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.

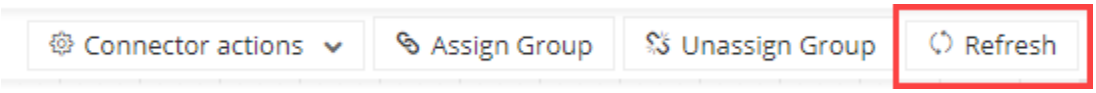
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

d. Click **Update**.

2. To enable auto renewal for the certificate connector:

a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
The **Server Certificate** inventory is displayed.

b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
The holistic view of the selected certificate is displayed.

c. For an existing CA connector for the certificate, hover over .

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting Microsoft Tomcat

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Microsoft Tomcat server.

Issues in Microsoft Tomcat Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Tomcat Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct details and click Save.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Communication to <Hostname> has failed due to Error while communicating via windows agent service	Windows agent provided is not reachable	Check Windows agent is Up and running and update the valid agent in the device addition page.
Parsing for PTPLD178 completed. 0 ports parsed.	Invalid Tomcat Server path	Login manually into the windows server and find the Tomcat installation directory path and provide the same path in Server path attribute of tomcat device addition page
Error on fetching Tomcat instance, config fetch process failed due to df9cbf67-e1af-4d8c-8a7c-fe88bb83e0b3: PowerShell ScriptExecution Error in PTPLD178 : Cannot find path 'C:\tmp_1615504487924.tmp' because it does not exist.	Invalid Server path	Login manually into the windows server and find the Tomcat installation directory path and provide the same path in Server path attribute of tomcat device addition page

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Permission denied for file/location.	1. File might not be present in the avx environment. 2. user might not have permission to read in the given source location 3.Device communication might not be established when service has started.	1.Check whether someone deleted the file from AppViewX environment. 2. Verify if read permission is given for the location. 3.Verify the device connection and restart the service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Verify the input details and check for device status error messages in the Issues in Communicating to Tomcat Server section.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e. in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/ write access to the path configured in application connector to certificate push.
Certificate push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	"Private key in Device" is enabled in application connector and also private key is available in the certificate	Ensure "Private key in Device" attribute in application connector is unchecked.
PrivateKey in device push invalid	"Private key in Device" is enabled in application connector, but key is not available in device.	Ensure to enable "Private key in Device" attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Automating CLM for JBoss

JBOSS can be configured on two types of machines: Linux and Windows. Developed by JBOSS, this server can be deployed on both operating systems, providing flexibility and compatibility for various environments.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- Ensure that the following packages are installed to facilitate device addition for linux:
  - sudo/dzdo (optional, as per the access elevation selected)
  - timeout
  - base64
- Ensure that the target IP address is accessible from the cloud connector and the port is open.
- Make sure that the language setting for the JBoss Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
- Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
- SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
- Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.
- Verify that the commands needing sudo or dzdo access have been enabled on the server.
- Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing JBoss server installed on the Windows machines).

Onboarding JBoss Linux

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **JBoss** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Operating system type**	Select the **Linux** radio button.
***Server name**	Enter the name of the designated JBoss Linux server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the JBoss server.
Communication mode	Select the SSH or SSM protocol to be used for communication between the AppViewX node and the JBoss server. **SSH** is the preferred communication mode.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name (FQDN) of the server that is to be onboarded.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the JBoss server device.
   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx • *SSH*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	By default, application uses none. You can change the command if needed. **Note:** SSH key-based authentication doesn't support password enabled sudo/dzdo.

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. Click **Save**.
   The JBoss Linux device is onboarded successfully.

Onboarding JBoss Windows

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **JBoss** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Operating system type**	Select the **Windows** radio button.
***Server name**	Enter the name of the designated JBoss Windows server.
***Hostname**	Enter the hostname of the windows server that is to be onboarded.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the JBoss server. **Gateway** is the preferred communication mode.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the JBoss server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the JBoss server device.

   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If the **Communication mode = Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\JBoss-Tomcat-8.5.35
**: Mandatory fields*	

If the **Communication mode = SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\JBoss-Tomcat-8.5.35
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

8. In the **Windows gateway details** section, enter the details as indicated below. (This section is not displayed if **Communication mode = SSM**)

Windows Gateway Details - Field Description Table

Fields	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value Remote is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway)
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway)
Client authentication certificate	Click Browse and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway)
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway)
**: Mandatory fields*	

9. Click **Save**.

   The JBoss Windows device is onboarded successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Discovering Certificates for JBoss

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to JBoss Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for JBoss

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **JBoss**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available JBoss devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Use Existing Configuration	If the **Use Existing Configuration** option is enabled,the existing **server.xml** file is used to create the application connector. (By default, this option is selected.) If it is disabled, the server configuration XML file will be overwritten with the values specified in the fields below (displayed only if this option is disabled). **Note:** After discovery, on editing the application connector, the use existing checkbox will be the selected/enabled state
Certificate Type	This field is displayed when **Use Existing Configuration** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the file type of the certificate to be pushed.
***KeyStore Location**	This field is displayed when **Use Existing Configuration** is enabled and **Certificate Type** = **JKS (*.jks)**. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***Password**	This field is displayed when **Use Existing Configuration** is disabled and **Certificate Type** = **JKS (*.jks)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
***Alias Name**	This field is displayed when **Use Existing Configuration** is disabled and **Certificate Type** = **Default JKS (*.jks)** or **JKS (*.jks)**. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The certificate topology view is displayed.

3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

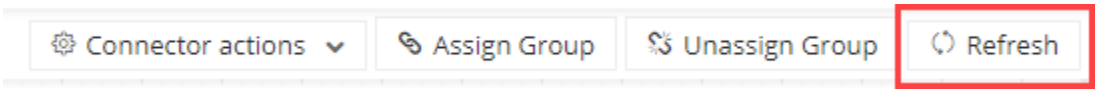
The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   Note: For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
    a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
    The **Group** page is displayed.
    b. From the **Name** field, select the required certificate group.
    The **Group : Modify : <group name>** page is displayed.
    c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
    d. Click **Update**.
2. To enable auto push for the certificate connector:
    a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
    To add an application connector, follow the instructions given here.
    b. From the menu displayed, click **Edit**.
    The **Edit Application Connector** pop-up is displayed.
    c. Select the **Push automatically** checkbox.

    > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

    d. Click **Save**.
    The holistic view of the selected certificate is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

Note: An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting Linux JBoss Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities.This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Linux JBoss server.

Issues in Linux JBoss Server Addition using AppViewX UI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Linux JBoss Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is either null or empty.	Provide device name as it is a mandatory field.
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Device IP/FQDN cannot be null or empty.	Device IP/FQDN is empty.	Provide device IP/FQDN as it is a mandatory field.
Invalid device IP/FQDN address.	IP/FQDN address is not valid.	Provide valid IP/FQDN address.
Communication to <ip/fqdn> has failed. Caused by: java.io.IOException: Unable to authenticate with password, keyboard-interactive and publickey methods Possible Remediations: 1. Kindly check the credentials provided.	Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct password and click Save.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable	Check manually by establishing an SSH session to the target device with the provided IP/FQDN.
Communication to <IP/FQDN> has failed. Caused by: java.net.ConnectException: Connection refused (Connection refused) Possible Remediations: 1. Kindly check the SSH Port configurations. 2. Kindly check the firewall settings	Problem with port configuration	Check if the configured port in the device addition page is correct.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed. Caused by: java.io.IOException: Key exchange was not finished, connection is closed.	Problem with SSH key handshake	Request to check the ciphers, key and HMACs configured in the target device and ensure AppViewX SSH-plugin supports the same
<IP/FQDN> has 0 JBoss instance(s)	No JBoss server running in the target device,	Login via SSH to the target device and execute the below command to check the status of the JBoss server “ps -ef | grep jboss”.

Issues in Accessing the Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Sudo Access failure	Linux Commands execution with sudo fails.	Verify if the system has the correct sudo setup.
dzdo Access failure	Linux Commands execution with dzdo fails.	Verify if the system has the correct dzdo setup.
Permission denied for file/ location.	File might not be present in the avx environment. User might not have permission to read in the given source location.	Check whether someone deleted the file from AppViewX environment. Verify if read permission is given for the location. Verify the device connection and restart the service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	Device communication might not be established when service has started.	

Issues in Credential List

Error Message	Possible Cause	Possible Solution
Invalid details	Mandatory credential details are missing.	Provide all the mandatory details to store the credential.
credentials already exist.	Credential List with the same name already exists.	Provide a unique name to each credential list.
Invalid file format. Accepted formats are .pem and .txt	The Identity Key file uploaded is not having the correct format.	Provide key file with correct format (.pem or .txt)

Issues in Managed Server

Error Message	Possible Cause	Possible Solution
The selected devices are managed. The operation cannot be performed.	Device cannot be managed because it is already in the managed state.	Unmanage the device(s) in the managed state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Unmanaged Server

Error Message	Possible Cause	Possible Solution
The selected devices are already unmanaged. The operation cannot be performed.	Device cannot be unmanaged because it is already in the unmanaged state.	Manage the device(s) in an unmanaged state before performing action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Fetch config not allowed for Unmanaged devices	Fetch config operation is only allowed on the devices which are in managed state.	Manage the device(s) in an unmanaged/in-progress state before performing action.
Device with inprogress status cannot be updated	Update action cannot be performed on a device in an in-progress state.	Wait for the device to be resolved to a state before performing action.

Issues in Import Server

Error Message	Possible Cause	Possible Solution
Invalid file type. Please select a valid file format (csv / xlsx / xls).	File type uploaded is not in expected format.	Supported file types are CSV/Xls/xlsx only. Check for the extension of the uploaded file.
Maximum five files allowed, please delete any completed file.	Maximum of 5 files can be maintained in file history of import page.	Delete any of the parsed/completed files to upload a new one.

Issues in Export Server

Error Message	Possible Cause	Possible Solution
Exception while exporting	General failure - Unable to create file on the local system due to permission issue. Unable to fetch device list from the database.	Provide access to be able to create the file on the local system. (e.g. check the directory where it is trying to export and give access to AppViewX for that directory) Make sure the database is running and has correct data.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <IP/FQDN> has failed.	Device communication has failed due to invalid credentials / SSH Port	Verify the input details and check device status error messages in the Issues in Communicating to Linux JBoss Server section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have the required permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct “connectorId” if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/write access to the path configured in application connector to certificate push.
PrivateKey in device push invalid	“Private key in Device” is enabled in application connector, but key is not available in device.	Ensure to enable “Private key in Device” attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR generate option from Device.

Troubleshooting Windows JBoss Server

This section helps you troubleshoot the common problems that you might encounter when using certificate server functionalities. Effective troubleshooting documents depend on the availability of useful, detailed information. This guide will give more troubleshooting processes on server addition, deletion, import, export, push, bind, rollback, and other actions associated with Windows JBoss server.

Issues in Windows JBoss Server Addition using AppViewX GUI

Error Message	Possible Cause	Possible Solution
Device Name already exists.	A device with the same name already exists in inventory.	Check the Device name, it should be unique.
Details incorrect	Some of the mandatory fields might be missing or might be invalid.	Add all the valid information in the mandatory section.

Issues in Communicating to Windows JBoss Server

Error Message	Possible Cause	Possible Solution
Device name cannot be null or empty.	Device name is empty.	Provide device name as it is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Invalid device name.	Device Name is not valid.	The Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Click on the device name in the Inventory Page. Update the correct details and click Save.
Communication to <Hostname> has failed due to Error while communicating via windows agent service	Windows agent provided is not reachable	Check Windows agent is Up and running and update the valid agent in the device addition page.
Error on fetching JBoss instance, config fetch process failed due to No configuration file found. Check installation directory path.	Provided installation directory path does not have JBoss configuration files like server.xml / standalone.xml	Login manually into the windows server and find the installation directory path which has the JBoss configuration files (server.xml or standalone.xml) and provide the same directory path in JBoss device addition page.
Error on fetching JBoss instance, config fetch process failed due to df9cbf67-e1af-4d8c-8a7c-fe88bb83e0b3: PowerShell ScriptExecution Error in PTPLD178 : Cannot find path 'C: \tmp_1615504487924.tmp' because it does not exist.	Invalid installation directory path	Login manually into the windows server and find the installation directory path which has the JBoss configuration files (server.xml or standalone.xml) and provide the same directory path in JBoss device addition page.
JBoss version fetch is failed	No JBoss server running in the target device / something wrong in the JBoss installation	Login manually into the windows server and find the JBoss server bin directory and run the below command to validate the JBoss version

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution

		For JBoss 4.0.5
		`<JBoss_server_Directory>/bin/run.bat -V`
		For JBoss 6.4 and 7.0
		`<JBoss_server_Directory>/bin/standalone.bat -V`
		Currently only JBoss 4.0.5, 6.4 and 7.0 versions are supported in AppViewX.

Issues in Accessing Server

Access Issues might be reproduced when communicating with servers while discovering or fetching configuration files. These errors can be collected either from logs, API responses, or in the status field for the particular server.

Error Message	Possible Cause	Possible Solution
Permission denied for file/location.	1. File might not be present in the environment. 2. User might not have permission to read in the given source location. 3. Device communication might not be established when service has started.	1. Check whether someone deleted the file from the environment. 2. Verify if read permission is given for the location. 3. Verify the device connection and restart the service.

Issues in Config Fetch

Error Message	Possible Cause	Possible Solution
Communication to <hostname> has failed	Hostname / Username / Password of the device added might be wrong.	Verify the input details and check for device status error messages in the Issues in Communicating to Windows JBoss Server section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.

Issues in CSR generation

Error Message	Possible Cause	Possible Solution
Problem while generating csr on target server	General Failure - SSH/SFTP communication failure	Provide correct credentials and make sure device communication is successful.
Invalid key type specified in the request	Given key type might not be supported by open SSL in the target machine.	Provide valid key type.
Problem while generating csr on the target server.	Location might not have permission.	Check the permission and provide it.
CSR and Private key has been failed	Open SSL configuration might be wrong in the target machine.	Check and correct open SSL configuration in the device.
CSR generation got failed	User has restricted access to the path configured for the “CSR FileName” and “Key File name”	Kindly ensure the user configured for device addition has read/write access to the path configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Push and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, i.e, in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is	Push to device after certificate has been retrieved from CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
	unavailable, i.e, in a new state.	
Certificate Push failed	User has restricted access to the path configured to push the certificate in the application connector	Kindly ensure the user is configured while device addition has the read/ write access to the path configured in application connector to certificate push.
Certificate push failed due to Private key In device configured. But key content is available with the certificate from appview pushRequest So failing push request.	“Private key in Device” is enabled in application connector and also private key is available in the certificate	Ensure to uncheck “Private key in Device” attribute in application connector
PrivateKey in device push invalid	“Private key in Device” is enabled in application connector, but key is not available in device.	Ensure to enable “Private key in Device” attribute in application connector, if the certificate does not have the key and the certificate is generated using CSR gen option from Device.

Automating CLM for Linux

Onboarding the Linux Server Device

Prerequisites

1. Ensure that SSH users have the required read and write permissions to perform CLM actions on the server device when access elevation is set to "**None**."
   If access elevation is configured as "**sudo**" or "**dzdo**," all commands for CLM operations will be executed using sudo or dzdo.
2. If sudo/dzdo access elevation is enabled on the device onboarding page, ensure that the user has the necessary permissions to execute the sudo command provided below.
3. Ensure that the following packages are installed to facilitate device addition:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- sudo/dzdo (Only applicable if access elevation is selected as sudo/dzdo in the device onboarding page)
- timeout
- base64

4. Ensure that the OpenSSL toolkit on the Linux machine is installed.

> **Note:** This package is essential for supporting endpoint enrollment. However, if endpoint enrollment is not required, the package is optional.

5. Ensure the server's resource health remains above the 50% threshold.
6. Ensure that the target IP address is accessible from the cloud connector and the port is open.

> **Note:** To SSH into a machine using a specific port, you can use the following command:
>
> ```
> ssh -p <port_number> <username>@<hostname_or_ip_address>
> ```

7. Ensure that the SFTP is configured.

> **Note:**
> Avoid restricting SFTP sessions to a single connection, as this may cause failures in push use cases. To prevent such issues, adjust the settings in
>
> `/etc/security/limits.conf`
>
> to allow up to 5 connections.

8. Ensure that GSKit is installed on the server to work with the KDB certificate.
   For the KDB use case, one of the available packages is utilized.

