Preface

Revision History

Revision	Description	Date
1.0	Initial draft of document for the release v2024.3.0.0	September 2025

About this Guide

This guide provides you step-by-step instructions for performing Certificate Lifecycle Management (Discovery, Monitor, Enroll, Renew, Push, Regenerate, Reissue, Revoke, and Inventorize certificate) and manage organization PKI posture. CERT+ helps you to enroll and manage public and private certificates.

Audience

This guide is intended for everyone deploying AppViewX CERT+ for managing their certificates.

Third-Party Software Acknowledgments

This section serves as a placeholder to document the third-party components referenced in this guide, along with their associated trademark information.

For example,

• This document includes software details developed by VMware, Inc. (www.vmware.com).

Text Conventions

The following text conventions are used in this document:

Convention	Description
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
`codeblock`	Indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Convention	Description
	Vendor/Version/Value is available only for the **on-premise** deployment
	Vendor/Version/Value is available only for the **SaaS** deployment

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Chapter 1: Getting Started

Know your Deployments for CERT+

We support multiple deployment options to cater to various customer needs and infrastructure preferences. Our solutions can be deployed in On-Premises environments, Managed Kubernetes platforms such as EKS, AKS,GKE and OpenShift and as a Software as a Service (SaaS).

SaaS Deployment (Highly Secure and Hassle-Free)

Our Software as a Service (SaaS) offering is designed for organizations that prioritize security, simplicity, and efficiency. In this deployment mode, we manage all aspects of application hosting, maintenance, and scaling, providing a worry-free experience for our customers. Our SaaS platform is built with cutting-edge security measures, including robust encryption, multi-factor authentication, and continuous monitoring to ensure your data and operations are protected at all times.

Choosing SaaS not only reduces the burden on your IT teams but also ensures that you benefit from the latest updates, features, and security enhancements without any additional effort. This option is ideal for organizations of all sizes, particularly those looking to quickly access our services with the assurance of enterprise-grade security and compliance. For additional information about saas deployment, click here.

On-Premises Deployment

On-Premises deployment enables organizations to install and operate our applications on their own infrastructure. This approach offers the highest level of control and customization, making it particularly suitable for organizations with strict security, compliance, or performance needs. It is best suited for enterprises with dedicated IT resources and the expertise to manage complex infrastructure. For additional information about on-premises deployment, click here.

Managed Kubernetes Deployment (AKS, EKS, and GKE)

We offer support for deployment on Managed Kubernetes services such as Amazon EKS, Microsoft AKS, and Google GKE. Managed Kubernetes platforms simplify the management of Kubernetes clusters by handling tasks like cluster provisioning, maintenance, and scaling.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

This deployment option is suitable for organizations looking for a balance between control and operational simplicity, and for those who prefer leveraging cloud providers' infrastructure and expertise. For additional information about managed kubernetes deployment, click here.

- Key Capabilities of CERT+
- Start with Your Onboarding Journey
- CERT+ Requirement and Access
- RBAC Configuration
- Enabling RBAC for CERT+ Native Workflows
- Invite Teammates to Your AppViewX Trial

Key Capabilities of CERT+

A single pane management interface for end-to-end Certificate and Key management, automation, and Orchestration:

Discovery and Visibility

An administrator can use CERT+ to identify certificates by scanning networks to fetch certificates from AppViewX-managed servers, devices, or certificates.

- Discover unknown certificates and keys across heterogeneous environments.
- Group certificates and keys, apply access restrictions and assign governance policies.
- Monitor expired certificates, notify, and renew certificates on time.
- Get a holistic view of certificates, keys, and respective device associations.

Inventory and Management

AppViewX Certificate Inventory serves as a repository for all certificates that have been discovered, uploaded, or enrolled via AppViewX. Administrator can configure role-based access control for these certificates by using Certificate Groups.

Dashboard for Visibility and Monitoring

The dashboard in AppViewX provides a comprehensive view of certificates and certificate hosting infrastructure. It enables users to gain insights into the PKI infrastructure, monitor expiring certificates, and assess security posture. Users can also configure custom widgets to create business-specific views of the certificate infrastructure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CLM Automation

Certificate automation allows you to automate the certificate lifecycle process across your enterprise using a configurable workflow engine. The platform can automate and orchestrate not only CLM actions but also configure change and process automation as defined by organizational processes.

- Access to a catalog of advanced automation workflows for certificate management.
- Build custom, event-driven automation using pre-built workflow tasks.
- Self-service automation workflows for easier policy-based certificate enrollment.
- Certification enrollment allows users to generate a CSR, get a CSR signed by a CA, renew or regenerate a certificate, and reissue a certificate.
- Certificate provisioning pushes a certificate to the device and binds it to the application configurations.
- Users can leverage additional management actions like revoke a certificate, migrate certificates from one CA to another through CA switch, check for revocation status of a certificate using OCSP and SSL checker to validate the deployment of a certificate.
- Integrate with ITSM, ChatOps tools for holistic Incident and Change management, and notifications.
- Enforce custom expiration dates or enable auto-rotation of keys.

Cloud and DevOps

- Discover, manage and automate certificates across multi-cloud and container environments.
- Generate internal certificates for test applications before migrating to external certificates.
- Request any certificate and provision it to cloud key stores using a single interface.
- Manage certificate enrollment and availability on Vault Keystores for containerized environments.
- ACME for easier certificate enrollment.

Secure Key Management

- Encrypt and secure private keys in a FIPS-compliant database and secure encryption keys on a vault or a FIPS 140-2 certified HSM.
- Use a built-in or third-party password vault to store critical passwords.
- Avoid Private Keys on wire by generating them directly on the device.

Certificate and Key Compliance

- Standardize certificate provisioning using self-service.
- Enforce organization standards through policies for compliance.
- Define granular role-based access control and enforce business-specific policies.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Create audit trails for each user and certificate or key-related activity.
- Get the certificate and key logs on SIEM dashboards.

IoT and Enterprise Mobility Certificate Management

- Get a single SCEP and EST for enrollment requests from IoT and network end-points.
- Integrate with EMM/MDM systems and self-service certificate issuance using SCEP.
- Intune SCEP for systems managed through Azure Intune.
- Standardize certificate management across multivendor platforms.
- Use out-of-box integration with vendors to handle certificate provisioning.

SSH Key Lifecycle Automation

- Discover SSH keys from Linux and Windows machines
- Enforce timebound access to servers by managing keys on both client and server machines.
- Discover non complaint keys or hosts not following organization standards.
- Report long existing accesses to be revoked.

Alerts & Logs

- CERT+ platform alerts you about certificates expiring within a user-configured time frame.
- CERT+ stores information about events that have occurred or actions performed by a user for certificate lifecycle management.
- CERT+ offers additional alerts to monitor changes to the availability of a certificate on an endpoint.
- CERT+ prevents unexpected certificate expirations by providing alerts and notifications to save time and secure the enterprise network.

Groups & Policies

- The certificates generated or discovered in the CERT+ platform can be logically grouped for ease of management.
- All certificate actions on a specific group can be restricted via role-based access control (RBAC).
- The platform comes prebuilt with a default group to which all the certificates identified from managed devices are associated.
- Groups are similar to a folder that stores a number of certificates with similar components.
- A policy is a set of rules that can be enforced on a certificate group.
- A defined set of certificate parameters can be created as policies.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Policies help in enforcing security compliance over certificate creation across the organization.
- All the certificates discovered and inventoried are compared against the policy to identify non-compliance.

Administration

This feature aids administrative tasks like saving a certificate keystore password into the password vault, configuring auto-enrollment, certificate authority, device management, certificate profile, programmable certificate authority, programmable application endpoint, job scheduler, certificate attributes, email settings, and actions on expired certificates and certificate history.

Start with Your Onboarding Journey

The customer onboarding process involves a trial subscription, initial network integration, and discovery of both public and private CA certificates for centralized management. Automated workflows address issues such as expiring certificates and compliance, enhancing security and visibility while reducing manual effort.

The Onboard Discovery feature in AppViewX automates the management of digital certificates by scanning the network to detect and import SSL/TLS certificates from devices such as servers and load balancers into the AppViewX Trust Protection Platform. This centralizes certificate management and eliminates manual intervention. The platform continuously monitors certificates for status changes, expiration dates, and compliance, automating renewals and deployment to prevent downtime.

For certificate onboarding, freemium/new customers and existing customers will follow different processes.

- **Freemium/New Customers**: Directed to the **CERT+** > **Insights** > **Summary** page, where a pop-up window appears outlining the onboarding journey.
- **Existing Customers**: Directed to the **CERT+** > **Insights** > **Summary** page. Here, a **Quick Discovery** button appears, which redirects them to the onboarding journey.

The **INSIGHTS** menu provides comprehensive information and analytics regarding the overall certificates summary, operations, Risk & Crypto, and Google 90-Day delivered through the CERT+ infrastructure. The INSIGHTS menu populates with relevant data, once the certificates have been successfully onboarded and discovered. For more details about Insights, refer to Insights section.

- Subscribe AppViewX Trial Application
- Onboarding Journey
- Remediate Certificate Issues

Subscribe AppViewX Trial Application

The AppViewX trial application is a limited-access version of the AppViewX platform designed to allow potential customers to explore and evaluate its features and capabilities. By subscribing to the trial application, you can test functionalities such as certificate management, CA discovery, and remediation of certificate issues without committing to a full purchase. You can gain hands-on experience with AppViewX's capabilities and determine how well it fits your organization's needs.

Note: If you have already subcribed for the trial application, skip this procedure and proceed with the Onboarding Journey.

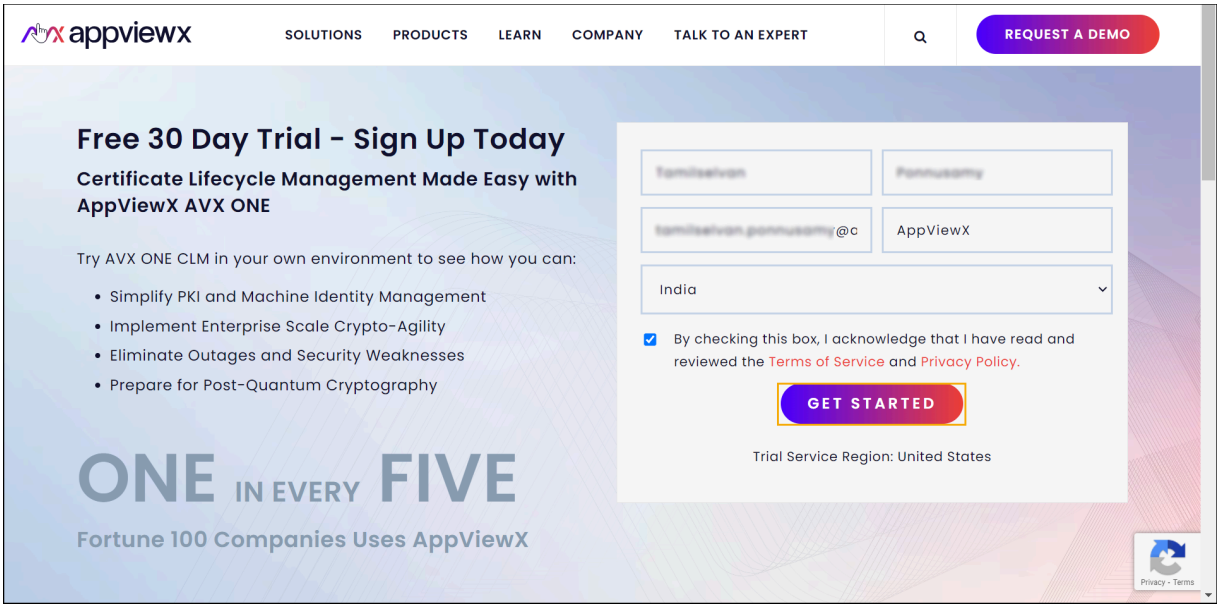
To subscribe AppViewX trial application,

1. Launch your preferred web browser, and then enter the AppViewX website URL.

   The AppViewX home page is displayed.

2. Click the **Free Trial** button.

   The **Free Trial** page is displayed.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the required details in the field such as **First Name**, **Last Name**, **Business Email**, and **Company Name**.

> **Note:** *: Mandatory fields

4. Select the country name from the **Select Country** dropdown list.
5. Click **GET STARTED**.
6. You will receive an email for the confirming your email address.
7. Click the **GET STARTED** button from the email.
8. Your email address will be verified.

> **Note:** Once you sign up, it takes a few minutes to create a tenant and send a welcome email to the provided email address.

9. You will get a welcome email.

   The email subject as **Welcome to your Free AppViewX <on-prem or SaaS> Trial**.

10. The email contains **Login URL**, **Username**, and **Temporary Password**.
11. Click the **login** URL.

    The **Sign in** page is displayed in the new browser window.

12. Enter the **User name** and then **Password** in its field.

> **Note:** For example,
> • **User name**: test.test@appviewx.com
> • **Password**: Temporary password that has been received via email.

13. Click **Sign in**.
14. The **Change password** page is displayed.
15. Enter your new password in the **New Password** field. Ensure that it meets the password requirements. For example, mix of upper and lower case letters, numbers, and special characters).
16. Re-enter your new password in the **Confirm New Password** field to verify it.
17. Click **Continue**.

    The **Change password** page is displayed with the message as Your password has been changed successfully. You will be redirected to login page. Please login again.

18. (or) Click **Back to Login**, to return to the login page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

19. Click the **login** URL in the message.

    You are redirected to **Sign in** page.

20. Enter the valid credential, and then click the **Sign in** button.

    The **Terms of Service** page is displayed.

21. Read the terms and conditions, and then click the check box to **I accept these terms and conditions**.
22. Click **Continue**.

What's Next

- Onboarding Journey
- Remediate Certificate Issues

Onboarding Journey

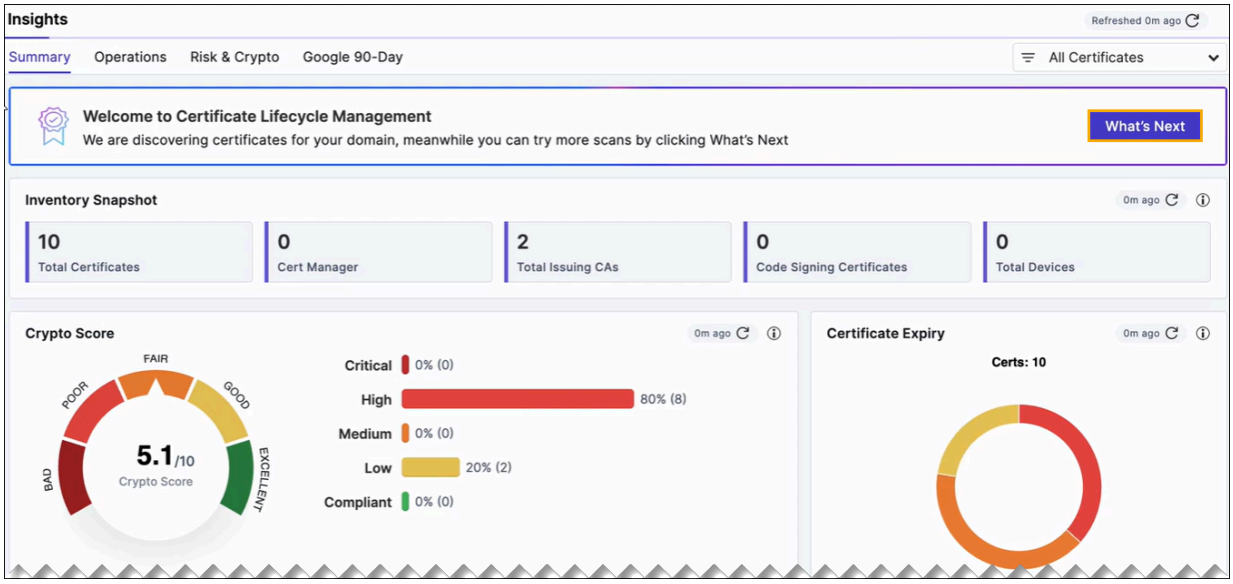
As part of the onboarding process, you have the capability to perform both Public CA Scans and Private CA Scans. These certificate discovery scans play a crucial role in identifying and analyzing digital certificates within your organization. By regularly conducting these scans, organizations can maintain an up-to-date record of their certificates, ensuring that all digital certificates, both public and private, are accurately inventoried and tracked. This facilitates efficient certificate management, including renewal, replacement, and revocation processes. Additionally, these scans help in proactively identifying and addressing any security concerns, such as expired, misconfigured, or vulnerable certificates, before they lead to potential breaches or disruptions.

These scans allow for the identification of high-risk, critical-risk, and non-standard certificates, providing the necessary insights to remediate these issues, thereby improving the overall crypto score and strengthening the organization's security posture. By leveraging these discovery scans, organizations can maintain robust certificate management practices, enhance their security measures, and ensure compliance with relevant regulations, ultimately safeguarding their digital infrastructure and data.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Freemium or New Customers to Initiate the Onboarding Process

- Click the **What's Next** button in the welcome banner that appears on the **Insights** > **Summary** section. For more details about Insights Summary, refer to Insights Summary section.

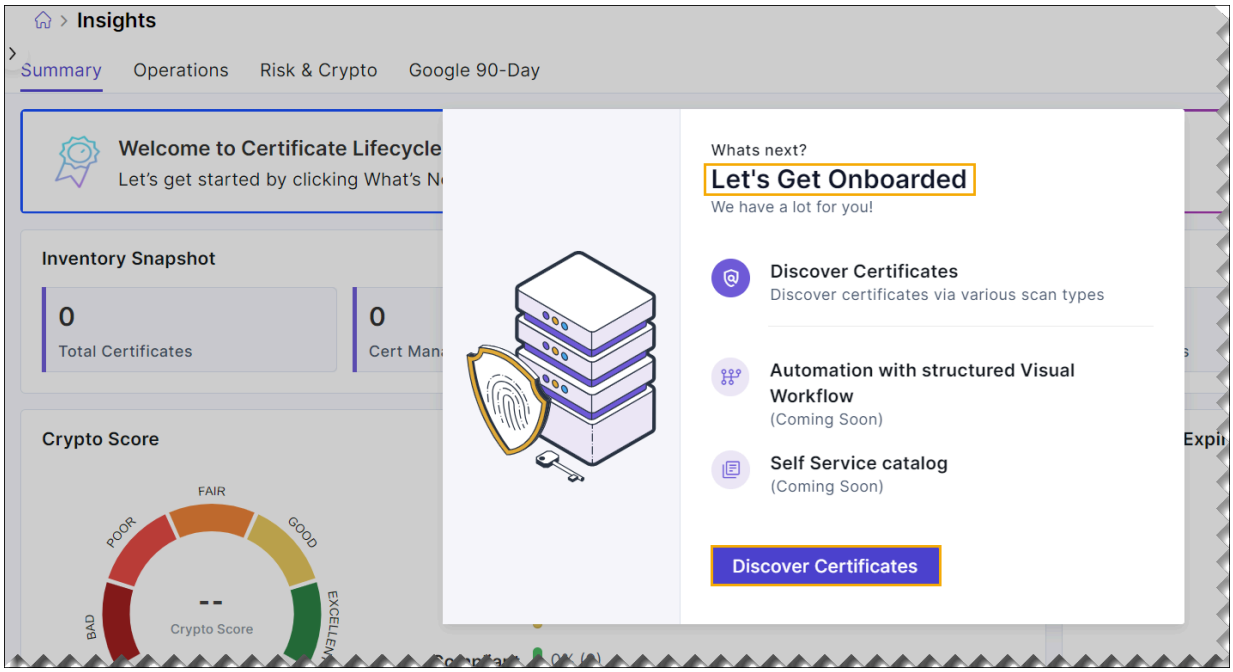


Note:

- The Certificate Transparency (CT) Log Scan is a background process in the CERT + application that continuously monitors and fetches certificate data from Certificate Transparency logs. This scan helps in identifying and managing certificates by bringing the results directly to the Insights Summary page, providing users with real-time visibility into their certificate landscape.
- If the CT Log Scan encounters issues such as a network outage or other disruptions that prevent it from completing its task, the application detects the failure. To ensure users are aware of the issue and to guide them through alternative steps, the application triggers a **Let's Get Onboarded** pop-up window.

- (or) The **Let's Get Onboarded** pop-up window appears in the **Insights** > **Summary** tab.

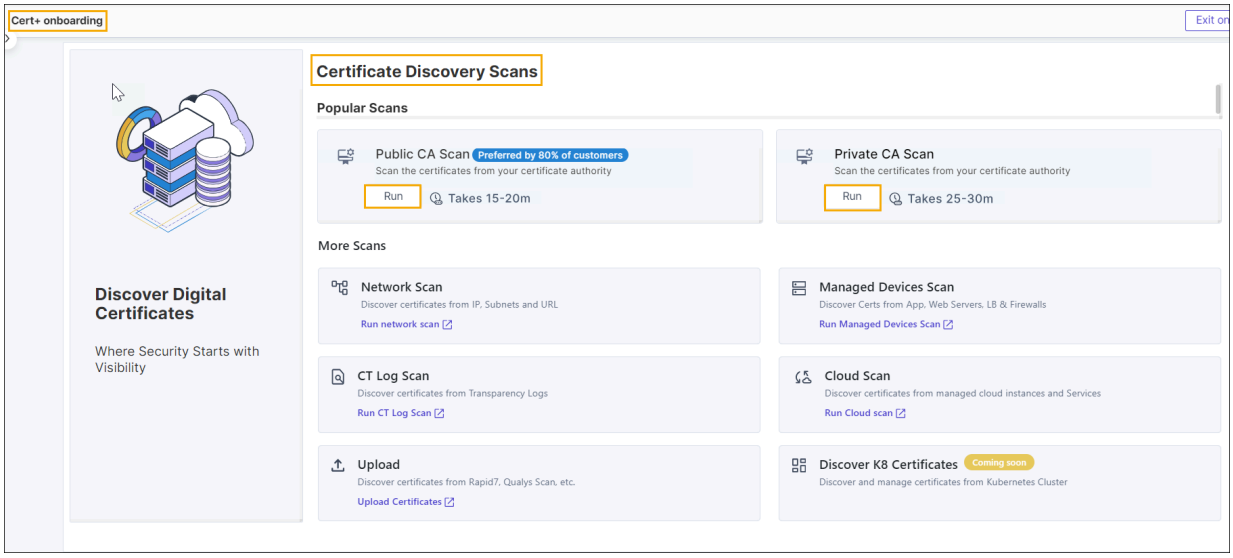
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: Once the certificate discovery process is complete, the welcome banner will disappear.

- Click the **Discover Certificates** button from the pop-up window.

The **Cert+ onboarding > Certificate Discovery Scans** page is displayed.