   To verify if the package is installed on the machine, use the following commands:

```
dspmqver -p 64

gsk8capicmd -version | grep FileVersion

gsk8cmd -version | grep FileVersion

gsk7capicmd -version | grep FileVersion

gsk7cmd -version | grep FileVersion
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- The command gsk8capicmd_64 -version will be supported in the future release v2024.2.0.0.
- The first successfully executed command determines the package to be used.

9. To discover a password-protected certificate, ensure the password is added to the password vault at **CERT+** > **ADMINISTRATION** > **Password Vault**.
10. SSH private keys are incompatible with password-enabled sudo/dzdo settings. Therefore, when using an SSH key for authentication, ensure that sudo/dzdo is configured for passwordless access.
11. Certificates cannot be identified from the mounted paths /boot, /bin, /dev, /lib, and /sbin. It is recommended to move the certificate to an alternative location.
12. Host-level configurations take precedence over global settings, allowing you to override global settings at the host level.

Note: The global setting can be configured in the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **(Device Settings)**.

13. Port scanning is disabled by default during Linux discovery. However, configurations are enabled at both the host level and global level to control this feature.
14. If device onboarding fails due to host key algorithm mismatches, activate the required algorithms on the client or server. Add deprecated algorithms only if necessary.
15. It is recommended to exclude the NAS mount paths from certificate scanning which might consume additional resources during scanning and might affect the server performance.

Onboarding Linux

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select the **Linux** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter a unique name for the designated Linux server that is to be onboarded
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) for device communication and integration with the Linux server.
Data center	Choose the desired data center.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the Linux server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *Credential List - HashiCorp* • *SSH*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the **Credentials** will be displayed in the dropdown. • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If **Credential list - HashiCorp** is selected, the ***Credentials list** dropdown field is displayed with credential type by default. • If SSH is selected, enter the ***Username**, ***Upload key** file, and optionally enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. **Note:** This field appears when the credential type is selected as Manual entry or SSH.
***Password**	Enter the secure password. **Note:** This field appears when the credential type is selected as Manual entry.
**: Mandatory fields*	

7. In the **Service account credentials** section, select/enter the details as indicated below. If interactive mode is not enabled for the service account on the Linux machine, the configured service account will switch the session from the logged-in SSH account to the service account using the command: `su - {serviceUserName}`. Once the session is switched, all subsequent commands will execute within the context of the service account session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Service account credentials - Field description table

Fields	Description
Username	Enter the designated username for authentication. **Note:** The service account is not used for authentication; instead, it is used to switch the session from the logged-in SSH user account to the service account.
Password	Enter the secure password.
**: Mandatory fields*	

8. In the **Vendor Specific Details** section, enter details as mentioned below.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	Select from the following:. • *None* (default) • *sudo*- to execute with root privileges using sudo access • *dzdo*- to execute with root privileges using dzdo access. **Note:** SSH key-based authentication does not support password-enabled sudo/dzdo.
Discover Formats	The Discover Formats fields contain all the possible certificate formats that are applicable to the 'Default' scan type. The formats include KBD(*.kbd), PEM(*.crt), PEM(*.cer), PEM(*.pem), DER(*.der) DER(*.cer), PKCS#7(*.p7b), PKCS#7(*.p7c), PKCS#12(*.p12), PKCS#12(*.pfx), JKS(*.JKS), JKS(*.keystore). To delete the certificate format from the scan, click the 'x' icon in the respective cert type. To delete all the certificate formats from the scan, click 'Clear' on the top-right of the field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
File Upload Temp Path	This field is displayed if the Access elevation value is selected as sudo or dzdo. Enter the path of the temp folder *Example*: /cert/temp This field is applicable for Push and CSR generation operations. This directory must have common access (RW) for the logged-in user and the service admin user if Service Account credentials are entered.
Enable access elevation for the service account?	When enabled, the commands are executed with selected access elevation. **Note:** • By default, this field is disabled. • This field is enabled only for a service account user when an Access Elevation type, such as sudo or dzdo, is selected.
Enable Network Scan	Select the checkbox to perform a network scan in addition to the managed device discovery scan for these devices. **Note:** • By default, this field is disabled and can be enabled through a global device setting. [**CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **(Device Settings)]**
**: Mandatory fields*	

9. In the **Certificate details** section, enter the details as indicated below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
Certificate Directory	Enter the actual directory/path where certificates are stored in the Linux server. *Example*: /cert/files
Scan Type	Select any of the following: • *Default* - System scans for all certificate formats and adds them in the certificate inventory. **Note:** It scans the provided directory and subdirectory as well. • *Aggressive* - System scans for all keystore files with non-standard SSL extensions and also scans for trust certificates from extension less files. **Note:** It scans only the given directory.
***Operation**	Select the value *include* or *exclude* from the dropdown field. It indicates that the specified certificate directory will be included/excluded from the certificate scan process.
**: Mandatory fields*	

10. Click **Add**.
    The certificate location will be listed in the table.
11. *(optional step)* Click the (Delete) icon if you want to delete the certificate details from the list.
12. Click **Save**.
    The Linux device is added successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The **Server Inventory** page is displayed.
3. Check that the device name appears in the inventory (name column) with the specified Status column.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.

4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Discovering Certificates for Linux

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to Linux Device

Important: Refer to the pre- and post-push script usage instructions here.

Linux Server

Important: If the certificate is generated with CSR generation at endpoint, if an application connector is created for the certificate, the following fields will be auto-populated/selected and cannot be modified:

- **Category**
- **Vendor**
- **Key Location**
- **Private key in Device**

Additionally, the available profiles will be filtered for the device profile selected at the time of certificate enrollment here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the client (or) server certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **LinuxServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Linux Server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .

You can use the **Available Devices** dropdown list to filter devices based on functionality.

The **Selected devices** list is updated automatically.

4. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Enable Truststore Update	This field is displayed for all **PEM** certificate types. Click the radio button to enable the Update System TrustStore option for root and intermediate certificates. **Note:** By default, this option is disabled. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** <⚙> **Vendor Specific Details** section > **Update System TrustStore**. Certificate Ownership & Permission	Enable the toggle button to customize the certificate ownership and define the file permissions for the certificates. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** <⚙> **Vendor Specific Details** section > **Certificate Ownership & Permission**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	 Field descriptions for the Certificate Ownership & Permission Details
Custom Push	This field is displayed for all **PEM** and **DER** certificate types. From the following options, select the method of pushing certificates: • **Chain**: The full certificate chain, which includes the end, intermediate, and root certificates, will be pushed to the server. • **Issuer & Server**: The server's certificate and its issuer's certificates will be pushed to the server. • **Server Only**: Only the server's certificate will be pushed to the server.
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Linux Server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Certificate Location	This field is displayed for all PEM, DER and PKCS#7 certificates. Enter the path to the location on your local system where the certificate file to be pushed is stored.
Key Location	This field is displayed for all PEM, DER and PKCS#7 certificates. The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***KeyStore Location**	This field is displayed for the PKCS#12 and JKS certificates. A keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the keystore file, for the certificate to be pushed, is stored.
***KeyStore Password**	This field is displayed for the PKCS#12 and JKS certificates. Enter the password required to access the keystore file for the certificate to be pushed.
***Alias Name**	This field is displayed for the PKCS#12 and JKS certificates. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Truststore Location	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the certificates to be pushed, is stored. **Note:** Truststore Location can be specified without the file extension as well.
Truststore password	This field is displayed for the JKS certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the password required to access the truststore file for the JKS certificate to be pushed.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

Field descriptions for the Certificate Ownership & Permission Details

Field	Description
Owner	Enter the username for certificate ownership on the target device.
Owner Permission	Select the owner permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
User Group	Enter name of the user group that requires access to the certificate.
User Group Permission	Select the group permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
Other User Permission	Select the other user permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Pushing a Server Certificate to a Device

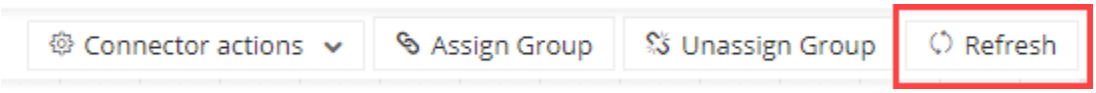
1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.
   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.
   d. Click **Update**.
2. To enable auto renewal for the certificate connector:
   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.
   c. For an existing CA connector for the certificate, hover over ⋯.
   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.
   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.
   c. Select the **Push automatically** checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Automating CLM for Windows Environment

Setting up AppViewX Windows Gateway

AppViewX Windows Gateway

The AppViewX Windows Gateway is packaged with two components:

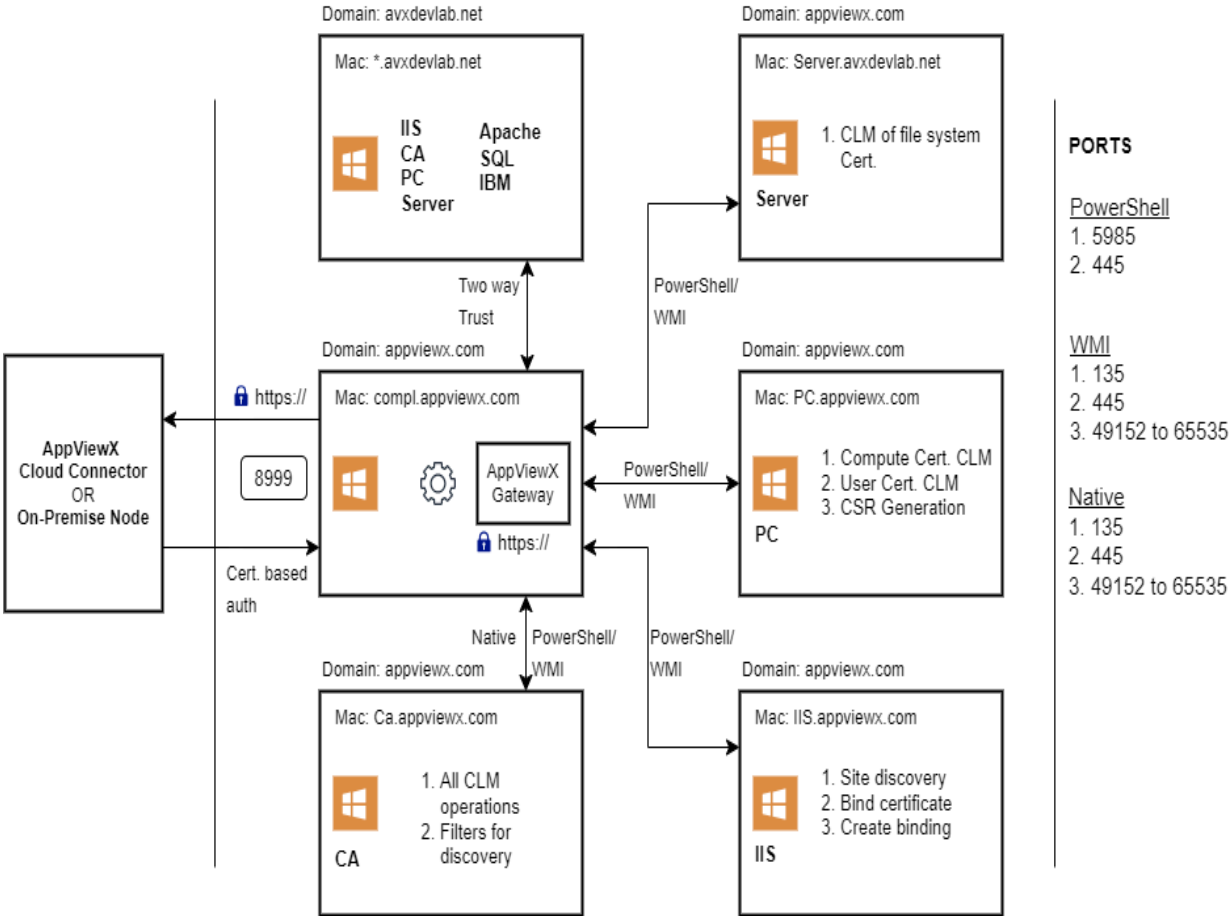
- AppViewX Windows Gateway Service
- AppViewX Windows Gateway Troubleshooting tool

AppViewX Windows Gateway service is a Windows Communication Foundation service that enables secure communication between AppViewX and Windows server infrastructure. Following are the key features of the that are supported by AppViewX for Windows Server Infrastructure:

- Certificate Life Cycle Management (CLM) on Windows servers (version 2012 R2 and above), Microsoft CA Servers, IBM Websphere, and Weblogic.
- Binding of certificates to IIS (Version 7.5 and above)
- Discovering certificates from the file system
- Executing custom scripts on PowerShell

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AppViewX Windows Gateway Troubleshooting tool facilitates the trouble shooting of any issues in the communication between AppViewX Windows Gateway service and the Windows server infrastructure in your premises.



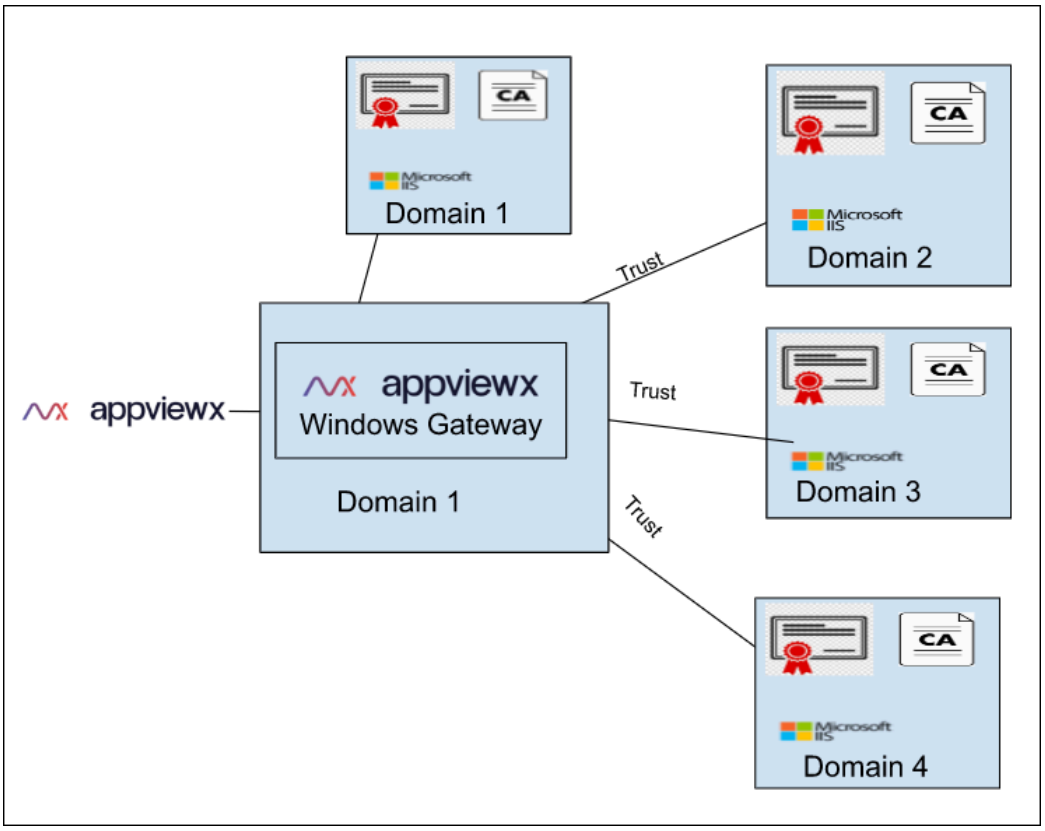
Deployment Modes

AppViewX WG installation is different for trusted and untrusted domains.

Trusted Domains

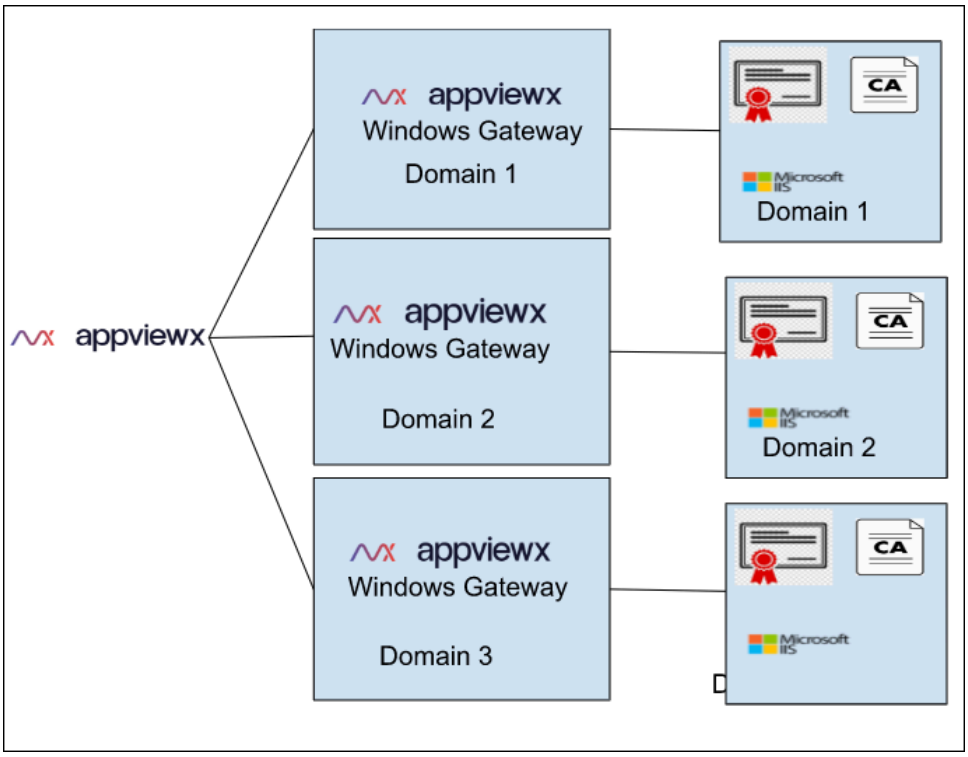
If your organization has multiple domains and each of these domains are trusted, then as depicted in the following figure, one installation of the AWG would be sufficient to manage the Windows server infrastructure of all the domains.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Alternatively, if the domains are independent, then at least one installation of the AWG is needed for each such untrusted domain, as shown in the figure below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Setting up the AppViewX Windows Gateway

Step 1: Checking Prerequisites

Software prerequisites

Name	Description
Operating System	AppViewX Windows Gateway is supported Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, Windows Server 2019, and Windows Server 2022.
.NET framework	.NET framework version 4.5.2 is required.
Admin access	Administrator privilege is needed to install AppViewX Windows Gateway.
PowerShell	PowerShell version 4.0 is needed

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Hardware prerequisites

Hardware	Capability
RAM	8 GB
HDD	10 GB
CPU	Intel or AMD processor with 64-bit support, 1.8 GHz or faster processor

Firewall prerequisites

Component	Port
Default Port communication from AppViewX to a AppViewX Windows Gateway	8999

Note:

- The firewall must not block the following port and the respective port must open on the Agent.
- During the installation of AppViewX Windows Gateway, the default port can be reconfigured. For more details refer Step 3 of the installation process.

Step 2: Downloading the AppViewX Windows Gateway Installer

Download and unarchive the **AppViewX.CertPlus.Installer.zip** file from the release portal, under the latest version of AppViewX, in the **Additional Resources** section. The download package consists of the following files:

File Name	Description
AppViewX.CertPlus.Installer.exe	Installer executable
ClientCertificateGateway.pfx	Default client certificate
ServerCertificateGateway.pfx	Default server certificate
config.xml	Application configuration settings that will override the default settings after the AppViewX Windows Gateway is installed.
Readme.txt	Help file with details of the AppViewX Windows Gateway.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

File Name	Description
InstallationLog.txt	Logs the success and error messages from the installation process.

Step 3: Installing the AppviewX Windows Gateway

Before you begin: By default, the AppViewX Windows Gateway securely communicates with AppViewX using the server/client certificates that are shipped along with the AppViewX Windows Gateway installer. If you choose to use a different server and client certificate for authentication, then follow the steps below:

1. From Windows explorer, browse to the location where you have unarchived the AppViewX Windows Gateway installer package.
2. Rename the default server certificate **ServerCertificateGateway.pfx** to **ServerCertificateGateway-Backup.pfx** and the client certificate file **ClientCertificateGateway.pfx** to **ClientCertificateGateway-Backup.pfx**.
3. Copy the server and client certificates that you intend to use in this directory.
4. Rename the server certificate file to **ServerCertificateGateway.pfx** and the client certificate file to **ClientCertificateGateway.pfx**, and then replace the default certificates in the installation folder.

Note: While installing the AppViewX Windows Gateway, you will be prompted to provide the server and client passwords.

CAUTION: If the certificate is replaced, ensure that the respective password has been provided to add the certificate to the store. The incorrect password during the installation of AppViewX Windows Gateway will cause the Windows Agent installation to fail.

1. Execute the **AppViewX.CertPlus.Installer.exe** file.
   The welcome screen for the setup wizard is displayed.
2. Click **Next**.
   The **License Agreement** is displayed.
3. Select **I accept the terms in the license agreement**.
4. Click **Next**.
   The **Destination Folder** screen is displayed.
5. To install the AppViewX Windows Gateway at the default location, click **Next**.
   OR

   To change the default destination folder:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Click **Change**.

b. On the **Change Current Destination Folder** screen, use the **Look in** dropdown list/ (up one level) icon/ (create new folder) icon to navigate to/create the required destination folder.

c. On the **Change Current Destination Folder** screen, use the **Look in** dropdown list/ (up one level) icon/ (create new folder) icon to navigate to/create the required destination folder.

d. Click **OK**.

e. On the **Destination Folder** screen, click **Next**.
The **Optionally you can modify the below details** screen is displayed.

f. Enter the details as required.

Field descriptions for the details

Field	Description
Please select default certificate store	Select the certificate store from which the certificates will be discovered and pushed to by AppViewX from the following options: • Current User Store This type of certificate store is local to a user account on a computer. It is located in the registry under the HKEY_CURRENT_USER root. • Local Machine Store (default) This type of certificate store is local to a computer and global to all the user accounts on the computer. It is located in the registry under the HKEY_LOCAL_MACHINE root. This configures the gateway for communicating with the appropriate certificate store.
Port	Port for accessing the service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Default value: 8999 (can be modified if required)
Server certificate thumbprint	If you are using a custom certificate, enter the corresponding server certificate thumbprint value.
Client certificate password	Password for accessing the client certificate For custom client certificates, enter the certificate password.
Server certificate password	Password for accessing the server certificate For custom server certificates, enter the certificate password.

Note: Refer to the **Before you Begin** section to use custom server and client certificates.

6. Click **Next**.
   The **Ready to Install the Program** screen is displayed.
7. Click **Install**.
   This will:
   • Install the AppViewX Windows Gateway Troubleshooter tool
   • AppViewX Windows Gateway service

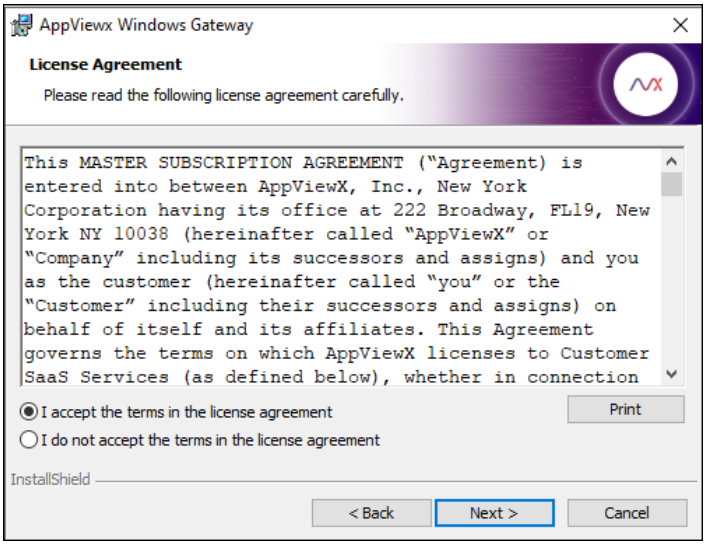
Navigating through the Installation

1. Execute the **AppViewX.CertPlus.Installer.exe** file.
   The following welcome screen for the setup wizard is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click **Next**.

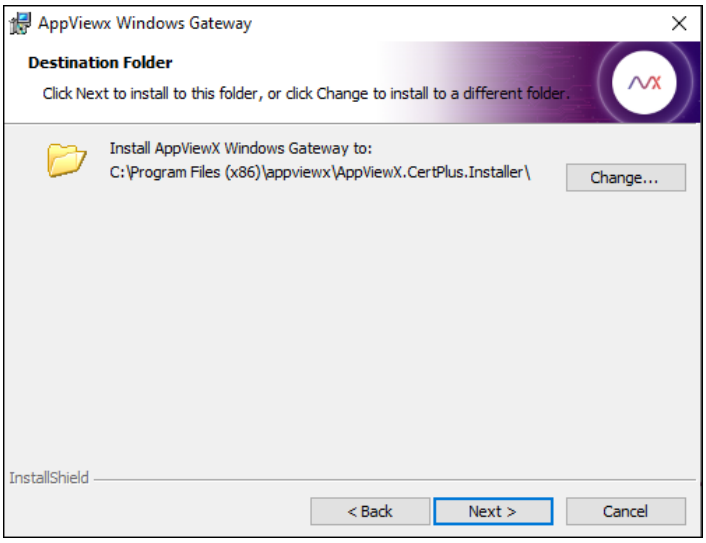
   The **License Agreement** is displayed.



3. Select **I accept the terms in the license agreement**.
4. Click **Next**.

   The **Destination Folder** screen is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



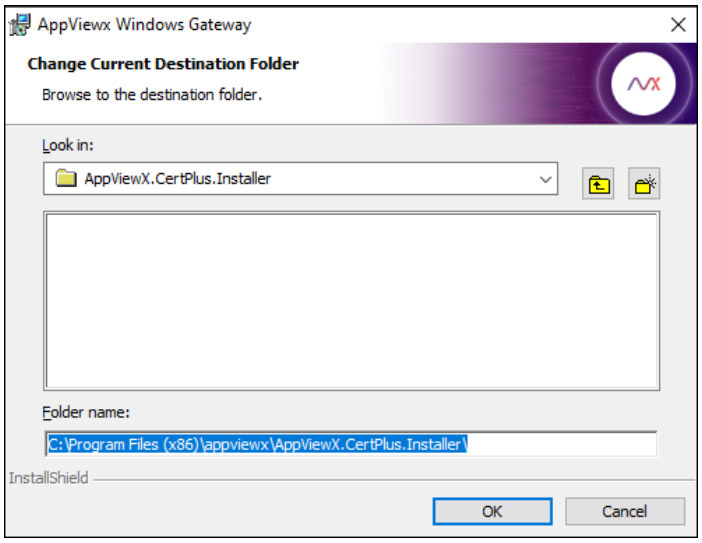
5. To install the AppViewX Windows Gateway at the default location, click **Next**.

   To change the default destination folder:

   a. Click **Change**.

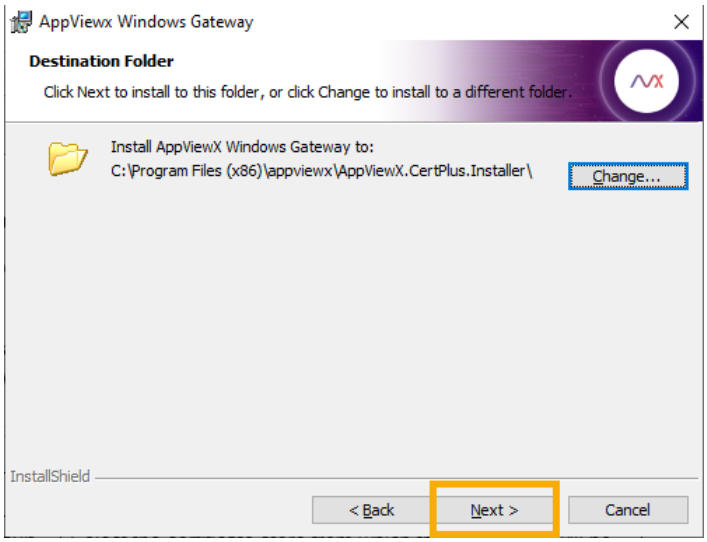
   b. On the **Change Current Destination Folder** screen, use the **Look in** dropdown list/ (up one level) icon/ (create new folder) icon to navigate to/create the required destination folder.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



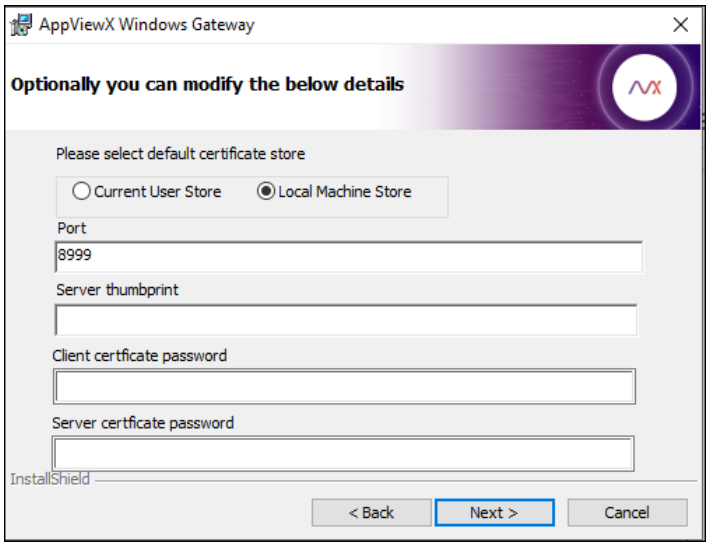
c. Click **OK**.

d. On the **Destination Folder** screen, click **Next**.



The **Optionally you can modify the below details** screen is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Enter the following details (optional):

Field	Description
Please select default certificate store	Select the certificate store from which the certificates will be discovered and pushed to by AppViewX from the following options: • Current User Store This type of certificate store is local to a user account on a computer. It is located in the registry under the HKEY_CURRENT_USER root. • Local Machine Store (default) This type of certificate store is local to a computer and global to all the user accounts on the computer. It is located in the registry under the HKEY_LOCAL_MACHINE root. This configures the gateway for communicating with the appropriate certificate store.
Port	Port for accessing the service.

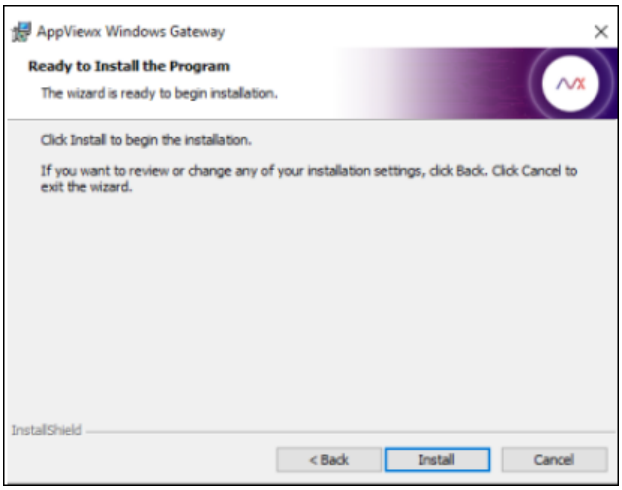
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Default value: 8999 (can be modified if required)
Server certificate thumbprint	If you are using a custom certificate, enter the corresponding server certificate thumbprint value.
Client certificate password	Password for accessing the client certificate For custom client certificates, enter the certificate password.
Server certificate password	Password for accessing the server certificate For custom server certificates, enter the certificate password.

Note: Read the **Before you Begin** section to use custom server and client certificates.

6. Click **Next**.

   The Ready to Install the Program screen is displayed.



7. Click **Install**.

   This will:

   • Install the AppViewX Windows Gateway Troubleshooter tool

   • AppViewX Windows Gateway service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Step 4: Verifying the AppviewX Windows Gateway Installation

1. Open **Services.msc** and ensure *AppViewXCertPlus* service is in running state.
2. Perform a Verification Test as follows:
   a. Access the following URL in an **Incognito** or **Private Browsing** window: *https://localhost:8999/appviewx/rest/help*.
   b. Upon accessing the URL, a dialog box will appear requesting a certificate to be chosen.
   c. Please select the AppViewX issued client certificate from the Installer package or choose the required certificate if any custom certificate is used for authentication.

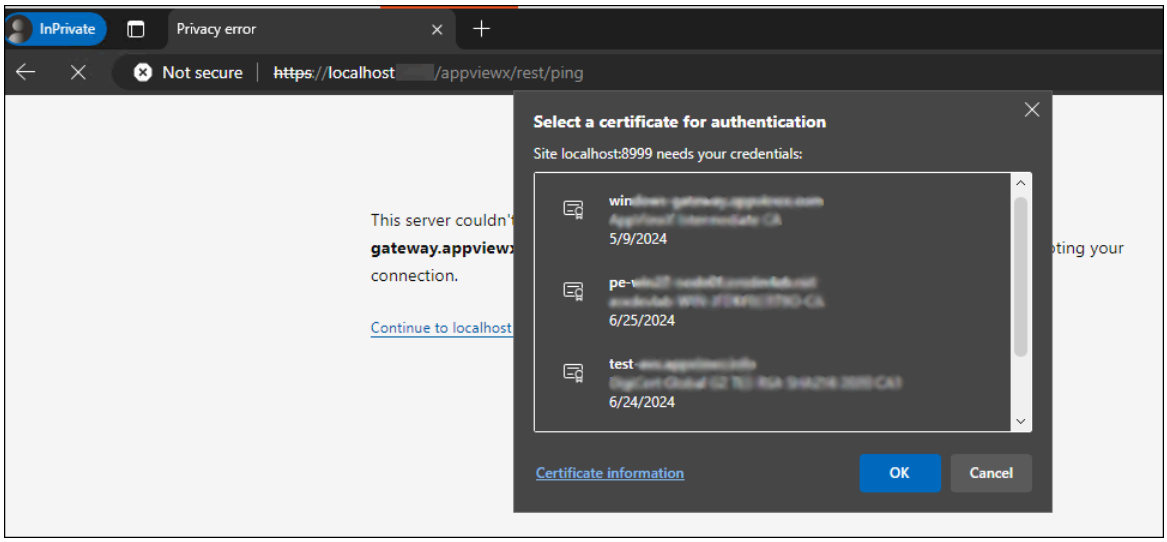
> **Note:** The same custom certificate has to be uploaded in the AppViewX CERT+ Application when configuring the Windows Gateway

Sample output:

   d. The browser should then display the available services as a response.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sample output



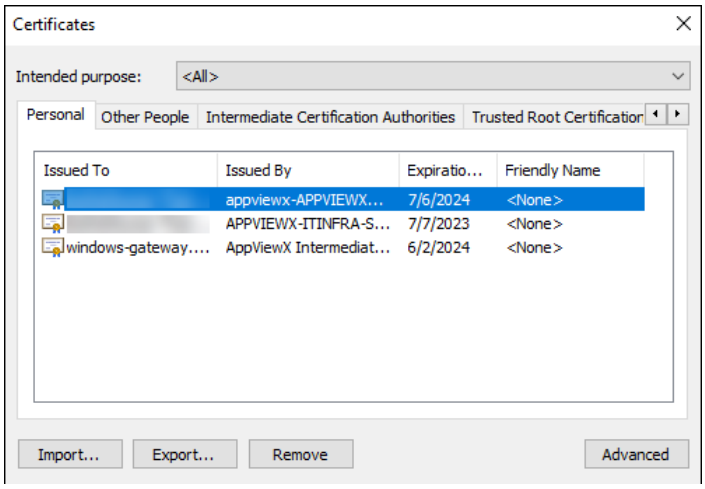
3. To verify the Windows AppViewX Gateway installation on Internet Explorer, import the client authentication certificate **ClientCertificateGateway.pfx**, from the download package (password: **appviewx**).

   a. Navigate to Internet Explorer's **Settings** > **Internet Options**, and then click the **Content** tab.

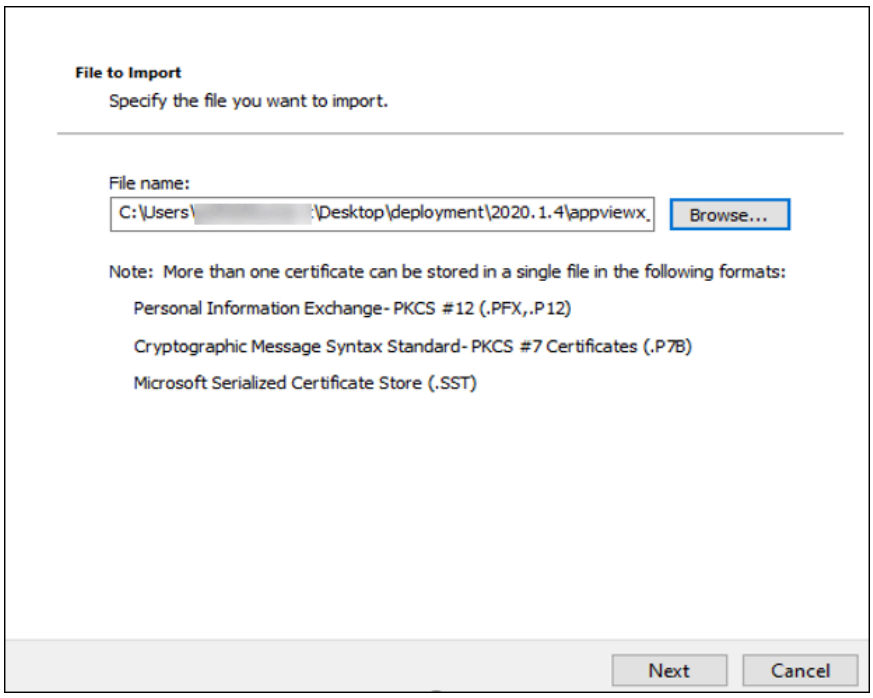
   b. Click the **Certificates** button.

   The **Certificates** popup window opens.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



c. Click the **Import** button on the **Certificates** page.



d. Go to the URL in the format: **https://hostname:portnumber/appviewx/rest/help**. For example: https://10.10.10.10:8999/appviewx/rest/help

The page displayed confirms the accessibility and installation of the service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operations at https://localhost:8999/appviewx/rest

This page describes the service operations at this endpoint.

Uri	Method	Description
BindCertificateToGateway	POST	Service at https://localhost:8999/appviewx/rest/BindCertificateToGateway
BindCertificateToSite	POST	Service at https://localhost:8999/appviewx/rest/BindCertificateToSite
BindSQLServerCertificate	POST	Service at https://localhost:8999/appviewx/rest/BindSQLServerCertificate
BootPropertiesReader	POST	Service at https://localhost:8999/appviewx/rest/BootPropertiesReader
CertDeviceInfo	POST	Service at https://localhost:8999/appviewx/rest/CertDeviceInfo
CheckConnection	POST	Service at https://localhost:8999/appviewx/rest/CheckConnection
CreateAndSubmitRequest	POST	Service at https://localhost:8999/appviewx/rest/CreateAndSubmitRequest
CreateCSR	POST	Service at https://localhost:8999/appviewx/rest/CreateCSR
CreateCSRKey	POST	Service at https://localhost:8999/appviewx/rest/CreateCSRKey
DeleteFile	POST	Service at https://localhost:8999/appviewx/rest/DeleteFile
DeleteKeys	POST	Service at https://localhost:8999/appviewx/rest/DeleteKeys
DeviceInfo	POST	Service at https://localhost:8999/appviewx/rest/DeviceInfo
DiscoverCertificates	POST	Service at https://localhost:8999/appviewx/rest/DiscoverCertificates
DiscoverCertStoreCertificates	POST	Service at https://localhost:8999/appviewx/rest/DiscoverCertStoreCertificates
DiscoverFileCertificates	POST	Service at https://localhost:8999/appviewx/rest/DiscoverFileCertificates
DiscoverIBM	POST	Service at https://localhost:8999/appviewx/rest/DiscoverIBM
DiscoverKeys	POST	Service at https://localhost:8999/appviewx/rest/DiscoverKeys
ExecuteScriptInPowershell	POST	Service at https://localhost:8999/appviewx/rest/ExecuteScriptInPowershell
ExecuteWLSTScript	POST	Service at https://localhost:8999/appviewx/rest/ExecuteWLSTScript
ExtractCertificate	POST	Service at https://localhost:8999/appviewx/rest/ExtractCertificate
GetCertStores	POST	Service at https://localhost:8999/appviewx/rest/GetCertStores
LatestLog	POST	Service at https://localhost:8999/appviewx/rest/LatestLog
MicrosoftCAs	POST	Service at https://localhost:8999/appviewx/rest/MicrosoftCAs
MqConnector	POST	Service at https://localhost:8999/appviewx/rest/MqConnector
Ping	GET	Service at https://localhost:8999/appviewx/rest/Ping
PushAndBindCertificate	POST	Service at https://localhost:8999/appviewx/rest/PushAndBindCertificate
PushCertificate	POST	Service at https://localhost:8999/appviewx/rest/PushCertificate
PushDiscoveredCertificates	POST	Service at https://localhost:8999/appviewx/rest/PushDiscoveredCertificates
ReadFile	POST	Service at https://localhost:8999/appviewx/rest/ReadFile
ReadMultipleFiles	POST	Service at https://localhost:8999/appviewx/rest/ReadMultipleFiles
RemoveCertificateFromStore	POST	Service at https://localhost:8999/appviewx/rest/RemoveCertificateFromStore
RemoveSiteBinding	POST	Service at https://localhost:8999/appviewx/rest/RemoveSiteBinding
RevokeCertificate	POST	Service at https://localhost:8999/appviewx/rest/RevokeCertificate
SaveKeys	POST	Service at https://localhost:8999/appviewx/rest/SaveKeys

Note: In the event that a custom client authentication certificate is used, ensure that the CRL mentioned in the certificate is reachable from the AppViewX Windows Gateway hosting server.

Note: The steps to import the client certificate will differ depending on the web browser.

e. To register the AppViewX Windows Gateway with AppViewX, navigate to the AppViewX Cert+ (on the SaaS deployment) admin UI/UX, and then **Settings** > **Certificate**.

Note: To add the AppViewX Windows Gateway for

- Microsoft Enterprise CA integration, see Microsoft Enterprise CA.
- Microsoft Standalone CA integration, see Microsoft Standalone CA
- Microsoft Device integrations, refer to the following sections:
  - Microsoft IIS
  - Microsoft PC
  - Microsoft Server
  - Microsoft SQL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

f. Register the gateway using the following URL format: **https://hostname:portnumber/appviewx**. For example: https://10.10.10.10:8999/appviewx

Note:

- The AppViewX's custom client authentication uses CRL and OCSP as proposed by Microsoft. If you choose to use Microsoft's client authentication then comment the config file as below:

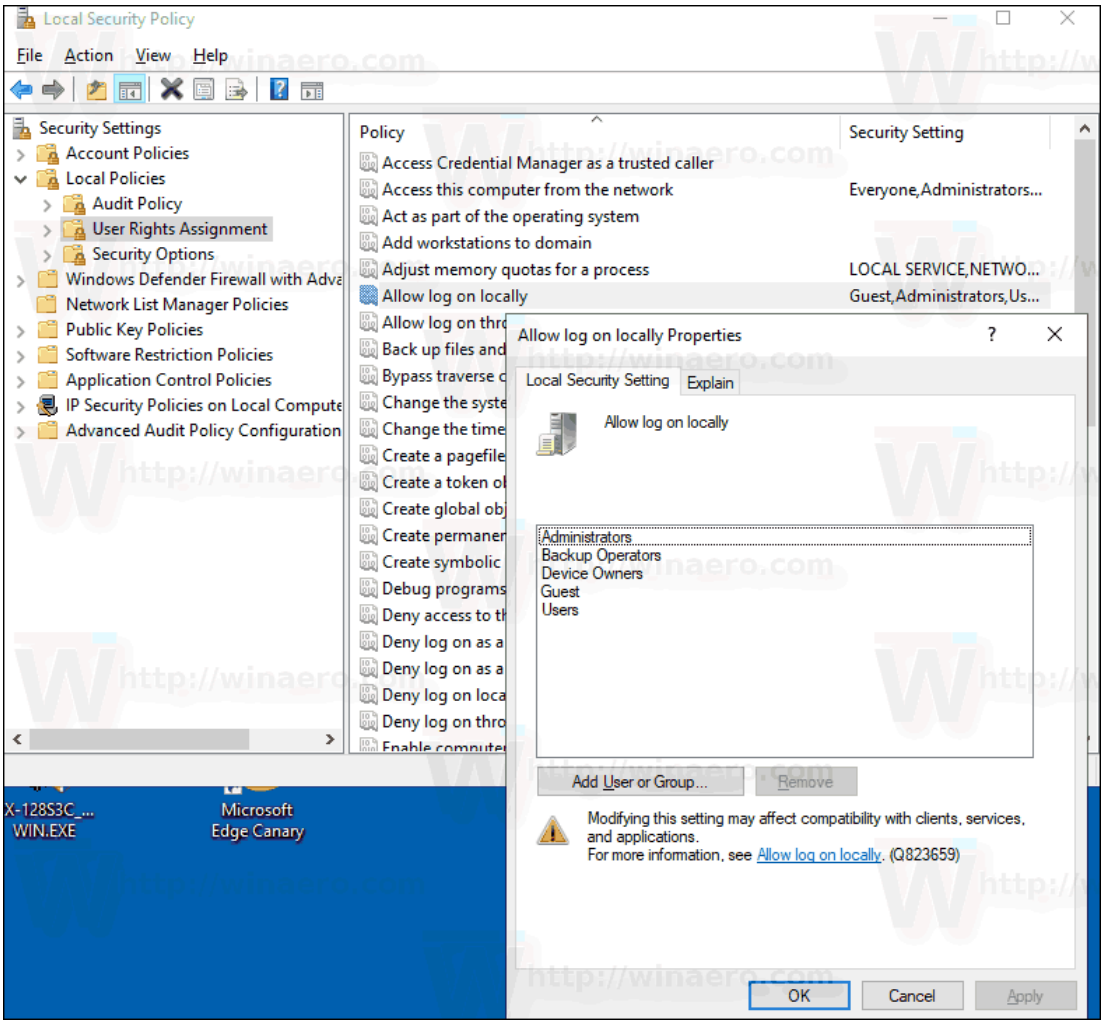
```
<!--<serviceCredentials>
<clientCertificate>
<authentication certificateValidationMode="Custom"
customCertificateValidatorType="AppViewX.CertPlus.Service.CustomValidator,  AppViewX.CertPlus.Service" />
</clientCertificate>
</serviceCredentials>-->
```

- AppViewX recommends customers not to change this default authentication configuration provided by AppViewX.
- Refer Appendix A for the prerequisites for managing the Windows Server infrastructure and Troubleshooting for troubleshooting the target machine.

Step 5: Managing a Target Server

To manage a target server with different credentials, the user account can be configured using the AppViewX user interface. Enable the **Allow log on locally** user rights assignment security policy for the account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Non-Admin Service Account

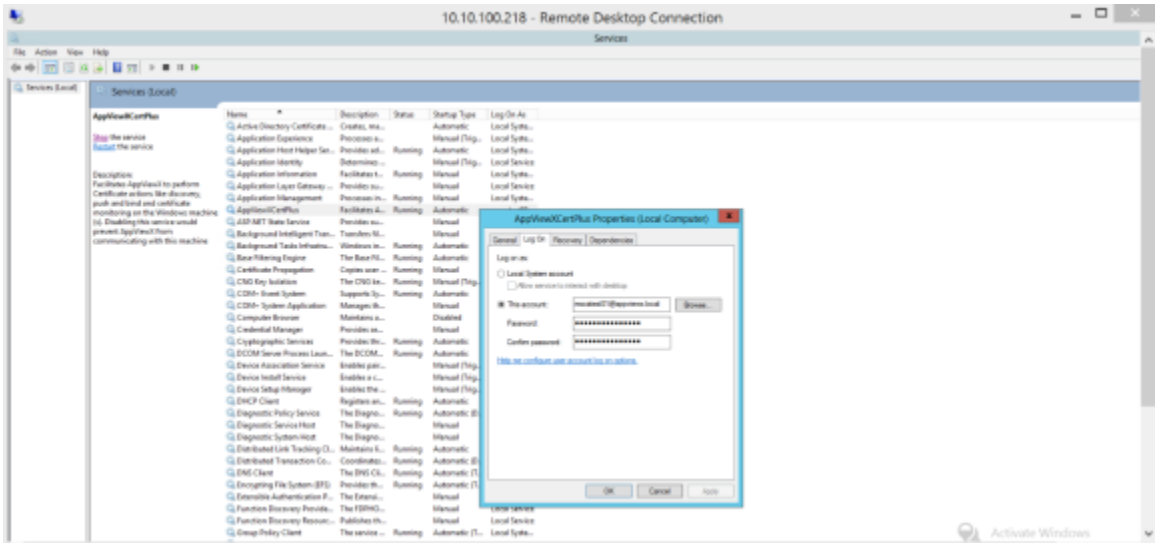
- The AppViewX Windows Gateway can be installed using a service account that is part of the local administrator group account.
- In this case, the following command has to be executed from the PowerShell:

```
netsh http add urlacl url=https://+:8999/appviewx/user=Username@domainname
```

- In the above command, the value for `user = <domainserviceaccount>` and the `URL` must be changed respectively.
- On the Regedit path, "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\EventLog\Application\AppViewXCertPlus" add the service account and give Full Control permission.
- On the Installation path of the application, the user needs permission to read and write.
- If the network has a policy that the service account cannot be part of the administrator group or that the service account is only a part of the user group, then:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The AppViewX Windows Gateway is installed using an admin account.
- It is then associated with the service account in **services.msc**, by adding the account in the properties of the AppViewXCertPlus service. Refer to the following image.



- Once this is done, stop and start the `AppViewXCertPlus Service` in `services.msc`.

Step 6: Disabling Current Operating System Information

On the https header, modify the registry.

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\HTTP\Parameters] "DisableServerHeader"=dword:00000002
```

Uninstalling the AppViewX Windows Gateway

Uninstalling AppViewX Windows Gateway involves the following steps:

1. Go to Windows control panel, select **Add or Remove program**.
2. Select **AppViewX.CertPlus.Installer**, and then click on **Uninstall** button.

Updating AppViewX Windows Gateway

Before updating the AppViewX Windows Gateway to a newer version, the old version of the AppViewX Windows Gateway should be uninstalled. Follow the instructions in Chapter 5 to uninstall AppViewX Windows Gateway.

After uninstalling the older version of AppViewX Windows Gateway, proceed with the installation of the new AppViewX Windows Gateway. Refer Chapter 2 for instructions on Installing the AppViewX Windows Gateway.

Appendix A

Appendix B

Onboarding Microsoft Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the ADC tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The Device details page is displayed.
4. Select **Microsoft Server** logo from the Vendors list. The following screen is displayed.
5. In the **Server Details** section button, enter details as mentioned below.

Server Details - Fields Description Table

Field Name	Description
Server Type	Select Server Type as **Microsoft Server**.
***Server name**	Enter the name of the designated Microsoft server.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Apache server.
Communication mode	Select the *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the Microsoft server. Gateway is the preferred communication mode.
Host name	Enter the hostname of the server to be onboarded. **Note:** If the Microsoft Server is configured for the **integrated** Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Name	Description
Cert sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Field Name	Description
Credential Type	Select the type of credential from the dropdown list. • Manual entry • Gateway credentials • Credential List - AppViewX AppViewX also supports the following external credential types: • HashiCorp • CyberArk • BeyondTrust • Thycotic If **Communication mode** = **SSM**, then **Credential list - cloudAccount** is supported.
***Username**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the username for authentication. **Note:** The username must be added with the domain in the following format: <username>@<domain>.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Name	Description
***Password**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the password for authentication.
***Credential List**	This field is displayed only if **Credential Type** = **Credential List - AppViewX**. Select the configured credentials value or Default from the dropdown list.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Field Name	Description
Credential Type	Select the type of credential from the dropdown list that will be entered in the username and password field. • Manual entry • Gateway credentials • Credential List - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Name	Description
	Note: Click the (**Settings**) icon next to the field to configure the ARN Advanced Settings.
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2 **Note:** Click the (**Settings**) icon next to the field to configure the S3 Advanced Settings.
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

7. Enter the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • Remote **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	From the following options, select the gateway: • New • Existing
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway** and is non-editable.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
**: Mandatory fields*	

8. In the **Vendor Specific Details** section, select/enter the details as follows.
   If **Communication mode** = **Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Services**	Select checkbox values as **MS Server**, or **Exchange Server**, or **Windows Gateway** or all. The default value is **MS Server**. **Note:** • Selecting all of the services will discover the certificates from MS Server, Exchange Server, and Windows Gateway. • If no services are selected, the service implementation will default to MSServer and CSR generation will be disabled. • The **Exchange Server** option is not supported for **Windows Gateway Mode** = **Integrated** and **SSM**. • Windows Gateway service can be used to enable the CLM support for the Windows GW certificate.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Fields	Description
***Services**	For SSM the default services enabled is **MS Server**. (Exchange Server is not supported in the cloud).
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance Id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example*: i-02573cafcftext **Note:** Click the (**Settings**) icon next to the field to configure the ARN Advanced Settings.
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2 **Note:** Click the (**Settings**) icon next to the field to configure the S3 Advanced Settings.
Proxy Required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

9. In the **Certificate details** section, select/enter the details as follows.

Note: The **Certificate details** section will not be displayed if **Communication mode** = **Gateway** and **Services = Exchange Server** (in the Vendor specific details)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
***Keystore Credential Type**	Select the type of credential from the dropdown list. • Manual entry • Credential List - Thycotic **Note:** If **Credential list - Thycotic** is selected, the ***Keystore Credential Name** dropdown field is displayed. Select any of the preconfigured credential values.
Certificate location	Enter the directory/path where the application is installed. *Example*: C:\Microsoft\ADFS\
Certificate Password	Enter the certificate password. This field is only displayed for Keystore Credential Type = Manual entry)
**: Mandatory fields*	

10. Click **Add.**
    Once the server is added successfully, the path will be listed in the table.
11. *(optional step)* Click the (Delete) icon, if you want to delete the server path from the list.
12. Click **Save**
    The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Discovering Certificates for Microsoft Server

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to Microsoft Server

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Microsoft Server

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Microsoft Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ABAP server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, from the dropdown list, select one of the following options:
   - **MS Server**
   - **Exchange Server**
   - **Windows Gateway**

Note: If you have selected **Exchange Server**, profiles will be displayed in the format, **Server type : Service name : Node details**.

4. Under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For MS Server: Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select the location to which the certificate will be pushed: • **File System** (a storage location on your computer) • **Certificate Store** (a specialized location within the operating system for managing digital certificates)
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Credential Type**	This field is displayed for the JKS certificates. From the dropdown list, select the source of the access credentials.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the server, or a URL from where the server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	This field is displayed for the **PEM**, **DER**, and **PKCS#7** certificates. The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***KeyStore Password**	This field is displayed for JKS certificate types. Enter the password required to access the keystore that contains the JKS certificate to be pushed.
Alias Name	This field is displayed for the PKCS#12 and CERTDB certificate types.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Private key entry password	This field is displayed for the JKS certificates. Enter the password required to decrypt the private key associated with the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate Certificate Alias Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. This field is not displayed for the JKS certificate types. Enter the alias name of the intermediate certificate file.
***Root Certificate Alias Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the alias name of the root certificate file.

For Exchange Server: Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	The certificate type is defaulted to the following values • For AppViewX CSR generation - certificates which have private key, **PKCS#12(*.p12)** is the supported certificate format. • For Endpoint CSR generation **PKCS#7(*.p7b)** is the supported certificate format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The password field in not set for **PKCS#12(*.p12)** since its a transactional password and handled by AppViewX.
***Friendly Name**	• For **PKCS#12(*.p12)** it is the user specified input. • For **PKCS#7(*.p7b)** certificate type, the friendly name is the common name of the certificate specified at the time of Endpoint CSR generation. During the push operation the common name is populated in the friendly name field (it is not editable).
Services	From the dropdown list, select one from the following services: • **POP** • **IIS** • **SMTP** • **IMAP**
Restart Service	This field is displayed only when **Services** = **IIS**. To restart the IIS service after the certificate is pushed, to ensure all changes have taken effect as required, select this checkbox.

For Windows Gateway: Field descriptions for the Certificate Details

Field	Description
Location Type	The **Certificate Store** option is selected by default—a specialized location within the operating system for managing digital certificates. (**File system** is disabled).
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. **Note:** Root and intermediate names cannot be entered for this CSR/Certificate. If auto-push is enabled for CSR, try again after the certificate is generated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings

This is applicable for all service/devices such as Microsoft Server, Microsoft Exchange Server, Windows Gateway.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

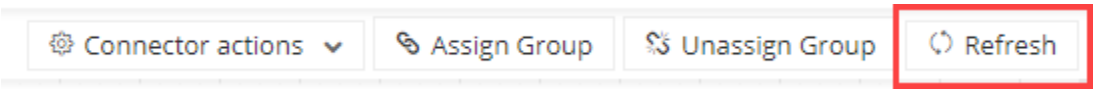
The **Confirmation** dialog box is displayed.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

> **Note:** While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   > **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
    a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
    The **Group** page is displayed.
    b. From the **Name** field, select the required certificate group.
    The **Group : Modify : <group name>** page is displayed.
    c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
    d. Click **Update**.
2. To enable auto push for the certificate connector:
    a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
    To add an application connector, follow the instructions given here.
    b. From the menu displayed, click **Edit**.
    The **Edit Application Connector** pop-up is displayed.
    c. Select the **Push automatically** checkbox.

    > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

    d. Click **Save**.
    The holistic view of the selected certificate is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

What's Next?

- Set alerts to be notified of all events and status changes in the certificate lifecycle.

Automating CLM for Microsoft IIS

The Microsoft IIS (Internet Information Services) server is a web server developed by Microsoft. It is used to host and serve web applications and websites on Windows Server operating systems. In a typical deployment, an IIS server device is configured with SSL/TLS certificates to secure communications and establish trust between the server and its clients.

Prerequisites

- Both the Windows gateway agent and the windows machine running Microsoft IIS must have administrative privileges.
- Ensure that PowerShell and WinRM tools are installed and running on the Windows machine.
- Verify that Microsoft IIS services are active on the Windows machine.
- At least one website must be configured on the Microsoft IIS server.
- If the Gateway type is selected as WMI, ensure that WMI is properly configured (optional).
- The user must have **read and write permissions** for the folder specified as the **discovery path** and the **push location**.
- The user must have the right **access permissions** to the drive, and the drive must be **configured in sharing mode** to allow discovery and push operations.
- To discover and push the certificate to the store, user should have **Read and write access to the trust store** (to discover and push certificates).

Limitations

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Certificates enrolled at the endpoint cannot be pushed to the file system, as this functionality is not supported in the application.
- External vault integration in Folder credential is not supported when the shared path credential differs from the onboarded device credential.

Onboarding Microsoft IIS

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Microsoft IIS** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the name of the designated Microsoft IIS server.
***Hostname**	Enter the hostname of the Microsoft IIS server that is to be onboarded. **Note:** If the Microsoft IIS server is configured for the integrated Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Microsoft IIS server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Microsoft server device.

Credentials - Field Description Table

Fields	Description

***Credential Type**	Select the credential type from the dropdown.
	• *Manual entry* (default)
	• *Credential List - Appviewx*
	• *Gateway credential*
	• All supported external vaults
	
	Note:
	• If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
	• If **Gateway credential** is selected no other fields are displayed.
	• AppViewX supports the following external credential types:
	  • HashiCorp
	  • CyberArk
	  • BeyondTrust
	  • Thycotic

Certificate Location Details	By default, only the **Certificate store** option is selected for certificate discovery. If the user wants to discover certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	from the **Centralized file system**, they must select the corresponding checkbox, specify the certificate location. The certificate location supports both a shared path and a local file system directory; however, only one of these can be configured at a time. From the given location `pfx and p12 certificates will be discovered.` Choose a pre-configured password vault from the dropdown menu to parse the password protected certificates.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. Enter/Select the **Windows gateway details**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • Remote • LocalSystem **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***FQDN**	**Note:** This field is displayed when **Gateway location** = **LocalSystem**. Enter the FQDN of the local system on which the Windows Gateway Agent will be installed.
***Port**	**Note:** This field is displayed when **Gateway location** = **LocalSystem**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Enter the port number of the local system on which the Windows Gateway Agent will be installed.
***Select gateway**	**Note:** This field is not displayed when **Windows Gateway Mode** = **Integrated**. From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

Microsoft IIS Discovery

The discovery process for Microsoft IIS can leverage multiple sources, as outlined below:

- **File System Discovery**: Requires at least one file path to be specified during device addition.
- **Microsoft Certificate Store Discovery**: Automatically scans the server's certificate store for available certificates.
- **Shared Network Path Discovery:**IIS supports discovery through shared network paths. This means that within the network of the managed IIS device, the logged-in user can be granted access to a shared folder on another system. By specifying that shared network path in the certificate location, the discovery process can be performed successfully.

The **AppConnector** is created dynamically based on the discovery method used.

Connector Behavior for IIS

For certificates discovered from the File System in Microsoft IIS, both Push-only/Default connectors and detailed profile connectors are created. The available profiles depend on the selected push certificate type in the application connector.

Push Certificate Type Options

When adding or updating certificates in Microsoft IIS using the app connector, users can select the desired Push Certificate Type:

a. **Push Certificate:** You can only push certificates to the Certificate store or Centralized File System.
   - Only the Device Name profile is displayed for selection.
   - Profile naming convention:

     `{device_name}`

b. **Push and Bind Certificate:** You can push a certificate to the Certificate store and bind it to the IIS site.

   All detailed profile connectors are displayed for selection, using the convention described below:

   `MS IIS::<siteName>::<host/IP>:<port>:<hostname (optional)>:CS[:(SNI or protocol)]`

   - `<siteName>`: IIS site name or wildcard (*)
   - `<host/IP>`: Hostname or IP address, or *
   - `<port>`: Port number (e.g., 80, 443)
   - `<hostname (optional)>`: FQDN or specific hostname, if applicable
   - `CS`: Certificate Store indicator
   - `:(SNI or protocol)`: *(SNI)* if SNI enabled, *(http)* for HTTP profile, as applicable

   Examples:

   - `MS IIS::test:*:8090:CS`
   - `MS IIS::test:*:443:CS`

Copyright © 2025 AppViewX Inc. All Rights Reserved.

8. In the **Certificate location details** section, enter the details as indicated below.

Certificate Location Details - Field Description Table

Fields	Description
***Location type**	Select to the checkbox for *Certificate store* or *Centralized file system* or both as the location type.
***Certificate location**	Enter the directory or path where the certificate is stored. *Example*: C:\Cert\folder
***Password vault**	Select any of the preconfigured password vault values. None is selected by default.
**: Mandatory fields*	

9. In the **Folder credential details** section, enter the details as indicated below.

Folder Credential Details - Field Description Table

Fields	Description
***Folder credentials**	Select from • Use gateway credential • New • Use device credential (disabled by default)
***Credential type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *Credential List - CyberArk* • *Credential List - Thycotic* • *Credential List - Hashicorp* • *Credential List - BeyondTrust* **Note:** If **Credential list - Appviewx** or **Credential list - CyberArk** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

10. Click **Save**.
    The Microsoft IIS device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Discovering Certificates for Microsoft IIS

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
***Discovery Instance Name**	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Time Zone	Select your time zone.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Servers**.
Devices window	A list of all the managed server devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Search**: Enter keywords to filter and select the desired vendor or device name from thematching results. • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to Microsoft IIS Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Microsoft IIS

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **IIS**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.
***Push Certificate Type**	Select from the following options: • **Push Certificate** You can only push certificates to the Certificate store or Centralized File System. • **Push and Bind Certificate** You can push a certificate to the Certificate store and bind it to the IIS site.

Based on the information entered here, the **Server selection** section is populated with the list of available IIS devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select where the certificate to be pushed is located: • **Certificate Store**: A repository that stores certificates and their associated keys • **Centralized file system**: A file server that stores certificate files

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Store	This option is displayed only when **Location Type** = **Certificate Store**. Within the certificate store, select the location where the certificates are stored from the following options: • **Personal store**: A location where user-specific certificates, such as those used for encryption and authentication, are stored • **Web hosting store**: A location where certificates used for web server configurations are stored
***Friendly name**	Enter the certificate friendly name assigned in the CSR generated for requesting/ enrolling the certificate
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.
***Bind type**	**Note:** This field is displayed when the **Push Certificate Type** is selected as **Push and Bind Certificate**. To manage the SSL/TLS certificates for websites, select a bind type from the following options: • **Update Certificate Only**: Update the SSL/TLS certificate used by an existing site binding on the web server. It replaces the current certificate with a new one without modifying any other settings associated with the site binding (such as the hostname or port). • Update Site Binding: Update the SSL/TLS settings for an existing site binding on the web server. It allows you to update not only the certificate but also other settings associated with the site binding, such as the hostname, port, and SSL/TLS protocol settings. • **Create New Site Binding**: Create a new site binding on the web server for the specified hostname, port, and IP address (if applicable) and associates it with the specified SSL/TLS certificate. This is typically used when you want to add a new website or domain to the web server and configure SSL/TLS settings for it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- **Certificate Store Push**
  - If the certificate is created **at the endpoint** (private key on the device):
    - The **server certificate** is pushed in **.pem** format.
    - The **root and intermediate certificates** are pushed in **.pfx** format.
  - If the certificate is created **in AppViewX** (private key within AppViewX):
    - The **server**, **root**, and **intermediate certificates** are all pushed in **.pfx** format.
- **File System Push**
  - Only a **single .pfx file** (containing the certificate, private key, and root/intermediate certificates if available) is pushed to the specified file system location.
- **Supported Certificate type for File System Push**
  - PKCS#12 (.pfx)
- When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:
  - **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
  - **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings
- File system push is supported only when the Centralized File System option is enabled on the onboarding page.
  - The Certificate Location field is optional. By default, the certificate will be pushed to the directory specified during onboarding.
  - The password for the certificate pushed to the file system is retrieved from the vault configured during onboarding.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system. **Note:** Overwrite option is disabled by default for Microsoft IIS.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

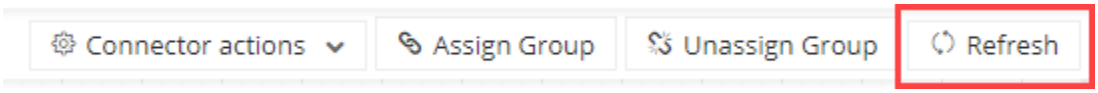
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

> **Note:** The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

> **Note:** While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.

The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Automating CLM for Firewall

Onboarding a Firewall Device

Adding a CheckPoint Device

Refer to Automating CLM for CheckPoint

Adding a Cisco Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - AppViewX needs an internet or proxy connection to communicate with the firewall via the REST API.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
  - The API must have elevated (admin) permissions to read and modify SSL certificates.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

  - Username/Password
  - Credential List AppViewX/CyberArk
- **Enable Password**: Required
- **License Check**: Not required
- **Services and Port for AppViewX Communication**: Port numbers 22 (SSH)
- **Internet Access/Proxy**: Not required
- **Location from which the certificates are discovered if Certificate Managed**: Certificates are fetched by issuing a direct command to the device through SSH.

Note: For Visual Workflow action items, you will require credentials with write privilege.

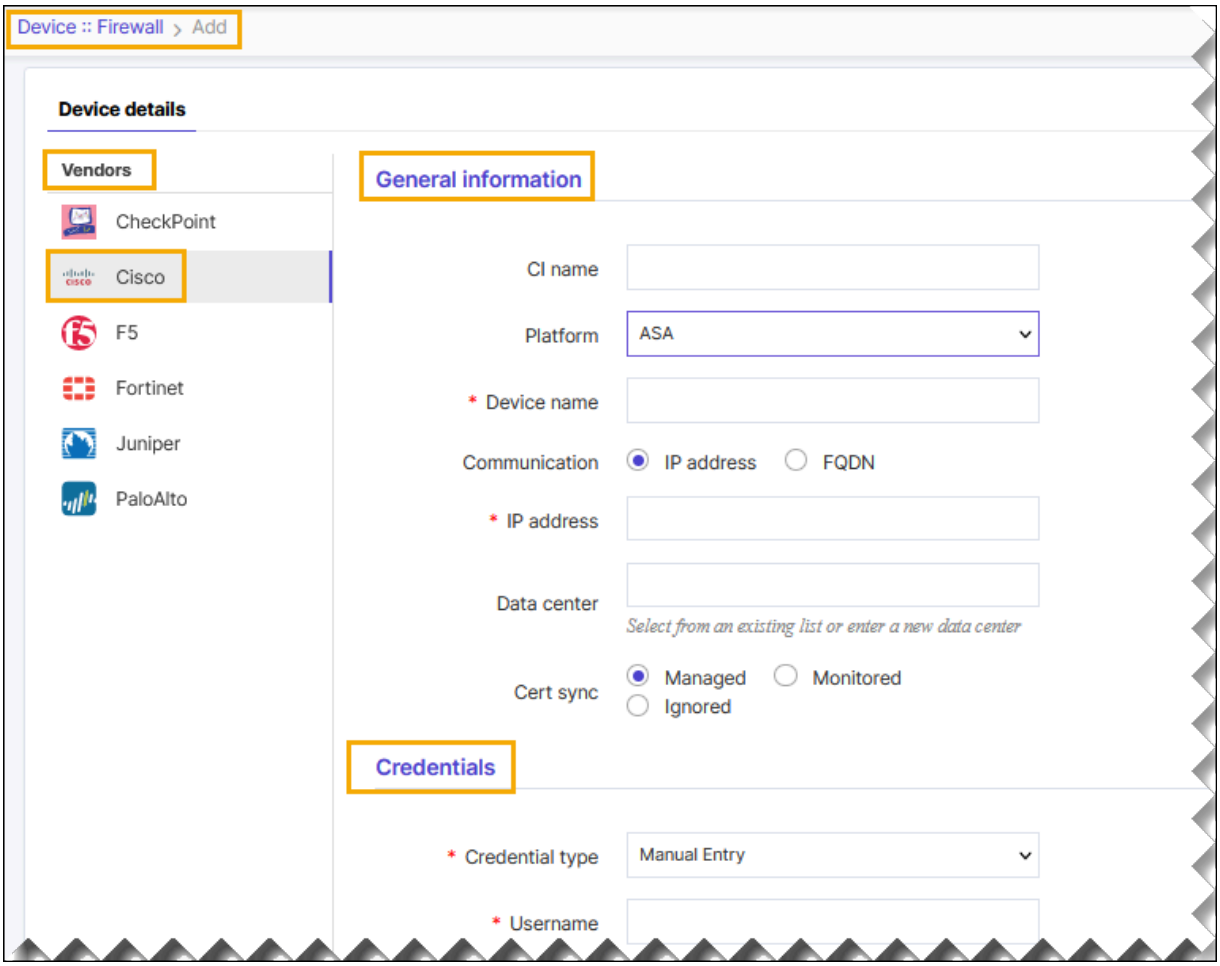
Configuring a Cisco Firewall Device

Prerequisites

To add a Cisco device:

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click (**Add**) icon located upper right corner.
   The **Add** page appears.
3. Select the **Cisco** vendor from the left side bar

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the dropdown list. The available option is ASA.
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

5. Enter the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the dropdown list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the privilege password.
**: Mandatory fields*	

6. Enter the field information in the **Secondary device information** section as follows:
   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

7. Click the **Save** button to add an Firewall device.

Note:

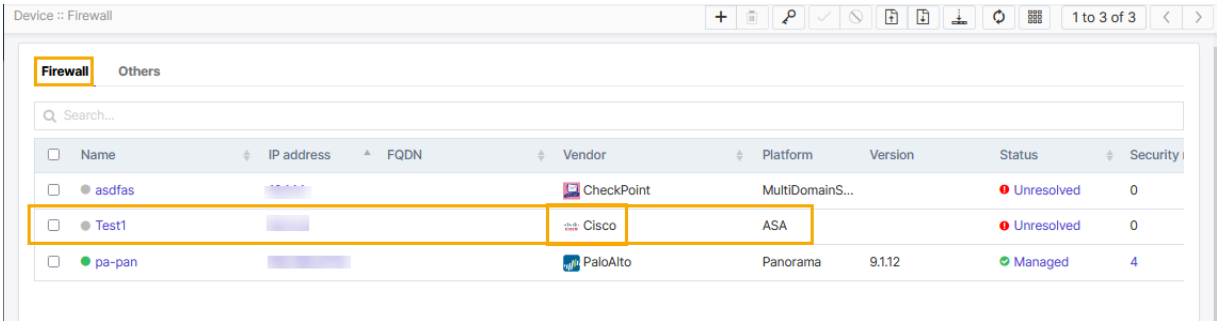
- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating the Cisco Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. Search the device name and validate whether the device is added successfully.



Adding a F5 Firewall Device

Configuring a F5 Firewall Device

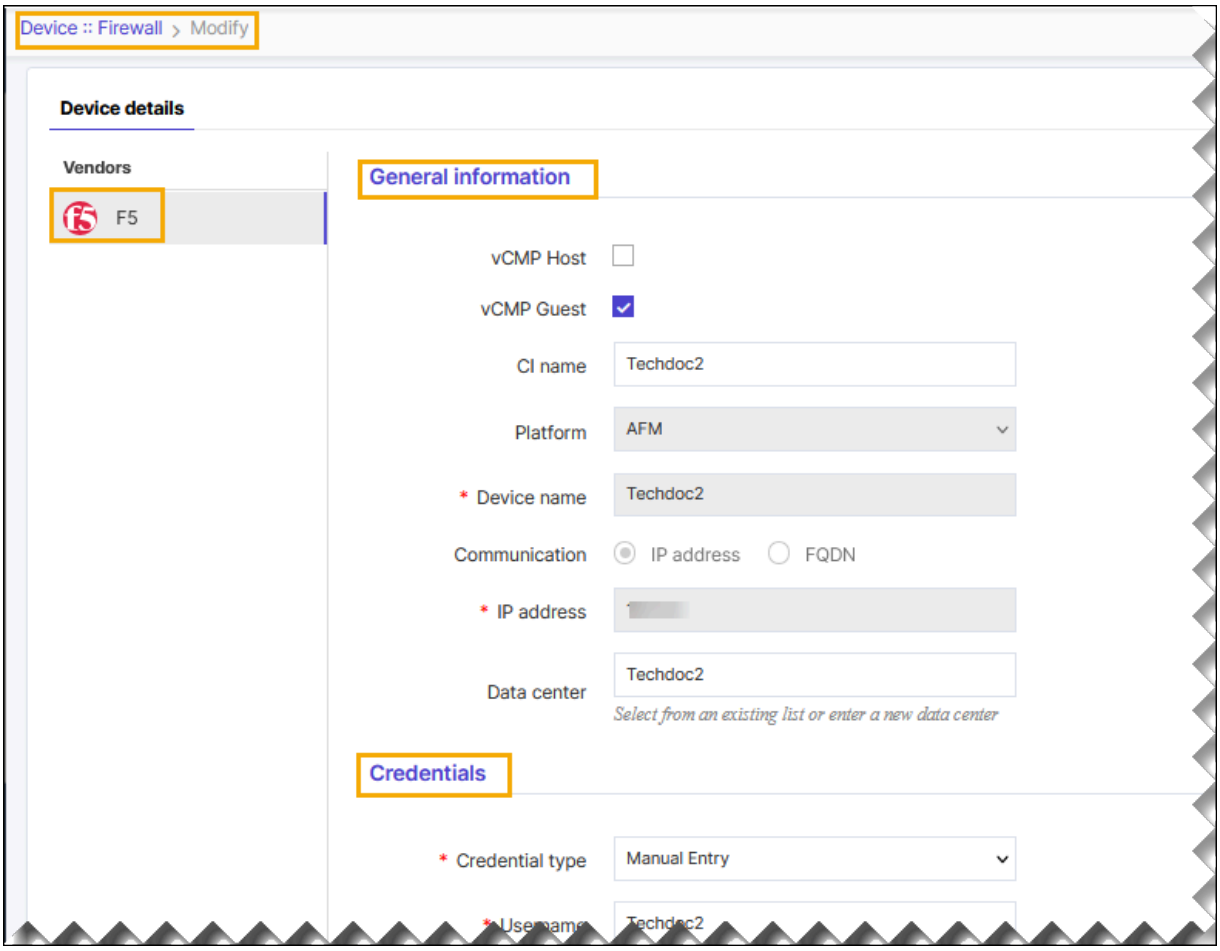
To add a F5 device:

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click + (**Add**) icon located upper right corner.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Add** page appears.

3. Select the **F5** vendor from the left side bar.



4. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
vCMP Host	Select the check box to add host based device if required.
vCMP Guest	Select the check box to add device as guest if required..
CI name	Name of the CI.
Platform	Select the platform from the dropdown list. The available option is AFM.
***Device name**	Unique custom identifier of your device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

5. Enter or select the field information in the **Credentials** section:

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the privilege password.
**: Mandatory fields*	

6. **Note:** This step is applicable only if you have selected **vCMP Host** check box in the **General Information** section.

   Enter or select the field information in the **Secondary device information** section as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
- **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
- **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

7. Click the **Save** button to add an Firewall device.

Note:

- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating the F5 Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. Search the device name and validate whether the device is added successfully.

Adding a Fortinet Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**: Username/Password
- **Services and Port for AppViewX Communication**: Port number 22 (SSH)

> **Note:** For Visual Workflow action items, you will require credentials with write privilege.

Configuring Fortinet Firewall Device

To add a Fortinet device:

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click + (**Add**) icon located upper right corner.
   The **Add** page appears.
3. Select the **Fortinet** vendor from the left side bar.
4. Enter the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select from the following options: • Fortigate • FortiManager
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the dropdown list or enter a data center name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
***SSH Port**	By default, it is 22.
**: Mandatory fields*	

5. Enter the field information in the **Credentials** section:

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential Type from the dropdown list. If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Api token	Enter the API token.
**: Mandatory fields*	

6. Enter the field information in the **Certificate specific details** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
Discover Private Keys	Select the check box.
Private Key Default Password	Enter the default password.

7. Enter the field information in the **Secondary device information** section as follows:
   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

   Note:
   - By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
   - By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

8. Click the **Save** button to add an Firewall device.

   Note:
   - To discard the changes, click the Cancel button.

   A pop-up message is displayed as **Device added successfully**.

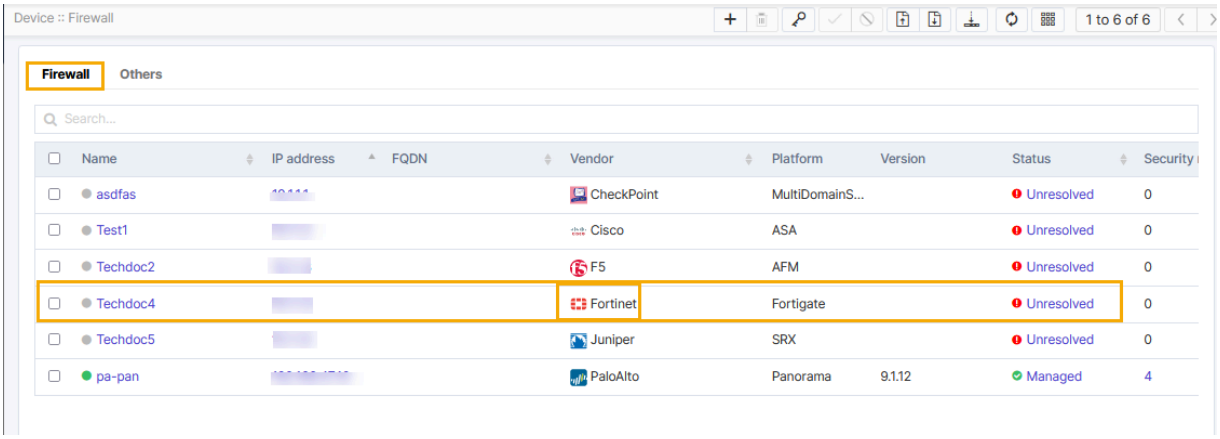
Validating the Device

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Search the device name and validate whether the device is added successfully.



CLI Commands

Minimum required permissions

- **Version of device:** 6.x or above
- **License type:** Cert+ Only 16
- **Device management**

  Network > Configuration > Read Only (Communication and version check)

- **Certificate discovery**
  - System > Configuration > Read/Write (System Local Certificates, System Setting)
  - VPN > Read (VPN Profiles)
  - Firewall > Others > Read (SSL/SSH Inspection Profile)
  - User & Device > Read (User Authentication Setting Profile)
- **Certificate Push and Bind**
  - System > Configuration > Read/Write (Push to System Local Certificates, Bind System Server Certificate)
  - VPN > Read/Write (Bind to VPN Setting Profile, VPN Ipsec profile)
  - Firewall > Others > Read/Write (Bind to SSL/SSH Inspection Profile)
  - User & Device > Read/Write (Bind to User Authentication Setting Profile)

Operation	Command	Description
System Status	`get system status`	Displays system information such as firmware version, VDOM status, and system mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description
Configure VDOM	`config vdom`	Enters VDOM configuration mode to manage Virtual Domains.
Edit configurations	`edit ?`	Enters edit mode for a specific configuration object (e.g., VDOM, interface, etc.).
End	`end`	Ends the current configuration mode and applies changes.
Switch to global	`config global`	Switches to the global configuration context.
Configure System's console	`config system console`	Used to configure console settings; often used with set output standard for terminal output.
Set output to standard	`set output standard`	Sets the console output format to standard (non-JSON or non-table).
Show full CA certs (VPN)	`show full-configuration vpn certificate ca`	Displays full configuration of CA certificates used in VPN.
Show full CA certs	`show full-configuration certificate ca`	Displays full configuration of CA certificates in the system.
Show full local certs (VPN)	`show full-configuration vpn certificate local`	Displays full configuration of local VPN certificates.
Show full local certs	`show full-configuration certificate local`	Displays full configuration of local certificates in the system.
Show IPSec VPN config	`show vpn ipsec {CONFIGURATIONS}`	Displays IPsec VPN configurations.
Show SSL VPN settings	`show vpn ssl settings`	Displays current SSL VPN settings.
Show user settings	`show user setting`	Displays user authentication settings.
Show SSL/SSH profiles	`show firewall ssl-ssh-profile`	Displays SSL/SSH inspection profiles used in firewall policies.
List CA cert names (VPN)	`show full-configuration vpn certificate ca ?`	Lists available CA certificate names in VPN configuration.
List CA cert names	`show full-configuration certificate ca ?`	Lists available CA certificate names in the system configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description
List local cert names (VPN)	`show full-configuration vpn certificate local ?`	Lists available local certificate names for VPN.
List local cert names	`show full-configuration certificate local ?`	Lists available local certificate names configured on the device (non-VPN).
Set CA certificate	`set ca \"{CERT_CONETNT}\"`	Sets the CA certificate content during certificate configuration.
Set private key	`set private-key \"{PVT_KEY_CONETNT}\"`	Sets the private key content for a certificate.
Set certificate content	`set certificate \"{CERT_CONETNT}\"`	Sets the actual certificate content.
Set password	`set password`	Sets a password (often used when importing password-protected keys/certs).
Unset password	`unset password`	Removes a previously set password from the configuration.
Configure SSL VPN settings	`config vpn ssl settings`	Enters configuration mode for SSL VPN settings.
Unset SSL VPN cert	`unset servercert`	Removes the currently configured SSL VPN server certificate.
Set SSL VPN cert	`set servercert {CERT_NAME}`	Sets the server certificate for SSL VPN.
Configure SSL/ SSH profile	`config firewall ssl-ssh-profile`	Enters configuration mode for SSL/SSH inspection profiles.
Unset SSL/SSH cert	`unset server-cert`	Removes the configured certificate from the SSL/SSH profile.
Set SSL/SSH cert	`set server-cert {CERT_NAME}`	Sets the server certificate for SSL/SSH inspection.
Configure global settings	`config system global`	Enters system-wide global configuration mode.
Set admin portal cert	`set admin-server-cert {CERT_NAME}`	Sets the certificate used for the FortiGate admin GUI (HTTPS portal).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description
Configure user settings	`config user setting`	Enters configuration mode for user authentication settings.
Set user auth cert	`set auth-cert {CERT_NAME}`	Sets the certificate used for user authentication.
Configure IPsec VPN	`config vpn ipsec`	Enters IPsec VPN configuration mode.
Append cert to IPsec VPN	`append certificate {CERT_NAME}`	Appends a certificate to the IPsec VPN configuration.
Generate certificate	`execute vpn certificate local generate`	Generate a local certificate on the device.

Pushing Server Certificates to the Device

The certificate can be pushed to the device in only PEM format.

Note: Starting from FortiOS version 5.4 and above, when pushing a certificate to FortiGate, if a certificate with the intended name is already present, a timestamp is automatically appended to the certificate name. This ensures the new certificate is successfully imported without conflict, while retaining the original.

Warning:

Fortigate does not allow importing a certificate that has already been imported earlier—even if you attempt to import it again under a different name or context. FortiOS maintains a checksum or fingerprint of certificates.

If a certificate with the same cryptographic material already exists in the system (for example, with the same subject, serial number, and public key), it will reject duplicates to prevent redundancy or configuration conflicts.

Profiles will be discovered irrespective of the cert sync option selected during device addition or during an on-demand discovery. The following profiles will be discovered currently in AppViewX:

- **Shared location:** Denotes a push-only operation which pushes a certificate to the end device.

  Profile convention : {DeviceName}::System/Vdom name

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **SSL VPN Settings:** SSL VPN allows remote users to securely connect to the corporate network using an encrypted SSL tunnel via a web portal or FortiClient. Apushed certificate can be associated to SSL-VPN setting if it is enabled.

  Profile convention : {DeviceName}::System/Vdom name::SSL VPN Setting:SSL VPN Setting

- **SSL/SSH Inspection Profile:** SSL/SSH inspection profiles inspect encrypted traffic (HTTPS/SSH) for threats or policy enforcement. Apushed certificate can be associated to any inspection profile if it is configured with Protecting SSL Server option.

  Profile convention : {DeviceName}::System/Vdom name::SSL/SSH Inspection Profile:{Inspection profile name}

- **System Setting Https Server Certificate:** This controls which certificate is used to secure access to the Fortigate administrative web interface. Apushed certificate can be associated to the System administration setting server certificate.

  Profile convention : {DeviceName}::System::System Setting Https Server Certificate

- **User Authentication settings:** Defines how users authenticate to Fortigate (e.g., captive portal, VPN, web portal). Ensures only clients with valid certificates can authenticate, enhancing security. Apushed certificate can be associated to the User authentication setting server certificate.

  Profile convention : {DeviceName}::System:User Authentication settings:User Authentication settings

- **IPSec VPN Profile:** IPSec VPN allows site-to-site or remote client VPN connections using the IPSec protocol suite. Apushed certificate can be associated to the IpSec tunnel configured in the device.