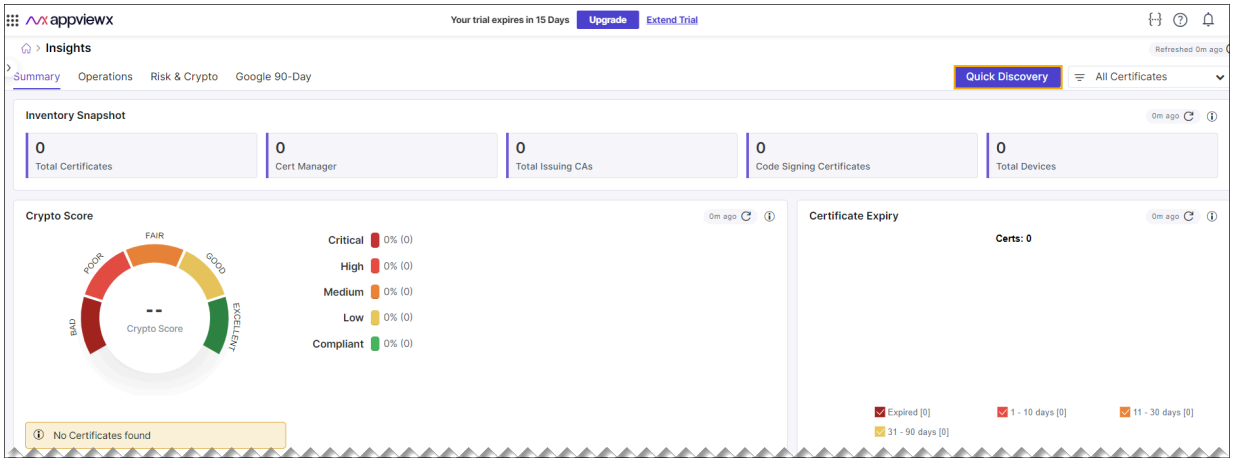


Note: Initially, only popular scans **Public CA Scan** or **Private CA Scan** will be enabled. More scans will become available once you try one of the popular scans.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

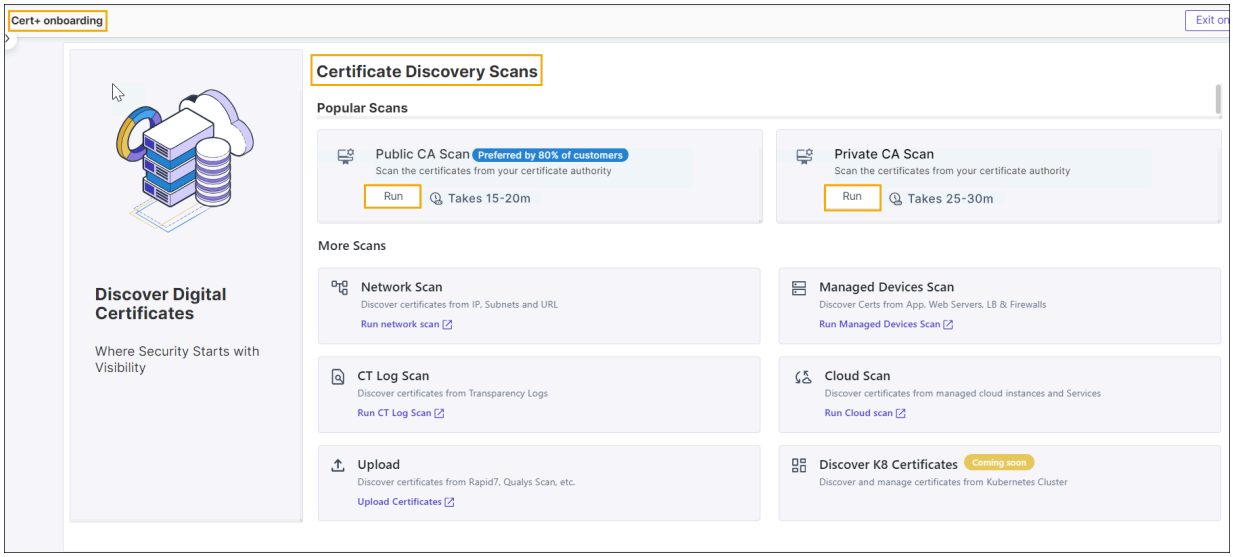
Existing Customers to Initiate the Onboarding Process

- Click the **Quick Discovery** button that appears on the **Insights** > **Summary** section. For more details about Insights Summary, refer to Insights Summary section.



Note: The Certificate Transparency (CT) Log Scan is a background process in the CERT+ application that continuously monitors and fetches certificate data from CT logs. This scan helps in identifying and managing certificates by bringing the results directly to the Insights Summary page, providing users with real-time visibility into their certificate landscape.

The **Cert+ onboarding > Certificate Discovery Scans** page is displayed.



Note: Initially, only popular scans **Public CA Scan** or **Private CA Scan** will be enabled. More scans will become available once you try one of the popular scans.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Public CA Scan

A public CA is a third-party organization that issues certificates for a fee after performing required checks on the requesting organization. These checks typically include domain validation. Public CAs use their own public-private key pairs to sign the certificates.

As part of the onboarding process, you can perform Public CA Scans targeting certificates issued by public Certificate Authorities (CAs) such as **DigiCert** and **Entrust**. These scans identify and analyze digital certificates within your organization's infrastructure, ensuring a complete inventory, timely renewal, security compliance, and proactive vulnerability remediation. They analyze certificate configurations, highlight high-risk, critical-risk, and non-standard certificates, and maintain detailed records. By leveraging these scans, organizations can effectively manage their certificates, ensure security and compliance, and safeguard their digital infrastructure while maintaining stakeholder trust.

DigiCert CA Scan

Prerequisites

- Make sure that you have DigiCert API key.
- To obtain the DigiCert API key, follow the instructions provided on the **Prerequisites Public Scan** page.

1. In the **Public Scan** section, click **Run**.

   The **Prerequisites Public Scan** page is displayed.

2. Click **DigiCert** from the **Vendors** left menu.

   > **Note:** Complete the instructions provided on the **Prerequisites Public Scan** page.

3. Click **Close** to return to the **Cert+ onboarding** page.

For the **DigiCert** CA discovery scan, follow these steps.

1. In the **Discovery Details** section,
   a. Enter the **Discovery Instance Name** in the field.

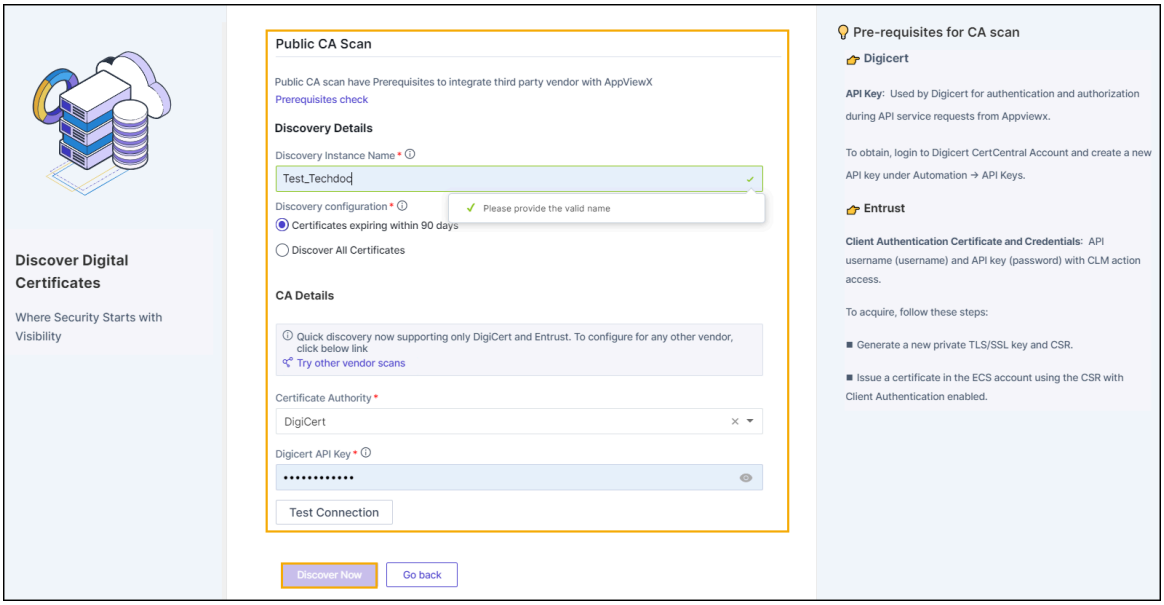
   > **Note:** The instance name can be any friendly name to the scan configuration.

   b. Click the required radio button for the discovery configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The available **Discovery configuration** options are,

- **Certificate expiring within 90 days**: By configuring the certificate expiring within 90 days feature, the discovery scan and monitoring will happen faster, allowing organizations to efficiently manage their digital certificates and ensure strong security and smooth operations.
- **Discover all certificates**: By configuring the Discover all certificates feature, the discovery scan might take longer depending on the certificate volume, with the time varying based on the number of certificates.



Note: By default, the **Certificates expiring within 90 days** radio button is enabled.

2. In the **CA Details** section,
   a. Select the **Certificate Authority** as **DigiCert** from the dropdown list.
   b. In the **Digicert API Key** field, enter the API key.
3. Click the **Test Connection** button.
4. Click the **Discover Now** button.

Entrust CA Scan

Prerequisites

- Client Authentication Certificate
- API username (username)
- API key (password) with CLM action access

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- To obtain the Entrust prerequisites, follow the instructions provided on the **Prerequisites Public Scan** page.
  1. In the **Public Scan** section, click **Run**.

     The **Prerequisites Public Scan** page is displayed.
  2. Click **Entrust** from the **Vendors** left menu.

     Note: Complete the instructions provided on the **Prerequisites Public Scan** page.
  3. Click **Close** to return to the **Cert+ onboarding** page.

For the **Entrust** CA discovery scan, follow these steps.

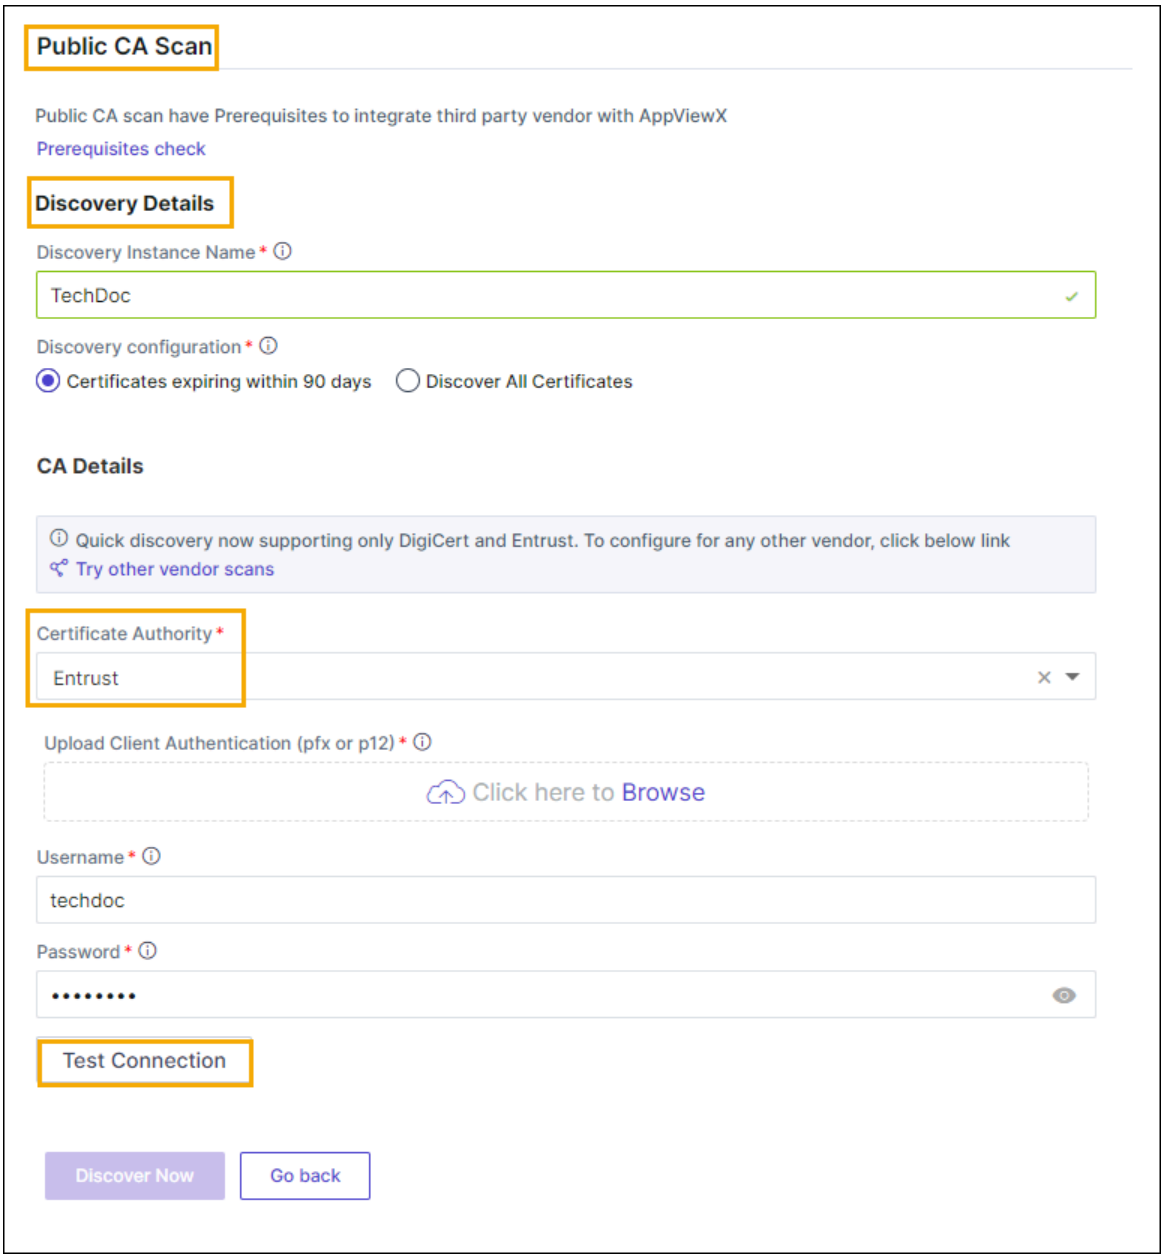
1. In the **Discovery Details** section,
   a. Enter the **Discovery Instance Name** in the field.

      Note: The instance name can be any friendly name to the scan configuration.

   b. Click the required radio button for the discovery configuration.

      The available **Discovery configuration** options are,
      - **Certificate expiring within 90 days**: By configuring the certificate expiring within 90 days feature, the discovery scan and monitoring will happen faster, allowing organizations to efficiently manage their digital certificates and ensure strong security and smooth operations.
      - **Discover all certificates**: By configuring the Discover all certificates feature, the discovery scan might take longer depending on the certificate volume, with the time varying based on the number of certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: By default, the **Certificates expiring within 90 days** radio button is enabled.

2. In the **CA Details** section,
   a. Select the **Certificate Authority** as **Entrust** from the dropdown list.
   b. Click the **Browser** button to upload the client authentication. Allowed formats are <**.pfx**> or <**.p12**>.
   c. Enter the API username to communicate with CA in its field.
   d. Enter the API password to communicate with CA in its field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click the **Discover Now** button.
4. Click the **Test Connection** button.

Private CA Scan

When an organization creates its own local CA instead of using an external one, it is referred to as a private CA. In this case, the certificates are signed with the private key of the organization's root certificate, which is the primary certificate used to sign other certificates. Private CAs can be established to issue certificates for an organization's internal network, where discretion is required and only a select group of users are involved.

As part of the onboarding process, you can perform Private CA Scans targeting certificates issued by private Certificate Authorities (CAs) such as Microsoft. These scans analyze and identify digital certificates across your organization, ensuring a thorough inventory, timely renewal, security compliance, and proactive vulnerability management. They assess certificate configurations, flag high-risk, critical-risk, and non-standard certificates, and maintain comprehensive records. By utilizing these scans, organizations can efficiently manage certificates, uphold security standards, protect digital infrastructure, and maintain stakeholder trust.

Microsoft CA Scan

Prerequisites

- Cloud Connector: Install on a Linux system with minimum requirements: 4CPU, 8GB.
- Command Execution Host: A Windows system attached to the Microsoft CA for cloud connector connection and scan execution.
- Username/Password: Credentials for accessing the command execution host.
- CA Machine Host Name: Automatically populated based on the selected CA.

Note: Use IP if hostname resolution fails from cloud connector.

For the **Microsoft** CA discovery scan, follow these steps.

1. In the **Discovery Details** section,
   a. Enter the **Discovery Instance Name** in the field.

Note: The instance name can be any friendly name to the scan configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. In the **Connectivity** section, click the Cloud Connector dropdown menu.
3. Click the **+Add New** button.

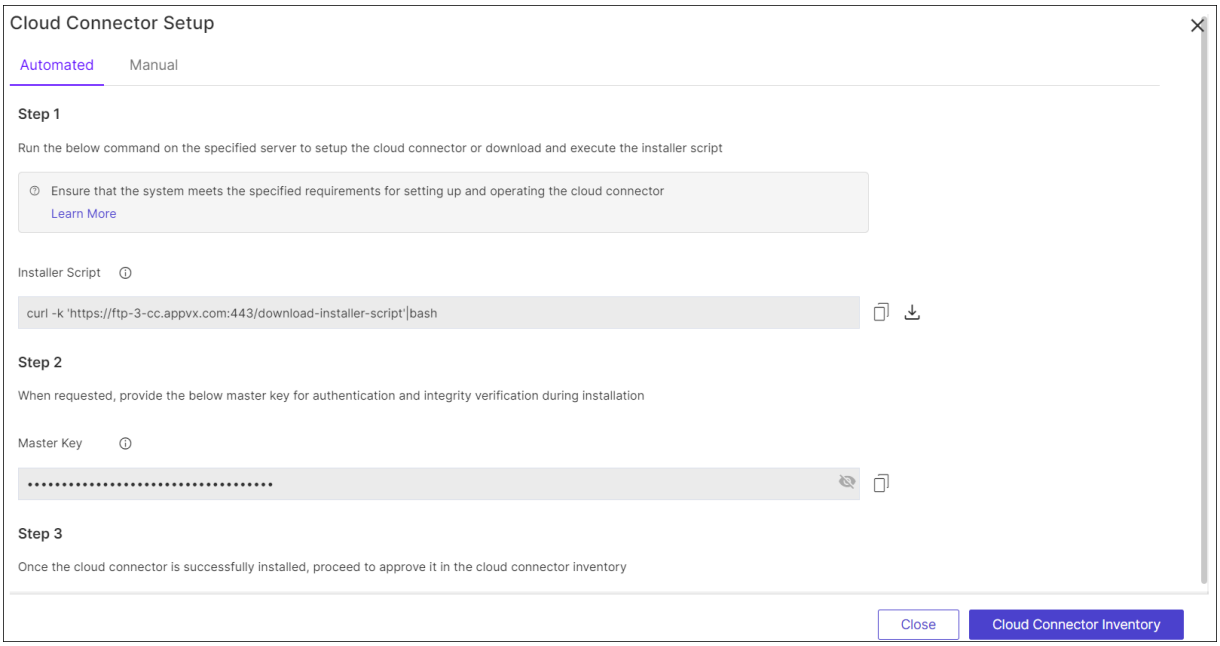
The **Cloud Connector Setup page** is displayed. For more details, refer Cloud Connector User Guide.

The cloud connector (CC) can be connected with private CA in two ways.

- Automated
- Manual.

Note: By default, the **Automated** tab is selected.

For the automated CC connection with private CA, follow these steps.



a. Run the below command on the specified server to setup the cloud connector or download and execute the installer script.

```
curl -k 'https://ftp-3-cc.appvx.com:443/download-installer-script'|bash
```

b. When requested, provide the below master key for authentication and integrity verification during installation.

```
22f77628-51c6-4209-b59f-3c91f859ea63
```

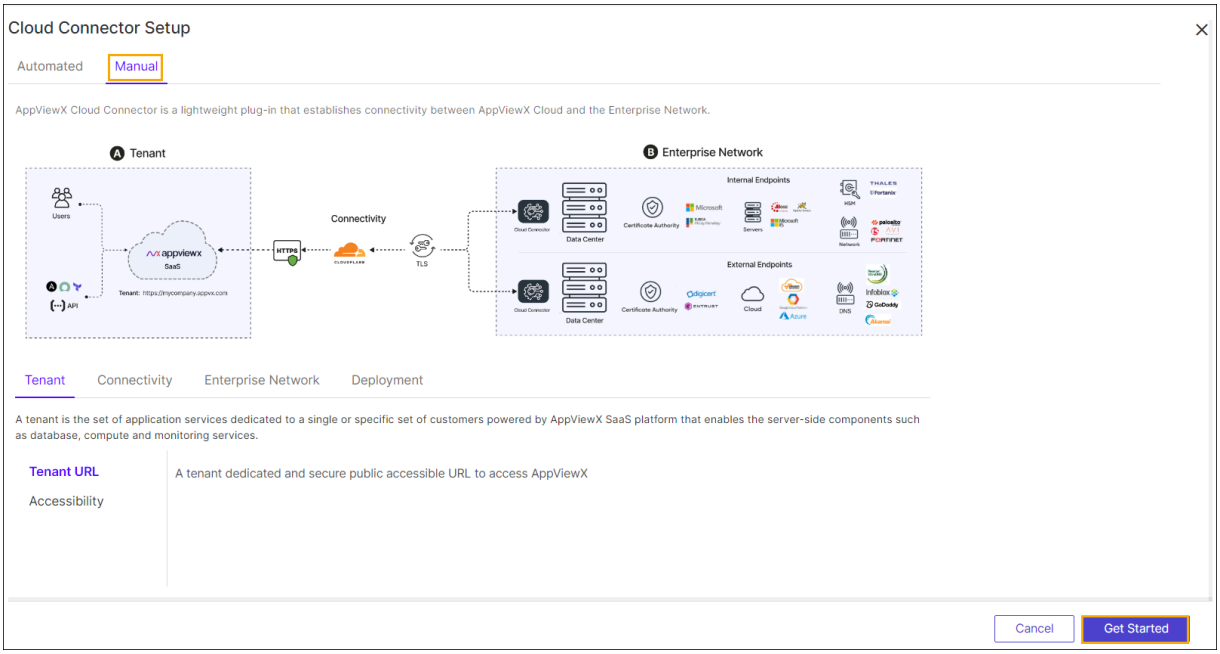
c. Once the cloud connector is successfully installed, proceed to approve it in the cloud connector inventor.
d. Click **Cloud Connector Inventory**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Setting Cloud Connector** page is displayed.

e. Click **Close**.

(or) **For the Manual CC connection with private CA, follow these steps.**



a. Click **Get Started**.

The **Basic Information** page is displayed. For more details, refer Cloud Connector User Guide.

i. Select the desired **Installation Type** radio button.
   - Native OS
   - Virtual Image.

ii. Enter the Cloud Connector Name (FQDN) in the field.

b. Click **Next**.

The **Assign Data Center** page is displayed.

i. Click Add Data Center.

The **Add Data Center** page is displayed.

ii. Enter the name of the data center in the field.

c. Click **Next**.

The **Advanced Configuration** page is displayed.

i. Select the TLS Authentication radio as required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*TLS Authentication	The available TLS Authentications are: • Auto Generate • Custom Certificate By default, **Auto Generate** is selected.
*TLS Certificate Password	Enter the TLS certificate's password.
*TLS Certificate	Upload TLS certificate in the <.p12> format.
*: Mandatory fields	

d. Select the **Use Proxy** check box if required.

e. Select the proxy from the dropdown list.

i. If not listed in the dropdown menu, click **Click here** link.

The Add Proxy page is displayed.

ii. Enter/select the following details **Proxy Name**, **Server IP**, **Port**, **URL**, **Authentication**, **Username**, and **Password** in the Add Proxy page

iii. Click **Save**.

4. Click **Finish**.
5. Click the **Test Connection** button, to validate the connection.
6. Click the **Discover Now** button.

What's Next

- Remediate Certificate Issues

Remediate Certificate Issues

Remediating certificate issues involves identifying and resolving problems related to digital certificates within an organization's infrastructure. By regularly deleting expired and revoked certificates, regenerating high-risk and critical-risk certificates with enhanced parameters, and renewing or regenerating certificates nearing expiration, organizations can significantly improve their crypto score. This proactive approach ensures robust cryptographic security, compliance with industry standards, and a well-maintained certificate infrastructure, ultimately safeguarding digital assets and maintaining stakeholder trust.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Delete Expired and Revoked Certificates from Inventory

Expired and revoked certificates pose significant security risks as they can no longer provide the necessary cryptographic protection. To improve your crypto score:

- **Identify Expired Certificates:** Regularly scan your inventory to detect certificates that have passed their expiration date.
- **Remove Expired Certificates:** Delete these expired certificates from your system to prevent any potential misuse.
- **Identify Revoked Certificates:** Similarly, identify any certificates that have been revoked due to compromise or other reasons.
- **Remove Revoked Certificates:** Ensure that revoked certificates are promptly removed from your inventory to maintain security integrity.

Regenerate High-Risk and Critical-Risk Certificates

High and critical-risk certificates typically have vulnerabilities or weak cryptographic parameters. Regenerating these certificates with enhanced security settings is crucial.

- **Identify High and Critical-Risk Certificates:** Use your certificate management system to identify certificates flagged as high or critical risk.
- **Review Risk & Crypto Settings:** Access the Risk & Crypto settings in your management system to understand the parameters required for secure certificate regeneration.
- **Regenerate Certificates:** Follow these steps to regenerate the identified certificates:
  - Generate new keys with stronger encryption algorithms (e.g., using RSA with a 2048-bit key or ECC with a recommended curve).
  - Ensure the use of longer key lengths and secure hashing algorithms.
  - Implement certificate policies that align with industry standards and best practices.
- **Deploy New Certificates:** Replace the old certificates with the newly generated ones in your infrastructure.

Renew or Regenerate Certificates That Are About to Expire

To maintain continuous security and avoid service disruptions, it’s essential to renew or regenerate certificates nearing their expiration date.

- **Identify Certificates Near Expiration:** Regularly monitor your certificate inventory to find those that are approaching their expiration dates.
- **Renew Certificates:**

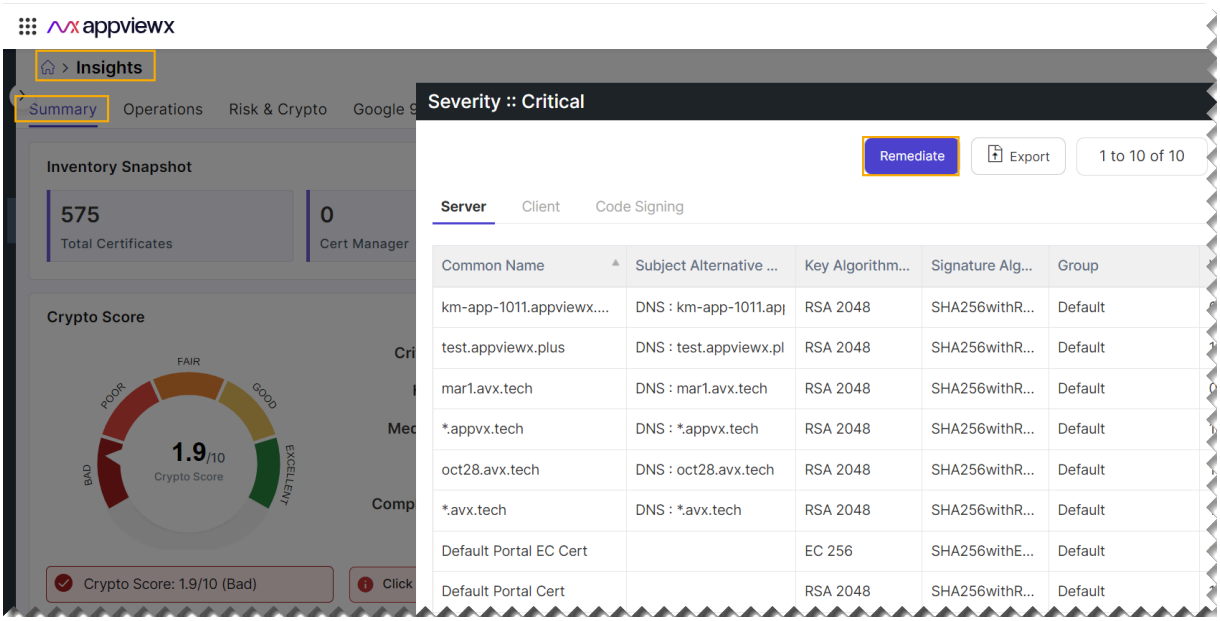
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Contact the issuing Certificate Authority (CA) to renew the certificates.
- Follow the CA's renewal process, ensuring that the renewed certificates meet your security requirements.

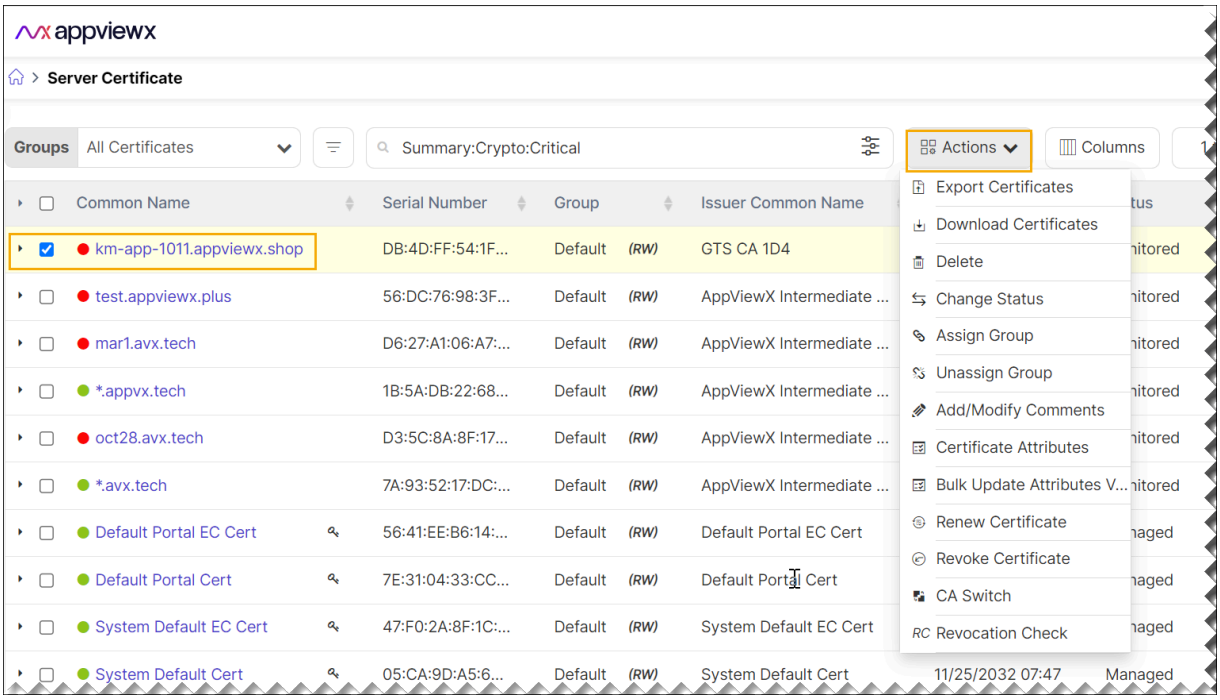
- **Regenerate Certificates:** If renewal is not possible or practical, regenerate new certificates using updated cryptographic parameters as described above.
- **Deploy Renewed/Regenerated Certificates:** Ensure that the newly renewed or regenerated certificates are deployed across all relevant systems and applications before the old ones expire.

Check Certificate Expiry

1. Navigate to **Insights** > **Summary** > **Crypto Score** section.
2. Click **Critical** or **High** priority certificate in the chart that takes to intermediate page.
3. Click the **Remediate** button to redirect to the Server/Client/Code signing certificate inventory.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Note: It allows you to initiate the renewal or replacement process for these certificates.

4. Take necessary actions for critical and high-priority certificates. For more details about CLM inventory actions, refer to the Managing the Certificate Inventory.

Remediate Non-Standard Certificate

Effective remediation of non-standard certificates is essential for maintaining a secure and compliant digital infrastructure. By regenerating self-signed certificates with trusted CAs, replacing wildcard certificates with individual domain certificates, verifying or deleting unknown certificates, issuing certificates from intermediate rather than root CAs, correcting SAN mismatches, and associating all certificates with their intended devices, organizations can significantly enhance their security posture and ensure adherence to industry best practices.

Self-Signed Certificates

Issue:

- Self-signed certificates are not issued by a trusted Certificate Authority (CA) and are typically used for internal testing or small-scale applications.

Remediation:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Regenerate the Certificate from a Trusted CA:** Replace self-signed certificates with ones issued by a trusted CA. This ensures that the certificates are recognized and trusted by other systems and browsers, thereby enhancing security and trust.

Self-Signed Certificates

Issue:

- Self-signed certificates are not issued by a trusted Certificate Authority (CA) and are typically used for internal testing or small-scale applications.

Remediation:

- **Regenerate the Certificate from a Trusted CA:** Replace self-signed certificates with ones issued by a trusted CA. This ensures that the certificates are recognized and trusted by other systems and browsers, thereby enhancing security and trust.

Wildcard Certificates

Issue:

- Wildcard certificates are used to secure multiple subdomains with a single certificate. While convenient, they can pose security risks if compromised, as they grant access to multiple subdomains.

Remediation:

- **Create Individual Certificates for Each Domain:** Instead of using a wildcard certificate, generate individual certificates for each subdomain. This limits the scope of any potential security breach to a single subdomain.

Unknown Certificates

Issue:

- Certificates issued by unknown or untrusted entities can’t be verified for their authenticity and may pose security risks.

Remediation:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Trust the Issuers or Delete the Certificates:** Verify the legitimacy of the issuing entity. If the issuer is trustworthy, add them to your list of trusted entities. If the issuer cannot be verified, delete the certificates to avoid potential security risks.

Root CA Issued Certificates

Issue:

- Certificates issued directly by a root CA are typically less secure than those issued by an intermediate CA, as they do not follow the recommended hierarchical trust model.

Remediation:

- **Regenerate the Certificates from a Trusted Intermediate CA:** Replace root CA-issued certificates with certificates issued by a trusted intermediate CA. This follows the best practice of using a hierarchical trust chain, improving overall security.

Subject Alternative Name (SAN) Mismatch

Issue:

- SAN mismatch occurs when the certificate's SAN fields do not match the actual Fully Qualified Domain Name (FQDN) it is supposed to secure.

Remediation:

- **Enroll New Certificates for the Actual FQDN:** Generate new certificates that correctly list the intended FQDNs in the SAN field. Deploy these new certificates to ensure they match the domain names they are intended to secure, preventing security warnings and potential man-in-the-middle attacks.

Unassociated Certificates:

Issue:

- Unassociated certificates are those that are not currently linked to any device or service within your infrastructure, leading to potential management and security gaps.

Remediation:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Manage Respective Devices to Associate Certificates:** Identify the intended devices or services for these certificates and properly associate them. This ensures that all certificates are actively managed and utilized, reducing the risk of forgotten or unused certificates that could lead to security vulnerabilities.

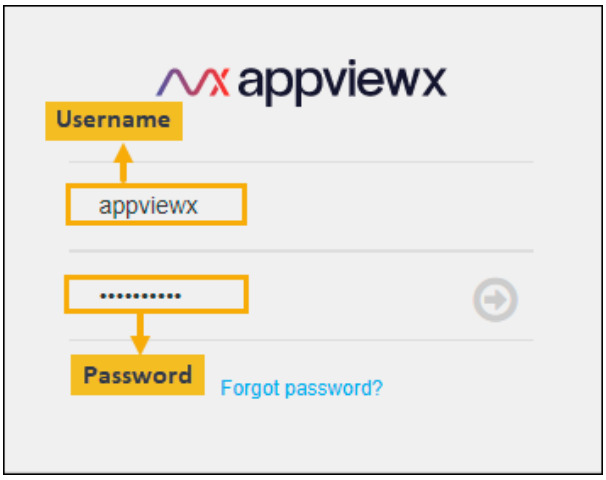
CERT+ Requirement and Access

Supported Web Browsers

Web Browser	Version
Firefox	128 (64-bit) or later
Google Chrome	127 (64-bit) or later

Accessing the CERT+

1. Log in to AppViewX with a valid credential.
   The AppViewX Landing page appears.



2. Click (**Menu**) button located in the upper left corner of the screen.

> **Note:** The product URL will be shared by AppViewX in the onboarding emails.

3. Click **CERT+** on the left navigation bar.
   The CERT+ home page is displayed, and the menu will be updated to the CERT+ menu.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Licensing Models

The licensing for CERT+ is done using two models:

- Certificate Instance Based Model
- Certificate Count Based Model (introduced in v2023.1.0 FP3)

You can choose the certificate licensing model at the time of requesting for a license.

Certificate Instance Based Model

In this model, the certificate count is the number of connectors associated with a certificate.

Certificate count is derived using the following logic:

- If a certificate has one non-sync and two certificate connectors, **certificate count = two**.
- If a certificate has one Kube and two certificate connectors, **certificate count = two**.
- If, for a certificate, only the Kube service exists and there are no cert connectors, the certificate will not be counted under the CERT+ license.
- Expired and revoked certificates are included in the certificate count.
- Certificates for which **EKU** = **Server Authentication**/**Server and Client Authentication** are categorized and counted under server certificates.

  Certificates for which **EKU** = any value other than the above two are categorized and counted under device certificates.
- Trial licenses use the certificate instance based model.

The following is a screenshot of an existing CERT+ license page where:

- Managed Certificate includes all Managed certificates (Server, Client, Code Signing and OTHERS)
- Monitored Certificates include all Monitored certificates (Server, Client, Code Signing and OTHERS)
- Managed Server Certificates Instances includes ONLY Managed Server Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Count Based Model

(Introduced in v2023.1.0 FP3)

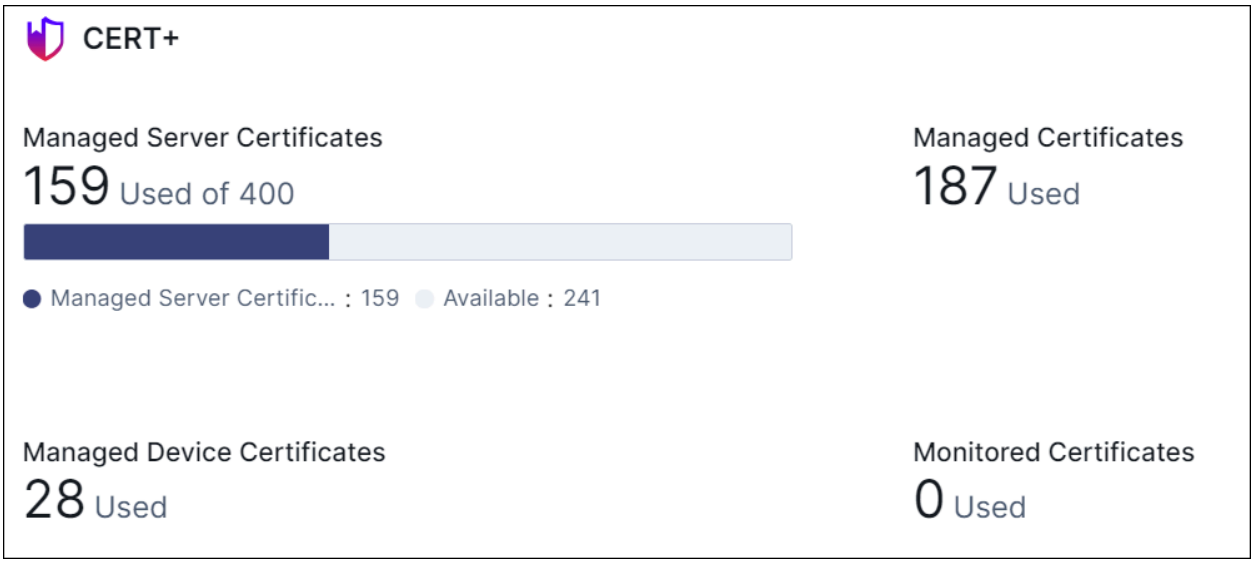
In this model, certificate count is the actual number of certificates in the inventory. Each certificate will be counted as one irrespective of any number of connectors associated with it. Additionally, in comparison with the certificate instance based model, the following changes have also been made:

- Expired and revoked certificates can be moved from Managed to Monitored.
- Once a certificate has been renewed, it can be moved from Managed to Monitored.
- Certificates issues via auto-enrollment will be added in the inventory as Monitored.
- Certificates issued via PKIaaS will be added in the inventory as Monitored, by default.

The following is a screenshot of an existing CERT+ license page, based on the new model, where:

- Managed Certificate includes all Managed certificates (Server, Client, Code Signing and OTHERS)
- Monitored Certificates include all Monitored certificates (Server, Client, Code Signing and OTHERS)
- Managed Server Certificates Instances includes ONLY Managed Server Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



RBAC Configuration

AppViewX offers comprehensive support for Role and Resource-Based Access Control (RBAC) and integrates with existing identity stores such as Active Directory (AD) and Lightweight Directory Access Protocol (LDAP) to enforce authorization policies. Roles and Resources can be customized to suit any organizational structure and any user requirements.

Role-based access control (RBAC) is a method of restricting AppViewX functions, network resources that can be managed and monitored in AppViewX based on the roles of individual users within an enterprise. RBAC lets employees have access rights only to the AppViewX functions and network resources they need to do their jobs and prevents them from accessing information that doesn't pertain to them.

The Account module enables you to create and manage resources, roles, user groups, and users which are used to ensure that the system:

- Verifies the identity of users logging in to the system **(Authentication)**.
- Controls user access to system resources **(Authorization)**.

Benefits of RBAC

Using RBAC should improve operational efficiency, enhance compliance, provide administrators increased visibility, reduction in costs, decrease in risk of breaches, and data leakage.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Simplified RBAC Configuration in AppViewX

To simplify the existing RBAC Configuration in AppViewX for the Account Administrator, the **Quick Config** wizard flow option has been introduced in the existing Authentication, User groups, Roles, and Resources. Using the **Quick Config** option, users should be able to perform all the following actions in the same wizard flow:

- Configure external authentication or single-sign-on for users to log in to AppViewX.
- Add users groups into AppViewX by pulling specific user groups from AD into AppViewX based on specific patterns/keywords/codes and support the Bulk Export/Import option to onboard user groups.
- Pre-packaged roles for ADC, Cert, Security, and Automation modules to assign permissions to user groups.
- Simplifying custom role creation by providing information help against each ACF explaining the significance of the functionality.
- Dynamic rule-based resource tagging of newly discovered ADC objects, Certificates based on Query or using a script, and assigning permissions to user groups dynamically.

For details on configuring the role and RBAC refer to the **Platform User Guide** > **Configuring Role and Resource-Based Access Control** section.

Enabling RBAC for CERT+ Native Workflows

Native workflows are built-in, automated processes designed to integrate with the UI-based CLM actions to manage the complete lifecycle of digital certificates in a structured, policy-driven manner.

To be able to execute a CLM action from the AppViewX UI, users are required to have the requisite access to the corresponding native workflow.

Native Workflows in CERT+

Native Workflow	CLM Action
certificate_new_request	Enroll certificate
certificate_renew_request	Renew certificate
certificate_new_request	Regenerate certificate
certificate_reissue_request	Reissue certificate
certificate_revoke_request	Revoke certificate

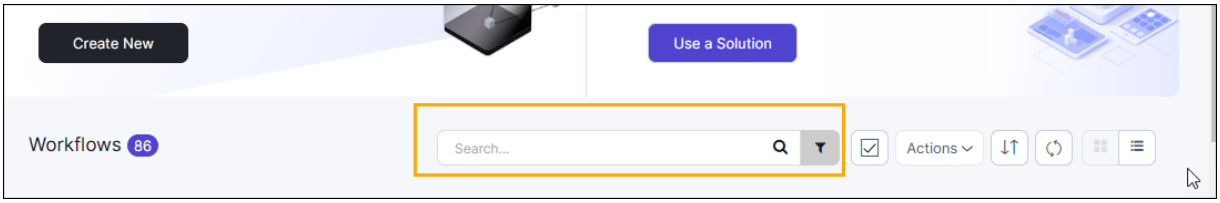
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Native Workflow	CLM Action
certificate_reinstate_request	Reinstate certificate
certificate_suspend_request	Suspend certificate

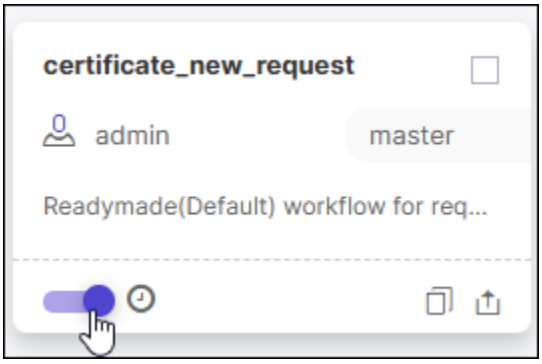
Enabling RBAC for CERT+ Native Workflows

Note: The following process is the same for all native workflows.

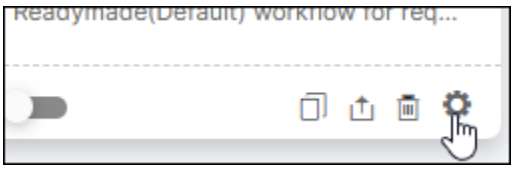
1. Login to AppViewX and go to (**Menu**) > **Automation** > **Workflow** > **Design**.
2. In the **Search** field, enter the name of the workflow you want to enable RBAC for.



3. Turn off the toggle button to disable the workflow before editing it.



4. To open the workflow settings, click .



The **Settings :: <workflow name>** dialog box is displayed.

5. Under the **General** tab, select **Assign workflow**.
6. From the list of resources displayed on the right, for the required resource, click **RW**.

This will enable the read-write permission for the selected resource.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Click **Save**.
8. Under the **RBAC** tab:

   a. Go to **CSR Submission Request** and, for the required resource, click **S**.
   This will enable the CSR submit permission for the resource.

   b. Click **Save**.

   c. Go to **Approval** and, for the required resource, click **RW**.
   This will authorize the resource to grant Level 1 approval for the request to perform the CLM action.

   d. Click **Save**.

   e. Go to **Implementation** and, for the required resource, click **RW**.
   This will authorize the resource to grant Level 1 approval for the request to perform the CLM action.

   f. Click **Save**.

9. Close the dialog box and turn on the toggle button to enable the workflow.

Invite Teammates to Your AppViewX Trial

AppViewX now allows you to invite your acquaintances to explore and test AppViewX in a trial environment.

To do this:

1. Go to (**Menu**) > **CERT+**.
   The **Insights** landing page is displayed.
2. From the top right corner of the screen, click **Invite Users**.
   The **Invite Teammates** dialog box is displayed.
3. Under **Enter Emails & Assign Groups**:
   a. Enter your teammate's **Email** address.
   b. From the dropdown list, select the user group you want to assign the teammate to.
   c. To add the email address of another teammate, click **Add Another Email**.
   d. Repeat the above step to add as many teammates as required.
4. Click **Send Invite**.
   New users will receive login credentials. If the user already exists, they'll be added to the selected user group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Chapter 2: CERT+ User Guide

AppViewX CERT+ User Guide offers detailed instructions for users on how to navigate and utilize the CERT+ certificate lifecycle management platform. It includes step-by-step guidance on performing essential tasks such as managing certificates, monitoring their status, and using various features to ensure effective and secure certificate management.

As a nonadmin user, you can perform the following tasks:

- Onboarding Certificates
- Manage Devices
- Certificate Actions
- Managing the Certificate Inventory
- Certificate Reporting and Monitoring
- Alerts and Logs
- Managing Certificates Using Automation Workflows

Onboarding Certificates

Important: In compliance with recent updates from the CA/Browser Forum S/MIME Baseline Requirements, for DigiCert-issued S/MIME certificates, it is now mandatory to include the first name and last name, or a pseudonym in the subject information during certificate enrollment.

However, in the current implementation:

- The discovery feature does not retrieve these values in the metadata.
- The upload certificate feature is not compatible with this enhancement since it does not have with a direct mapping to the certificate type, unless the certificate is discovered via a Certificate Authority scan.

- Discovery Configuration
- Syncing Certificates with Network Devices or Servers

Prerequisites for Onboarding Certificates

- To discover certificates from managed devices, the device must be managed under the AppViewX Device Inventory.
- To discover certificates from a CA, the CA account should be determined under the AppViewX Certificate Authority settings and network access should be considered.
- AppViewX discovery agent role and usage. For more details, refer to Roles section in the Platform Guide.

Certificate Discovery

Certificate discovery is the process of finding certificates existing in an enterprise network. The first mitigation step to address the certificate expiry outages is to get visibility over the existing certificates and host information in the infrastructure. AppViewX CERT+ enables you to detect risk by discovering all the certificates hosted in the network by various applications.

The scan process involves collecting information about each certificate, such as its subject, issuer, validity period, key length, and usage. This data helps administrators keep track of certificates' expiration dates, identify potential vulnerabilities related to weak encryption algorithms or outdated certificate versions, and ensure compliance with industry standards and best practices.

The purpose is to provide an organization with an inventory of all certificates present within their network. This inventory helps in managing and monitoring the certificates effectively, ensuring their validity, and avoiding potential security risks associated with expired or compromised certificates.

AppViewX supports certificate discovery through different types of scans as explained in the following sections:

- Network Scan
- Managed Devices Scan
- Transparency Log Scan
- Certificate Authority Scan
- Cloud Scan
- Scanning Uploaded Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- On-demand Discovery
- Scheduled Discovery

Network Scan

A network certificate discovery scan is used to identify and analyze digital certificates within a network or infrastructure. These certificates can include SSL/TLS certificates used for secure website communication, code signing certificates, client authentication certificates, and other types of digital certificates.