  Profile convention : {DeviceName}::System:IPSec VPN Profile:{TUNNEL_NAME}

Backing Up Certificates

Before a bind operation, a backup will be taken for the currently associated certificate so that a rollback can be performed once the new certificate is associated.

Binding Certificates

Certificates can be bound for profile connectors. These connectors include all the connectors other than the shared location connector.

The selected selected certificate will be pushed to the shared location first and then the certificate will be associated to the selected profile.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Rolling Back Certificates

In the event of a rollback, the system restores the previous state by unbinding the current certificate, pushing and binding the backed-up certificates to the selected profile.

CSR Generation

Note: Generation of CSR can be performed for a Fortigate device during certificate enrollment. The Partition name, CSR File Name, and Key File Name have to be provided.

Adding a Juniper Firewall Device

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - AppViewX needs an internet or proxy connection to communicate with the firewall via the REST API.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
  - The API must have elevated (admin) permissions to read and modify SSL certificates.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:
  - Username/Password
  - Credential List AppViewX/CyberArk
- **Enable Password**: Required
- **License Check**: Not required
- **Services and Port for AppViewX Communication**: Port number 22 (SSH)
- **Internet Access/Proxy**: Not required
- **Location from which the certificates are discovered if Certificate Managed**: Not supported

Note: For Visual Workflow action items, you will require credentials with write privilege.

Configuring a Juniper Firewall Device

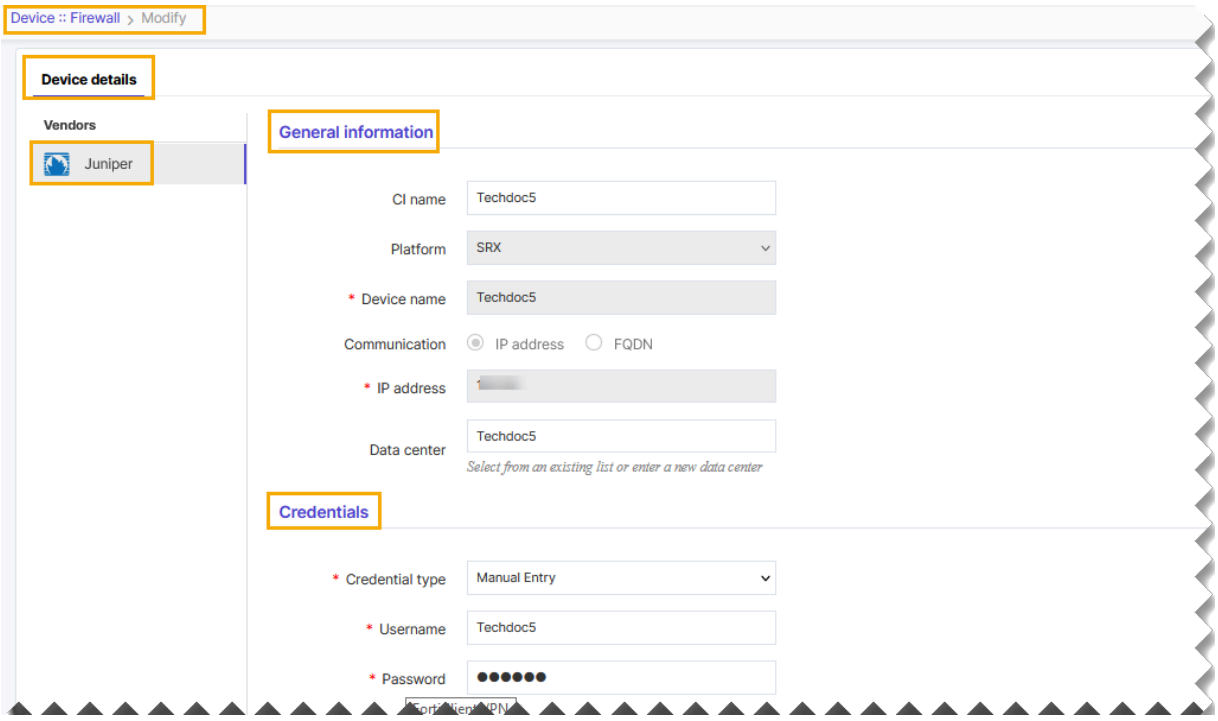
To add a Juniper device,

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click + (**Add**) icon located upper right corner.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Add** page appears.

3. Select the **Juniper** vendor from the left side bar. bar.



4. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the drop-down list. The available option is, • SRX.
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/ FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

5. Enter or select the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the password.
**: Mandatory fields*	

6. Enter or select the field information in the **Secondary device information** section as follows:

   • **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.

   • **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.

   • **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

7. Click the **Save** button to add an Firewall device.

Note:

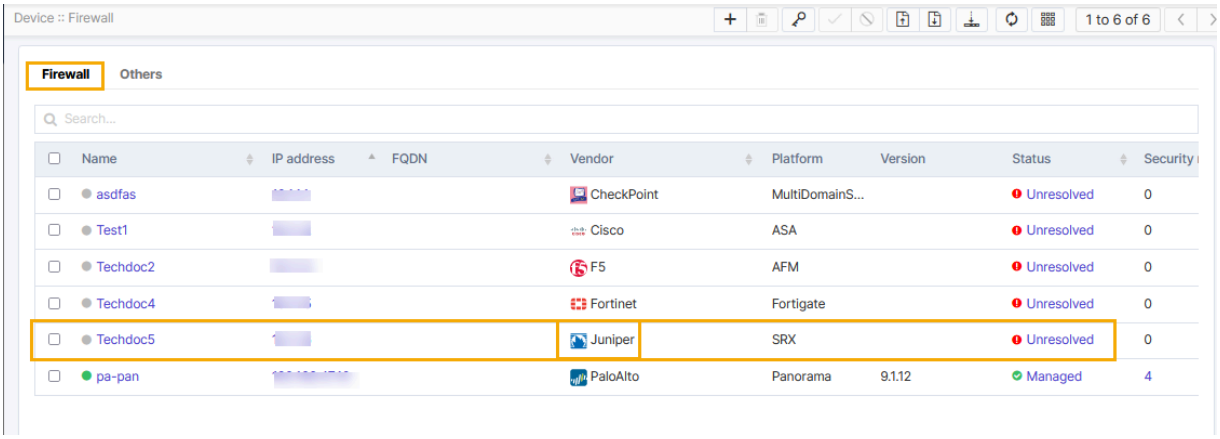
- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating the Juniper Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. Search the device name and validate whether the device is added successfully.



Adding a Palo Alto Firewall Device

Refer to Automating CLM for Palo Alto.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Discovering Certificates for Firewall

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

   Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Note: Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Firewalls**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Devices window	A list of all the managed firewall devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Adding and Pushing Certificates to Firewall Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding Application Connectors for Firewalls

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **Firewall**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select the required firewall vendor. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **Profile Selection** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

2. To select the device(s) to which the certificate will be pushed, under **Profile Selection**:

   a. For **CheckPoint** Vendor, to filter the available profiles, from the dropdown menu for Available profiles, select a value from the following options:
   - **Admin Portal**
   - **HTTPS Inspection**.

   b. For **PaloAlto** vendor, to filter the available profiles, from the dropdown menu for Available profiles, select a value from the following options:
   - **PaloAlto Firewall**
     - Shared location
     - SSL/TLS Service profile
     - IKE Gateways
     - SSL Inbound Inspection Profiles
     - Authentication Profiles.
   - **Panorama**
     - Shared location
     - SSL/TLS Service profile
     - IKE Gateways
     - SSL Inbound Inspection Profiles
     - Authentication Profiles.

   c. From the list of **Available Devices** displayed, to select the target device(s) for pushing the certificate, click .

   The **Selected devices** list is updated automatically.

3. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Trust Point Name**	A trustpoint configuration is an element that includes details related to a certificate such as the certificate file, the private key file, the CA certificate, and other settings related to the certificate. In the **Trustpoint Name** field, enter the name of the trustpoint configured on the target system to which the certificate will be pushed.
Alias Name	Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Password	Enter the password required to access the certificate file/trust store.
Private Key Passphrase	Enter the password required to access the private key file associated with the certificate.
Push to Firewall	To push the certificate when it is updated directly to the firewall, select this checkbox.
Trust Type	**Important:** Trust type is applicable only for server certificates issued by private CAs with a customized template that issues certificate to the PaloAlto device with **Key Usage** as **Certificate Signing** for certificates that have a private key. **Trust Type** defines how a firewall handles SSL/TLS traffic based on whether a certificate is trusted or untrusted. Select a trust type status from the following values: • **Forward Trust** Select this option to establish the firewall as a trusted third party (proxy) to the session between the client and the server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	For **Trust Type** = **Forward Trust**, if the server's certificate is valid (trusted) and signed by a known, trusted CA (like VeriSign, DigiCert, etc.), the firewall decrypts the traffic, inspects it, and then re-encrypts it using its own certificate, which is trusted by the client due to the configured CA. • **Forward Untrust** Select this option for the firewall to notify to clients when the server certificate is signed by a CA that the firewall does not trust. For **Trust Type** = **Forward Untrust**, if the server's certificate is self-signed or from an unknown CA, the firewall may re-encrypt the traffic using an untrusted certificate, causing the client to see a warning that the connection is not secure. **Note:** If the certificate trust type was already specified when configuring the certificate on the device, then upon discovery in AppViewX, the trust type field will reflect the same value as configured in the device port.

4. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

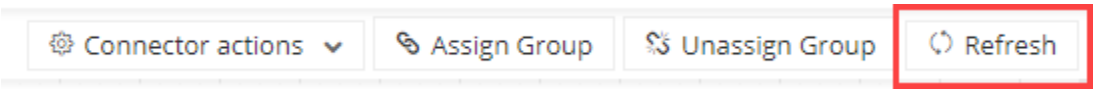
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The work order status displayed beside the connector updates to **Push-Review In Progress**.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Note: Every time a certificate is pushed to a shared location in Palo Alto Firewall / Panorama,the user currently needs to log into the device and manually commit the changes. Moving forward, pushing a certificate to the shared location will automatically trigger the commit process.
The push operation will only be marked as successful in AppViewX after the commit process successfully completes on the device.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   > **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Automating CLM for Palo Alto

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

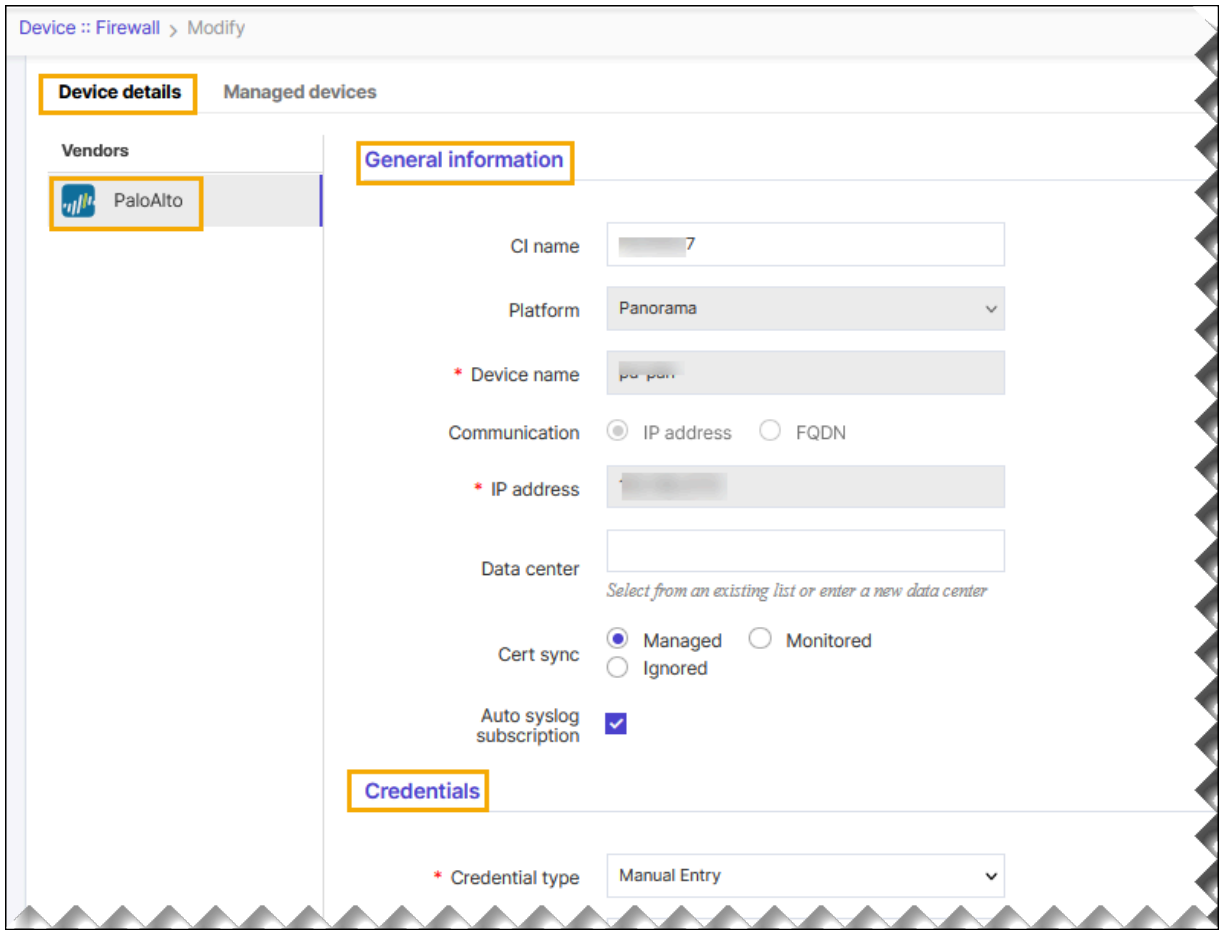
- **General prerequisites**:
  - Palo Alto Networks user assigned an Admin Role Profile with Configuration, Operational Requests, Commit, Export and Import privileges for the XML API.
  - Ensure communication between AppViewX and the firewall is enabled.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:
  - Username/Password
  - Credential List AppViewX
  - If authentication relies on an external credential such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
- **License Check**: Not required
- **Services and Port for AppViewX Communication**: Port number 443 (API)
- **Location from which the certificates are discovered if Certificate Managed**: Certificates are fetched by issuing a direct API call to the device.

Onboarding Palo Alto Device

To add a PaloAlto device,

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click + (**Add**) icon located upper right corner.
   The **Add** page appears.
3. Select the **PaloAlto** vendor from the left side bar. bar.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Enter or select the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the drop-down list. The available option is, • Firewall • Panorama.
***Device name**	Unique custom identifier of your device.
Data center	The data center on which the device has been hosted. Select a Datacenter from the drop-down list or enter a data center name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/ FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
**: Mandatory fields*	

5. Enter or select the field information in the **Credentials** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the drop-down list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the *Platform User Guide*.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type. **Note:** Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
Expert password	Enter the password.
**: Mandatory fields*	

6. Enter or select the field information in the **Secondary device information** section as follows:

   • **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.

   • **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.

   • **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
- By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

7. Click the **Save** button to add an Firewall device.

Note:

- To discard the changes, click the Cancel button.

A pop-up message is displayed as **Device added successfully**.

Validating the Palo Alto Device

1. Go to (**Menu**) > **FIREWALL+** > **Device Management** > **Inventory** > **Firewall**.
   By default, the **Firewall** tab opens.
2. Search the device name and validate the device addition.

Onboarding Certificates for Palo Alto

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certificates

Discovering Certificates for Palo Alto

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Firewalls**.
Devices window	A list of all the managed firewall devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to a Palo Alto Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for Palo Alto

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **Firewall**.
***Vendor**	From the dropdown list, select **PaloAlto**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **Profile Selection** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

Profiles will be discovered irrespective of the cert sync option selected during device addition or during an on-demand discovery.

- **The following profiles will be discovered currently in AppViewX for Palo Ato Firewall:**
  - **Shared location** - denotes a push only operation which pushes a certificate to the end device.
  - **SSL/TLS Service profile** - A pushed certificate to the device can be associated to any available SSL/TLS profile in the device.
  - **IKE Gateways** - A pushed certificate to the device can be associated to any IKE gateway where certificate was chosen as authentication type.
  - **SSL Inbound Inspection Profiles** - The pushed certificate can also be associated to a decryption rule.
  - **Authentication Profiles** - A pushed certificate can be associated with an authentication profile, typically used for authenticating users or administrators. This includes profiles configured to use client certificates or SAML authentication where a signing certificate or certificate profile is referenced.

    Note: The shared location profile will be framed by default when a device is added, but for the other profiles to be framed they have to configured in the device.

- **The following profiles will be discovered currently in AppViewX for Palo Alto Panorama:**
  - **Shared location** - denotes a push only operation which pushes a certificate to the end device. This functionality is enabled for both the shared location of Panorama and the shared location of templates.
  - **SSL/TLS Service profile** - A pushed certificate to the device can be associated to any available SSL/TLS profile in the device. Note: Profiles will be framed for SSL/TLS profiles in both Panorama and template/ template stacks.
  - **IKE Gateways** - A pushed certificate to the device can be associated to any IKE gateway where certificate was chosen as authentication type.
  - **SSL Inbound Inspection Profiles** - The pushed certificate can also be associated to a decryption rule under policies section for policy managed in a template.
  - **Authentication Profiles** - A pushed certificate can be associated with an authentication profile, typically used for authenticating users or administrators. This includes profiles configured to use client certificates or SAML authentication where a signing certificate or certificate profile is referenced.

    Note: The shared location profile will be framed by default when a device is added, but for the other profiles to be framed they have to configured in the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To select the device(s) to which the certificate will be pushed, under **Profile Selection**, from the list of **Available Devices**, click .

   The **Selected devices** list is updated automatically.
3. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Password	Enter the password required to access the certificate file/trust store.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.
Push to Firewall	This field appears only when Platform = Panorama. Pushing the configuration changes to the firewall devices in Panorama can be managed through this setting. The available options are: • **Not Required:** This option commits changes to Panorama only after a successful push and bind operation. It does not synchronize the chaages with the firewall. • **Push Only:** This option pushes and commits the certificates to Panorama and the firewall but it does not perform a commit after binding the certificate to the profile. • **Push and Commit:** This option pushes and binds the certificates to Panorama and the firewall profile followed by a commit operation. **Note:** Alternatively, you can provide the dropdown values in **CERT+ > Device Management > Firewall >** **(Device Settings) > Palo Alto.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Trust Type	**Important:** Trust type is applicable only for server certificates issued by private CAs with a customized template that issues certificate to the PaloAlto device with **Key Usage** as **Certificate Signing** for certificates that have a private key. **Trust Type** defines how a firewall handles SSL/TLS traffic based on whether a certificate is trusted or untrusted. Select a trust type status from the following values: • **Forward Trust** Select this option to establish the firewall as a trusted third party (proxy) to the session between the client and the server. For **Trust Type** = **Forward Trust**, if the server's certificate is valid (trusted) and signed by a known, trusted CA (like VeriSign, DigiCert, etc.), the firewall decrypts the traffic, inspects it, and then re-encrypts it using its own certificate, which is trusted by the client due to the configured CA. • **Forward Untrust** Select this option for the firewall to notify to clients when the server certificate is signed by a CA that the firewall does not trust. For **Trust Type** = **Forward Untrust**, if the server's certificate is self-signed or from an unknown CA, the firewall may re-encrypt the traffic using an untrusted certificate, causing the client to see a warning that the connection is not secure. **Note:** If the certificate trust type was already specified when configuring the certificate on the device, then upon discovery in AppViewX, the trust type field will reflect the same value as configured in the device port.

4. Enter/Select the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where th pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

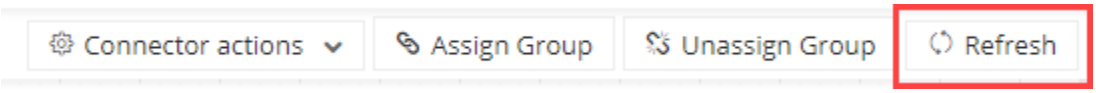
- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   Note: For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Troubleshooting Paloalto Firewall

This section helps you troubleshoot the common problems that you might encounter while using Paloalto firewall functionalities. This guide will give more troubleshooting processes on Paloalto firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Paloalto firewall.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.
Unsupported Key type provided	Unsupported key type is selected.	Please select RSA or EC.
Csr generation is device failed	CSR generation has failed.	CSR generation has failed. Please refer to the associated error message.
Invalid parameter for number of bits Csr generation is device failed	Selected EC bit length may not be supported by Paloalto.	Please select valid bit length supported.

Issues in Certificate Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name not given or length less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Please select a device	No device is selected in the “Discover By” section.	Select at least one device to discover certificates from.
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.

Issues in Backup, Push, Bind and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn’t proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Exception occured while getting Api key - Invalid credentials.	Credentials may be invalid.	Provide valid credentials.
Certificate <cert name> is not a valid reference	Private key not available in the certificate or the certificate is not in the required partition to bind.	Certificate should be pushed with the private key to bind with the profile.
Creating local certificate file failed	Unable to create the folder in EXPORT_DIRECTORY.	Please check whether the user has permission to create a folder or file in EXPORT_DIRECTORY in AppViewX.
Certificate name already exists in inventory, Cannot overwrite until Overwrite is enabled in Profile connector	Certificate with the same name already exists on the device.	Please change the certificate name or enable overwrite in the application connector.
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than current time.	Only valid certificates can be pushed.

Automating CLM for CheckPoint

Prerequisites

- **General prerequisites**:
  - Ensure communication between AppViewX and the firewall is enabled.
  - AppViewX needs an internet or proxy connection to communicate with the firewall via the REST API.
  - Valid firewall account details, including API tokens/keys and user credentials, are necessary.
  - The API must have elevated (admin) permissions to read and modify SSL certificates.
  - The username and password entered during the device onboarding process must be identical in both the Gaia Portal and the Smart Console user accounts. This ensures consistency, as the same credentials will be used for authentication in Gaia CLI and Management REST API sessions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Admin Portal**: To read/modify the certificate used for admin portal, cat/echo commands are needed. Generic linux commands can be executed only in expert mode. **In order to switch to expert mode admin privileges has to be given in the Gaia portal for a user.**
- **HTTPS Inspection**: To read/modify inspection rules and to add server certificates, these are the permissions needed in Checkpoint Management Smart Console.
  - **Access Control** > **General** > **Access Control Objects and Settings** > **Write**.
  - **Others** > **Permissions** > **HTTPS Inspection** > **Write**.
  - **Management** > **Publish sessions without an approval** > **Write**.
  - **Management** > **Management API Login** > **Write**.
- **IP Address/FQDN**: IP address or FQDN
- **User Privilege**:
  - Username/Password
  - Credential List AppViewX/CyberArk
  - If authentication relies on an external credential such as AppViewX, Thycotic, BeyondTrust, Hashicorp, and CyberArk, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
- **Platform**: Security Management Server
- **Enable Password**: Required
- **License Check**: Not required
- **Services**
  - Admin Portal (requires SSH port)
  - HTTPS Inspection (requires https port).
- **Supported versions**: vR75.x, vR77.x, vR80.x, vR81.x
- **Internet Access/Proxy**: Not required
- **Location from which the certificates are discovered if Certificate Managed**:
  - Certificates are fetched by issuing a direct command to the device through SSH.
  - Location in the device:
    - /web/conf/server.crt
    - /web/conf/server.key

Note: Discovering the certificates used for inbound inspection is not feasible because Checkpoint does not provide an API to retrieve the content of the certificates. Therefore, only the formation of profiles for the server certificates' shared location and the inspection policies will be done by AppViewX.