By performing regular network certificate discovery scans, organizations can maintain an up-to-date record of their certificates, manage them efficiently, and proactively address any security concerns or compliance issues.

Initiating a Network Discovery Scan

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Network Scan**.
   The **Discovery : Network Scan : Add Discovery** page is displayed.
2. To initiate a network certificate discovery scan, enter/select the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Network certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	Network certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter/Select the details for **initiating an on-demand network certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Note: Character limit: **2000 characters**

OR

Enter/Select the details for **initiating a scheduled network certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, from the **Discovery From** dropdown list, select the source for the certificate discovery.
   - **Network**

Field descriptions for discovering certificates from Network

Network List	From the dropdown list, select the network(s) you want to include in the discovery. This list is populated based on the networks added to the network inventory in CERT+.
SNI Hostname(s)	To discover certificates from SNI protected websites that share the same IP and port number with another web application, enter the hostname in this field. You can also enter a comma-separated list of hostnames.

   - **IP Range**

Field descriptions for discovering certificates from IP range

Field	Description
***Start IP**	Enter the IPv4 address from which the network scan should start.
***End IP**	Enter the IPv4 address till which the network scan should run.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Ensure that the **End IP** value is greater than the **Start IP** value,
***IPs per Batch of Discovery**	Enter the number of IP addresses that should be scanned in one batch. **Note:** • A batch can include a maximum of 256 IP addresses. • Batching IP addresses for scanning in one go can be useful for throttling scan traffic.
***Scan Ports**	From the dropdown list, from the following options, select which ports have to be scanned: • **All Ports** • **Standard Ports** To get a list of the standard ports, click **Download here** from below the dropdown menu. • **Custom Ports**
Add More Ports	**Note:** This field is displayed only when **Scan Ports** = **Standard Ports**. To scan ports other than the standard ports, enter a comma-separated list of port numbers in this field. You can enter a hyphenated range of ports, as well as a comma-separated list of port ranges.
***Add Ports**	**Note:** This field is displayed only when **Scan Ports** = **Custom Ports**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter a comma-separated list of port numbers to be scanned from between 0 to 65535. You can also enter a hyphenated range of ports, as well as a comma-separated list of port ranges. For example: **444-666**, **888-999**.
Select Node to Trigger Scan From	Select the CLM node from where the discovery scan will be performed. **Note:** Select a node close to the network entered and avoid traffic through firewalls when possible.
SNI Hostname(s)	To discover certificates from SNI protected websites that share the same IP and port number with another web application, enter the hostname in this field. You can also enter a comma-separated list of hostnames.
***TLS version(s)**	From the dropdown list, select the required TLS version.
Exclusion List	From the dropdown list, select the exclusion lists that have to be used for this scan. For a network discovery scan, you can create exclusion lists that specify network sources that must be excluded from a certificate discovery scan. For instructions on viewing, creating, and managing exclusion lists, click here. **Important:** This dropdown is populated with disabled execution lists, which can be selectively enabled for a scan. Exclusion lists, once created, are automatically enabled and must be manually disabled. The disabled lists are populated in this dropdown list and can be selectively enabled.
Add	Click **Add** to add the network details entered.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The entered details are displayed in the table shown after the **Select a File** field.
Exclusion List	Same as above
Select a File	You can specifying the entries for all the above fields in a **.xlsx** or **.csv** file and upload it in this field. **Note:** To download a sample file, click **Download Sample Template**. You can fill in your details in this downloaded template. a. Click **Upload** and navigate to the location of your file. b. Click **Open**.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration in this field. The sequential execution of the batches is spaced according to the interval value entered here.
Scanning Intensity	If **Execute Batches Sequentially** is not enabled, select a scanning intensity for the discovery operation. A higher scanning intensity means a higher scanning speed and a larger network load. Maximum connections from a discovery engine will be chosen based on the Scanning Intensity.
Skip Full Scan	Enabling this field will skip a full scan and restrict the discovery operation to sources (IP addresses and port numbers) from which certificates were discovered previously.
***Device discovery**	From the dropdown list, from the following options, select your device discovery requirement: • **Do not discover devices** Existing certificate scanning alone carried for the configured IPs. On completion, the batches and certificate tabs displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Discover devices along with their operating system** AppViewX scans for the device and certificates for the configured IPs. On completion, the batches, Certificates, and Devices tabs are displayed. **Note:** To discover the operating system version, AppViewX requires sudo access.
**: Mandatory fields*	

• **Subnet**

Field descriptions for discovering certificates from a subnet

Field	Description
***Network**	Enter the subnet/mask in the field. For example: **192.168.1.1/24**.
***Subnets per Batch of Discovery**	Based on the value entered, the provided subnet will be split into multiple batches for the discovery process.
***Scan Ports**	From the dropdown list, from the following options, select which ports have to be scanned: • **All Ports** • **Standard Ports** To get a list of the standard ports, click **Download here** from below the dropdown menu. • **Custom Ports**
Add More Ports	**Note:** This field is displayed only when **Scan Ports** = **Standard Ports**. To scan ports other than the standard ports, enter a comma-separated list of port numbers in this field. You can enter a hyphenated range of ports, as well as a comma-separated list of port ranges.

Field	Description
Skip Full Scan	Enabling this field will skip a full scan and restrict the discovery operation to sources (IP addresses and port numbers) from which certificates were discovered previously.
***Device discovery**	From the dropdown list, from the following options, select your device discovery requirement: • **Do not discover devices** Existing certificate scanning alone carried for the configured IPs. On completion, the batches and certificate tabs displayed. • **Discover devices along with their operating system** AppViewX scans for the device and certificates for the configured IPs. On completion, the batches, Certificates, and Devices tabs are displayed. **Note:** To discover the operating system version, AppViewX requires sudo access.
**: Mandatory fields*	

- **URL**

Field descriptions for discovering certificates from a URL

Field	Description
***URL**	Enter the HTTPS URL for discovering the associated certificate.
***Ports to Scan**	**Note:** This field is disabled if the **Scan All Ports** field is selected. Enter a comma-separated list of port numbers in this field. You can also enter a hyphenated range of ports, as well as a comma-separated list of port ranges.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Scan All Ports	**Note:** Enabling this field will disable the **Ports to Scan** field is enabled. Select the **Scan All Ports** checkbox to scan all the HTTPS-enabled ports. This is particularly useful if the number of HTTPS-enabled ports is significantly large or is unknown.
Select Node to Trigger Scan From	Select the CLM node from where the discovery scan will be performed. **Note:** Select a node close to the network entered and avoid traffic through firewalls when possible.
Add	Click **Add** to add the network details entered. The entered details are displayed in the table shown after the **Select a File** field.
Select a File	You can specifying the entries for all the above fields in a **.xlsx** or **.csv** file and upload it in this field. **Note:** To download a sample file, click **Download Sample Template**. You can fill in your details in this downloaded template. a. Click **Upload** and navigate to the location of your file. b. Click **Open**.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter a interval duration in this field. The sequential execution of the batches is spaced according to the interval value entered here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Scanning Intensity	If **Execute Batches Sequentially** is not enabled, select a scanning intensity for the discovery operation. A higher scanning intensity means a higher scanning speed and a larger network load. Maximum connections from a discovery engine will be chosen based on the Scanning Intensity.
Skip Full Scan	Enabling this field will skip a full scan and restrict the discovery operation to sources (IP addresses and port numbers) from which certificates were discovered previously.

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. Configure the **After Discover** settings.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Managed Devices Scan

A managed devices certificate scan involves scanning and managing digital certificates on organizational devices to maintain security and prevent incidents. AppViewX's feature manages the entire certificate lifecycle on devices like ADC load balancers, servers, and firewalls, from discovery to renewal, revocation, and removal. This section details how to discover certificates, using SSL profiles and virtual servers to gather and retain certificate information.

Note: The chapter on Certificate Actions, in this guide, talks about how AppViewX manages the lifecyle of the discovered certificates.

Important: For devices with integrated gateways, discovery is performed in batches of 500 certificates.

Initiating a Managed Devices Scan

For Managed ADCs

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**. The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

Frequency Type	Description
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed ADCs**.
Devices window	A list of all the managed ADC devices is displayed in the devices window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
***Discovery Type**	From the following options, select one: • **All Certificates**: Select this to discover all certificates. • **Certificates in Use**: Select this to discover only those certificates that are associated with a service.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

For Managed Firewalls

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Managed Devices Scan**.
   The **Discovery : Managed Devices Scan : Add Discovery** page is displayed.
2. To initiate a managed devices scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	The certificate discovery scan will be triggered manually by the user as and when required.
Scheduled	The certificate discovery scan will be triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand managed devices certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

   OR

   Enter the details for **initiating a scheduled managed devices certificate discovery scan**.

   Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Frequency Type	Description
	Note: Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter the discovery details.

Instruction for discovering certificates

Field	Description
***Discovery From**	From the dropdown list, select **Managed Firewalls**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Devices window	A list of all the managed firewall devices is displayed in the devices window. To select devices for certificate discovery, select the checkbox(es) for the required devices. The devices window has the following option: • **Add as Favorites**: You can mark your frequently used devices as favorites. • **All**: Select this to see the complete list of devices (unfiltered). • **Selected**: Select this to list only the selected devices. • **Unselected**: Select this to list only the unselected devices. • **Delete**: Delete the required devices from the favorites list.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.

**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are displayed in the certificate inventory.

What's Next

After discovering certificates, you can now:

- Go to the certificate inventory to view and manage the certificates.
- Automate certificate lifecycle management by enabling:
  - Auto renewal of certificates
  - Auto regeneration of certificates
  - Auto push of certificates to endpoints
  - Alerts to notify events and status changes related to the certificates

Transparency Log Scan

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Transparency Log Scan**.
   The **Discovery : Transparency Log Scan : Add Discovery** page is displayed.
2. In the **Discover Details** section, select/enter the following details:

***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Certificate Authority Scan

AppViewX can communicate with CA and scan certificates. To discover certificates from a CA, the CA account must be determined under the AppViewX inventory settings.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Important:

- Certificate discovery for CAs that include the integrated gateway functionality will be done in batches of 500 certificates.
- For the HydrantID CA, the certificate authority scan will discover only active certificates. To discover expired certificates, a rule must be created and applied at the time of triggering the certificate authority scan.

To trigger a certificate authority scan:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Certificate Authority Scan**.
   The **Discovery : Certificate Authority Scan : Add Discovery** page is displayed.
2. In the **Discover Details** section, select/enter the following details:

Field descriptions for the Discover Details section

Field	Description
***Discovery Run Type**	Click the check box to select the desired discovery run type. The possible types are: • **On-demand** - The user can trigger a discovery manually whenever he/she wants. • **Schedule** - By scheduling the discovery, the user can automate the process for a defined time/ frequency. **Note:** AppViewX will trigger the discovery certificates process for that instance.
Discovery Instance Name	Enter the name of the discovery instance.
Description	Enter the required details in this field. **Note:** Character limit: **2000 characters**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Note: The following fields are displayed only when **Discovery Run Type** = **Scheduled**.	
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. In the **Discover By** section, enter/select the following details:

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select the source for certificate discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Select CA**	From the dropdown list, select a CA to view its managed accounts in AppViewX for certificate discovery. **Note:** Starting version 2021.1.0, on selecting the ACM Private CA, the regions configured corresponding to the selected account are listed in the Region field. CA accounts table	All managed CAs will be listed in the CA accounts table, just after the **Select CA** field. Select the CAs you want to discover certificates from. The CA accounts table has the following option: • **Add as Favorites**: You can mark your frequently used CAs as favorites. • **All**: Select this to see the complete list of CAs (unfiltered). • **Selected**: Select this to list only the selected CAs. • **Unselected**: Select this to list only the unselected CAs. • **Delete**: Delete the required CA(s) from the favorites list.
Scan Type	**Scan Type** for **on-demand** discovery: • **Aggressive**: To discover all certificates from the selected CA account, select **Aggressive**. • **Optimized**: To filter and discover certificates based on a specific discovery parameter, select **Optimized**. **Scan Type** for **scheduled** discovery: • **Aggressive**: To discover all certificates from the selected CA account during every scan, select **Aggressive**. • **Optimized**: To filter and discover only the delta certificates from the selected CA (Account), during every scan, select **Optimized**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: For Microsoft CA (standalone and enterprise) configured with the integrated mode, optimized certificate discovery is not supported.
Discovery Parameters	To filter the results of the certificate authority scan, AppViewX lets you select from a list of CA-specific columns/fields, called the discovery parameters. Currently, AppViewX supports discovery parameters for the following CAs: • CSC Global • DigiCert • Entrust • HydrantID • Microsoft • Sectigo
Include Expired Certificates	**Note:** This field is displayed only for the DigiCert and HydrantID, for all scan types and discovery parameters. To include expired certificates in the discovery results, select this checkbox. By default, expired certificates are not discovered unless specified by the discovery parameters.
Include Renewed Certofoc	**Note:** This field is displayed only for the HydrantID CA, except when **Status** is one of the selected **Discovery Parameters**. To include renewed certificates in the discovery results, select this checkbox.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Discovery Parameters for CSC Global CA

Field	Description
Discovery Parameters (CSC Global)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for CSC Global CA: • **Certificate Status** • **Certificate Types** • **Certificate Effective Date** • **Certificate Expiration Date** To filter the discovery of CSC Global CA certificates: a. From the dropdown list, select the required discovery parameter(s). **Note:** You can select a combination of discovery parameters. However, only one from the following discovery parameters can be selected: • **Certificate Effective Date** • **Certificate Expiration Date** When one of these parameters is selected, the other one is disabled for selection. Corresponding to the discovery parameter(s) selected, a text field/ dropdown list is displayed. b. Enter/select the value(s) for the selected discovery parameter(s).
**: Mandatory fields*	

Discovery Parameters for DigiCert CA

Field	Description
Discovery Parameters (DigiCert CA)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for DigiCert CA: • **None** • **Product Name** (multiple values can be selected) • **Common Name** • **Order ID** (multiple values can be selected) • **Certificate ID** • **Status** • **Domain Name**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Organization ID** (multiple values can be selected) • **Expires On** • **Certificate Created On** (to discover certificates created within the selected date range; the date range must not exceed two years) • **Expiring Before** (to discover certificates expiring before the selected date; discovery does not include certificates expiring on the selected date) • **Expiring After** (to discover certificates expiring after the selected date; discovery does not include certificates expiring on the selected date) To filter the discovery of DigiCert CA certificates: a. From the dropdown list, select the required discovery parameter. Corresponding to the discovery parameter selected, a text field/ dropdown list is displayed. b. Enter/select the value for the selected discovery parameter.
**: Mandatory fields*	

Discovery Parameters for Entrust CA

Field	Description
Discovery Parameters (Entrust CA)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for Entrust CA: **certificate status** and **certificate type** To filter the outcome of the certificate authority discovery for Entrust CA, from the **Discovery Parameters** dropdown list, select the parameter(s). **Important:** The discovery parameters specified in the subsequent fields will take precedence over the **Associate Rule** specified in the **Discovery Rules** section. **Important:** If the certificates discovered basis the discovery parameters have associated root and/or intermediate certificates, those certificates will also be included in the results, irrespective of their type and status.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Status	This field is displayed only when **Select CA** = **Entrust** and **Discovery Parameters** = **Certificate Status**. To filter the certificate authority discovery for Entrust CA based on the certificate status, from this dropdown menu, select the required status value(s). **Important:** When **Certificate Status** = **Declined, Pending**, the discovery will return no certificates, since in both these events (when a certificate enrollment is declined or is pending), the end entity certificate has not been created.
Certificate Type	This field is displayed only when **Select CA** = **Entrust** and **Discovery Parameters** = **Certificate Types**. To filter the certificate authority discovery for Entrust CA based on the certificate type, from this dropdown menu, select the required type(s).
**: Mandatory fields*	

Discovery Parameters for HydrantID CA

Field	Description
Discovery Parameters (HydrantID CA)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for HydrantID CA: • **Certificate Types** • **Created From** • **Updated From** • **Not Before** • **Not After** • **Common Name** • **Serial Number** • **Status** • **Owner** • **Account** • **Organization** From the dropdown list, select the required discovery parameter.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Types**	This field is displayed when **Certificate Types** is one of the selected **Discovery Parameters**. To filter the certificate authority discovery for HydrantID CA based on the certificate types, from this dropdown menu, select a certificate type based on the required certificate characteristics and use cases.
***Created From**	This field is displayed when **Created From** is one of the selected **Discovery Parameters**. To filter discovery results based on the certificates' initial creation date, use the (calendar) widget to select the required date. The discovery results are then filtered to include only those certificates that were created between the selected date and the current date. **Example**: If the selected date is 2022-04-07, then the discovery results will include only those certificates that were created between 2022-04-07 and the current date. **Important:** The maximum allowed date range is **three** years from the current date.
***Updated From**	This field is displayed when **Updated From** is one of the selected **Discovery Parameters**. To filter discovery results based on the most recent certificate update date, use the (calendar) widget to select the required date. The discovery results are then filtered to include only those certificates that were updated between the selected date and the current date. **Example**: If the selected date is 2022-04-07, then the discovery results will include only those certificates that were updated between 2022-04-07 and the current date.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: The maximum allowed date range is **three** years from the current date.
Not Before	This field is displayed when **Not Before** is one of the selected **Discovery Parameters**. To filter discover results based on when a certificate's validity period begins, use the (calendar) widget to select the required date. The discovery results are filtered to include only those certificates that become valid after the selected date, which means the certificates are **not** valid **before** the selected date.
Not After	This field is displayed when **Not After** is one of the selected **Discovery Parameters**. To filter discovery results based on when a certificate's validity period ends, use the (calendar) widget to select the required date. The discovery results are filtered to include only those certificates that are **not** valid **after** the selected date.
***Common Name**	This field is displayed when **Common Name** is one of the selected **Discovery Parameters**. To filter certificates based on a specific common name, enter the required common name in this field.
***Serial Number**	This field is displayed when **Serial Number** is one of the selected **Discovery Paramters**. To filter certificates based on the unique identifier assigned to them by the issuing Certificate Authority (CA), enter the required serial number in this field.
***Status**	This field is displayed when **Status** is one the selected **Discovery Parameters**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To filter certificates based on their current status, from the dropdown list, select the required status value.
***Owner**	This field is displayed when **Owner** is one of the selected **Discovery Parameters**. To filter discovery results based on the designated owner responsible for managing the certificates, enter the required owner name in this field.
***Account**	This field is displayed when **Account** is one of the selected **Discovery Parameters**. To filter discovery results based on the user account associated with a certificate, enter the required account name in this field.
***Organization**	This field is displayed when **Organization** is one of the selected **Discovery Parameters**. To filter discovery results based on the organization, enter the required organization name in this field. An organization is the entity to which a certificate is issued and which is used to validate the ownership and authenticity of the certificate.
**: Mandatory fields*	

Discovery Parameters for Microsoft CA

Field	Description
Discovery Parameters (Microsoft CA)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for Microsoft CA: • **Requester Name** • **Certificate Template** • **Common Name** • **Certificate Effective Date** • **Certificate Expiration Date** • **Time Range**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To filter the discovery of Microsoft CA certificates: a. From the dropdown list, select the required discovery parameter(s). **Note:** You can select a combination of discovery parameters. However, only one from the following discovery parameters can be selected: • **Certificate Effective Date** • **Certificate Expiration Date** • **Time Range** When one of these three parameters is selected, the other two are disabled for selection. Corresponding to the discovery parameter(s) selected, a text field/ dropdown list is displayed. b. Enter/select the value(s) for the selected discovery parameter(s).
**: Mandatory fields*	

Discovery Parameters for Sectigo CA

Field	Description
Discovery Parameters (Sectigo CA)	To filter the results of the certificate authority scan, AppViewX supports the following discovery parameters for Sectigo CA: • **Start Date** • **End Date** Using these parameters, you can specify a date range to discover only those certificates that were issued between the specified start and end dates.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter/select the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**. **Note:** If the discovered certificate already exists in the inventory, its objects will be moved with the same status.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Note:

- For **EJBCA**

  The revoked certificates are not discovered. On discovery, the end certificates are discovered based on the days configured in the CA settings, the expired certificates are always discovered. The expiry days calculate from 0 - given value, for example, 0 -1500. On discovery, all the root and intermediate certificates that expire before 100 years will be discovered along with the end certificates by default. The discovered certificate count cannot be validated against the certificates present in the CA.

- For **Hydrant ID CA**

  Starting v2024.0.2.0, the triggered discovery instance will also fetch the expiry email addresses specified for the Hydrant ID CA certificates.

  For existing certificates that are not yet updated for this detail, triggering a new discovery instance will fetch the details and the discovery details will be automatically updated when the inventory status is moved to **Managed** state.

Cloud Scan

A cloud discovery scan lets you identify certificates in use within your cloud environment. The discovery is filtered based on specific cloud environments and identifies certificates irrespective of the issuing certificate authority.

Initiating a Cloud Discovery Scan for Azure

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	• **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Discovery Scope	Select the Azure environment scope (range/boundary) within which the certificate discovery process will operate. • **Azure Settings** Azure settings are configurable parameters that define the behavior of the resources within a subscription. • **Azure Subscriptions** Azure subscriptions are logical containers that constitute the Azure services and resources, identified based on a customer's agreement with Microsoft.
Enable Service Specific Discovery	**Note:** This field is displayed only when **Discovery Scope** = **Azure Subscriptions**. To filter discovery results based on the services under each subscription mapped to a service, turn on the **Enable Service Specific Discovery** option. If this field is disabled, the discovery scope will include all the services within a subscription that is mapped to a setting.
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. To make your search more specific: i. From the **Type your search and press Enter** field, click . ii. Enter values for one or more of the following parameters: • **Azure Settings** • **Subscription ID** • **Tenant ID** • **Resource Type**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	iii. In the **Condition** field: • To get search results that meet all your specified criteria, select **AND**. • To get results that meet at least one (or more) of your specified criteria, select **OR**. b. From the search results, select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR** Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select one from the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once the certificates are discovered, you can view them in the certificate inventory.

To automate the certificate lifecycle management for the discovered certificates, you can enable auto regeneration of certificates, auto renewal of certificates, and auto push of certificates to endpoints.

What's Next?

To automate certificate lifecycle management for certificates discovered from your Azure account:

- Enable auto regeneration of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Initiating a Cloud Discovery Scan for AWS

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

   a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

   Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

   b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

   Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
	Note: Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click **(Calendar** widget) to select a date to start the scheduled discovery.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Frequency Type	Description
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget)
Summary	Displays a summary of the selections made for scheduled discovery
**: Mandatory fields*	

3. To filter the discovered certificates, enter the **Discover By** details.

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select **Cloud** (the source to discover a certificate from).
***Vendor**	From the dropdown list, select **AWS**.
***Account type**	From the following options, select the AWS account type for certificate discovery: • **Stand-alone account sign-in** (In a stand-alone account, the user account and the resources are available in the same account.) • **Cross account sign-in** (In a cross-account resources are available across multiple accounts and users are given role-based access.)
***Select Account View**	**Note:** This field is displayed only when you've selected **Account type** = **Cross account sign-in**. From the given options, select one to specify if the discovery will be performed for the master account or for the child accounts.

Field	Description
***Select Filter Type**	**Note:** This field is enabled when: • • **Account type** = **Stand-alone account sign-in** • **Account type** = **Cross account sign-in** AND **Select Account View** = **Child Account**. From the following options, select one to specify how the discovery results should be filtered: • **Account View** • **Service View**
***Selected Resources**	To search for a resource: a. (Optional) In the **Type your search and press Enter** field, enter a search keyword to filter the list of resources. b. Select the checkbox corresponding to the required resource. To add an existing resource to the list: a. Click Add Resource. b. From the **Add Accounts** dialog box, select the checkbox corresponding to the required resource(s). c. Click **Add Selected**. **Note:** The **Add Selected** button is enabled after at least one resource is selected. To delete a resource from the list: a. Select the checkbox corresponding to the resource you want to delete. b. From the **Action** field, click . **OR**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Click Remove. **Note:** To delete multiple resources at once: i. Select the checkboxes for the resources to be deleted. ii. Click Remove.
Execute Batches Sequentially	To execute the discovery operation on the specified batches sequentially, select this checkbox.
***Interval Between Batches**	If **Execute Batches Sequentially** is selected, enter an interval duration (in minutes) in this field. The sequential execution of the batches is spaced according to the interval value entered here.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A set of filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.
   The discovered certificates are listed in the certificate inventory.

What's Next?

To automate certificate lifecycle management for certificates discovered from your AWS account:

- Enable auto regeneration of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Initiating a Cloud Discovery Scan for GCP

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Cloud Scan**.
   The **Discovery : Cloud Scan : Add Discovery** page is displayed.
2. To initiate a cloud certificate discovery scan, enter the **Discover Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. To specify the frequency at which the certificate discovery scan will be triggered, select the **Discovery Run Type**.

Discovery run type options

Frequency Type	Description
On-demand	Cloud certificate discovery scan is triggered manually by the user as and when required.
Scheduled	Cloud certificate discovery scan is triggered automatically at the specified time and date.

b. Enter the details for **initiating an on-demand cloud certificate discovery scan**.

Field descriptions for on-demand discovery

Frequency Type	Description
Discovery Instance Name	Enter a name for the discovery instance.
Description	Enter additional details related to the discovery option. **Note:** Character limit: **2000 characters**

OR

Enter the details for **initiating a scheduled cloud certificate discovery scan**.

Field descriptions for scheduled discovery

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery, respectively.

Scanning Uploaded Certificates

You can upload individual certificates or you can zip a group of certificates and then add them. For Windows-related servers and CA communication, an agent should be installed and configured in AppViewX.

To scan the uploaded certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery** > **Upload**.
   The **Discovery : Upload : Add Discovery** page is displayed.
2. In the **Discover Details** section, select/enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Discover Details section

Field	Description
Discovery Instance Name	Enter the name of the discovery instance.
Description	Enter the required details in this field. **Note:** Character limit: **2000 characters** .

3. In the **Discover By** section, enter the following details:

Field descriptions for the Discover By section

Field	Description
***Discovery From**	From the dropdown list, select the source of the discovery.
***Choose File**	You can upload a certificate file in one of the following formats: **.zip**, **.tar**, **tar.gz**, **.crt**, **.cer**, **.der**, **.p7b**, **.p7c**, **.pem**, **.pfs**, **.jks**, **.p12**. To upload a certificate file: a. Click **Upload** and navigate to the location of the required certificate file. b. Select the file and click **Open**.
***File Password**	If the certificate file uploaded in **Choose File** is password-protected, in this field, enter the password for accessing the file.
Comments	Enter any additional remarks or details related to the process.
**: Mandatory fields*	

4. In the **Discovery Rules** section, from the **Associate Rule** dropdown list, select a rule that will be used to filter the discovered certificates.
   A setof filters is combined to create a rule, from the **Rules** menu. The selection of rules will apply respective filters on discovered certificates.
5. In the **After Discover** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select from one of the following options: • **Do not move**: The newly discovered certificates and their objects will not be moved to the inventory. • **Managed**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Managed**. • **Monitored**: The newly discovered certificates and their objects will be moved to the inventory with the status set to **Monitored**.
Use Access Control Rule	To apply the rule configured using Access Control, select this checkbox. **Note:** If this checkbox is enabled, the certificate group will be associated automatically by the rule in access control.
***Certificate Group**	From the dropdown list, select a certificate group to which the discovered certificates will be associated. Based on the group association, a policy will also be applied to these certificates, which will help ascertain compliance or non-compliance.
**: Mandatory fields*	

6. Click **Discover**/**Schedule** to trigger the on-demand/scheduled discovery.

On-demand Discovery

On-demand discovery is a discovery process execution type that is triggered immediately (as opposed to a scheduled discovery that is triggered according to a predefined schedule, and not necessarily immediately).

There are two ways you can trigger an on-demand discovery, as explained in the following sections.

On-demand Discovery: Method 1

This method is useful when you know the type of discovery process you want to trigger, from the following types:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Network scan
- Managed devices scan
- Transparency log scan
- Certificate authority scan
- Cloud scan

For each of these scan types, the form fields described in the respective sections explain the option that lets you specify whether the discovery will be on-demand or scheduled.

Click a scan type from the list above for instructions on how you can select on-demand discovery for that type.

On-demand Discovery: Method 2

The difference between method 1 and method 2 is that the **Discovery From** dropdown list for method 2 lists the sources for all discovery types.

To trigger an on-demand discovery:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**. The **Discovery Status : On-demand** page is displayed. .
2. To create a new on-demand discovery distance:

   If this is the first on demand discovery instance, click Discover Now from the center of the page.

   OR

   Click + Create Discovery .
3. In the **Discover Details** section, enter the following details:

Field descriptions for the Discover Details section

Field	Description
***Discovery Run Type**	Select **On-demand**.
Discovery Instance Name	Enter the name of the discovery instance.
Description	Enter the required details in this field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Character limit: **2000 characters**
**: Mandatory fields*	

4. In the **Discover By** section, from the **Discovery From** dropdown list, select the source of the discovery.
   Based on your selection in this field, the rest of the fields will be displayed. For instructions on specifying the rest of the details:

Field descriptions for the Discover By section

Selection	Refer for further instructions
• **IP Range** • **Subnet** • **URL**	Network Scan
• **Managed ADCs** • **Managed Servers** • **Managed MDMs** • **Managed Firewalls** • **Managed WAFs** • **Internal**	Managed devices scan
CtLogs	Transparency Log Scan
Certificate Authorities	Certificate Authority Scan
Cloud	Cloud Scan
Upload	Scanning Uploaded Certificates
**: Mandatory fields*	

5. In the **Discovery Rules** section, select the associate rule from dropdown list.
6. In the **After Discover** section, select the required options.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the After Discover section

Field	Description
***Move Certificate to Inventory with Status**	Select the required options as required. The available options are, • **Do not move** • **Managed** • **Monitored**.
Use Access Control Rule	Enable the checkbox to apply rule. **Note:** This dield is enabled when **Move Certificate to Inventory with Status** = **Managed** or **Monitored**.
Certificate Group	Select the required certificate group. Discovered certificates will be associated with the provided certificate group.
**: Mandatory fields*	

7. In the **Discovery Notifications** section, select the notification field as required.

Field descriptions for the Discovery Notifications section

Field	Description
Subscribe for discovery status notifications	Select the checkbox for the notification.
Who should be notified ?	• **Notify User**: Send notification to the user configuring/modifying the discovery. • **Notify User-Group**: Send notification to all the users in the triggering User's User Group(s).
**: Mandatory fields*	

Scheduled Discovery

Scheduled discovery is a discovery process execution type that lets you trigger a discovery process one/multiple times according to a predefined schedule.

There are two ways you can schedule a discovery process, as explained in the following sections.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Scheduled Discovery: Method 1

This method is useful when you know the type of discovery process you want to trigger, from the following types:

- Network scan
- Managed devices scan
- Transparency log scan
- Certificate authority scan
- Cloud scan

For each of these scan types, the form fields described in the respective sections explain the option that lets you specify whether the discovery will be on-demand or scheduled.

Click a scan type from the list above for instructions on how you can select on demand discovery for that type.

Scheduled Discovery: Method 2

The difference between method 1 and method 2 is that the **Discovery From** dropdown list for method 2 lists the sources for all discovery types.

To trigger a scheduled discovery:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** >**Scheduled**.
   The **Discovery Status : Scheduled** page is displayed. .
2. To create a new on demand discovery distance:

   If this is the first scheduled discovery instance, click 
from the center of the page.

   OR

   Click

.
3. In the **Discover Details** section, enter the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Discover Details section

Field	Description
***Discovery Run Type**	Select **Scheduled**.
Discovery Instance Name	Enter the name of the discovery instance.
Description	Enter the required details in this field. **Note:** Character limit: **2000 characters**
Occurrence Type	From the dropdown list, from the following options, select an occurrence frequency: • **Daily** • **Weekly** • **Monthly** • **Yearly**
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day of the week on which you want the discovery occurrence to repeat.
***Starts On**	Click (**Calendar** widget) to select a date to start the scheduled discovery.
***Ends**	From the following options, select when the scheduled discovery is to end: • **Never**: Discovery never stops. • **After**: Discovery stops after the number of occurrences specified in the text field. • **On**: Discovery stops on the date selected using **(Calendar** widget).
Summary	Displays a summary of the selections made for scheduled discovery

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

4. In the **Discover By** section, from the **Discovery From** dropdown list, select the source of the discovery.
   Based on your selection in this field, the rest of the fields will be displayed. For instructions on specifying the rest of the details:

Field descriptions for the Discover By section

Selection	Refer for further instructions
• **IP Range** • **Subnet** • **URL**	Network Scan
• **Managed ADCs** • **Managed Servers** • **Managed MDMs** • **Managed Firewalls** • **Managed WAFs** • **Internal**	Managed devices scan
CtLogs	Transparency Log Scan
Certificate Authorities	Certificate Authority Scan
Cloud	Cloud Scan
Upload	Scanning Uploaded Certificates

Discovery Status

The discovery status section gives a summary of the on-demand and scheduled discoveries triggered. In addition to this, the discovered certificates can be filtered for their status, exclusion in the discovery list, and so on.

- Viewing Discovery Summary
- Excluding Unmanaged Certificate
- Updating Discovered Certificates Status
- Executing a Scheduled Discovery Scan Before Schedule
- Exporting Details of Discovered Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Aborting Certificate Discovery
- Delta Discovery
- Viewing the Scan Status of a Discovery Instance

Viewing Discovery Summary

Certificate discovery Summary is displayed as a dashboard that provides a high-level overview of a discovery instance's results. It presents a set of statistics and visual widgets that highlight certificate distribution across various categories.

To view the discovery summary:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous and active discovery instances triggered are listed here.

   Note: When a scheduled discovery scan is triggered, it is also listed in the on-demand inventory.

2. To view the summary of a discovery instance, click the discovery instance's **Name**.
   By default, the summary details of the selected discovery instance are displayed.

   The summary details are displayed in two parts:
   - Certificate Discovery Summary
   - Certificate Summary widgets

   Certificate Discovery Summary

Field	Description
Total Certificates	Total number of certificates currently associated with this discovery instance. This includes all certificates discovered during the scan, including any that were previously known or re-identified.
Discovered Certificates	Number of certificates discovered in the most recent execution of this discovery instance
Password Protected Certificates	Number of certificates discovered during the scan that are stored in password-protected file formats

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Encrypted Private Keys	Number of private keys found during the discovery scan that are encrypted

Certificate Summary widgets

Field	Description
Certificate Summary	This widget gives a quick snapshot of the overall certificate landscape, showing the number of newly discovered certificates and the proportion that are actively managed or monitored.
Certificate Distribution by Category	This widget shows the number of certificates across certificate categories. Understanding this distribution helps you identify the primary uses of certificates in your environment and potential areas of focus for management and security policies.
Certificate Distribution by Issuer	This widget visualizes certificate distribution based on the issuing authority. Knowing which entities issued your certificate is crucial for trust management and for understanding your dependencies on different Certificate Authorities (CAs).
Certificate Status Report	This widget provides a breakdown of certificates based on their expiration status (certificates nearing expiry, already expired, and revoked). This data is critical for proactive certificate management, enabling timely renewal and preventing service disruptions or security vulnerabilities. The number of revoked certificates is also an indicator of potential security incidents or policy enforcement actions.
Certificates by Key Algorithm Strength	This widget shows certificate distrbution based on the cryptographic strength of certificate key algorithms, helping you assess the overall security posture of your certificate landscape. A high number of certificates with low or medium strength key algorithms might indicate potential vulnerabilities and the need for

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	upgrades to stronger algorithms. Ideally, you want the majority of your certificates to fall into the **high** strength category.
Certificates by Hash Algorithm Strength	This widget shows certificate distribution based on the strength of their hash algorithms. This assessment helps you prioritize migration of certificates using weaker hash algorithms to stronger, more secure ones.
Certificates Usage by Type	This widget shows the distribution of certificate usage across all supported certificate types. The widget displays certificates grouped by type (e.g., DV, OV, EV, Wildcard, SAN, Self-signed, etc.). Since a single certificate can belong to multiple categories (e.g., an EV certificate can also be a Wildcard or SAN certificate), it is counted in each applicable type. As a result, the sum of all certificate types shown here may exceed the actual number of unique certificates discovered. This design helps you understand certificate usage patterns across categories, even when overlaps occur.
Vendor Type Distribution	This widget displays certificate distribution based on the vendors of the devices or servers where the certificates were discovered. When populated, this widget would help you understand your reliance on different device/server vendors. This information can be valuable for vendor management, cost analysis, and ensuring diversity or consolidation of your application infrastructure providers based on your organisational policies. It can also help in identifying potential single points of failure related to a specific vendor.
Certificates with Trusted vs Untrusted CA Status	This widget displays certificate distribution based on whether they are issued by trusted or untrusted certificate authorities (CAs). This widget is crucial for assessing the trustworthiness and security of your certificate ecosystem. Ideally, you want the vast majority of your certificates to be issued by trusted CAs. A high number of untrusted certificates can indicate potential security risks, misconfigurations, or the use of self-signed certificates where CA-

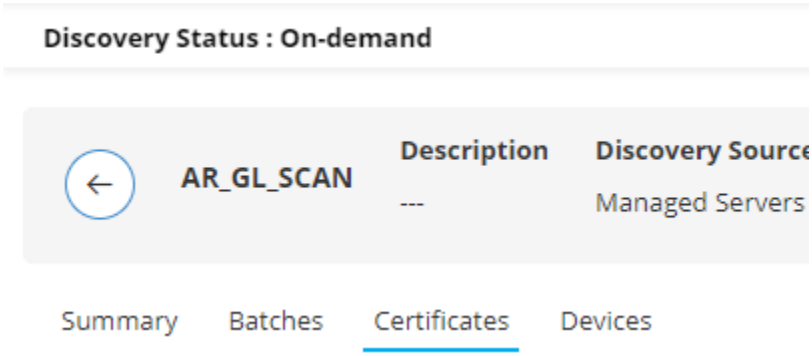
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	signed ones are recommended. Investigating and addressing untrusted certificates is vital for maintaining a secure environment.
PQC Compliance Certificates	This widget displays certificate distribution based on their compliance with post-quantum cryptography (PQC) standards. As quantum computing technology advances, the cryptographic algorithms we rely on today may become vulnerable. This widget helps you understand your organisation's readiness for the post-quantum era. A high number of non-compliant certificates signifies a potential future security risk, and planning for migration to PQC-compliant algorithms will be essential in the long term. Currently, with all certificates marked as non-compliant, it highlights an area to monitor and prepare for as PQC standards and implementations evolve.
MTLS Adoption Report	This widget displays the number of endpoints (IP:Port combinations) with Mutual TLS (mTLS) enabled, as detected during network-based discovery. Mutual TLS ensures both the client and the server authenticate each other using certificates, adding a stronger layer of security over standard TLS.

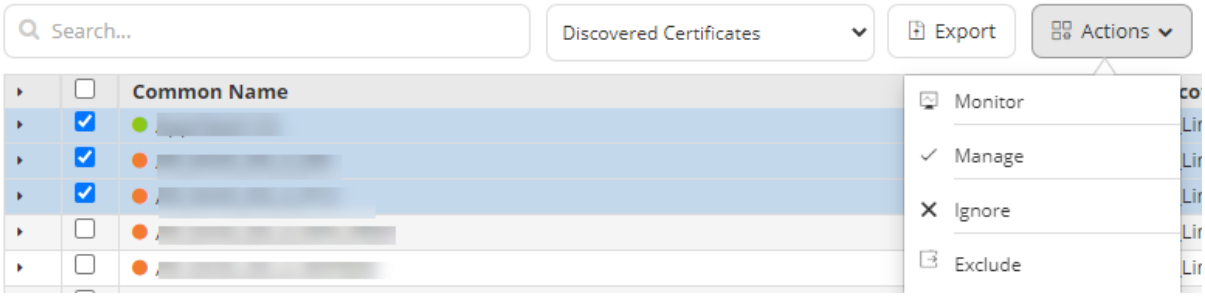
Excluding Unmanaged Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous discovery instances triggered are listed here.
2. To view the details of a discovery operation, click the **Name**.
   The **Discovery Status : On-demand** page is updated to show the details of the discovery instance.
3. To view the certificates discovered by this discovery instance, click **Certificates**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. To exclude a certificate, from the list of certificates displayed, click the checkbox corresponding to the required certificate.
   You can select multiple such certificates.
5. From the **Actions** menu, click **Exclude**.



6. From the **Exclude** confirmation dialog box, click **Yes**.

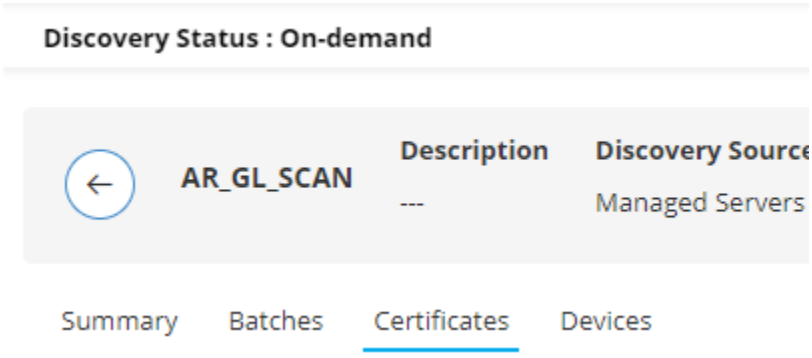
> **Note:** Excluded certificates will be removed from the current discovery instance and will be added to the **Excluded from discovery** inventory.

Updating Discovered Certificates Status

To set the discovered certificate status to **Monitor/Manage/Ignore/Exclude**:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous discovery instances triggered are listed here.
2. To view the details of a discovery operation, click the **Name**.
   The **Discovery Status : On-demand** page is updated to show the details of the discovery instance.
3. To view the certificates discovered by this discovery instance, click **Certificates**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. From **Name**, select the checkbox for the certificate that you want to filter.
5. From the **Actions** menu, select the new certificate status from the following options:
   - **Monitor**
   - **Manage**
   - **Ignore**
   - **Exclude**
6. Click **Yes**.

Bulk Updating Discovered Certificates Status

To bulk update the status of the discovered certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous discovery instances triggered are listed here.
2. Select the checkbox against the column name **Common name**.
   The option to **Select All () Certificates present in Discovery Inventory**.
3. Click **Select All () Certificates present in Discovery Inventory**.
   All discovered certificates in the inventory are selected.
4. From the **Actions** menu, select the new certificate status from the following options:
   - **Monitor**
   - **Manage**
   - **Ignore**
   - **Exclude**
5. To view details of the bulk certificate status update operation, go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Certificate Logs**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:
- Root and intermediate certificates can be moved only to the managed status.
- Inventoried certificates cannot be moved to the monitored/managed status.

The tooltip text for the corresponding entry of this operation in the certificate log includes the complete details of the operation.

Executing a Scheduled Discovery Scan Before Schedule

In addition to running at their configured intervals, scheduled discovery scans can now be triggered manually, ahead of their predefined schedule. This capability is particularly useful in time-sensitive scenarios where the latest certificate is required for purposes such as troubleshooting or compliance.

Important: This feature is RBAC-controlled, which means only authorized users will be able to see the corresponding menu option and trigger a scheduled discovery before time.

To execute a scheduled discovery scan manually, ahead of its schedule:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **Scheduled**.
   The **Discovery Status : Scheduled** page is displayed, listing all existing scheduled discovery instances.
2. To manually trigger a scheduled discovery instance, select the checkbox corresponding to that discovery instance.
3. From the **Actions** dropdown menu, select **Run now**.
   The message **Discovery execution has been triggered successfully** is displayed and the active discovery instance is moved into the on-demand discovery instances inventory.

Note: This does not impact the scheduled discoveries; they will be triggered as per the configured schedule.

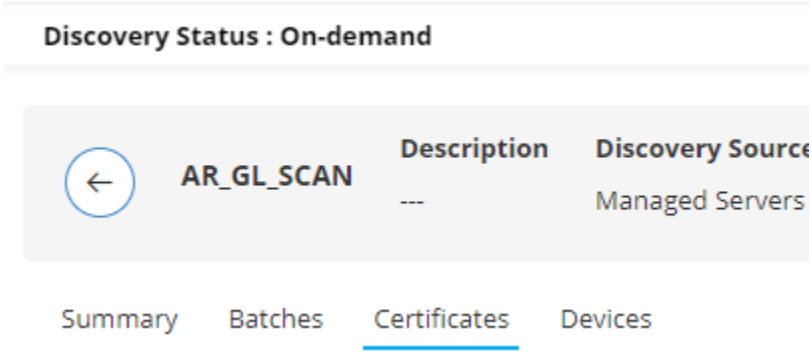
Exporting Details of Discovered Certificates

AppViewX lets you export all/selected details of the certificates discovered by a discovery instance. You can export the details in the XLS or CSV format.

To export the details of discovered certificates:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** >**On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous discovery instances triggered are listed here.
2. To view the details of a discovery operation, click the **Name**.
   The **Discovery Status : On-demand** page is updated to show the details of the discovery instance.
3. To view the certificates discovered by this discovery instance, click **Certificates**.



4. From **Name**, select the checkbox for the certificate of which you want to export the details.
5. Click **Export**.
   The **Export** dialog box is displayed.
6. In the **Export** dialog box:
   a. Under **Options**, select if you want to export all the details or only those shown in the columns currently displayed.
   b. Under **Format**, select the format for the exported file.
7. Click **Export**.
   A **.csv**/**.xls** file (as selected) is downloaded to your system.

Aborting Certificate Discovery

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous discovery instances triggered are listed here.
2. From **Name**, select the checkbox for the discovery instance you want to abort.
3. From the **Actions** dropdown menu, select **Abort**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Delta Discovery

Delta Discovery of certificates involves discovering only those certificates that have been pushed to the device, modified, or removed from the inventory since the last config sync. It is available and limited to Fetch Config and Midnight Sync for

- IBM MQ server (Linux)
- Generic Linux devices
- Apache Linux Server

When Fetch Config is carried out for the first time, it will pull all the certificates from the server. However, every Fetch config after that will only pull the delta certificates, that is the certificates added to the device since the last sync. Behavior for on-demand discovery and Config sync after Save/Edit to the device remains the same as before, that is all the certificates will be discovered.

Viewing the Scan Status of a Discovery Instance

CERT+ discovery feature has been enhanced to include endpoint checks for mTLS enforcement and supported cipher suites. You can enable these checks under **Discovery Configuration** > **Report Settings**, as explained here.

When enabled, these settings capture detailed endpoint-level data for each network scan discovery instance and are displayed as the scan status.

To access the scan status:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **On Demand**.
   The **Discovery Status : On-demand** page is displayed. Results of all previous and active discovery instances triggered are listed here.

   Note: When a scheduled discovery scan is triggered, it is also listed in the on-demand inventory.

2. To view the summary of a discovery instance, click the discovery instance's **Name**.
   The summary details of the selected discovery instance are displayed.
3. To view the scan status for the selected instance, click **Scan Status**.
   The page is updated to display the scan status details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Scan Status Toolbar

Field	Description
Search	Use the search field to execute a free text seach across the **IP**, **Port**, and **Status** fields in the scan status details.
	To narrow down search results based on specific criteria, click and, in the **Advanced Search** dialog box, enter the required details.
Export	To export the scan results, click **Export** and select the required format from the following options: • CSV • XLS
	Use the pagination control dropdown to select the number of records that will be displayed per page of the scan status details. You can select to display 25, 50, 75, or 100 records per page.
	Use the pagination navigation buttons to move between pages in the scan status details.
	Use the **Refresh** button to reload the scan status detail to display the up-to-date records.

Scan Status Details

Field	Description
IP	IP addresses of all the endpoints discovered by this discovery instance
Port	Port number scanned
Status	Status of the checks for mTLS, Cipher Suite enablement, and data fetch

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This column displays one of the following values: • **Success** (when both mTLS and Cipher Suite data is fetched successfully) • **Failed** (when an internal error occurs or the data fetch fails) • **Disabled** (when both mTLS and Check and Cipher Suite Reports are not enabled in the Report Settings) To view the scan status summary, click .
MTLS	mTLS enforcement status for the corresponding endpoint This column displays one of the following values: • **Enabled** (mTLS is enforced and enabled on the endpoint) • **Disabled** (mTLS is enforced and disabled on the endpoint) • **NA** (mTLS is not enforced on the endpoint)
Ciphers	List of ciphers enabled in the endpoint

Discovery Exclusions

• Certificate Exclusions

Certificate Exclusions

This feature helps you if you do not want a certificate or a list of certificates to be discovered. You can exclude those certificates from getting discovered.