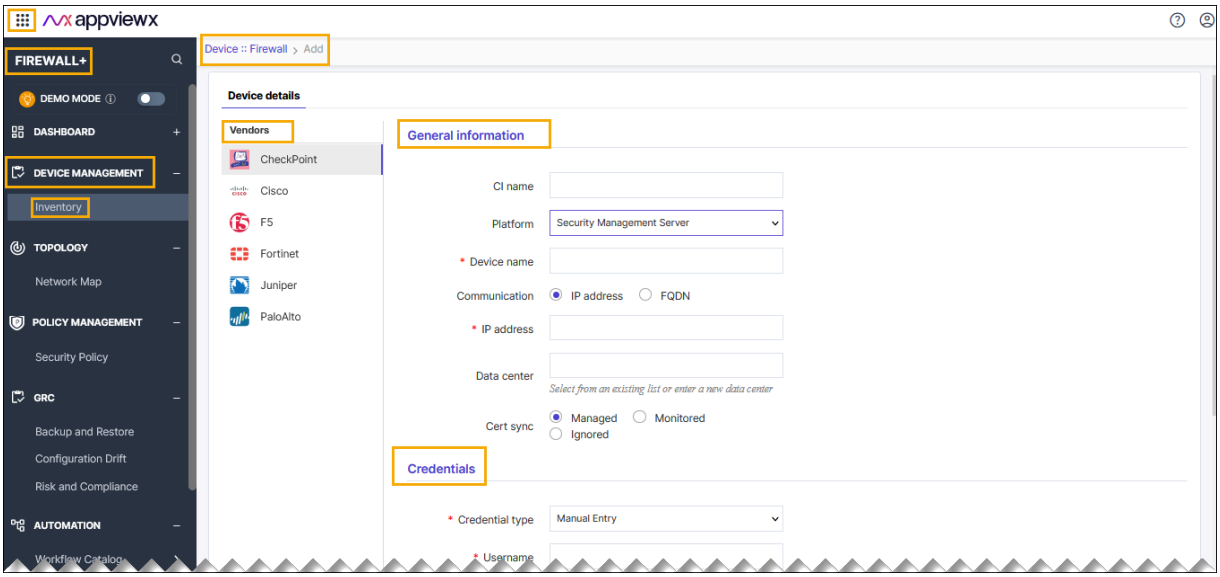
Note: For Visual Workflow action items, you will require credentials with write privilege.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding CheckPoint Device

To add a CheckPoint device:

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. In the **Firewall** tab, click + (**Add**) icon located upper right corner.
   The **Add** page appears.
3. Select the **CheckPoint** vendor from the left command bar



4. Enter the field information in the **General Information** section.

Field and Description Table

Field	Description
CI name	Name of the CI.
Platform	Select the platform from the drop-down list. The available option is, • **Security Management Server** • MultiDomain Security.
***Device name**	Unique custom identifier of your device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Communication	The communication mode that firewall devices can be added to AppViewX. The possible communication modes are: • **IP Address** - The IP Address can be IPV4 and it can be either management IP or Self IP of the Firewall device. By default, the IP address has been selected. • **FQDN** - On adding the device with FQDN, it will be resolved to an IP address and communication to the device will be made through it. If the FQDN is resolved to more than one device IP, AppViewX will choose a random IP for communication.
***IP address/FQDN**	Enter the IP address or FQDN based on the selected communication mode.
Data center	The data center on which the device has been hosted. Select from an existing list or enter a new data center.
Cert sync	Provision to discover and manage the SSL certificates from the firewall devices. The possible Cert syncs are: • **Managed** - All SSL certificates will be discovered and added to AppViewX certificate inventory and used for certificate lifecycle management like renew, revoke, etc. • **Monitored** - All SSL certificates will be discovered and will not have any CA-related communication. • **Ignored** - No SSL certificates will be discovered from the firewall device. **Note:** The certification sync is based on the license applied.
***Services**	Select the required services. By default **Admin Portal** is selected. The available services are, • **Admin Portal** • **HTTPS Inspection**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • If you select **HTTPS Inspection**, the HTTPS Port field becomes enabled, and inspection profiles appear in the application connector. • HTTPS supports only profile discovery, certificate push, and certificate binding.
***SSH Port**	Enter the SSH port number on the field.
***HTTPS Port**	Enter the SSH port number on the field.
**: Mandatory fields*	

5. Enter the field information in the **Credentials** section:

Field and Description Table

Field	Description
***Credential type**	Credentials can be manually provided or stored as a one-time entry onto the credential library and referred at the time of device addition. Select one of the following credential types from the dropdown list: • **Manual Entry** - The user name and password of the device need to be entered with device details. By default, the Manual Entry option is selected. • **AppViewX Credential List** - The user name and password can be added to the List and that entry can be referred to during device addition. The credential lists are integrated within AppViewX application for the secured authentication. To create a credential list, see Creating Credential List in the ***Platform User Guide***.
***Username**	Username for the firewall device when you select the **Manual Entry** credential type.
***Password**	Valid password for the firewall device when you select the **Manual Entry** credential type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Use strong passwords for secure device communication. Your Passwords can be of any length with a combination of alpha-numerical, symbols, and special characters.
***Expert password**	Enter the privilege password.
**: Mandatory fields*	

6. Enter the field information in the **Secondary device information** section as follows:
   - **Auto-Detect** - This option will automatically detect the corresponding secondary devices and add it as a new entry into AppViewX inventory using the Primary device's credential.
   - **Manual Entry** - This selection will enable you to manually add Secondary devices with a Sync-group name entered for reference. This name will be used to identify the pairs in the inventory. Follow similar steps.
   - **Ignore** - This option can be enabled if you need to ignore the detection of the secondary device associated with the current device.

   Note:
   - By clicking the Add button, multiple devices can be added as secondary devices and all the devices will be available in the grid.
   - By managing the Primary and Secondary devices in AppViewX during the device flips, traffic routing and management can be seamlessly handled in AppViewX.

7. Click the **Save** button to add an Firewall device.

   Note:
   - To discard the changes, click the Cancel button.

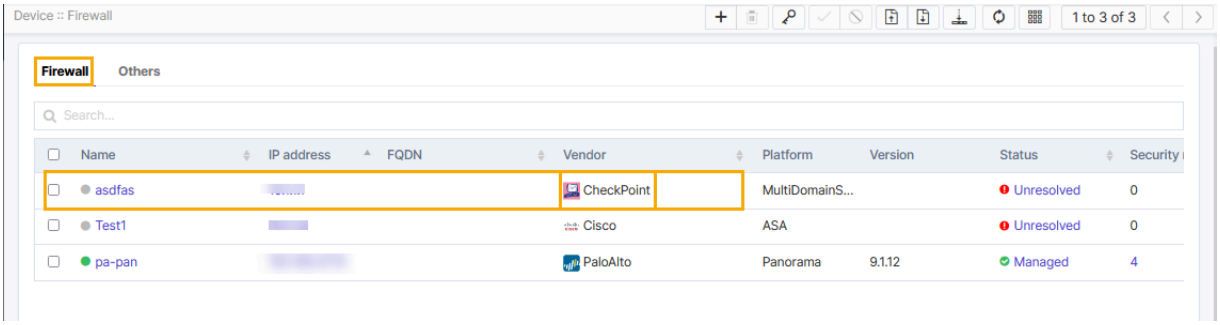
   A pop-up message is displayed as **Device added successfully**.

Validating the CheckPoint Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **Menu** > **FIREWALL+** > **DEVICE MANAGEMENT** > **Inventory**> **Firewall**.
   By default, the **Firewall** tab opens.
2. Search the device name and validate whether the device is added successfully.



Onboarding Certificates for CheckPoint

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certificates.

Discovering Certificates for CheckPoint

Note: Discovering the certificates used for inbound inspection is not feasible because Checkpoint does not provide an API to retrieve the content of the certificates. Therefore, only the formation of profiles for the server certificates' shared location and the inspection policies will be done by AppViewX.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Firewalls**.
Devices window	A list of all the managed firewall devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These

Field	Description
	notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to a CheckPoint Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for CheckPoint

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **Firewall**.
***Vendor**	From the dropdown list, select **CheckPoint**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **Profile Selection** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

Profiles will be discovered irrespective of the cert sync option selected during device addition or during an on-demand discovery.

- **Admin Portal**: The Admin portal CLM integration in AppViewX with CheckPoint is primarily designed to discover and manage the server certificate found at the file path **'/web/conf/server.crt'** in both SMS and MDS environments.

  Note: For executing linux commands, it's necessary to enter expert mode on the CheckPoint device. This is achieved using the command 'expert'. During the device addition process in AppViewX, an expert password field is provided to facilitate switching to expert mode when required.

- **HTTPS Inspection**: HTTPS Inpsection has to be enabled in services during device on-boarding to perform end-to-end automation for inspection certificates.
  - **Push Only Profile**

    Format: deviceName:HTTPSInspection:ServerCertificate

    Description: This profile is used for pushing server certificates only. It does not bind the certificates to any specific inspection rules.
  - **Push and Bind Profile**

    Format: deviceName:HTTPSInspection:InspectionLayerName:RuleNumber:RuleName

    Description: This profile is used for both pushing and binding certificates. It binds the certificates to specific inspection rules defined by the rule number and rule name.

2. To select the device(s) to which the certificate will be pushed, under **Profile Selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Password	Enter the password required to access the certificate file/trust store.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

4. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where th pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.

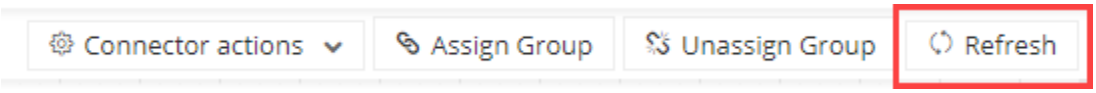
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

d. Click **Update**.

2. To enable auto push for the certificate connector:

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.
   The holistic view of the selected certificate is displayed.

   Note: For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Troubleshooting Check point Firewall

This document helps you troubleshoot the common problems that you might encounter when using the Check point firewall functionalities. This guide will give more troubleshooting processes on Check point firewall certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with Check point firewall.

Issues when device goes to unresolved state after on-boarding

The device might have entered an unresolved state due to connectivity issues from the AppViewX installed node or CC node. In such cases, please follow the steps below:

1. Attempt to establish an SSH connection from the AppViewX installed node or CC node to the Check point server.
2. Verify if there is proper connectivity between the nodes and the Check point server.

Issues when device goes to failed state with version failure

When a device enters a failed state with version check failure, it typically indicates that the system is unable to retrieve the version information from the Check point SMS server.

1. Login to the Check point SMS server via CLI using the credentials configured in AppViewX.
2. Attempt to enter expert mode. The user should be able to switch to expert mode.
   - Verify the expert password provided during on-boarding is correct.
   - Confirm expert mode privileges are granted for the user account.
3. Once in expert mode, execute the following command: **`fwm ver`**. This command should confirm the server is indeed a Check point SMS server and display the version details of the server.
   Sample expected output:

```
This is Check Point Security Management Server R81.20 - Build 440
```

Automating CLM for F5 Devices

Prerequisites

1. Download:
   - iControl from https://community.f5.com/kb/technicalarticles/icontrol-library-for-java-with-source/279110
   - axis JAR files from https://repo1.maven.org/maven2/org/apache/axis/axis/1.4/axis-1.4.jar
   - javax.xml.soap-api-1.4.0.jar from the file library.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Copy both the JAR files to an AppViewX node as the installed user.
   - **On-prem**: Place the JAR files in the **appviewx_dependencies/external_libs/** folder within the AppViewX installation directory.
   - **SaaS**: Place the JAR files in **deps/external_libs** where the cloud connector is installed.
3. Ensure the following prerequisites are met:
   - **Version Supported**: v11.x , v12.x , v13.x, v14.x, v15.x, v16.x, v17
   - **IP Address/FQDN**: IP address or FQDN
   - **User Privilege**: { Role : Admin , bash access is required } Username /Password, Credential List AppViewx/CyberArk
   - **Enable Password**: Not applicable
   - **License Check**: Yes
   - **Services and Ports for AppViewX Communication**: 22 and 443
   - **Internet Access/Proxy if Required**: Not applicable
   - **Location from which Certificates are discovered if managed**:
     - /config/filestore/files_d/<partition>_d/certificate_d/
     - V10
     - /config/ssl/ssl.crt/
     - /config/httpd/conf/ssl.crt/
4. For SaaS, restart only the **appviewx-platform-gateway** pod in CC whereas for on-prem, restart **avx-vendors** pod.

Onboarding F5 Device

Onboarding F5 Device

1. Go to **Menu** > **ADC+** > **ASSET MANAGEMENT**.
2. Perform one of the followings:
   - Click **Device Inventory**, and then select **Add (+)** icon to navigate to the Device details page.
   - Click **Onboard Device** in the left navigation panel.
3. In the **Device details** page, click the **F5** icon.
4. Enter or select the field information in the **General information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. For the device type **Device/Tenant**:

General information Section for "Device/Tenant" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Device/ Tenant, you will need to provide the relevant device information in the following fields.	NA
***Module**	Check box	LTM / BIG-IP DNS Module.	NA
VCMP Guest	Check box	To add a device as a vcmp guest, this checkbox should be checked.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
***Cert Sync**	Radio button	**Managed**: The certificates of the device can be managed.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
		Monitored: The certificates of the device can be monitored. **Ignored**: The certificate sync can be ignored.	
DNSSEC sync	Radio button	By default, the Ignored option is selected. If your ADC acts as an authoritative DNS server, then select the Managed option to manage the DNSSEC Zones and Keys (KSK and ZSK).	
AppViewX Group Sync	Check box	This should be enabled if the user wants to sync the devices within the device group.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

b. For the device type **Host**:

General information Section for "Host" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Host, you will need to provide the relevant device information in the following fields.	NA
Host Type	Radio button	Select any of the following host types: • vCMP Host - Enables the running of multiple virtual instances of BIG-IP software on a single physical device • rSeried Host - A host type representing the F5 rSeries hardware platform, designed for	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
		high-performance application delivery and security. • Velos Partition - A logical partition on the F5 VELOS platform, allowing for the segmentation of resources and management of multiple tenants within a single VELOS chassis.	
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
**: Mandatory fields*			

c. For the device type **Controller**:

General information Section for "Controller" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Controller, you will need to provide the relevant device information in the following fields.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
**: Mandatory fields*			

5. Enter or select the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password. 	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
		Credential List: The user can select the credential details which are already stored in the credential inventory page. For more details on secure authentication, refer to Platform User Guide. 	
***Username**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
Token based authentication	Toggle button	To access the device REST API using token.	NA
**: Mandatory fields*			

6. Enter or select the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

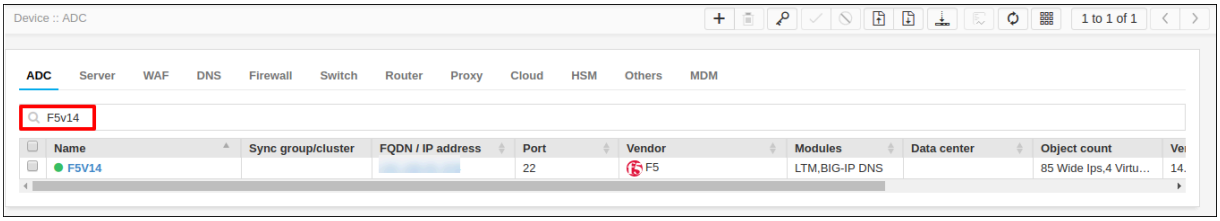
Name	Type	Description	Validation
Secondary device information	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

7. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating the F5 Device Onboarding

1. Go to **Menu** > **ADC+** > **ASSET MANAGEMENT** > **Device Inventory**.
2. From the device inventory page, search for the added F5 device name.



Onboarding Certificates for F5 Devices

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for F5 Devices

Prerequisites

- **User Permission Required**: Administrator/ Certificate Manager role
- **Terminal Access**: Advanced Shell or TMSH

Certificate discovery involves downloading certificate and key files from the device via SFTP. This method is accessible only to F5 users with Advanced Shell access. Refer to the relevant F5 article (https://my.f5.com/manage/s/article/K16621651) for detailed instructions.

For users without Advanced Shell access, SFTP attempts will fail as explained in the aforementioned F5 article. In such instances where SFTP fails, certificates and key files are retrieved using SCP.

F5 imposes restrictions on SCP access to specific paths listed in the scp.blacklist file. During discovery, encountering route limits in F5 may result in SCP download errors ("Unable to download") in the log. In such cases, two alternatives are available (and either can be chosen):

- Use REST API(s) to download the files from the device by running:

```
db.cert_metadata.update({"_id": "CERT_VENDOR_BASED_CONDITIONS"},{"$set": {map.adc_f5_discover_certs_with_rest" : "true"}});
```

- Remove the following paths accessed via AppViewX from the scp.blacklist file path accessed from AppViewX:
  - /config/filestore/files_d/
  - /config/ssl/ssl.crt/

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- /config/ssl/ssl.key/
- /config/httpd/conf/ssl.crt/
- /config/httpd/conf/ssl.key/

• Remove these paths and restart sshd based on the steps mentioned in the F5 article: https://my.f5.com/manage/s/article/K73463547

Discovering Certificates for F5 Devices

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**. The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed ADCs**.
Devices window	A list of all the managed ADC devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling Certificates

Enrolling a Server Certificate

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42 • urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional). • **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to a F5 Device

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for a F5 Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Enter the **General Information** for the ADC devices.

Field descriptions for the Certificate Details

Field	Description
***Category**	From the dropdown list, select **ADC**.
***Vendor**	From the dropdown list, select **F5**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **SSL profiles** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

Note: The name of this section is populated based on the **Vendor** selected.

2. To select the device(s) to which the certificate will be pushed, under **SSL profiles**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For the Web Dispatcher server, this field is enabled by default and is non-editable.
***Chain File or Bundle Name**	**Note:** This field is displayed only when **Push Root and Intermediate Certificates** is enabled. When pushing certificates to F5 devices, particularly for SSL/TLS configurations, a chain file or bundle refers to a single file that includes the entire certificate chain. Enter the chain file name in this field.

4. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system. **Note:** Overwrite option is disabled by default for Microsoft IIS.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

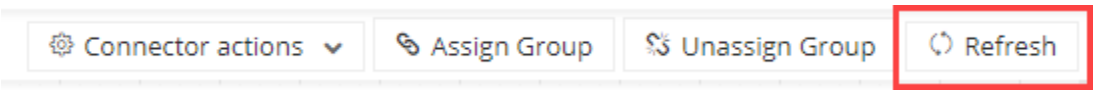
   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The push action is triggered. After the push action is completed, the status updates to **Completed**.

To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.
   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.
   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
   d. Click **Update**.
2. To enable auto push for the certificate connector:
   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
      To add an application connector, follow the instructions given here.
   b. From the menu displayed, click **Edit**.
      The **Edit Application Connector** pop-up is displayed.
   c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

d. Click **Save**.
The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

> **Note:** While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. For an existing CA connector for the certificate, hover over .

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Troubleshooting F5 WAF

This section helps you troubleshoot the common problems that you might encounter when using the F5 WAF functionalities. This guide will give more troubleshooting processes on F5 WAF certificate config fetch, discovery, CSR creation, backup, push, bind, rollback, and other actions associated with F5 WAF.

Issues in Fetch Config

Error Message	Possible Cause	Possible Solution
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
Failed to fetch partitions from the device	Partition fetch failed.	1. Check the device partitions. 2. Please check the associated error message.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Issues in Discovery

Error Message	Possible Cause	Possible Solution
Please provide information as required	Discovery name is not given or length is less than 2 characters.	Enter a valid name with a minimum of 2 characters.
	Interval between batches info. is missing when execution type is sequential.	Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device to discover certificates from.
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
Failed to fetch partitions from the device	Partition fetch failed.	1. Check the device partitions. 2. Please check the error message associated.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.

Issues in CSR Generation

Error Message	Possible Cause	Possible Solution
Authentication failed for the device	Invalid credentials specified for the device	Provide valid credentials for the device.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.
CSR Generation using HSM on this device version is not supported.	Version not supported.	Please use the supported version device to create CSR using HSM. Supported versions are v13 and v12.
1) CSR content unavailable in device	CSR content unavailable on device.	For some reasons CSR creation has failed, please check the logs to reproduce.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
2) Requested CSR is not available in device 3) Csr could not be fetched		
CSR already exists in this scope with the same Key reference name	The name is already used on the device.	Please use a different name.
Csr generation is device failed	CSR generation has failed.	CSR generation has failed. Please refer to the associated error message.
Thales HSM is not installed in the device. Please install and try again.	Thales is not installed in the device.	Please install Thales HSM and try again.
Invalid module. Please specify the valid module and try again.	Invalid module specified.	Specify a valid module and try again.
The CSR <name> was not found in the device.	CSR content is not available in the name specified.	Please check the name in the CA connector.
NetHSM private key is not available/installed in device	NetHSM private key is not available/installed in the device.	Please install NetHSM private key on the device.

Issues in F5 WAF Backup, Push, Bind, and Rollback

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
	Previous work order is in progress and not completed.	Initiate push after previous work order is finished.
	AppConnector might not be in sync.	Synchronize the appConnector and retry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state.	Enable the push/rollback workflow from the Workflow section.
User is not authorized	User does not have required permissions to push to the device.	Retry after getting the access for required action.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Authentication failed for the device	Invalid credentials specified for the device.	Provide valid credentials for the device.
SSH connection failed	Unable to establish the SSH connection.	Please ensure that the device can be connected via SSH from AppViewX.
Invalid profile type	Specified profile type is not supported.	Please use client-SSL or server-SSL.
Certificate fetch failed	Certificate fetch failed.	Check the error message associated to know more about the problem.
Certificate already exists	Certificate is already available with the same.	Either change the name or enable overwrite in the application connector.
Key already exists	Key is already available with the same.	Either change the name of the key or enable overwrite in the application connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error Message	Possible Cause	Possible Solution
Certificate is expired	Certificate is expired.	Push the certificate which is currently valid.
Unknown certificate algorithm	Unknown certificate algorithm.	Push the certificates only with RSA or EC.
certificate is not yet valid	Certificate valid from value is greater than the current time.	Only valid certificates only can be pushed.

Troubleshooting

User Permission Required:

- **Role:** Administrator
- **Terminal Access:** Advanced Shell or TMSH

Certificate Discovery

For discovering certificates from device, use SFTP to download certificate and key files from the device. SFTP will work only for F5 users provided with Advanced Shell access. Refer to the F5 article: https://my.f5.com/manage/s/article/K16621651

For Users without Advanced Shell access, SFTP will fail as stated in the above F5 article & in case of SFTP failure, try to download certificate and key files from the device using SCP.

F5 devices enforce **security restrictions** that limit access to specific directories via **SCP**. These restricted paths are defined in the `scp.blacklist` file on the device.

During certificate discovery, if these path restrictions are encountered, AppViewX may log an error such as *Unable to download* when attempting to retrieve files through SCP.

In such cases, you can proceed with either of the following alternatives to resolve the issue:

- REST API(s) can be used to download the files from device. To enable REST API(s) for downloading files, run:

```
db.cert_metadata.update({"_id": "CERT_VENDOR_BASED_CONDITIONS"},{"$set": {
"map.adc_f5_discover_certs_with_rest" : "true"}});
```

- Remove particular paths accessed via AppViewX from the scp.blacklist file.

Paths accessed from AppViewX

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- “/config/filestore/files_d/”
- “/config/ssl/ssl.crt/”
- “/config/ssl/ssl.key/”
- “/config/httpd/conf/ssl.crt/”
- “/config/httpd/conf/ssl.key/

Remove these paths and restart sshd based on the steps mentioned in the F5 article: https://my.f5.com/manage/s/article/K73463547

Note: If user has been provided with Advanced Shell access, both SFTP and SCP will work without any modification in device configuration or DB query execution.

CLI command to check whether SFTP is working from AppViewX to device:

Run the SFTP command from AppViewX CLI -> sftp < username >@ (Ex: sftp admin@192.168.41.2)

CLI command to check whether SCP works between device and AppViewX

1. Open an SSH connection to the device -> ssh username@
2. Run bash command.
3. Change the directory to any one of the certificate location

   cd /config/filestore/files_d/Common_d/certificate_d/

4. Run ls command and copy any one of the certificate file name.
5. Try SCP for the file copied to AppViewX location > scp <file_name_with_location><appviewx_user_name>@<appviewx_ip>:<appviewx_location>

   Example:

   ```
   "/config/filestore/files_d/Common_d/certificate_d/:Common:Xecure.crt_67510_4" appviewx@192.168.220.129:/home/appviewx/)
   ```

Certificate Push

During certificate push, the file will be copied from AppViewX to the F5 device certificate location; If push fails with the error, *Unable to upload file using SCP*, it is because of the F5 device's SCP constraints. You can use any of the solution approaches:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The certificate file must be copied to an **SCP-allowed directory** on the F5 device. From there, it will be relocated internally to the appropriate certificate location.

  To enable this behavior, run the following database query, specifying any SCP-permitted path on the F5 device.

```
db.cert_metadata.update({_id:"CERT_VENDOR_BASED_CONDITIONS"},{"$set":{"map.a
dc_f5_file_upload_path":"/config/"}});
```

- Remove certificate path from the scp.blacklist file mentioned above in the solution approach of discovery.