To exclude certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Excluded Certificates**.
   The **Excluded Certificates** page is displayed.
2. To view the details of a discovery operation, click the **Common Name**.
3. To view the certificates discovered by this discovery instance, click **Certificates**.
4. From **Common Name**, select the checkbox for the certificates that you want to exclude.
5. From the **Exclude** confirmation dialog box, click **Yes**.

Discovery Configuration

- Network Exclusions
- Port Exclusions
- Network Inventory
- Discovery Configuration Settings

Network Exclusions

For a network scan, AppViewX lets you create a list of network sources that have to be excluded from the scans. This list is called an exclusion list and it is made of IP addresses and/or subnets that have to be excluded from a network discovery scan. Exclusion lists are different from rules; while rules let you exclude IP addresses after a discovery operation is completed, an exclusion list will do the same thing but before the discovery operation is triggered.

Creating an Exclusion List

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Networks**.
   The **Excluded Networks** page is displayed.
2. Click **+ Create**.
   The **Add** page is displayed.
3. Enter/Select the exclusion list details.

   Important: Maximum of 5000 exclusion list is allowed.

   Field descriptions for the exclusion list details

Field	Description
***Excluded IP Name**	Enter a name for the exclusion list. **Important:** This field does not support special characters.
Description	Add a short description with the reason to be excluded.

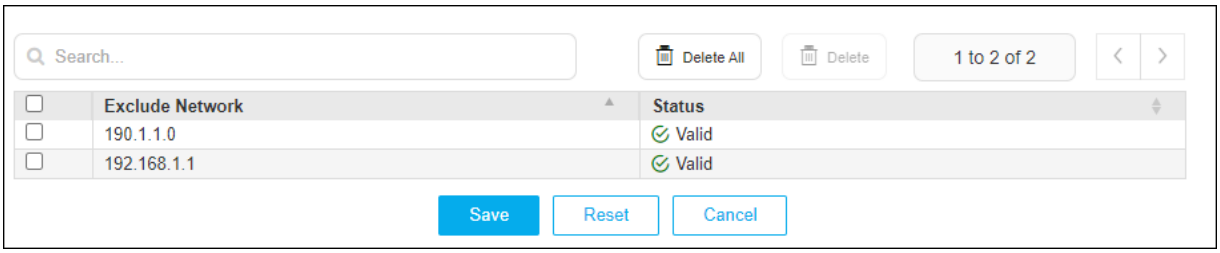
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Network Setting	Select a network setting to enforce this excluded network across all associated networks. The available options are: • **All** • **Custom**.
***Select Settings**	Select the network settings that applies to this entry. **Note:** This field appears when **Network Setting** = **Custom**.
***Exclusion By**	From the dropdown list, from the following options, select the source of the exclusion list: • **Custom**: Lets you enter a list of the IP addresses and/or subnets to be excluded from the network scan • **Upload**: Lets you upload a file that has the IP addresses and/or subnets to be excluded from the network scan Acceptable file formats: **.xlsx**, **.xls**, **.csv** **Important:** To view a sample exclusion list file: a. From this dropdown list, select **Upload**. The **Upload File** field is displayed. b. From below the **Upload File** field, click **Download Sample Template**. The sample template will be downloaded to your system.
***Exclude List**	This field is displayed if **Exclusion By** = **Custom**. Enter a valid IP address, subnet, IP range, or a combination of these network sources for exclusion from all network discovery scan(s). Listed below are examples of valid values: • Sample value for IP address: **192.168.1.1** • Sample value for subnet: **192.168.1.1/24** • Sample value for a range of IP addresses: **192.168.1.1 – 192.168.1.10**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Browse**	This field is displayed if **Exclusion By** = **Upload**. To upload a **.xlsx/.xls/.csv** file that has the exclusion list: a. Click **Upload**. b. Navigate to the location of the file. c. Select the required file. d. Click **Open**. **Important:** To view a sample exclusion list file: a. From below the **Upload File** field, click **Download Sample Template**. The sample template will be downloaded to your system.
**: Mandatory fields*	

4. Click **Add.**
   The table below the fields is populated with entries from the **Exclusion List**/file uploaded with the exclusion list.



5. Click **Save.**
   If an excluded IP address/subnet was previously discovered and is already part of the inventory, the current discovery operation will not change that. If required, you can manually delete the corresponding certificates from the inventory.

Disabling an Exclusion List

By default, exclusion lists are enabled as soon as they are created. Which means that when a network discovery operation is triggered, the results will exclude all the network sources that are a part of the exclusion lists. You can choose to disable an execution list so that it is not considered for the subsequent network discovery scans.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Additionally, you can enable selected disabled exclusion lists for a specific scan at the time of configuring the scan, by selecting the required list(s) from the **Exclusion Lists** dropdown list.

To disable an exclusion list:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Networks**.
   The **Excluded Networks** page is displayed.
2. From the exclusion list inventory, under **Status**, move the radio button to left that you want to disable.
   The confirmation dialog box appears as **Excluded Netwrok Successfully Disabled**.

Enabling an Exclusion List

To enable an exclusion list after it has been disabled:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Networks**.
   The **Excluded Networks** page is displayed.
2. From the exclusion list inventory, under **Status**, move the radio button to right that you want to enable.
   The confirmation dialog box appears as **Excluded Netwrok Successfully Enabled**.

Deleting an Execution List

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Networks**.
   The **Excluded Networks** page is displayed.
2. From the exclusion list inventory, under **Exclude Network**, select the checkbox(es) corresponding to the exclusion list(s) you want to delete.
3. From the menu bar, click 
.
4. From the confirmation dialog box, click **Submit**.
   The selected exclusion list(s) are deleted.

Port Exclusions

For a network scan, AppViewX lets you create a list of port sources that have to be excluded from the scans. This list is called an exclusion list and it is made of IP addresses and/or subnets that have to be excluded from a network discovery scan. Exclusion lists are different from rules; while rules let you

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

exclude port addresses after a discovery operation is completed, an exclusion list will do the same thing but before the discovery operation is triggered.

Creating an Exclusion List

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Ports**.
   The **Excluded Ports** page is displayed.
2. Click **+ Create**.
   The **Add** page is displayed.
3. Enter/Select the exclusion list details.

> **Important:** Maximum of 5000 exclusion list is allowed.

Field descriptions for the exclusion list details

Field	Description
***Excluded Ports Name**	Enter a name for the exclusion list. **Important:** This field does not support special characters.
Description	Add a short description with the reason to be excluded.
Network Setting	Select a network setting to enforce this excluded network across all associated networks. The available options are: • **All** • **Custom**.
***Select Settings**	Select the network settings that applies to this entry. **Note:** This field appears when **Network Setting** = **Custom**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Exclusion By**	From the dropdown list, from the following options, select the source of the exclusion list: • **Custom**: Lets you enter a list of the Port addresses and/or subnets to be excluded from the network scan. • **Upload**: Lets you upload a file that has the IP addresses and/or subnets to be excluded from the network scan Acceptable file formats: **.xlsx**, **.xls**, **.csv** **Important:** To view a sample exclusion list file: a. From this dropdown list, select **Upload**. The **Upload File** field is displayed. b. From below the **Upload File** field, click **Download Sample Template**. The sample template will be downloaded to your system.
***Excluded Ports**	This field is displayed if **Exclusion By** = **Custom**. Enter a valid port numbers between 1 to 65535.
***Browse**	This field is displayed if **Exclusion By** = **Upload**. To upload a **.xlsx/.xls/.csv** file that has the exclusion list: a. Click **Upload**. b. Navigate to the location of the file. c. Select the required file. d. Click **Open**. **Important:** To view a sample exclusion list file: a. From below the **Upload File** field, click **Download Sample Template**. The sample template will be downloaded to your system.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Click **Add.**
   The table below the fields is populated with entries from the **Exclusion List**/file uploaded with the exclusion list.
5. Click **Save.**

Disabling an Exclusion List

By default, exclusion lists are enabled as soon as they are created. Which means that when a network discovery operation is triggered, the results will exclude all the network sources that are a part of the exclusion lists. You can choose to disable an execution list so that it is not considered for the subsequent network discovery scans.

Additionally, you can enable selected disabled exclusion lists for a specific scan at the time of configuring the scan, by selecting the required list(s) from the **Exclusion Lists** dropdown list.

To disable an exclusion list:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Ports**.
   The **Excluded Ports** page is displayed.
2. From the exclusion list inventory, under **Status**, move the radio button to left that you want to disable.
   The confirmation dialog box appears as **Excluded Port Successfully Disabled**.

Enabling an Exclusion List

To enable an exclusion list after it has been disabled:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Ports**.
   The **Excluded Ports** page is displayed.
2. From the exclusion list inventory, under **Status**, move the radio button to right that you want to Enable.
   The confirmation dialog box appears as **Excluded Port Successfully Enabled**.

Deleting an Execution List

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Excluded Ports**.
   The **Excluded Ports** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. From the exclusion list inventory, under **Excluded Ports**, select the checkbox(es) corresponding to the exclusion list(s) you want to delete.
3. From the menu bar, click 
.
4. From the confirmation dialog box, click **Submit**.
   The selected exclusion list(s) are deleted.

> **Note:** Default ports cannot be deleted.

Network Inventory

The **Network Inventory** feature defines where certificate discovery should occur by listing specific IP addresses for scanning. It supports manual entry and bulk upload, with tagging options like datacenter or application name. This focused approach avoids scanning irrelevant areas, improves efficiency, and ensures consistent, repeatable discovery across key network segments like DMZs and app layers.

Adding Networks to the Network Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Network Inventory**.
   The **Discovery Configuration :: Network Inventory** page is displayed.
2. Click **+ Create**.
   The **Discovery Configuration :: Network Inventory > Add** page is displayed.
3. Enter/Select the **Basic Details** of the network you want to add to the inventory.

Field descriptions for the Basic Details

Field	Description
***Name**	Enter a name for the network. **Important:** This field does not support special characters.
Description	Add additional details about the network entry.
***Network Settings**	Select a network setting that applies to this entry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Network Input By**	From the dropdown list, from the following options, select the source of the network entry list: • **Custom**: Lets you enter a list of the port addresses and/or subnets to be excluded from the network scan. • **Upload**: Lets you upload a file that has the IP addresses and/or subnets to be listed in the network inventory. Acceptable file formats: **.xlsx**, **.xls**, **.csv** **Important:** To view a sample network list file: a. From the **Network Input By** dropdown list, select **Upload**. The **Upload File** field is displayed. b. From below the **Upload File** field, click **Download Sample Template**. The sample template will be downloaded to your system.
***Network List**	For **Network Input By** = **Custom** Enter the IP addresses, IP address ranges, or subnets that have to be listed in the network inventory. Separate multiple entries with commas or a new line. For **Network Input By** = **Upload** To upload a **.xlsx/.xls/.csv** file that has the netwprk list: a. Click **Upload**. b. Navigate to the location of the file. c. Select the required file. d. Click **Open**.
**: Mandatory fields*	

4. Click **Add**.
   The network details are listed in the table below the **Add** button.
5. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Disabling Networks Listed in the Network Inventory

You can disable a network listed in the network inventory to exclude it from a discovery instance. This helps avoid scanning irrelevant or restricted networks, reduce duplicates, or optimize performance. The disabling is temporary and the networks can be re-enabled when needed.

Networks can be disabled even if they are included in scheduled certificate discoveries. This allows more flexibility in network discovery configurations, without manual dependency checks.

To disable a network listed in the network inventory:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Network Inventory**.
   The **Network Inventory** page is displayed.
2. From the inventory, under **Status**, turn off the toggle.
   The **Network Successfully Disabled** message is displayed.

   When a network that is mapped to a scheduled discovery instance is disabled (after it is already mapped), the status of that network, in the discovery instance inventory, is set to **Disabled**. The overall status of a discovery instance, where at least one network is disabled, is set to **Partially success**. If all networks in a discovery instance are disabled, the discovery status if set to **Failed**.

   A discovery instance that includes a disabled network cannot be triggered for execution.

Enabling Disabled Networks in the Network Inventory

To enable a network for inclusion in the discovery instances after it has been disabled:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Network Inventory**.
   The **Network Inventory** page is displayed.
2. From the inventory, under **Status**, turn on the toggle.
   The **Network Successfully Enabled** message is displayed.

Deleting Networks Listed in the Network Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Network Inventory**.
   The **Network Inventory** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. From the network inventory list, under **Network Name**, select the checkbox(es) corresponding to the network list(s) you want to delete.
3. From the menu bar, click 
.
4. From the confirmation dialog box, click **Submit**.
   The selected network list(s) are deleted.

Discovery Configuration Settings

The **Discovery Configuration Settings** page is a centralized interface for defining how certificate and network discovery operations are conducted and reported. It is organized into the following three sections:

- Network Discovery Settings
- General Settings
- Report Settings

Details of the configuration settings in each section are covered subsequently.

Configuring Network Discovery Settings

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Settings**.
   The **Settings** page is displayed.
2. Click **+ Create**.
   The **Add** page is displayed.
3. Enter/Select the basic details.

Field descriptions for the basic details

Field	Description
***Name**	Enter a name of the setting. **Important:** This field does not support special characters.
Description	Add additional details about this scan settings.
**: Mandatory fields*	

4. Enter/Select the Network Scan Configuration details.

5. Click **Save**.

Configuring General Discovery Settings

The **General Discovery Settings** section of the **Discovery Configuration :: Settings** page let you manage the general behavior of network discoveries.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To configure the general discovery configuration settings, enable/disable the following features, as required:

Field descriptions for the general discovery settings

Field	Description
Discover Private Key	To fetch private keys from endpoints as part of the discovery results, turn on the **Discover Private Key** toggle. While this feature is disabled by default to preserve confidentiality, fetching private keys from endpoints is required if you want to push the discovered certificates to new endpoints.
Synchronize Network Connectors	To ensure that the configuration and status of all associated network connectors is regularly synchronized, turn on the **Synchronize Network Connectors** toggle. If this feature is enabled, the discovery instance will attempt to sync device data with the latest connector state before scanning.
Number of Discovery History Required	Enter the number of discovery iterations to retain per job. Entries older than the specified number will be auto-purged. **Default value**: 5 **Maximum value**: 5
Access Control Scheduled Discoveries	To restrict access to scheduled discoveries to the discovery owner's user group, turn on the **Access Control Scheduled Discoveries** toggle.
**: Mandatory fields*	

Configuring Discovery Report Settings

The **Report Settings** section of the **Discovery Configuration :: Settings** page lets you define the compliance and vulnerability insights that should be included in the discovery reports.

To configure the discovery report settings, enable/disable the following features, as required:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the general discovery settings

Field	Description
Identify if MTLS is enabled on HTTPS endpoints	To check if mutual TLS (mTLS) is configured on the discovered HTTPS endpoints, turn on the **Identify if MTLS is enabled on HTTPS endpoints** toggle. This means that both, the server and the client, must provide valid certificates for authentication.
Check ciphers enabled on endpoints	To check if the supported ciphers are enabled on the discovered endpoints, turn on the **Check ciphers enabled on endpoints** toggle. In addition to discovering the ciphers, enabling this feature will also categorize them according to their security strengths in the discovery report and trigger additional scans, if required.
Check CAA records	To query the DNS for Certificate Authority Authorization (CAA) records associated with discovered domains, turn on the **Check CAA records** toggle. These records are then evaluated against the issuing Certificate Authorities to verify that certificates have been issued only by CAs explicitly authorized for those domains.
Check for Heart Bleed, Poodle and Roca Vulnerabilities	To check if there are legacy TLS vulnerabilities (such as heart bleed, POODLE, and ROCA) associated with the discovered certificates, turn on the **Check for Heart Bleed, Poodle and Roca Vulnerabilities** toggle.
**: Mandatory fields*	

Deleting Network Settings

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Settings**. The **Settings** page is displayed.
2. From the network inventory list, under **Name**, select the checkbox(es) corresponding to the network list(s) you want to delete.
3. From the menu bar, click Delete.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the confirmation dialog box, click **Submit**.
   The selected settings list(s) are deleted.

> **Note:** Default settings cannot be deleted. Additionally, any setting mapped to a network cannot be removed.

Cloning Network Settings

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Configuration** > **Settings**.
   The **Settings** page is displayed.
2. Select the checkbox that to be cloned from the settings list.
3. From the menu bar, click the **Clone** button.
   The confimation window appears.
4. Enter the new settings name that to be cloned.
5. Click **Submit**.
   The pop-up message appears as **Selected Network Settings Cloned Successfully**.

Syncing Certificates with Network Devices or Servers

It is important to ensure that the onboarded certificates are in sync with network devices. AppViewX has a cron job called **Device and Certificate synchronization** that, on being triggered, will fetch the config and update the data.

This cronjob syncs the configuration file for the eligible devices and refreshes the list of certificates available in the inventory of that device.

> **Note:** The device must be managed in AppViewX.

By default, the **Device and Certificate synchronization** cron job runs at 3AM every day. The schedule and frequency of the cron job can be customized.

- Viewing the Device and Certificate Synchronization Cron Job
- Modifying the Device and Certificate Synchronization Cron Job

Viewing the Device and Certificate Synchronization Cron Job

To view the **Device and Certificate Synchronization** cron job:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Job Scheduler**.

The **Job Scheduler** page is displayed. The **Device and Certificate synchronization** cron job is listed on this page, along with its details.

Modifying the Device and Certificate Synchronization Cron Job

To modify the **Device and Certificate Synchronization** cron job:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Job Scheduler**.
   The **Job Scheduler** page is displayed. The **Device and Certificate synchronization** cron job is listed on this page, along with its details.
2. Under **Task Name**, click **Device and Certificate synchronization**.
   The **Device and Certificate synchronization** pop-up window is displayed.
3. Enter the following details:

Field descriptions for the details

Field	Description
***Description**	Enter a description of what the cron job is for.
***Time Zone**	From the dropdown list, select the time zone in which this cron job will be scheduled.
***Occurrence Type**	From the dropdown list, select a frequency from the following options: • **Daily** • **Weekly** • **Monthly** • **Minutes**
***Starts On**	**Note:** This field is **not** displayed when **Occurrence Type** = **Minutes**. Click (**Calendar** widget) to select a date on which the cron job will be triggered.
Repeat	**Note:** This field is displayed when **Occurrence Type** = **Daily**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the number of times the cron job should be triggered in a day. When **Occurrence Type** = **Minutes**, from the **Repeat** dropdown list, select the interval between two triggers in minutes
***Repeat On**	**Note:** This field is displayed only when **Occurrence Type** = **Weekly**. Select the checkbox corresponding to the day(s) of the week on which you want the cron job to be triggered.
Summary	Displays a summary of the selections made for scheduling the cron job
**: Mandatory fields*	

4. Click **Update**.
   The details of the cron job are updated on the **Job Scheduler** page.

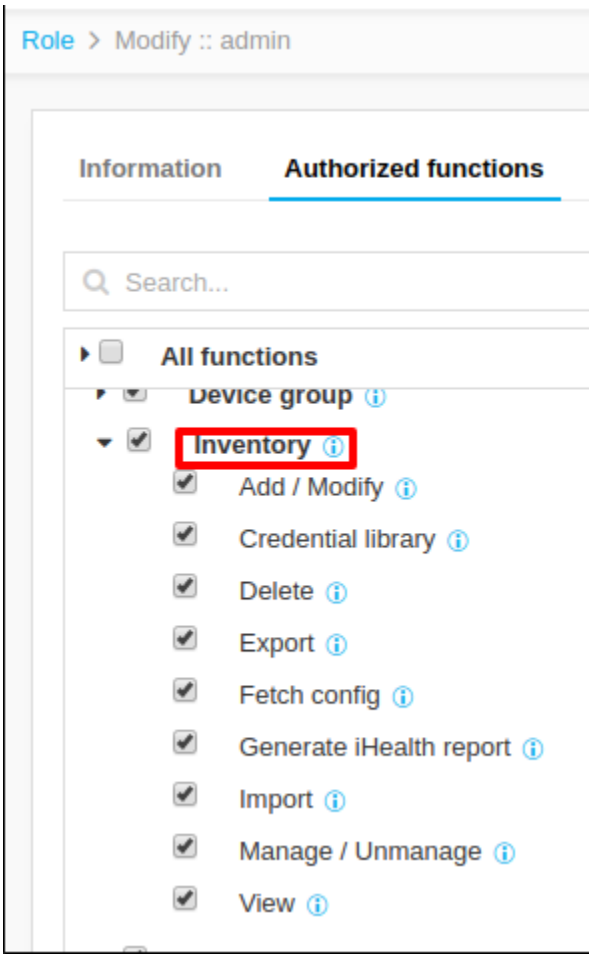
Manage Devices

- Inventory Actions
- Device Prerequisite
- ADC Prerequisite
- Firewall and Web Application Firewall (WAF) Prerequisite
- Prerequisites for Cloudflare - AppViewX CLM
- Server Prerequisite

Inventory Actions

To do any actions in the inventory, the user should have ACF permissions to access the inventory page and its various actions as mentioned in the screenshot.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



- Manually Fetch the Configuration for a Device
- Delete Device
- Export Device Details
- Import Devices
- Customizing Columns
- Manage Device
- Pagination
- Unmanage Device

Manually Fetch the Configuration for a Device

If the latest configuration in the device needs to be pulled into AppViewX, those devices can be selected, and fetch config can be triggered. AppViewX will communicate with the device and pull the latest configuration available in the device and persist in AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To manually get the configuration for a device,

1. Go **Menu** > **CERT+** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.
2. If the device is not listed on the screen, run a search to locate it.
3. Click the checkbox beside the device name. If you want to fetch configurations for multiple devices of the same type, select their checkboxes too.
4. Click (**Fetch Con fig**) from the command bar.
5. A notification appears at the top of the screen stating, "**Fetch config has been triggered for the device.**

Delete Device

To delete the device from the inventory,

1. Go **Menu** > **CERT+** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.
2. Select the desired device to delete.
3. Click the **Delete** button in the Command bar.
   The **Delete** confirmation modal appears.
4. Click **Yes** to delete the selected device.

> **Note:** To discard the deletion, click **No**. The device details and configurations will be permanently deleted from AppViewX. If the deleted device is onboarded again, it will be considered as onboarding a new device.

Export Device Details

The device details that are available in the Device Inventory page can be exported into an Excel file.

To export the details of one or more devices,

1. Go **Menu** > **CERT+** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.
2. If the device you want to export is not listed on the screen, run a search to locate it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click the checkbox beside the device name. If you are exporting details of multiple devices of the same kind, select the checkboxes for each one.
4. Click the **Export** icon in the Command bar at the upper right of the screen.
5. On the **Export** pop-up screen that appears, select the type of information you want to export.
   - **All Columns** - Select this option if you want to export all information about the device.
   - **Displayed columns** - Select this option if you want to export only the information that is visible on the Device screen. This is useful if you need to compare values or settings for different devices and do not have any need to see the less important data.
   - **Columns to modify data and import** - Select this option if you are exporting device details to make modifications and then re-import the data into the Device Inventory.
6. On the screen that opens, select the location where you want the device details file to go, then click **Save**.
7. The details are then downloaded as an Excel `<.xls>` file.

Import Devices

Device import provides a hassle-free experience in onboarding multiple devices into AppViewX in one single step. For onboarding multiple devices, the details should be filled in the excel sheet in the predefined format and can be uploaded to AppViewX and from there AppViewX will dynamically onboard all the devices available in the sheet.

To import devices using a `<.csv>` file,

1. Go **Menu** > **CERT+** > **Inventory** > **Device**.
2. Click the **Import** icon in the Command bar.
3. On the Import screen that appears, navigate to the location of the import file, then select it.
4. Click **Import** to add the devices and their details to the Inventory.

Note: When the file is uploaded with improper structure or incorrect data, the import process will terminate with the errors highlighted.

Customizing Columns

The columns in the Device Inventory page are highly customizable as per the user's convenience. Any column can be hidden, added, or alter in the order of columns.