F5 Device Communication

- Certificate discovery, push and bind functionalities in AppViewX communicates with F5 using iControl SOAP methods.
- When the F5 device uses an HTTPS port other than **443**, or if **iControl method failures** occur, AppViewX should communicate with the device through **REST API-based integration**.
- To enable the REST based communication to F5 device, run the below DB query in AppViewX DB:

```
db.cert_metadata.update({"_id": "CERT_VENDOR_BASED_CONDITIONS"},{"$set": {
"map.adc_f5_rest_enabled":"true"}})
```

Automating CLM for Citrix Devices

Prerequisites

Prerequisites for Managing Citrix devices on AppViewX are:

- **Version Supported**: V11.x, v12.x, v13.x, and 14.x
- **IP Address/FQDN**: IP address and FQDN
- **User Privilege**: [Role : Admin , bash access is required] Username /Password, Credential List AppViewx/CyberArk.
- **Enable Password**: Not applicable
- **License Check**: Yes
- **Services and Ports for AppViewX Communication**:
  - Outbound Access from AppViewX for SSH and HTTPS service (Default/Custom Port Information) is required.
  - Outbound access to port 5514 is required for Citrix Device to forward the Syslog to AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Internet Access/Proxy if Required**: Not applicable for local devices. But required, if the device needs be accessed with Public IP address.
- Required Command Policy:

```
((show cs vserver))|((show lb vserver))|((show ns partition))|
((show ssl certKey).*)|((show ssl vserver).*)|((add audit syslogAction).*)|(
(add audit syslogPolicy).*)|((bind system global).*)|((logout))|((save ns config))|
((show HA node))|((show audit syslogAction))|((show cs policy))|((show gslb service))|(
(show gslb site))|((show gslb vserver))|((show ns feature))|((show ns hardware))|(
(show ns hostName))|((show ns license))| ((show ns runningConfig))|((show ns version))|(
(show server))|((show service))|((show serviceGroup))|
((stat interface))|((stat lb vserver descending))|((stat ns))|((stat service))|
((stat system))|((switch ns partition).*)|((shell))|((add ssl certKey).*)|
((bind ssl vserver).*)|((sftp-server))|((link ssl certkey).*)|((show  ip -type).*)|
((sftp-server))|((link ssl certkey).*)|((unbind ssl vserver ).*)|((update ssl certKey).*)|
((set ssl vserver).*)|((show system file).*)|((add system file).*)|((rm system file).*)|
(^show\s+ns\s+\S+)|(^show\s+ns\s+\S+\s+.*)
```

Web Browser Requirement

Browsers	Version
Internet Explorer	v11.0.9600.18817 or later
Firefox	118.0.1 (64-bit) or later
Google Chrome	117.0.5938.134 (Official Build) (64-bit) or later

ACF Permission

Ensure the following ACF permission is available to add and manage devices:

- ADC > Inventory > Add / Modify
- ADC > Device group > Add / Modify

You can check this under any of the following menus:

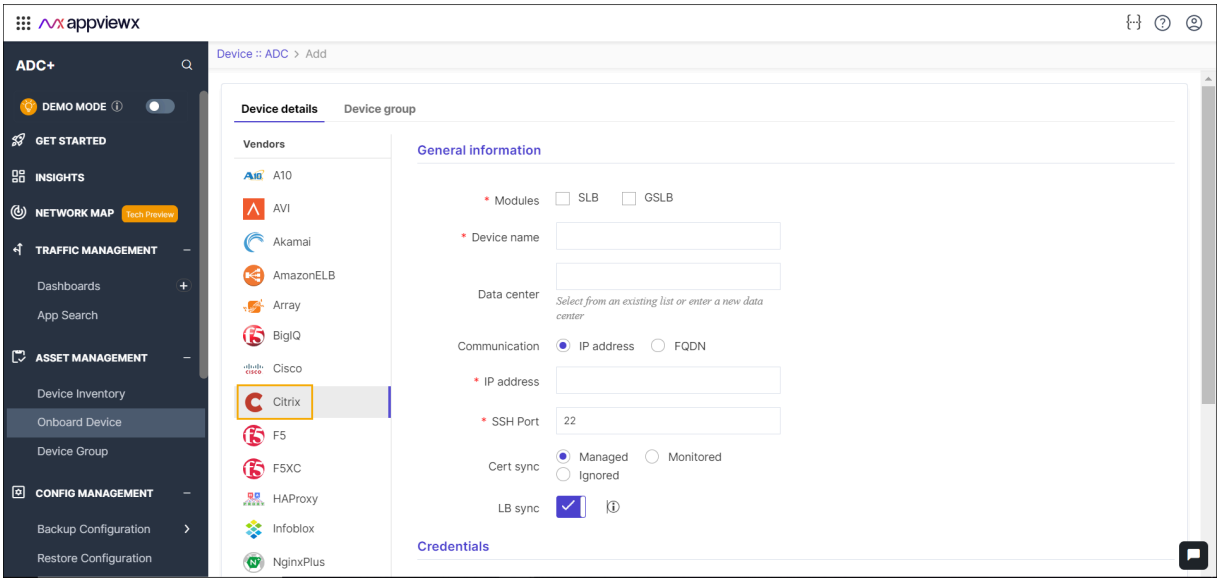
- **Old menu**: menu > Accounts > Role
- **New menu**: menu > Platform > IDENTITY > Role

To associate ACF permissions with a role, see Platform User Guide.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

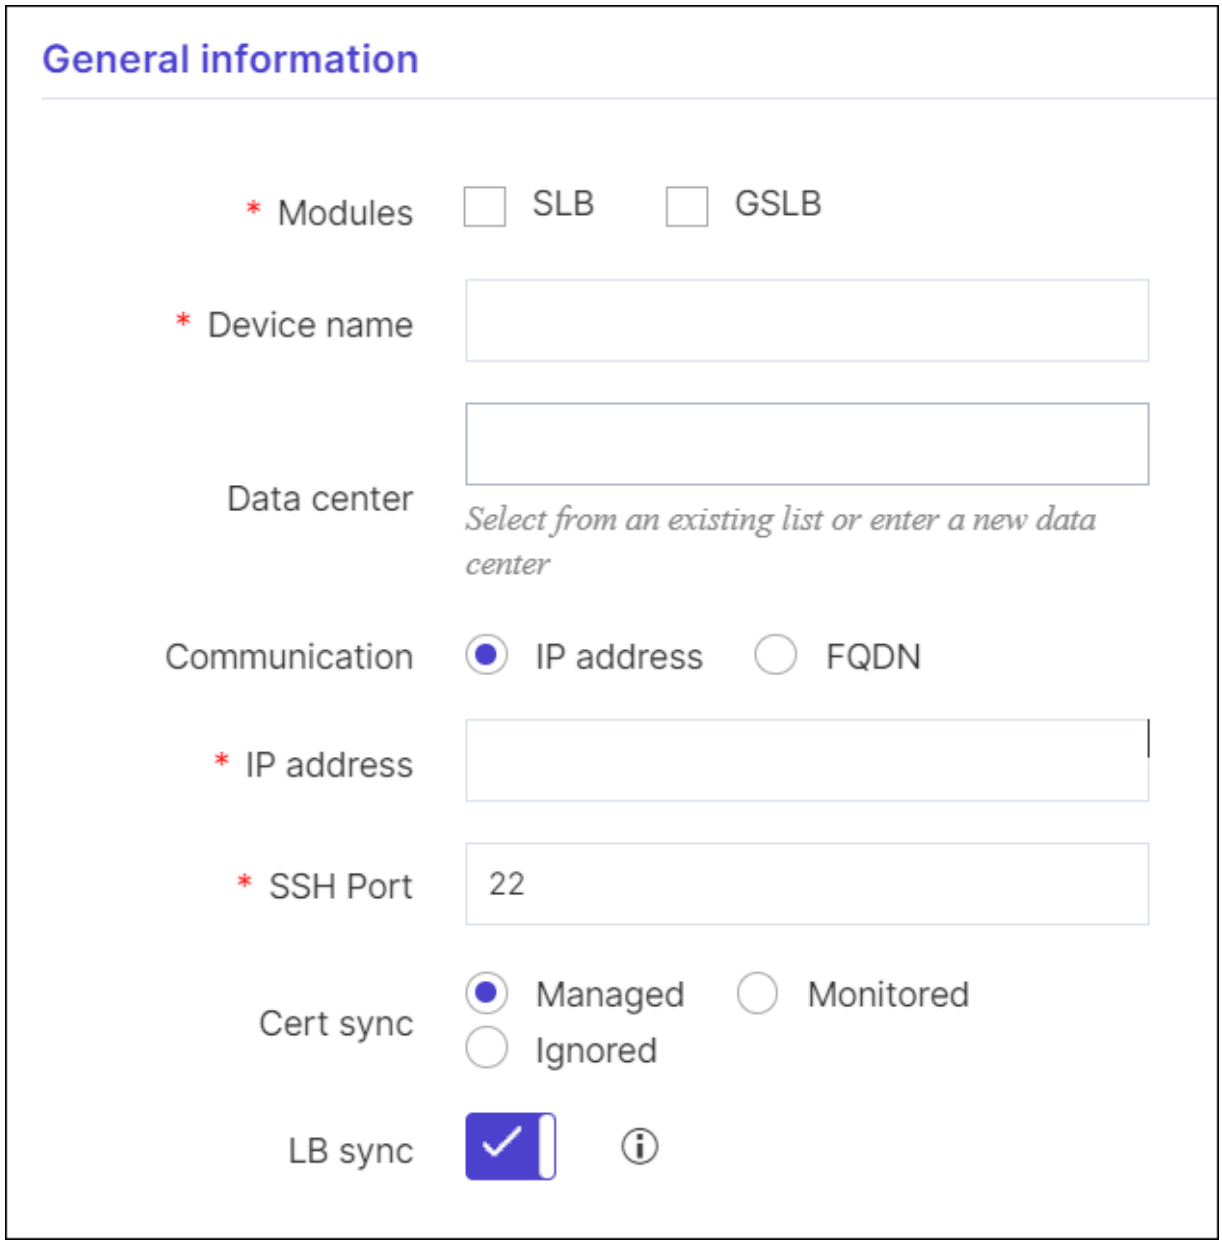
Onboarding Citrix Device

1. Go to **Menu** > **ADC+** > **ASSET MANAGEMENT**.
2. Perform one of the followings:
   - Click **Device Inventory**, and then select **Add (+)** icon to navigate to the Device details page.
   - Click **Onboard Device** in the left navigation panel.
3. In the **Device details** page, select **Citrix** from the left sidebar.



4. Enter or select the field information in the **General information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



General information Section - Field and Description Table

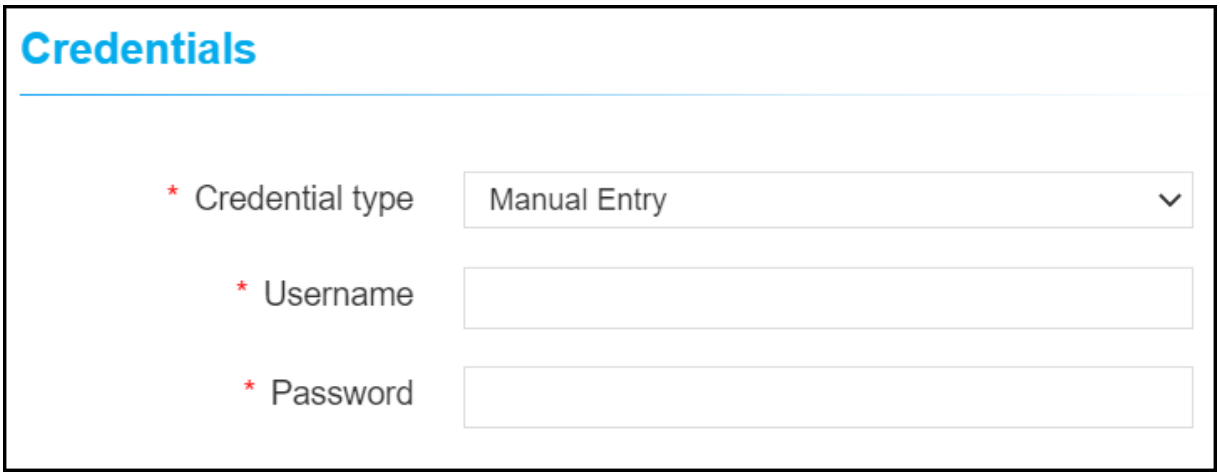
Name	Type	Description	Validation
***Module**	Check box	SLB / GSLB Module.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The IPv4 address of the device.	The IP address should be in the right format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
***Cert Sync**	Radio button	**Managed**: The certificates of the device can be managed. **Monitored**: The certificates of the device can be monitored. **Ignored**: The certificate sync can be ignored.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter or select the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

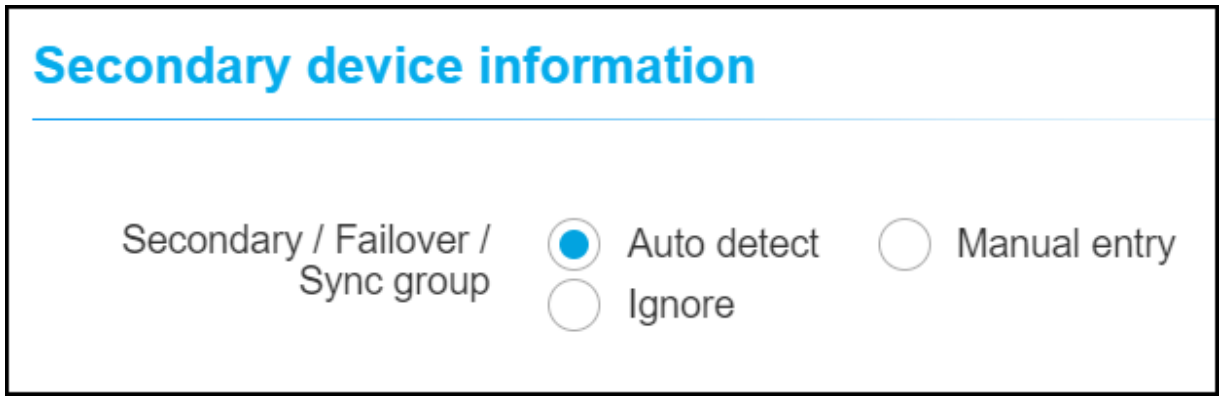


Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password.  **Credential List**: The user can select the credential details which are already stored in the credential inventory page. 	NA
***Username**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
**: Mandatory fields*			

6. Enter or select the field information in the **Secondary device information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Secondary device information Section - Field and Description Table

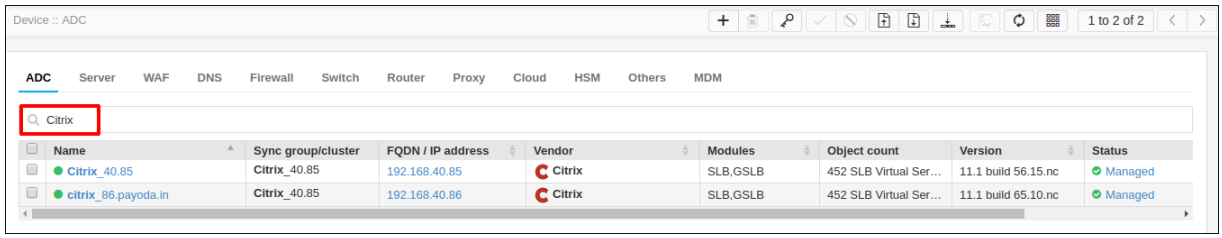
Name	Type	Description	Validation
Secondary device information	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

7. Click **Save**.

Validating the Citrix Device Onboarding

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to **Menu** > **ADC+** > **ASSET MANAGEMENT** > **Device Inventory**.
2. Search the device name and validate whether the device is added successfully.



Onboarding Certificates for Citrix Devices

There are two ways you can onboard certificates in AppViewX:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Via certificate discovery, for existing certificates
• Via certificate enrollment, for new certifcates

Discovering Certificates for Citrix Devices

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed ADCs**.
Devices window	A list of all the managed ADC devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

Enrolling Certificates

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regenaration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given below. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions below.
**: Mandatory fields*

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

> **Note:** For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name. The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-).
Subject Alternative Name	From the dropdown list, select the Subject Alternative Name category for the certificate being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the corresponding field(s) displayed for the selection made, enter the required values. **Note:** • Multiple values must be separated by a comma. • After enrollment, the cumulative count of SANs is displayed in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** For renewal of the certificate being enrolled, country name is required.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you've uploaded multiple attachments, use the **Search** field to find the required one.
*: Mandatory fields	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**. **Note:** This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

    Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

Client certificate enrollment refers to the process of creating a digital ID for an individual/device for authentication/encryption purposes. It follows the same process as a server certificate.

Note: These certificates cannot be hosted on clients.

To enroll a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled. **Note:** This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the references section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the references section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given. To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given below. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If Regenerate Automatically field, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	No special characters allowed except en dash (_) and hyphen (-).
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page. Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to a Citrix Device

Important: Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for a Citrix Device

1. Enter the **General Information** for the ADC devices.

Field descriptions for the Certificate Details

Field	Description
***Category**	From the dropdown list, select **ADC**.
***Vendor**	From the dropdown list, select **Citrix**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.
**: Mandatory fields*	

Based on the information populated here, the **SSL profiles** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

Note: The name of this section is populated based on the **Vendor** selected.

2. To select the device(s) to which the certificate will be pushed, under **SSL profiles**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***Certificate key pair name**	The name with which the certificate-key pair will be created in the device with above certificate and key.
Enable SNI Push for Certificate	If enabled, certificate will be enabled with SNI while associating to the virtual server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Enable SNI in Virtual Server	If enabled, SNI will be enabled in Virtual Server
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For the Web Dispatcher server, this field is enabled by default and is non-editable.
***Intermediate File Name 1**	Enter the intermediate file name.
***CA File Name**	Enter the CA file name.
**: Mandatory fields*	

4. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.
**: Mandatory fields*	

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:
    a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
    The **Group** page is displayed.
    b. From the **Name** field, select the required certificate group.
    The **Group : Modify : <group name>** page is displayed.
    c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.
    d. Click **Update**.
2. To enable auto push for the certificate connector:
    a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
    To add an application connector, follow the instructions given here.
    b. From the menu displayed, click **Edit**.
    The **Edit Application Connector** pop-up is displayed.
    c. Select the **Push automatically** checkbox.

    > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

    d. Click **Save**.
    The holistic view of the selected certificate is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Enabling Auto Renewal of Certificates

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

> **Note:** While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:
    a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
    The **Group** page is displayed.
    b. From the **Name** field, select the required certificate group.
    The **Group : Modify : <group name>** page is displayed.
    c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.
    d. Click **Update**.
2. To enable auto renewal for the certificate connector:
    a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
    The **Server Certificate** inventory is displayed.
    b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
    The holistic view of the selected certificate is displayed.
    c. For an existing CA connector for the certificate, hover over .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

d. From the menu displayed, click **Edit**.
The certificate details are displayed.

e. Under **CA Details**, turn on the **Renew Automatically** toggle.

f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

g. Click **Update**.
The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

Automating CLM for AWS Resources

Amazon Web Services (AWS) is a comprehensive and widely adopted cloud platform provided by Amazon. It offers a wide array of services such as computing power, storage options, networking, databases, and more, allowing businesses and individuals to build, deploy, and manage applications and infrastructure without having to invest in physical hardware.

This section will guide you through the process of integrating AWS with AppViewX, providing detailed steps, configuration guidelines, and automation techniques for the following services:

- With ACM Integration
- With IAM Integration
- With ELB Integration
- With CloudFront Integration
- With EC2 Integration

With ACM Integration

This document will guide you through the process of integrating the ACM AWS service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

AWS Certificate Manager (ACM)

AWS Certificate Manager (ACM) is a service provided by Amazon Web Services that simplifies the process of provisioning, managing, and deploying SSL/TLS certificates for use with AWS services and your internal connected resources.

Onboarding AWS Resources with ACM Integration in AppViewX

Onboarding AWS Standalone Accounts in AppViewX

A standalone AWS account operates independently with its own set of resources and is not connected to any other AWS accounts.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important:

- AWS standalone device migration is supported only from the following versions of CERT + SaaS: v2020.1, v2020.2, v2020.3 - v2020.3 FP7. The following prerequisites are also applicable to only these versions.
- AWS device migration is not supported from the following versions of CERT+ SaaS: v2012.x, v2019.x, and v2021.x. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Note:

- For customers migrating from versions 20.1.x, 20.2.x, and 20.3.6, AppViewX recommends that you delete the following before migration:
  - All of their Amazon CA settings
  - Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).
- For customers migrating from version v2020.3.10 (mandatory):
  - Delete all of their Amazon CA settings before migration.
  - Trigger config fetch for all of their cloud accounts after migration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The following actions have to be performed for the standalone AWS cloud accounts migrated from the above listed versions to version v2022.1 FP1:

For standalone accounts where one of the associated services is not EC2

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.

   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.

   The **Device :: Cloud** page is displayed.
3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

   Troubleshooting: If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.
4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).

   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

Note: For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Before migration
  1. Merge permissions from all individual buckets into any one S3 bucket.
- After migration
  1. Select a migrated standalone account from the **Device :: Cloud** page.

     The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.
  2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
  3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
  4. Click **Add**.
  5. Click **Save**.

     Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

Onboarding AWS Standalone Accounts with ACM Integration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Account Type*	From the dropdown list, select **Standalone**.
Account name*	Enter the customer's unique AWS account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
Account number*	Enter the customer's AWS account number.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: Manually enter the access and secret key for the customer's AWS account).
Access key*	Enter the access key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Secret key*	Enter the secret key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Credential name*	If the customer's AWS credentials are stored in CyberArk, from the dropdown list, select the CyberArk credential name. **Note:** This field is displayed only when **Credential** type is set to **Credential List - CyberArk**.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	According to the type of the new cloud device being added, select the corresponding Amazon Cloud Service for the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Service region*	Service regions are regions that are supported by the selected service. From the dropdown list, select the service regions that should be scanned for certificates. **Note:** To be able to fetch and select from the available regions, ensure that the credentials have been provided in the **Credentials** section.
CA Operation Mode*	**Note:** This field is displayed only when the **Amazon Private CA** service is selected. From the following options, select one/both operation mode(s) for discovering all the certificates enrolled by the Private Certificate Authority: • **ACM** • **PCA**
S3 Bucket*	**Note:** This field is displayed only when the **PCA** CA operation mode is selected. Enter the S3 bucket name.
Discovery Certificate	**Note:** This field is displayed only when one/both of the CA operation modes are selected. To enable instance certificate discovery at the time of device addition, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

Onboarding AWS Cross Accounts in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

This section of the documentation will guide you through the process of onboarding an AWS cross account, for both discovery types, in AppViewX. In AWS, cross-account discovery can be set up in two ways:

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.
    3. Attach policies to the created user.

       For the AWS IAM permissions to be added for the master account, click here.
  - In your AWS child account:
    1. Create a role in the child account in AWS.
    2. Attach policies to the created role.

       For the AWS IAM permissions to be added for the child account, click here.
    3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
    4. Attach policies to the EC2 role.

       For the AWS IAM permissions for the EC2 policy, click here.

       For the AWS IAM permissions for the EC2 role, click here.

Note: For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX for Organization-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the ACM service component(s) required for the CLM operations. Depending on the service component(s) selected, additional fields are displayed. The instructions for these fields are covered in the subsequent steps.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **ACM Certificate Authority Service** section.

> **Note:** This section is displayed only when one or both **ACM** services are selected from the **Services** dropdown list.

Field description for the ACM Certificate Authority Service

Field	Description
Role Setting Preference*	**Note:** This field is displayed only when both auto discovery modes (**Organization Based Discovery** and **IAM Policy Based Discovery**) are selected. From the dropdown list, select one of the following options: • **Organization Based Discovery** • **IAM Policy Based Discovery**
Route53 Zone Auto Approval	To support DNS validation as an automatic process, enable this toggle.
**: Mandatory fields*	

9. Enter/Select the required details in the **ACM Private CA** section.

> **Note:** This section is displayed only when the **ACM (Amazon Private CA)** service is selected for a **Cross or Federated** account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the ACM Private CA section

<table>
<tr><th>Field</th><th>Description</th></tr>

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section. To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.
   The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

> **Note:**
> - If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
> - Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.
Auto Discovery Mode*	To onboard a cross account for IAM policy-based discovery: a. Select **Policy Based Discovery**. The **Policy based Discovery** dialog box is displayed. b. Enter/Select the details required to configure IAM policy-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Organization Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the ACM service component(s) required for the CLM operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Depending on the service component(s) selected, additional fields are displayed. The instructions for these fields are covered in the subsequent steps.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. Enter/Select the required details in the **ACM Certificate Authority Service** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: This section is displayed only when one or both **ACM** services are selected from the **Services** dropdown list.

Field description for the ACM Certificate Authority Service

Field	Description
Role Setting Preference*	**Note:** This field is displayed only when both auto discovery modes (**Organization Based Discovery** and **IAM Policy Based Discovery**) are selected. From the dropdown list, select one of the following options: • **Organization Based Discovery** • **IAM Policy Based Discovery**
Route53 Zone Auto Approval	To support DNS validation as an automatic process, enable this toggle.
**: Mandatory fields*	

9. Enter/Select the required details in the **ACM Private CA** section.

Note: This section is displayed only when the **ACM (Amazon Private CA)** service is selected for a **Cross or Federated** account.

Field description for the ACM Private CA section

Field	Description
CA Operation Mode*	From the following options, select one/both operation mode(s) for discovering all the certificates enrolled by the Private Certificate Authority: • ACM • PCA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>S3 Bucket*</td><td>
NOTE: This field is displayed only when the PCA operation mode is selected.

a. Enter the S3 bucket name.

b. Click .

The ARN Advanced Settings action pane is displayed.

c. In the ARN Advanced Settings action pane, enter the following details:
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Role ARN*</td><td>Amazon Resource Name of the role that the caller is assuming</td></tr>
<tr><td>Role Session name</td><td>Role Session name is an identifier for the assumed role session.

Use the Role Session name to uniquely identify a session when the same rule is assumed by different principals or for different reasons.</td></tr>
<tr><td>Duration Seconds</td><td>Enter the duration, in seconds, for which the credentials should remain valid.

Acceptable durations for IAM user sessions:

• Minimum: 900 seconds (15 minutes)

• Maximum: 129,600 seconds (36 hours)

Default: 3600 seconds (1 hour)</td></tr>
<tr><td>External Id</td><td>External Id is a unique identifier that might be required when you assume a role in another account.</td></tr>
</table>
</td></tr>
</table>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Source Identity</td><td>The source identity is specified by the principal that is calling the AssumeRole operation.</td></tr>
<tr><td>Session Tags</td><td>Session Tags are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

To create a session tag:

i. In the Enter Key field, enter a key for the key-value pair.

ii. In the Enter Value field, enter a value for the key-value pair.

iii. Click Add.

The added key-value pair is shown in the table below the fields.</td></tr>
</table>
d. Click Apply.
</td></tr>
<tr><td>Discover Certificate</td><td>To enable instant certificate discovery at the time of device addition, select this checkbox.</td></tr>
<tr><td colspan="2">*: Mandatory fields</td></tr>
</table>

10. To add the new device to the cloud device inventory, click **Add**.

> **Tip:** To select multiple services for a device, after you click **Add**, go back to the **Services** dropdown list and select the next service you want to enable for the device. Enter/select the rest of the details and click **Add**. Repeat this process for as many services you want to enable for the new device. The table is populated with a separate entry for each service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Details of the child accounts for the added master account are displayed in the inner inventory table at the bottom of the page. The details captured in the inner inventory are explained here.
- Details of the master account are listed on the **CERT+** > **Administration** > **Certificate Authority** > **<Selected CA>** page.

> **Note:** For a public Certificate Authority, only the child account details are listed on the **CERT +** > **Administration** > **Certificate Authority** > **Amazon** > **ACM CA** page. There is no inner inventory for a public certificate authority.

11. To add the new device to the cloud device inventory, click **Add**.
12. Click **Save**.
    The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.
   The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

> **Note:**
> - If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
> - Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Field	Description
Account Name	Name of the account to which the cloud device belongs

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state. • **In-Progress**: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is **In-Progress** till the resource discovery status for all individual entities is **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This is possible only when the account is in the **Managed** state. • **Completed**: Resource discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the account is in the **Managed** state. **Note:** • Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. • The resource discovery status of all entities mapped to the account should be **Completed**. • **Not Applicable**: The resource discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved,** • for ACM and ELB resources, • for all existing devices and child accounts as part of data migration.
Cert Discovery Status	**Note:** Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to **Not Applicable**. This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Certificate discovery for the entity is yet to begin **Note:** At this point, the resource discovery status of the associated account can be **Not started**, **In-Progress**, or **Completed**. • **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
```

```
  ]
}
```

Permissions for Enabling Assume Role Access to all AWS Accounts

Note: This action helps to automatically discover CLM resources in the newly created cloud accounts without manual intervention. This is an optional action, required only if the user prefers to grant access to all the child accounts for the IAM user.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": "sts:AssumeRole",
   "Resource": [
    "arn:aws:iam::<child account 1>:role/<Assume-role>",
    "arn:aws:iam::<child account 2>:role/< Assume-role>",
    "arn:aws:iam::<child account 3>:role/< Assume-role>"
   ]
  }
 ]
}
```

Permissions for Enabling Assume Role Access for a Specific Child Account

Note: If a user prefers not to grant assume role access to all accounts, they can define the RoleARN of a specific child account in the IAM policy, as is shown in the policy below.

Note: This is mandatory when IAM Policy-based account discovery is enabled in AppViewX for child account discovery.

```
{
 "Version": "2012-10-17",
 "Statement": [
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Certificates for AWS Resources in AppViewX

There are two ways you can onboard certificates in AppViewX:

- Via certificate discovery, for existing certificates
- Via certificate enrollment, for new certifcates

Discovering Certificates for AWS Resources

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

Enrolling Certificates

Enrolling Server Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**. From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: **Note:** This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter the vendor details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

> **Note:** For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Enrolling Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Pushing Certificates to AWS Resources with ACM Integration

> **Important:** Refer to the pre- and post-push script usage instructions here.

Adding an Application Connector for AWS Resources with ACM Integration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter/Select the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**.
***Vendor**	From the dropdown list, select **AWS**.
Service Types	From the dropdown list, **ACM**.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
The **Selected devices** list is updated automatically.
4. Enter/Select the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Certificate ARN	This field is displayed when **Certificate Location** = **ACM**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The ARN (Amazon Resource Name) is a unique identifier assigned to each certificate that is managed by ACM. It is used to reference the certificate in API calls, policies, and so on. In this field, enter the ARN of the certificate to be pushed.
***Certificate File Name**	In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

   a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

   b. Click **Add**.
      The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter/Select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.
Post - Push Script File Name	Enter the file name of the post push script.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pushing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.

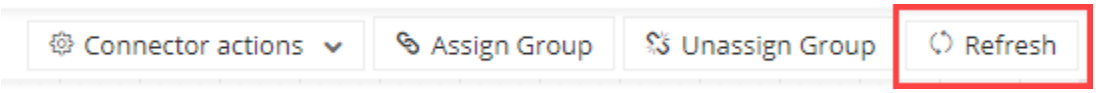
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Pushing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The approval process is triggered. The current flow is based on the default policy of two-level approvals.
- A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.

6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Enabling Auto Regeneration of Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.
   The certificate details are displayed.
5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
      The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
      The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

c. Select the **Push automatically** checkbox.

> **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

d. Click **Save**.
   The holistic view of the selected certificate is displayed.

> **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

> **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Troubleshooting for AWS ACM

Overview

This section helps you troubleshoot the common problems that you might encounter when using AWS cloud functionalities for ACM & IAM service like server addition using AppViewX, fetch, certificate discovery & certificate push.

Supported Web Browsers

Browser	Version	Notes
Firefox	Till latest (Version 84.0.4147.135)	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Browser	Version	Notes
Chrome	Till latest (Version 80.0)	NA
IE	Limited support in 9, Full support from 10+	No support for IE9 post-AppViewX Version 11.0
Safari	Till latest (Windows - Version 5.1.7, macOS - Version 13.1.2)	From AppViewX Version 11.1
Opera	Till latest (Version 70)	From AppViewX Version 11.1

Supported Devices

Device	OS	Resolution
Desktop	Windows	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Linux	1024 X 768 onwards, 1366x768, 1920x1080, Higher
Desktop	Mac	1024 X 768 onwards, 1366x768, 1920x1080, Higher
iPad	iOS	1024 X 768

Issues in Server Addition using AppViewX GUI

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	Provided credential is invalid.	1. Provide valid Access Key. 2. Provide valid Secret Key.
Provide valid account name	Account name can be duplicate or not as per standard.	1. Provide unique name for account name. 2. Account name can be alphanumeric and can also have period (.) in it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Details Incorrect	Provide mandatory fields.	Enter mandatory fields like 1. Account Number 2. Access Key 3. Secret Key 4. Data Center 5. Services 6. Regions

Issues in Fetch Regions

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide valid credentials	The provided credential is invalid.	1. Provide valid Access Key. 2. Provide a valid Secret key.

Issues in Discovery in ACM

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Please provide information as required	1. Discovery name is not given or the length is less than 2 characters. 2. Interval between batches info. is missing when execution type is sequential.	1. Enter a valid name with a minimum of 2 characters. 2. Provide a time interval between batches in minutes.
Please select a device	No device is selected in the Discover By section.	Select at least one device from which to discover certificates.

Issues in Push and Rollback

Error messages and resolutions

Error Message	Possible Cause	Possible Solution
Unable to initiate request.	1. Pushing to device when certificate is unavailable, such as in a new state. 2. Previous work order is in progress and not completed. 3. AppConnector might not be in sync.	1. Push to device after certificate has been retrieved from CA. 2. Initiate push after previous work order is finished. 3. Synchronize the AppConnector and retry.
Unable to initiate request, template is in disabled state	Given workflow is not in enabled state	Enable the push/rollback workflow from the Workflow section.
User is not authorized	Userdoes not have required permissions to push to the device.	Retry after getting the access for required action.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Error messages and resolutions (continued)

Error Message	Possible Cause	Possible Solution
Private key content is unavailable.	Private key content is not available for the certificate.	Private key is mandatory for the certificate to be pushed.
Application connector(s) not found	Application connector info was not found.	Provide the correct connectorId if not pushing using AppViewX UI.
Request associated with the application connector is in progress	Previous work order is in progress and not completed.	Initiate this request after the previous work order is finished.
Push not triggered or succeeded or No existing data available for backup process.	Rollback couldn't proceed because push was not successful.	Only successfully pushed certificates can be rolled back.
Certificate not found.	Pushing to device when certificate is unavailable, i.e, in a new state.	Push to device after certificate has been retrieved from CA.
Provided certificate is not a valid self signed. Please provide either a valid self-signed certificate or certificate chain	Provided certificate is not a valid certificate.	Push a valid certificate.
Push failed as there exists another certificate with commonName	Certificate with same common name is present in certificate manager	Check whether it is a duplicate certificate and remove the invalid one.

With IAM Integration

This document will guide you through the process of integrating the IAM AWS service with AppViewX, providing detailed steps, configuration guidelines, and automation techniques.

IAM (Identity and Access Management)

IAM (Identity and Access Management) is a web service that helps you securely control access to AWS resources. IAM enables you to manage users, groups, roles, and their associated permissions to ensure that the right individuals and services have the appropriate access to your AWS resources.

Onboarding AWS Resources with IAM Integration in AppViewX

Onboarding AWS Standalone Accounts in AppViewX

A standalone AWS account operates independently with its own set of resources and is not connected to any other AWS accounts.

Prerequisites for Migrating AWS Standalone Accounts from Older Versions

Important:

- AWS standalone device migration is supported only from the following versions of CERT + SaaS: v2020.1, v2020.2, v2020.3 - v2020.3 FP7. The following prerequisites are also applicable to only these versions.
- AWS device migration is not supported from the following versions of CERT+ SaaS: v2012.x, v2019.x, and v2021.x. For these versions, it is recommended that you delete all AWS devices (both, standalone and cross accounts) before migration and add them after the migration to 22.1 is complete.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- For customers migrating from versions 20.1.x, 20.2.x, and 20.3.6, AppViewX recommends that you delete the following before migration:
  - All of their Amazon CA settings
  - Any EC2 instances that were added manually from the server inventory (excluding the EC2 instances auto-discovered from the cloud accounts).
- For customers migrating from version v2020.3.10 (mandatory):
  - Delete all of their Amazon CA settings before migration.
  - Trigger config fetch for all of their cloud accounts after migration.

The following actions have to be performed for the standalone AWS cloud accounts migrated from the above listed versions to version v2022.1 FP1:

For standalone accounts where one of the associated services is not EC2

1. After you have upgraded the product from a version < v2020.3 FP8 to v2022.1 FP1, from the top left corner of the AppViewX user interface, go to (**Menu**) > **CERT+** > **Administration** > **Device Management**.

   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.

   The **Device :: Cloud** page is displayed.
3. From the device accounts listed under **Account Name**, select the required migrated standalone accounts.

   Troubleshooting: If you cannot see the migrated standalone accounts listed, request the super user to grant you the required permissions. Only **superusers** and users authorized by the superuser can view these migrated accounts in the list.
4. From the top-right corner of the **Device :: Coud** page, click the (**Fetch config**).

   This step is mandatory to upgrade the data recorded for the older devices to the latest format followed in v2022.1 FP1.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For standalone accounts where one of the associated services is EC2

In versions v2020.1/v2020.2/v2020.3-v2020.3FP7, for accounts in which multiple regions are associated with the EC2 service, individual S3 buckets are used to store the permissions for each region.

In v2022.1 FP1, this has been modified to use only one S3 bucket to store the permissions for all regions, irrespective of the number of associated regions.

Note: For accounts with only one associated service region, skip the following steps, since only one S3 bucket includes all permissions anyway. For such accounts, trigger **Fetch Config** manually from the inventory page.

- Before migration
  1. Merge permissions from all individual buckets into any one S3 bucket.
- After migration
  1. Select a migrated standalone account from the **Device :: Cloud** page.

     The **Device :: Cloud > Modify** page is displayed, with the details of the selected account.
  2. In the **Amazon Cloud Service Settings** section, click **Fetch collection type**.
  3. From the **Collection type** dropdown list, select the S3 bucket into which all permissions for this account were merged.
  4. Click **Add**.
  5. Click **Save**.

     Fetch Config is automatically triggered and the account details are upgraded according to the latest version.

Onboarding AWS Standalone Accounts with IAM Integration

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
Account Type*	From the dropdown list, select **Standalone**.
Account name*	Enter the customer's unique AWS account name. Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Account number*	Enter the customer's AWS account number.
Account Description	Enter a description of the device to be added.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox.
Data center*	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
Credential type*	From the dropdown list, from the following options, select the credential type: • **Manual Entry**: Manually enter the access and secret key for the customer's AWS account).
Access Key ID*	Enter the access key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Secret Access Key*	Enter the secret key for the customer's AWS account. **Note:** This field is displayed only when **Credential** type is set to **Manual Entry**.
Credential name*	If the customer's AWS credentials are stored in CyberArk, from the dropdown list, select the CyberArk credential name. **Note:** This field is displayed only when **Credential** type is set to **Credential List - CyberArk**.
**: Mandatory Fields*	

7. Enter/Select the details for the **Amazon Cloud Service Settings**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the Amazon Cloud Service Settings section

Field	Description
Services*	From the dropdown list, select **IAM** > **Identity & Access Management (IAM)** .
Default region*	Based on the customer's requirement, select the default region in which the customer's AWS cloud account is deployed. AppViewX will use this region to communicate with the other (geographically farther) regions.
Cert sync	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
**: Mandatory Fields*	

8. Click **Add**.
   Account details are now available in the device inventory. Once the account is onboarded, you can discover the corresponding certificates and manage them.

Onboarding AWS Cross Accounts in AppViewX

AppViewX streamlines the management and visibility of your AWS resources by putting in place a simple workflow that lets you onboard your AWS resources onto AppViewX's holistic certificate lifecycle management solution. One part of this configuration will be done on the AWS management console and the rest of the configuration will be facilitated via the AppViewX interface.

You can onboard the following AWS account types to AppViewX: a standalone account (all resources are available in the same account) and a cross or federated account (resources are distributed across multiple accounts).

This section of the documentation will guide you through the process of onboarding an AWS cross account, for both discovery types, in AppViewX. In AWS, cross-account discovery can be set up in two ways:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Organization-based**: A centralized discovery mechanism that automatically finds and accesses resources across accounts in your AWS Organization using built-in trust and roles
- **IAM Policy-based**: A more flexible discovery mechanism that allows to connect to only the required accounts by manually configuring roles and permissions

Note: The following steps cover only the bare minimum requirements for onboarding a cross account AWS account in AppViewX. The optional fields are out of scope and their configuration is left to the discretion of the user.

Prerequisites for Onboarding a AWS Cross Account in AppViewX

- Ensure that the following configurations are done on the AWS Management Console:
  - In your AWS master account:
    1. Create an IAM user in the AWS master account.
    2. Generate user identity.
    3. Attach policies to the created user.

       For the AWS IAM permissions to be added for the master account, click here.
  - In your AWS child account:
    1. Create a role in the child account in AWS.
    2. Attach policies to the created role.

       For the AWS IAM permissions to be added for the child account, click here.
    3. Create an EC2 role. This will be used to manage the existing EC2 instance in the AppViewX device inventory.
    4. Attach policies to the EC2 role.

       For the AWS IAM permissions for the EC2 policy, click here.

       For the AWS IAM permissions for the EC2 role, click here.

> **Note:** For detailed instructions, you can access the corresponding AWS documentation using the references given here.

- If credentials for onboarding have to be fetched from a credential list in CyberArk:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Onboarding a Cross Account in AppViewX for Organization-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name. **Constraints**: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
**: Mandatory fields*	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Auto Discovery Mode*	To onboard a cross account for organization-based discovery: a. Select **Organization Based Discovery**. The **Organization based Discovery** dialog box is displayed. b. Enter/Select the details required to configure organization-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Policy Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the IAM service component for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring Organization Based Discovery

1. In the **Organization based discovery** popup window, under **Organisation Accounts**, enter/select the discovery details.

Field description for the Organisation Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.
Account Number*	By default, the AWS account number is automatically fetched from the value entered in the Account Number field in the Basic information section. To enter a different account number: a. From the **Account Number** field in the **Organization based discovery popup** window, click **Self**.  b. Enter the required account number.
Role Session Name	**Role Session Name** is an identifier for the assumed role session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

2. Enter/Select the required details in the **Child Accounts** section.

Field description for the Child Accounts section

Field	Description
Role Name*	Enter the IAM role name for the target account here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

3. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Organization based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the **Organization based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **Organization based discovery** checkbox is checked or unchecked, unless the values are updated.

Configuring Trigger Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Trigger Based**.
   The **Trigger Based Sync** popup window is displayed.
2. Enter/Select the required **Queue Parameter** details.

Field description for the Queue Parameter section

Field	Description
SQS URL*	Enter the URL of the SQS queue.
Dead Letter Queue	Enter the URL of the Dead Letter Queue. **Note:** This field is optional and can be used for user reference purposes only. Currently, AppViewX does not have any insights based on DLQ messages.
**: Mandatory fields*	

3. Enter/Select the **STS Token** details.

Field description for the STS Token section

Field	Description
Role ARN*	Enter the Amazon Resource Name that will interact with the SQS queue through the AWS STS.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Role Session name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.
**: Mandatory fields*	

4. Enter/Select the **SQS Attributes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the SQS Attributes section

Field	Description
SQS Polling Interval*	Enter an interval value for the SQS message polling from AppViewX.
Max Number of Messages*	Enter the maximum number of messages that will be returned by the queue per request.
Visibility Timeout in Minutes*	After messages are retrieved by a **ReceiveMessage** request, they need to be made invisible to subsequent retrieve requests for a custom duration. In this field, enter this duration in minutes.
Wait time in seconds*	Enter a duration, in seconds, for which a call will wait for a message to arrive in the queue before returning.
**: Mandatory fields*	

5. In the **Auto Sync Services** section, select the list of services for which the trigger-based sync mechanism is required.
6. In the **Service Specific Parameters** section, from the **EC2 Sync Delay Time** dropdown list, select the delay interval (in hours) for the synchronization of EC2 instances when they are discovered for the first time.

Note: This section is displayed only if the EC2 service is selected in the **Auto Sync Services** section.

7. Click **Apply**.

Configuring Schedule Based Sync

1. In the **Discover Resources** section, enable **Auto Sync** and select **Schedule Based**.
   The **Schedule Based Sync** popup window is displayed.
2. Enter/Select the **General Information**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for the General Information section

Field	Description
Frequency of Sync*	To schedule the sync, set a frequency using the two dropdown lists for this field. For example, to set the frequency to 1 day: a. From the first dropdown list, select **1**. b. From the second dropdown list, select **Days**.
Advance Settings	For the current release, this field is set to **Off** and is disabled. This field and the associated features will be enabled in the upcoming release.
**: Mandatory fields*	

3. Click **Apply**.

Onboarding a Cross Account in AppViewX for IAM Policy-based Discovery

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   The **Device :: ADC** page is displayed.
2. From the **Device :: ADC** page, select **Cloud**.
3. On to the **Device :: Cloud** page and click (**Add**).
   The **Device :: Cloud > Add** page is displayed.
4. On the **Device :: Cloud > Add** page, from the list of Vendors, select **AWS**.
5. Enter/Select the **Basic information**.

Field description for the Basic Information section

Field	Description
***Account Type**	From the dropdown list, from the following options, select **Cross or Federated**.
***Account name**	Enter your AWS account name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Constraints: • A duplicate account name should not exist in the cloud inventory. • The account name should include only alphanumeric and period (.) characters.
Description	Enter a description of the device to be added.
***Account number**	Enter your AWS account number.
***Data center**	From the dropdown list, select the data center through which communication with the Certificate Authority will be established.
Proxy required	To use a proxy server for communication, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
**: Mandatory fields*	

6. Enter/Select the **Credentials**-related information.

Field description for the Credentials section

Field	Description
***Credential type**	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the standalone account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
: Mandatory fields	

7. Enter/Select the information required to **Discover Resources**.

Field description for the Discover Resources section

Field	Description
Auto Discover Resources	To discover all the cross or federated/child accounts for the master account details provided, enable this field.
Advanced Settings	To customize the auto discovery process, enable this field.
Auto Discovery Mode*	To onboard a cross account for IAM policy-based discovery: a. Select **Policy Based Discovery**. The **Policy based Discovery** dialog box is displayed. b. Enter/Select the details required to configure IAM policy-based discovery. **Note:** For the Auto Discovery Mode, you can select both options, Organization Based Discovery as well as Policy Based Discovery. For instructions on configuring Organization Based Discovery, click here.
Service*	From the **Select the Service(s)** dropdown list, select the IAM service component for the CLM operations.
Service Region*	To select a service region: a. To fetch the service regions for the account information provided, click **Fetch Region.** The retrieved service regions are populated in the **Select the Region(s)** dropdown list. b. From the **Select the Region(s)** dropdown list, select the required service region.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Cert Sync*	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic synchronization, use the **Auto Sync** key. If **Auto Sync** is enabled, select the checkbox for the type of synchronization from the following options: • **Trigger Based** (For steps on configuring trigger-based sync, click here.) • **Schedule Based** (For steps on configuring schedule-based sync, click here.)
**: Mandatory fields*	

8. To add the new device to the cloud device inventory, click **Add**.
9. Click **Save**.
   The added device is listed in the outer inventory on the **Device :: Cloud** page.

Configuring IAM Policy Based Discovery

1. In the **IAM Policy based discovery** popup window enter/select the **Child Accounts** details.

Field description for the Child Accounts section

Field	Description
Role Session Name	**Role Session Name** is an identifier for the assumed role session. Use the **Role Session Name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) • **Default**: 3600 seconds (1 hour)
External Id	**External Id** is a unique identifier that might be required when you assume a role in another account.
Source Identity	The source identity is specified by the principal that is calling the **AssumeRole** operation.
Session Tags	**Session Tags** are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS. To create a session tag: a. In the **Enter Key** field, enter a key for the key-value pair. b. In the **Enter Value** field, enter a value for the key-value pair. c. Click **Add**. The added key-value pair is shown in the table below the fields.

2. Click **Save**.

   The **IAM Policy based discovery** popup window is closed and you will be navigated back to the **Discover resources** section.

Note:

- If the popup is closed without values entered for at least one field, then the**IAM Policy based discovery** checkbox will be unchecked.
- Values once saved in the popup will be stored and made available on the screen always, regardless of the number of times the **IAM Policy Based Discovery** checkbox is checked or unchecked, unless the values are updated.

3. Click **Apply**.

Account Level/Inner Inventory

For the child accounts added, this table explains the fields that AppViewX displays to show the details of each account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Account Name	Name of the account to which the cloud device belongs
Role Name	Role name of the account creator
Service Region	The service region selected for the account
Service	Service integrated for the cloud device

Status	Status of the discovered accounts.
	
	This field takes the following values:
	
	• For the master account:
	  • **Managed**
	  • **Failed**
	• For the child account:
	  • **Success**
	  • **Partial Success**
	  • **Queued**
	  • **In Progress**
	  • **Failed**

Resource Discovery Status	**Note:** Resource discovery status is not applicable for master accounts. For master accounts, the resource discovery status is set to **Not Applicable**. This field indicates the status of the resource discovery for the individual entities belonging to a discovered account using the following values: • **Not started**: Resource discovery for the entity is yet to begin. **Note:** At this point, it is not mandatory for the associated account to be in the **Managed** (account credentials validated) state.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
• In-Progress: Resource discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The aggregated resource discovery status is In-Progress till the resource discovery status for all individual entities is Completed.

Note: This is possible only when the account is in the Managed state.

• Completed: Resource discovery by AppViewX in the customer's AWS environment is complete.

Note: This is possible only when the account is in the Managed state.

Note:
• Completed resource discovery only implies completion of the discovery process by AppViewX on AWS. All resources may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting.
• The resource discovery status of all entities mapped to the account should be Completed.

• Not Applicable: The resource discovery status is set to Not Applicable:
• when Status = Failed or Resolved,
• for ACM and ELB resources,
• for all existing devices and child accounts as part of data migration.
</td></tr>
<tr><td>Cert Discovery Status</td><td>
Note: Cert discovery status is not applicable for master accounts. For master accounts, the cert discovery status is set to Not Applicable.

This field indicates the status of the certificate discovery for the individual entities belonging to a discovered account using the following values:

• Not started: Certificate discovery for the entity is yet to begin

Note: At this point, the resource discovery status of the associated account can be Not started, In-Progress, or Completed.
</td></tr>
</table>

Field	Description
	• **In-Progress**: Certificate discovery for the entity by AppViewX in the customer's AWS environment is currently in progress. The status is **In-Progress** till the certificate discovery status for all accounts is either **Completed** or **Not Applicable**. • **Completed**: Certificate discovery by AppViewX in the customer's AWS environment is complete. **Note:** This is possible only when the certificate discovery status for all the entities associated with the account is **Completed**. **Note:** Completed certificate discovery only implies completion of the discovery process by AppViewX on AWS. All certificates may not be discovered all the time. The count of resources discovered with respect to the total resources will be shown in detailed reporting. . • **Not Applicable**: The certificate discovery status is set to **Not Applicable**: • when **Status** = **Failed** or **Resolved** • for EC2 when no EC2 instances are discovered • for all existing devices and child accounts as part of data migration **Note:** The cert discovery status is based on the status of only those entities for which the cert discovery status is not **Not Applicable**.
Cert sync	Cert sync type (**Managed**, **Monitored**, **Ignored**) selected for the entity
State	Outcome of the device addition (**Success**, **Failed**)

AWS IAM Prerequisites for Master Account

Permissions for Discovering Child Accounts using Policy-based Discovery

Note: This is required if IAM Policy-based account discovery is enabled in AppViewX. This IAM user account should be dedicated for the AppViewX Platform.

    "iam:GetGroupPolicy",
    "iam:GetUser"
   ],
   "Resource": "*"
  }
 ]
}
```

Permissions for Discovering Child Accounts using AWS Organization Services

Note: The permissions mentioned below should be enabled in the account in which organization service is enabled.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "organizations:Describe*",
```

```
            "organizations:List*"
        ],
        "Resource": "*"
    }
  ]
}
```

Permissions for Enabling Assume Role Access to all AWS Accounts

Note: This action helps to automatically discover CLM resources in the newly created cloud accounts without manual intervention. This is an optional action, required only if the user prefers to grant access to all the child accounts for the IAM user.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": "sts:AssumeRole",
   "Resource": [
    "arn:aws:iam::<child account 1>:role/<Assume-role>",
    "arn:aws:iam::<child account 2>:role/< Assume-role>",
    "arn:aws:iam::<child account 3>:role/< Assume-role>"
   ]
  }
 ]
}
```

Permissions for Enabling Assume Role Access for a Specific Child Account

Note: If a user prefers not to grant assume role access to all accounts, they can define the RoleARN of a specific child account in the IAM policy, as is shown in the policy below.

Note: This is mandatory when IAM Policy-based account discovery is enabled in AppViewX for child account discovery.

{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "sts:AssumeRole"
   ],
   "Resource": "arn:aws:iam::<child-account>:role/AppViewX"
  }
 ]
}
```

Permissions for Enabling S3 Bucket Access to the AppViewX Platform

Note: The permissions mentioned below are required only if the EC2 service has been added in AppViewX. IAM role should be created in the account with S3 permissions where the S3 bucket resides.

Note: This permission is required when assume role access is granted only to a specific RoleARN.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "sts:AssumeRole"
      ],
      "Resource": "arn:aws:iam::<child-account>:role/AppViewX-S3-Bucket-Access"
    }
  ]
}
```

Permissions for Accessing Organization Services to Discover AWS Accounts

Note: This permission is required when assume role access is granted only to a specific RoleARN.

Note: This permission enables AppViewX to discover the AWS accounts associated to a specific organization.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "sts:AssumeRole"
   ],
   "Resource": "arn:aws:iam::<child-account>:role/AppViewX"
  }
 ]
}
```

AWS IAM Prerequisites for Child Account

Permissions for Establishing a Trust Relationship in Child Accounts

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Effect": "Allow",
   "Principal": {
    "AWS": "arn:aws:iam::master-account-number:root"
   },
   "Action": "sts:AssumeRole",
   "Condition": {}
```

```
  }
 ]
}
```

Permissions for Discovering and Managing Certificates in IAM

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "iam:GetServerCertificate",
        "iam:ListServerCertificates",
        "iam:UploadServerCertificate",
        "iam:ListServerCertificateTags",
        "iam:TagServerCertificate",
        "iam:UntagServerCertificate",
        "ec2:DescribeRegions"
      ],
      "Resource": "*"
    }
  ]
}
```

Permissions for Managing SSM Permissions for the EC2 Policy

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