To customize columns,

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

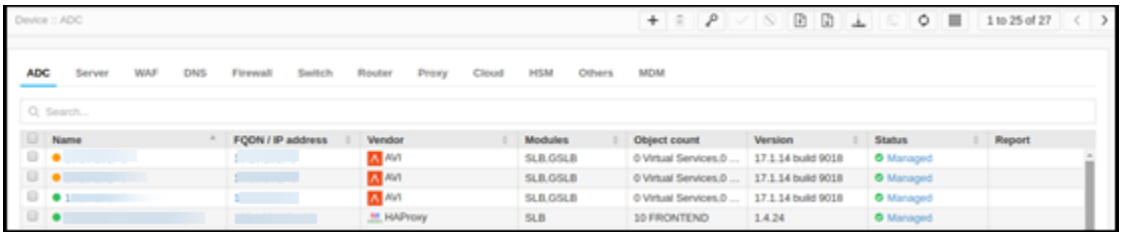
1. Log in to AppViewX application with valid credentials.
2. Click the **Menu** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.
3. Click the **Columns** icon in the Command bar.
   The **Columns** pop-up opens.
4. In the Columns pop-up, you can modify the columns by doing any of the following or in combination:
   a. Select or deselect the desired columns to be displayed.
   b. Alter the order of the column by dragging the column name to the desired order.
   c. Select all the available columns by clicking the **Select all** checkbox.
   d. Reset to the previous column selection by clicking the "**Reset to previous column selection**".
5. Click the **Save** button.

> **Note:** The saved column selection/order changes only at the user level and will remain the same until user changes it again.

6. Click the **Cancel** button to discard the changes.

Validating the Column selection

Once the user selects the columns to be displayed on the inventory page and saves the data, the device inventory page will be reloaded again with the selected columns.



Manage Device

To manage devices,

1. Log in to AppViewX application with valid credentials.
2. Click the **Menu** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.

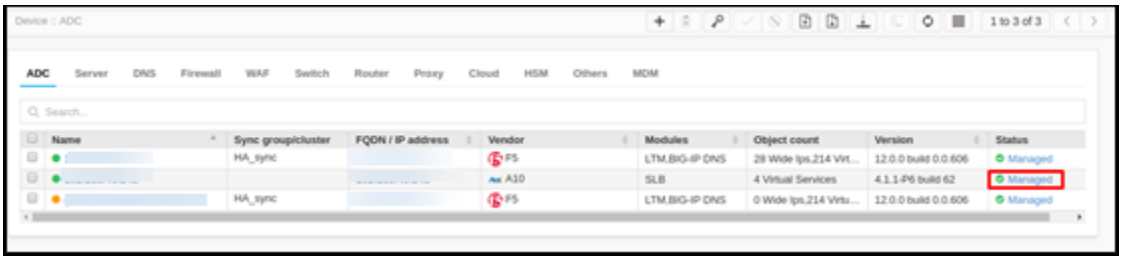
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. If the device you want to manage is not listed on the screen, run a search to locate it.

> **Note:** If you try to manage a device that is already in managed state or unmanaged a device that is already in an unmanaged state, an error message appears at the top of the screen.

Validating the Manage Action

Once the devices are moved from Unmanaged status to Managed status, the config fetch will be triggered to those devices and the device status will be updated.



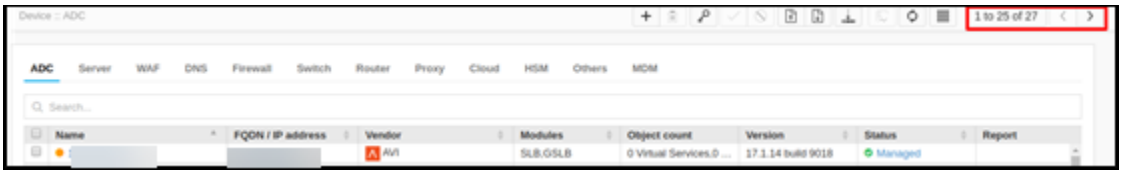
Pagination

Pagination is being used to display many devices into discrete pages. So, the user can configure the number of device details to be displayed on a page and he can navigate to the previous and the next page using the previous and the next icon.

1. Log in to AppViewX application with valid credentials.
2. Click the **Menu** > **Inventory** > **Device**.

   By default, the **ADC** tab opens.

3. Select the number of records to be displayed on the device inventory page.



4. Select the Previous or Next icon to move to the previous or next page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Unmanage Device

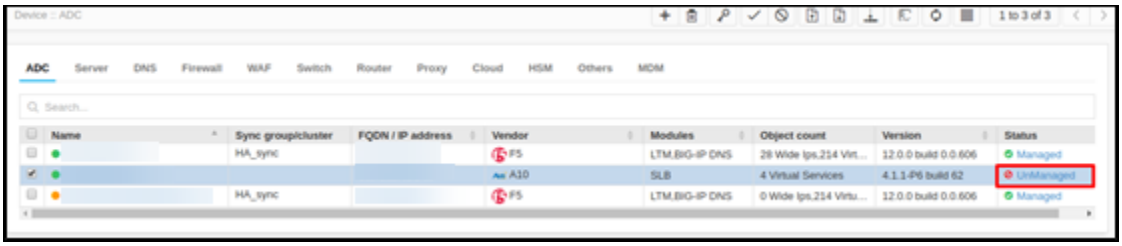
This action is being used to move the device to the unmanaged status from the managed status in the AppViewX application. If the devices are in ‘Unmanaged’ status, the midnight config fetches, and other features like Syslog, Statistics, Write actions will be disabled for those devices.

1. Log in to AppViewX application with valid credentials.
2. Click the **Menu** > **Inventory** > **Device**.
   By default, the **ADC** tab opens.
3. **Note:** If you try to manage a device that is already in managed state or unmanaged a device that is already in an unmanaged state, an error message appears at the top of the screen.

   If the device you want to unmanage is not listed on the screen, run a search to locate it.
4. Click the checkbox beside the device name.
5. To start managing the device, click the Unmanage button in the Command bar at the top of the screen.

Validating the Unmanaged Action

Once the devices are moved from Unmanaged status, the config fetch will be triggered to those devices and the device status will be updated.



Device Prerequisite

A user can discover applications or configurations and certificates associated with the applications from devices. For this CERT+ needs to login to the devices using its credentials. Devices can be inventoried on CERT+ by adding them under relevant categories of devices such as ADC, Servers, Firewall, WAF, or Cloud. Following are some prerequisites that a user has to ensure while adding the device to Inventory.

ADC Prerequisite

Firewall and Web Application Firewall (WAF) Prerequisite

General prerequisites

- Confirm that communication between AppViewX and the firewall is active.
- Provide an internet or proxy connection for AppViewX to interact with the firewall via REST API.
- Ensure that valid firewall account details, such as API tokens/keys and user credentials, are available.
- Grant the API admin permissions to read and modify SSL certificates.

Prerequisites for Cloudflare - AppViewX CLM

Cloudflare - AppViewX CLM refers to an integration between Cloudflare's services and AppViewX's Certificate Lifecycle Management (CLM) solution. This integration would combine Cloudflare's robust security and performance capabilities with AppViewX's comprehensive certificate management features.

Prerequisites

- Must have an active Cloudflare SAAS account
- Internet/ Proxy connection is required at AppViewX environment for communication between Cloudflare and AppViewX and it happens through the Rest API.
- AppViewX public ip should be whitelisted in the firewall.
- Valid Cloudflare account details like **API Tokens/API Keys.**
- Supported Certificate Format: PEM.

Roles and Permissions

- The API Tokens/ API Keys must have **Zone edit and Zone SSL Certificates-edit**access permissions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Rest API Endpoints

- The API is accessed by making HTTPS requests to a specific version endpoint URL, using GET, POST, PUT, PATCH, and DELETE methods to interact with the available information.
- Every endpoint is accessed only via the SSL-enabled HTTPS (port 443) protocol. The latest version is **Version 4**.
- The stable base URL for all Version 4 HTTPS endpoints is https://api.cloudflare.com/client/v4/.
- Requests can be authenticated using either of the following methods:
  - **API Tokens**: Include Authorization: Bearer accessToken in the request header.

```
curl -X GET "https://api.cloudflare.com/client/v4/zones/cd7d0123e3012345da9420df9514dad0" \
    -H "Content-Type:application/json" \
    -H "Authorization: Bearer YQSn-xWAQiiEh9qM58wZNnyQS7FUdoqGIUAbrh7T"
```

  - **API Keys**: Include `X-Auth-Key` and `X-Auth-Email` in the request headers.

```
curl -X GET "https://api.cloudflare.com/client/v4/zones/cd7d0123e3012345da9420df9514dad0" \
    -H "Content-Type:application/json" \
    -H "X-Auth-Key:1234567893feefc5f0q5000bfo0c38d90bbeb" \
    -H "X-Auth-Email:example@example.com"
```

Device Management

Navigate to **Inventory** > **Device** > **WAF**.

General Information for device addition:

- Account name
- Data center
- Cert Sync (Monitored/ Managed/ Ignored)

Credential Types and Authentication Methods:

- **Credential Type**: (Manual / AppViewX / CyberArk)
  - **Manual**: There are two methods of authentication for APIs.
    - **Token-Based Authentication**: Requires entering the API token.
    - **Username & Password Authentication**: Requires entering the username and password.
  - **AppViewX**: Integration with the AppViewX vault.
  - **CyberArk**: Integration with the CyberArk vault.

- Secondary device addition is not applicable.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

List of APIs Used at Backend

- **https://api.cloudflare.com/client/v4/user/tokens/verify**: Used for credential validation and device communication.
- **https://api.cloudflare.com/client/v4/zones**: Used to list account and zone details.
- Account ID, account name, zone ID, zone name, custom certificate quota, and permission details are parsed and saved in AppViewX.
- Device communication messages and other status messages are listed based on the above API responses:
  - Device communication and status messages
  - List of accounts and their details
  - List of zones and their details
  - Certificate quota and SSL permission details.

Discover Operation

- Certificate content is not discovered from Cloudflare due to API restrictions.
- Only specific certificate attributes are discovered: [Resource ID, Zone ID, Host Name, Issuer, Signature, Bundle Method, Priority, Uploaded, Modified, and Expiry time of SSL Certificate].
- The following API is used to discover certificate attributes from a particular zone using the ZoneID in the request:
  - **https://api.cloudflare.com/client/v4/zones/6812dae14999809307c0df2f23b50924/custom_certificates**
- Device profiles are created based on the zone name in the format: **[{AppViewX_AccountName}:@{CloudFlare_AccountName}:@{ZoneName}:@{ZoneId}]**

Push Operation

- Cloudflare only accepts publicly trusted certificates of the following types:
  - SHA256WithRSA
  - SHA1WithRSA
  - ECDSAWithSHA256.
- Certificates are parsed and checked for validity before being accepted. Each certificate uploaded must:
  - Be encoded in PEM format.
  - Not expire in less than 14 days from the time of upload.
  - Have a Subject Alternative Name (SAN) matching at least one hostname in the zone where it's being uploaded.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Use a private key with a minimum length (currently 2048 bits for RSA and 225 bits for ECDSA).
- Be publicly trusted by a major browser unless the User Defined bundling method is used.

Backend APIs in Use

1. POST Method API for Pushing New Certificates:
   - **API Endpoint:** https://api.cloudflare.com/client/v4/zones/023e105f4ecef8ad9ca31a8372d0c353/custom_certificates
   - This API endpoint is used to push new certificates.

```
curl -X POST https://api.cloudflare.com/client/v4/zones/023e105f4ecef8ad9ca31a8372d0c353/custom_certificates \
  -H "Authorization: Bearer 17b9lxqsnSvQrnyvYdvur8h_Fu6N0iKOirMRuECk" \
  -H "Content-Type: application/json" \
  --data '{"certificate":"-----BEGIN CERTIFICATE-----\n cert content \n-----END CERTIFICATE-----\n","private_key":"-----BEGIN RSA PRIVATE KEY-----\n
key content\n-----END RSA PRIVATE KEY-----\n" ,"bundle_method":"ubiquitous", "geo_restrictions":{"label":"us"},"type":"sni_custom"}'
```

2. PATCH Method API for Replacing Existing Certificates:
   - **API Endpoint:** https://api.cloudflare.com/client/v4/zones/6812dae14999809307c0df2f23b50924/custom_certificates/76e0e95c-2e20-44a8-b60e-fd919c9b1445
   - This API endpoint is used to replace the existing certificate identified by the certificate ID in the request.

```
{
  "certificate": "-----BEGIN CERTIFICATE-----\nMIIG...\n-----END CERTIFICATE-----",
  "private_key": "-----BEGIN PRIVATE KEY-----\nMIIJQ...\n-----END PRIVATE KEY-----",
  "bundle_method": "force",
  "geo_restrictions": {
    "label": "us"
  },
  "type": "sni_custom"
}
```

Connectors Page Field Definitions

On the Connectors page, the following fields are defined:

- **Certificate Type**: Only supports PEM format.
- **Bundle Method**: Dropdown values include Compatible, Modern, and User Defined.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **API Request Data Mapping Values for Bundle Method**:
  - Compatible maps to ubiquitous
  - Modern maps to Optimal
  - User Defined maps to force.

- **Private Key Restriction**: Dropdown values include:
  - Distribute to all Cloudflare data centers
  - Distribute only to U.S. data centers
  - Distribute only to E.U. data centers
  - Distribute only to highest security data centers.
  - API Request Data Mapping Values for Private Key Restriction:
    - No-input (Default), us, eu, highest_security.

- **Legacy Client Support**: Dropdown values are Modern and Legacy.
  - API Request Data Mapping Values for Legacy Client Support: sni_custom & legacy_custom

- **Overwrite**: Checkbox option.
  - If selected, it will replace the existing certificate.
  - If not selected, it will add a new certificate based on the quota value.

Certificate Operations

Bind Operation:

- Since this process involves importing certificates at the zone level, the Bind operation is not applicable.

Backup Operation:

- Since certificate content cannot be discovered from Cloudflare, the Backup operation is not applicable.

Rollback Operation:

- Since the Backup operation is not applicable, reverting back to an existing certificate is not possible.
- Currently, similar to other WAF devices, the rollback operation involves removing the pushed certificate. Users can then push the same certificate again through the connector if it exists in the AppViewX inventory.

Reference

For more information, visit Cloudflare API Documentation.

Certificate Actions

For launching any new application in an enterprise, an SSL certificate is required to secure the communication. The certificate lifecycle has different phases starting from enrolling. AppViewX Cert+ enables you to manage every action that is involved in the certificate lifecycle.

In the Certificate Action section, the following actions can be performed:

- Enrolling Certificates
- Renewing Certificates
- Pushing Certificates to Devices
- Reissuing Certificates
- Revoking Certificates
- Regenerating Certificates
- Reinstating Certificates
- Duplicating Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Running Revocation Check-OCSP
- Generating Certificate Signing Request (CSR)
- Migrating CAs (CA Switch)
- Running the SSL Checker for a Certificate

Enrolling Certificates

Certificate enrollment is a process of requesting digital identity for a server or an individual from the Certificate Authority (CA). It is a primary step in certificate lifecycle management (CLM). In the enrollment process, a user must submit the details of the entity (server/individual) to the certifying authority. The authority validates the correctness of the information and ownership before issuing a digital certificate and issues a certificate.

Note: For enrolling with a CA, the respective account details must be added in AppViewX. For more details, refer to Add a CA Account section in Configuring CA Settings.

• Enrolling a Server Certificate
• Enrolling a Client Certificate
• Enrolling a Code Signing Certificate

Enrolling a Server Certificate

Important: Effective October 1st, 2025, DigiCert CA server certificates will include only server authentication in the Extended Key Usage (EKU). Dual authentication will no longer be supported.

As a temporary provision till May 01st, 2026, DigiCert CA will allow dual authentication in the EKU. Customers who need to continue enrolling server certificates with dual authentication enabled can contact the AppViewX's Site Reliability Engineering (SRE) team at saashelp@appviewx.com.

However, it is strongly recommended to transition away from the use of server certificates for dual authentication to align with industry best practices.

Prerequisites

[For Linux-based vendor] OpenSSL is used to generate a private key and a Certificate Signing Request (CSR) as part of the endpoint enrollment process. Ensure that OpenSSL is installed and properly configured on the system before proceeding.

Enrolling a Server Certificate

Server certificate enrollment refers to the process of creating a digital ID for an application/web server hosted in the network. It starts with the generation of a key pair (private and public key) and CSR, and then submitting the CSR to the required CA to procure a certificate. CERT+ supports the generation of keypair on the device, HSM, AppViewX. Users can also upload the CSR for enrolling for a digital certificate.

To enroll a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Server**
   The **Enroll Server Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter the **CA Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	From the dropdown list, select the certificate authority to request the certificate enrollment. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
***Renew Automatically**	**Note:** • If the Override feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	From the dropdown list, select the CA account to which the certificate enrollment request will be submitted.
Certificate Type	From the dropdown list, select the required certificate type.
***Division**	**Note:** This field is applicable only for Digicert CA. From the dropdown list, select the division with which the certificate will be enrolled.
Certificate Profile	**Note:** This field is displayed for only selected CAs. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the certificate profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Issuer Location**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer location associated with the CA account.
***Issuer Name**	**Note:** This field is applicable only for Google CA. From the dropdown list, select the issuer name for issuing the certificate.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter a friendly name for the CA connector. On saving this form, the name entered here will be displayed in the holistic view.
Description	**Note:** Character limit: **2000 characters** Enter the description in this field.
***CSR Generation**	**Note:** This field is applicable for all CAs **except Amazon**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the required method for generating the CSR: • **AppViewX**: Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` • **Upload CSR**: You can upload a file that contains the CSR details. This source file will be used to populate the CSR parameters, which will then be submitted to the CA. a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: **Note:** This option is disabled/not displayed when **Certificate Authority** = **Google**, **CSC Global**, and **DigiCert One**. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter the configuration details for CSR generation, refer the field descriptions given here. • **End Point**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This option is disabled when **Certificate Authority** = **Google** and **CSC Global**. To generate the private key and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter the configuration details for CSR generation, refer the field descriptions given here.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. Enter the desired handler name in the field.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. In this field, enter the reference name assigned to the private key stored in/accessible to the selected ADC device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • ADC • Cloud • Server • WAF • Firewall **Note:** • Run the following script to enable endpoint CSR generation support for **GlobalSignAtlas**: `db.getCollection('cert_metadata').insertOne({ "_id": "CSR_GENERATION_ENDPOINT_SUPPORTED_VENDOR_GLOBALSIGNATLAS", "objectMap": { "Server": [ "ABAP", "Web Dispatcher" ] } });` • On selecting GlobalSignAtlas CA, Category is automatically populated as Server.
Vendor	The dropdown list for this field is populated based on the **Category** selected. From the dropdown list, select the vendor for the end point device. **Note:** On selecting GlobalSignAtlas CA, Vendor is populated with ABAP and Web Dispatcher.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the dropdown list, select the end point device on which you want to generate the private key and the CSR. **Note:** On selecting **Vendor = Fortinet,** both Fortigate and FortiManager devices are populated. Auto-regeneration of certificates with FortiManager as endpoint is not supported.
***Profile**	This field is applicable only when **Category** = **Server/WAF**. Select a profile from the dropdown list. **Note:** On selection of **Vendor = Imperva,** CSR generation at the endpoint is supported only for SaaS platforms. Profiles will not be displayed for AWS/on-prem deployments.
***Tenant**	This field is applicable only when **Category** = AD. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	This field is applicable only when **Category** = **Server**.
***Template Name**	This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	This field is applicable only when **Category** = **Firewall**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** • As the extension is already included in the field, ensure that you enter the file name without the file extension. • Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. For the **EJBCA** certificate authority, enter the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. For the certificate being enrolled, enter the **CSR Parameters**.

Note: For DigiCert One, all CSR parameters that are assigned static values in the certificate profile will be auto-populated and disabled for editing.

Field descriptions for the CSR Parameters

Field	Description
Replace PSE File	The **Replace PSE File** checkbox enables users to generate the CSR or private key in the Server. This checkbox is displayed only in the case described below: a. Select the **CSR Generation** radio button as **Endpoint**. b. Select **Category** as *Server*, **Vendor** as *ABAP* or *Web Dispatcher* The Profiles dropdown is the only other field displayed below it and is populated with a list of .pse file names. c. Select the required **Profile** from the dropdown. Based on the values selected, the fields in the CSR Parameters section are auto-populated. The **Replace PSE File** checkbox is disabled by default and the SAN details fields in CSR Parameters section are also disabled. Selecting the checkbox will make the SAN details enabled and allow for values to be updated.
***Common Name**	Enter the certificate's common name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, **<appviewx>**. **Note: Constraints**: • Character limit: 64 characters • No special characters allowed except en dash (_) and hyphen (-). • For VMware vCenter, enter the device's FQDN to avoid certificates being rejected. If left blank, the FQDN will be auto-detected and populated.
Subject Alternative Name	From the dropdown list, select the **Subject Alternative Name** category for the certificate being enrolled. You can select more than one SAN category from the dropdown list. The cumulative count of SANs and the corresponding values are displayed in the certificate details (accessed from the holistic view in the certificate inventory). Depending on the SAN category selected from the dropdown list, corresponding fields are displayed for you to enter the required values.
DNS	Enter the domain names that the certificate will secure. Multiple domain names can be entered as a comma-separated list.
URI	This field is displayed when **Microsoft Enterprise** is the selected **Certificate Authority** and **URI** is one of the selected **Subject Alternative Name** categories. In this field, enter one or more URIs (URLs or URNs) that identify the resource(s) to be secured by the enrolled certificate. For a detailed description of URIs, URLs, and URNs, see the Glossary. **Examples of Valid/Correct URN** • urn:example:device123 • urn:ietf:rfc:8141 • urn:uuid:123e4567-e89b-12d3-a456-426614174000 • urn:org-id:org.acme:department42

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• urn:acme:product:router-x100:v1.2.3 • urn:example:svc+api-1.0@domain.com **Examples of Invalid/Incorrect URN** • urn::device (empty namespace) • URN:example:device (uppercase URN, **case-sensitive**) • urn:example: (empty NSS) **Important:** Ensure that the values entered here are in adherence to the CA policy enforcement type (strict or suggestive) selected for the Microsoft Enterprise CA.
Organization	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For VMWare vCenter, this is a mandatory field.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: For VMWare vCenter, this is a mandatory field.
Country	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on). **Note:** • For renewal of the certificate being enrolled, country name is required. • For VMWare vCenter, this is a mandatory field.
Email Address	Enter a valid email address of the person responsible for maintaining the certificate. **Note:** For VMWare vCenter, this is a mandatory field.
***Validity**	To specify the validity of the certificate being enrolled: a. From the first dropdown list, select the number of days/months/years. b. From the second dropdown list, select the unit of the duration from the following values: **Days**/**Months**/**Year**. For example, if the validity of the certificate is 2 months: i. From the first dropdown list, select **2**. ii. From the second dropdown list, select **Months**. **Note:** The uploaded certificate validity for Globalsign MSSL is set to 365 days.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Re-enter the password entered in the **Challenge Password** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA. **Note:** • FortiManager supports only RSA key type of 512, 1024, 1536, 2048, 3072, 4096 bits. • VMWare supports only RSA of 2048, 3072, 4096, 7680, 8192 bits and EC key type.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Attachments section

Field	Description
Name	Enter a name for the document. This need not be the actual name of the document; it can be an alternate name that will be used for reference only.
Comments	Enter any details relevant to the document being attached. **Note:** Character limit: **2000 characters**
Upload File	To upload an attachment: a. Click **Upload**. b. Navigate to the location of the document to be uploaded. c. Select the document to be document and click **Open**. The selected document is uploaded and listed in the table displayed below these fields in the **Attachments** section. **Tip:** If you have uploaded multiple attachments, use the **Search** field to find the required one.
**: Mandatory fields*	

7. In the **Certificate Attributes** section, enter organization-specific values, for the certificate attributes and custom attributes for the issuing CA, that need to be mentioned along with the CSR.
   These values will not be a part of the certificate but will be available in the AppViewX inventory. For example, cost center.

   Note: This additional information can be used to filter certificate details in the inventory.

8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the CSC Global CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Business Unit**	Enter the name of the business unit that is requesting the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Organization Contact**	Enter the email address of the contact in the organization requesting the certificate.
***Phone Number**	Enter the phone number of the **Organization Contact** in the followung format: **+<country code>-<phone number>**. **Note:** For CSC Global, the phone number is not fetched from the AppViewX user information because of the difference in format.
***Domain Control Validation Type**	From the following options in the dropdown list, select the method CSC Global will use for authentication before issuing a certificate: • **EMAIL**: CSC Global will send an approval/confirmation request to the registered email ID. Certificate issuance happens only after approval is received. • **CNAME**: On requesting certificate issuance, CSC Global will provide you with a dynamic string. Add a CNAME record with this string to your DNS settings. CSC will issue the certificate requested only after validating this CNAME record. **Note:** CSC Global will perform domain validation for all CLM actions.
**: Mandatory fields*	

Field descriptions for the Custom CA vendor specific details

Field	Description
***CRL and OCSP required**	To control the inclusion of CRL and OCSP settings, turn this toggle button on/off as required.
**: Mandatory fields*	

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the DigiCert One CA vendor specific details

Field	Description
Seat ID	Enter the seat ID that will be assigned to the certificate being enrolled. Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. **Note:** The **Seat ID** field is displayed only if the **Allow Seat ID during enrollment** option is selected for the CA account. In this case, the value entered in the **Seat ID** field is now a unique identifier for the certificate being enrolled. Otherwise, a common seat ID is assigned to all certificates enrolled for the selected CA account

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the GlobalSign CA vendor specific details

Field	Description
For **Certificate Type** = **Alpha SSL**	
***Domain Admin Email**	From the dropdown list, select the email ID that will receive the approval requests from GlobalSign.
For **Certificate Type** = **Domain SSL**	
***Validation Type**	From the dropdown list, from the following options, select the DNS verification method that will be used by the CA to verify the domain challenge: • **DNS**: A specific DNS TXT record must be added to your domain's DNS configuration, either manually or automatically. The CA will query this DNS TXT record to verify the domain challenge. When **Validation Type** = **DNS**, the **Challenge Verify** dropdown list is displayed, allowing you to choose how the record will be added. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here. • **Email**: The CA will send a verification email to the selected domain contact. You must follow the instructions in the email to complete validation.
***Challenge Verify**	This field is displayed when **Validation Type** = **DNS**. From the dropdown list, from the following options, select the method for adding the DNS TXT record: • **Manual**: You must manually create the required DNS TXT record in your DNS configuration. For instructions, see Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates. After the DNS TXT record is successfully validated and the certificate is issued, you can delete the DNS TXT record (optional).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Automatic**: AppViewX will automatically create the DNS TXT record using the configured DNS vendor and then request the CA to proceed with the validation. After the CA has successfully validated the DNS TXT record, it will proceed with certificate issuance. After the certificate is successfully issued, AppViewX will automatically delete the DNS TXT record. **Important:** For DNS validation, ensure that the **Enable DNS Automation** version of the **certificate_new_request** workflow is activated. Follow the workflow activation instructions given here.
***Vendor**	This field is displayed when **Challenge Verify** = **Automatic**. From the dropdown list, select the DNS vendor that supports automatic challenge verification. The current implementation of this feature supports the following two DNS vendors: **CloudFlare** and **Azure DNS**. **Note:** Ensure that the selected vendor is pre-integrated under the PKI category and supported by the system. For instructions on vendor integration, see the PKI+ Vendor Configurations documentation.
***Settings**	From the dropdown list, select the DNS vendor configuration setting that will be used by AppViewX to create, and later delete, the DNS TXT record. The options in the dropdown list are vendor settings pre-integrated in AppViewX. These settings enable AppViewX to programmatically create and remove DNS TXT records for the automatic challenge verification.
For **Certificate Type** = **Organization SSL**	
No additional vendor-specific details are required for this condition.	
For **Certificate Type** = **Extended SSL**	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Incorporating Agency Reg. No**	Enter the official registration number assigned to your organization by the government agency that authorized its incorporation. This number serves as a unique identifier for validating the legitimacy of an entity's legal existence and must match the records held by the relevant business registry.
***Designation**	Enter the designation of the requester.
***Business Category**	Enter the industry sector your organization operates in (for example, Information Technology, Finance, Healthcare, and so on). This gives GlobalSign a context of the nature of your organization and is used as part of the verification process.
**: Mandatory fields*	

Field descriptions for the GlobalSign MSSL CA vendor specific details

Field	Description
***Profile name**	A profile name is defined at the time of creating an account on the GlobalSign MSSL portal. AppViewX retrieves all your profile names from the GlobalSign MSSL portal and populates them in this dropdown list. From the dropdown list, select the profile name the enrolled certificate should be mapped to.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Microsoft Enterprise CA vendor specific details

Field	Description
***Template Name**	From the dropdown list, select the template that will define the settings and policies for issuing the certificate from the Microsoft Enterprise CA. This list is populated based on the policy settings and group associations.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

Field descriptions for the LetsEncrypt CA vendor specific details

Field	Description
***Challenge Type**	Specifies the method for verifying domain ownership. Select the required domain for the validation. The available challenge types are: • **HTTP** • **DNS**.
Challenge Verify	Determines how the DNS challenge will be verified. Select the required verification process. The available challenge verifies are: • **Manual** • **Automatic**. The value **Automatic** suggests that the system will automatically handle the verification process without manual intervention. **Note:** This field appears when the challenge type is selected as **DNS**.
Vendor	Indicates the DNS provider responsible for managing DNS records. The available DNS service providers are: • **Cloudflare** • **Azure**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field appears when the challenge verify is selected as **Automatic**.
***Settings**	Allows for additional configuration settings related to the DNS challenge. The selected value **None** implies that no extra settings are applied. **Note:** This field appears when the challenge verify is selected as **Automatic**. **Note:** • Make sure that you have enabled **LetsEncrypt DNS Automation** from the workflow. • To add new vendors for the integration and configuration, refer to Integration topic in the Automation Guide.
**: Mandatory fields*	

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

Note: If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. Click **Yes**.
    Once the approval process is complete, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

Important: For CSR generation at endpoint, for **Category** = **Server** and **Vendor** = **LinuxServer**, in the endpoint application connector created after the certificate is issued, the following fields (explained here) are auto-populated/enabled and cannot be modified:

- **Category**
- **Vendor**
- **Key Location**
- **Private key in Device**

Additionally, the available profiles are filtered for the device profile selected at the time of certificate enrollment here.

Manually Verifying DNS TXT Records for GlobalSign Domain SSL Server Certificates

For DNS providers that don't support automatic challenge verification of DNS TXT records, you are required to manually create the DNS TXT record.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: DNS providers that support automatic challenge verification can also opt for manual verification, if and as required.

To do this:

1. Activate the **Enable DNS Automation** version of the **certificate_new_request** workflow.
   To do this:

   a. Go to (**Menu**) > **Automation** > **Workflow** > **Design**.
   The **Workflow** page is displayed.

   b. To change the workflow version, turn off the toggle key to disable the **certificate_new_request** workflow.

   c. Once it is disabled, click the **certificate_new_request** workflow card to open the workflow view.

   d. In the workflow view, from the dropdown list on the menu bar, select **Version List**.
   The **Version List** dialog box is displayed.

   e. From the **Version List** dialog box, select the **Enable DNS Automation** version.
   The workflow view for the selected version is displayed.

   f. From the top right corner of the workflow view, click **ON**.

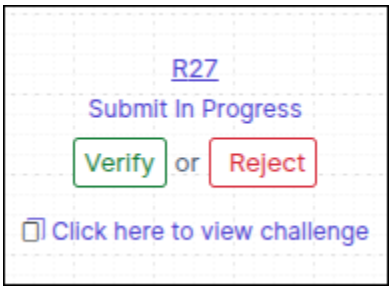
   g. In the **Confirmation** dialog box displayed, click **Validate & Enable**.
   The **Confirmation** dialog box is updated to display the message **There is an active workflow version running. Do you wish to activate & enable this version for request generation?**

   h. Click **Yes**.
   The **Enable DNS Automation** version of the **certificate_new_request** workflow is activated and the workflow is enabled.

   Note: On the **Workflow** page, validate if the **certificate_new_request** workflow is enabled. If not, turn on the toggle key to enable the workflow.

2. In the server certificate enrollment process, from the **Challenge Verify** dropdown list, select **Manual**, as explained here.
   Once the enrollment process is initiated, the **Enable DNS Automation** version of the workflow is triggered and the prompt shown in the image below is displayed on the holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



3. Click the **Click here to view challenge** prompt.
   The **Copy Token** dialog box is displayed.
4. To manually add the DNS TXT record, follow the instructions given in the **Copy Token** dialog box.
5. After creating the DNS TXT record in the corresponding DNS configuration, close the **Copy Token** dialog box.
6. On the holistic view, click **Verify**.
7. Enter your comments in the text field displayed (optional) and click **Yes**.
   The **Submit Manual TXT record update in progress** message is displayed on the holistic view.

   AppViewX validates if the DNS TXT record is updated correctly. If the validation is successful, the enrollment request is moved to the CA verification stage.

What's Next

After Enrolling the certificates, you can now:

- Go to the certificate inventory to view and manage the certificates.
- Automate certificate lifecycle management by enabling:
  - Auto renewal of certificates
  - Auto regeneration of certificates
  - Auto push of certificates to endpoints
  - Alerts to notify events and status changes related to the certificates

Enrolling a Client Certificate

Client certificate enrollment refers to the process of creating a digital ID for an individual/device for authentication/encryption purposes. It follows the same process as a server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: These certificates cannot be hosted on clients.

Important: In compliance with recent updates from the CA/Browser Forum S/MIME Baseline Requirements, for DigiCert-issued S/MIME certificates, it is now mandatory to include the first name and last name, or a pseudonym in the subject information during certificate enrollment.

However, in the current implementation:

- The discovery feature does not retrieve these values in the metadata.
- The upload certificate feature is not compatible with this enhancement since it does not have with a direct mapping to the certificate type, unless the certificate is discovered via a Certificate Authority scan.

To enroll a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Client**
   The **Enroll Client Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Field	Description
***Certificate Authority**	**Note:** Depending on the CA selected, the rest of the fields will be displayed. From the dropdown list, select the required certificate authority (CA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description

	Note: For enrolling certificates with policies using Google CA, consider the following points:
	
	Certificate Enrollment - Strict Policy
	• The Common Name will not be pre-filled from the policy.
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Certificate Enrollment - Suggestive Policy
	• The Common Name will not be pre-filled from the policy
	• The following validation will be seen based on strict policy guidelines.
	  • If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
	  • If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.
	
	Note: For **Certificate Authority** = **EJBCA**, an additional set of fields, **Vendor specific details** is displayed after the **CA Details** section. Instructions on specifying the vendor specific details are covered in step 4.

***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	Select the division to which the certificate must be enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field will be shown only for Digicert CA.
Certificate Profile	**Note:** This field is applicable only for AppViewX CA and Google CA. For the IDnomic CA, this field is displayed when only-CA setting is selected from the **CA Account** dropdown list. From the dropdown list, select the profile with which the certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	Select the location of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuer Name**	Select the name of the issuer CA from the dropdown. **Note:** This is applicable only for Google CA.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM. In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list. **Note:** • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

4. For the **EJBCA** certificate authority, enter/select the vendor details.

Field descriptions for the EJBCA Vendor Specific Details section

Field	Description
* **End Entity Profile Name**	From the dropdown list, select the end entity profile name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
End entity user name	Enter the name of the end user entity.
* **Issuer Common Name**	From the dropdown list, select the issuer common name.
***Certificate Profile Name**	From the dropdown list, select the certificate profile name.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Field descriptions for the CSR Parameters section

Field	Description
***Common Name**	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-).
***Common Name Indicator**	**Important:** See note. This field is displayed when the selected **CA Account** is **DigiCert** and **Certificate Type** is one of the following: • Secure Email for Business • Digital Signature • Premium As part of DigiCert's revised security regulations, the common name for the above listed DigiCert certificate types is derived from the one of the input attributes, as selected from the dropdown list. For the common name indicator, from the dropdown list, select one of the following: • **First Name and Last Name** • **Pseudonym** • **Email** (applicable only for the **Secure Email for Business** certificate type)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***First Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified first name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.
***Last Name**	This field is displayed when: • **Common Name Indicator** = **First Name and Last Name** • **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** Enter the verified last name of the individual subject. For **Common Name Indicator** = **First Name and Last Name** A combination of the first name and last name will be used to derive the certificate's common name, which will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from the holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **First Name and Last Name** The first and last name will be appended as mandatory additional information to the Subject Alternative Name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Pseudonym**	This field is displayed when: • **Common Name Indicator** = **Pseudonym** • **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** Enter the pseudonym of the individual subject. A pseudonym is a fictitious name assumed for a particular person. For **Common Name Indicator** = **Pseudonym** The entered pseudonym will be displayed in the certificate's **Common Name** field or the **Subject DN** (in the certificate details that can be accessed from trhe holistic view). For **Common Name Indicator** = **Email** and **Indicator Type** = **Pseudonym** The pseudonym will be appended as mandatory additional information to the Subject Alternative Name.
***Indicator Type**	This field is displayed when **Certificate Type** = **Secure Email for Business** and **Common Name Indicator** = **Email**. In this case, the issuer's email address, as specified in the CSR parameters, is used to derive the common name. For **Common Name Indicator** = **Email**, it is mandatory to include additional information in the form of the first name and last name or the pseudonym, which will be appended to the Subject Alternative Name. From the following options, select the required indicator type to be used as mandatory information along with the email: • **First Name and Last Name** The **First Name** and **Last Name** fields are displayed. • **Pseudonym** The **Pseudonym** field is displayed.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Order Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The **Order Validity** for the following DigiCert S/MIME certificate types cannot exceed **2** years: • Secure Email for Business • Digital Signature • Premium **Note:** As per revised security regulations for DigiCert S/MIME certificates, the maximum lifespan of the the above listed certificate types is **two** years.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit logentries (typically enrollment and revocation events)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters as meta data for their operational purposes. Details common to all CAs will be taken from the AppViewX user information of the logged in user.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

    If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

    Once the certificate is issued successfully, the certificate will be retrieved into AppViewX. You can now push the enrolled certificate(s) to the required endpoint.

What's Next?

To automate certificate lifecycle management for enrolled certificates:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Enable auto regeneration of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Enrolling a Code Signing Certificate

Code Signing certificate enrollment refers to the process of creating a digital ID for a code or document. It starts with the generation of a key pair (private and public key) and CSR and then submitting the CSR to the desired CA to procure a certificate. CERT+ supports the generation of key pair on the device, HSM, and AppViewX. You can also upload the CSR for enrolling for a digital certificate.

Note: These certificates cannot be hosted on servers.

To enroll a code signing certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Enroll Certificate** > **Code Signing Certificate**.
   The **Enroll Code Signing Certificate** page is displayed.
2. In the **General Information** section, from the dropdown list, select the required **Assign Group**.
3. Enter/Select the **CA Details**.

Field descriptions for the CA Details section

Options	Description
***Certificate Authority**	Select the desired certificate authority from the dropdown lists. Based on the selected CA, other CA details are configured. **Note:** The IDnomic CA can be used for issuing certificates only in an on-prem deployment. Certificates issued through IDnomic CA can be renewed only if they are enrolled using a Registration Authority workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
***Renew Automatically**	**Note:** • If the **Override** feature is enabled for the certificate group selected from the **Assign Group** dropdown list, auto renew settings done in the enrollment page will be overwritten by the group level settings. • If **Regenerate Automatically** has been enabled for the selected certificate group, the **Renew Automatically** field is not displayed here. To automatically renew this certificate: a. Turn on the **Renew Automatically** toggle. The ***Start Renewing** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120** **Note:** The auto renew settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was renewed manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time this certificate is auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
	If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.
***Regenerate Automatically**	To automatically regenerate this certificate: a. Turn on the **Regenerate Automatically** toggle. The ***Start Regenerating** field is displayed. b. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates. **Note:** • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • The auto regenerate settings from the parent certificate will be transferred to the child certificate only if the toggle was enabled; they will not transfer if the certificate was regenerated manually. After migration, these settings will be disabled for the parent certificate, so enable them manually if needed.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time this certificate is auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, this setting overrides the group setting for email alerts subscription, unless group-level overrides have been enforced.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
***CA Account**	To which account the enrollment request to be submitted.
Certificate Type	Select the desired certificate type from the dropdown list.
***Division**	This field will be shown only for Digicert CA. Select the division to which the certificate must be enrolled.
Certificate Profile	This field is applicable only for AppViewX CA and Google CA. Select the Profile to which the Certificate must enroll.
***RA Workflow**	**Note:** This field is displayed when **Certificate Authority** = **IDnomic** and a RA setting is selected from the **CA Accounts** dropdown list. From the dropdown list, select the RA workflow that will be used for certificate enrollment. For the details of a workflow, you can check them on your CA portal on IDnomic.
***Issuer Location**	This is applicable only for Google CA. Select the location of the issuer CA from the dropdown.
***Issuer Name**	This is applicable only for Google CA. Select the name of the issuer CA from the dropdown.
***Issuance Policy**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the issuing policy for this certificate. An issuance policy defines the rules Futurex must follow to process the certificate enrollment request. The selected issuance policy will determine the approval requirements for the certificate, the cryptographic settings, notification triggeres and other configuration parameters.
***Root CA**	**Note:** This field is applicable only for Futurex.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
	From the dropdown list, select the root CA for the certificate being enrolled. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	**Note:** This field is applicable only for Futurex. From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Extension Profiles**	**Note:** This field is applicable only for Futurex. Extension profiles enable you to further modify your certificates with additional field, attributes, and requirements. From the dropdown list, select the extension profile that will be used for the certificate being enrolled. To read more on and for instructions to create extension profiles, refer the Futurex documentation. For links, see the References section.
***Approval Group Name**	**Note:** This field is applicable only for Futurex. An approval group is a predefined set of users or roles authorized to approve the certificate enrollment request. From the dropdown list, select the approval group to authorize this enrollment request. To read more on and for instructions to create and manage approval groups, refer the Futurex documentation. For links, see the References section.
***Connector Name**	Enter the friendly name for Certificate Authority connector in this field which will be displayed in the holistic view on saving this form.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
Description	Enter the description in this field. **Note:** Character limit: **2000 characters**
***CSR Generation**	Select the CSR generation option as required. Options are: • **Upload CSR**: Uploaded CSR will be used as the source to populate CSR parameters and submit to CA. To upload a CSR: a. Under **CSR Generation**, select **Upload CSR**. The **Please paste your CSR** field is displayed. b. From the **Please paste your CSR** field, select **Browse**. c. Navigate to the location of your CSR file, and click **Open**. d. Click **Upload**. On successful upload of this file, the CSR fields are populated with the corresponding details. • **HSM**: The private key and CSR will be created in the selected HSM device based on CSR parameters given. To generate the private key and the CSR, based on the CSR parameters given in an HSM device: a. Under **CSR Generation**, select **HSM**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here. • **End Point**: The private key and CSR will be created in the selected end point device based on the CSR parameters given. To generate the private and the CSR, based on the CSR parameters given in an endpoint device: a. Under **CSR Generation**, select **End Point**. b. To enter/select the configuration details for CSR generation, refer the field descriptions given here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
	• **AppViewX** - Private key and CSR will be created in AppViewX based on CSR parameters given. **Note:** If auto regeneration has been enabled for this cerificate, AppViewX can be enforced as the default CSR generation source (irrespective of any selections made here) every time the certificate is regenerated. To do this, execute the following db script: `db.cert_metadata.insertOne({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})` **Note:** For all CA types except Amazon, you have the option to generate the CSR.
**: Mandatory fields*	

Field descriptions for using HSM as the CSR generation source

Field	Description
***Device Type**	From the dropdown list, from the following options, select the type of device on which the private key and the CSR will be generated: • **HSM Devices** (AppViewX will directly communicate with the HSM device for the CSR generation.) • **ADC Devices** (The selected ADC device will interact with the HSM to generate the CSR and subsequently transmit the relevant details to AppViewX.)
***Vendors**	This field is displayed only when **Device Type** = **ADC Devices**. From the dropdown list, select the required ADC device vendor.
Module Number	This field is displayed when **Device Type** = **ADC Devices** and **Vendors** = **Thales**. In the event that multiple HSMs are configured on a system, module number is a unique identifier assigned to each HSM.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In this field, enter the module number assigned to the selected Thales device.
***Devices**	From the dropdown list, select the required HSM/ADC device. This field is populated based on the **Device Type** and **Vendors** selected. • For **Device Type** = **HSM Devices** The dropdown list is populated with HSM devices that were enabled for CSR generation at the time of onboarding and have been successfully onboarded. To read more on onboarding HSM devices in AppViewX, click here. • For **Device Type** = **ADC Devices** The dropdown list is populated with F5 devices that are in the **Managed** state. Currently, AppViewX enables HSM key generation only through F5 devices for the following HSM vendors and their respective supported versions: • Fortanix (v14 and onwards) • Thales (v12 and onwards) • Safenet (v12 and onwards)
***Key Handler Name**	This field is displayed when **Device Type** = **HSM Devices**. Key handler name refers to an identifier used to reference a cryptographic key managed by an HSM device. In this field, enter the reference name assigned to the Master Encryption Key stored in the selected HSM device.
***Key Reference Name**	This field is displayed when **Device Type** = **ADC Devices**. Key reference name refers to an identifier used to reference a private key that is stored locally on an ADC device or is securely accessible to the device via an external HSM. Enter the desired handler name in the field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for using an endpoint device as the CSR generation source

Field	Description
Category	From the following options, select the ADC device category: • **ADC** • **Cloud** • **Server** • **Firewall**.
Vendor	From the dropdown list, select the vendor for the end point device. **Note:** The dropdown list for this field is populated based on the **Category** selected.
***Devices**	This field lists the end point devices present in your environment that belong to the above selected **Category** and **Vendor**. From the dropdown list, select the end point device on which you want to generate the private key and the CSR.
Tenant	**Note:** This field is applicable only when **Category** = **ADC**. Enter the tenant ID.
***Service name**	From the dropdown list, select the cloud service running on the selected cloud **Devices**.
CSR Location	**Note:** This field is applicable only when **Category** = **Server**.
***Template Name**	**Note:** This field is applicable only when **Category = Firewall**. Select the required template from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: • This field will be enabled when the Platform = Panorama while onboading PaloAlto device at **Menu** > **CERT+** > **Device Management** > **Inventory**> **Firewall** > **Add**. • Templates and partitions are used to enroll certificates at the template level. To enroll a certificate at the **Panorama** level, set the template to **None**.
Partition	**Note:** This field is applicable only when **Category** = **Firewall**.
***CSR File Name**	Enter the name of the file that contains the CSR parameters. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **CSR File Location**.
***Key File Name**	Enter the name of the file that contains the private key details. **Note:** Since the extension is already included in the field, ensure that you enter the file name without the file extension. **Note:** Starting v2023.1.0 FP2, for enrolling Apache server certificates, this field is labeled as **Key File Location**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate File Name**	**Note:** This field is displayed only when **Category** = **Cloud**. Enter the certificate file name.
***Key vault**	**Note:** This field is displayed only when **Category** = **Cloud**, **Vendor** = **Azure**, and **Service name** = **Key Vault (Azure)**.
***Service**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. This dropdown list is populated based on the **Device** selected. From the options in the dropdown list, select the service.
***Exchange Server**	**Note:** This field is displayed when **Category** = **Server** and **Vendor** = **Microsoft Server**. From the dropdown list, select the name of the MS Exchange server for which the certificate is being enrolled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: While enrolling certificates with policies using Google CA, the following points must be considered.

Certificate Enrollment - Strict Policy

- The Common Name will not be pre-filled from the policy.
- The following validation will be seen based on strict policy guidelines.
  - If the Common Name's domain name is not present in the **Allowed Domain Name** list, an error validation will be shown upon saving the policy details.

Certificate Enrollment - Suggestive Policy

- The Common Name will not be pre-filled from the policy
- The following validation will be seen based on strict policy guidelines.
  - If the Common Name's domain name is not present in the **Allowed Domain Name** list, the non-compliant policy will be created.
  - If the Common Name's domain name is present in the **Blocked Domain Name** list, an error validation will be shown upon saving the policy details.

4. For the EJBCA CA, enter/select the **Vendor Specific Details**.

Field descriptions for the Vendor Specific Details section.

Field	Description
End entity user name	Enter the name of the end entity.
*** End Entity Profile Name**	Select the profile name from the dropdown list.
*** User Common Name**	Select the common name from the dropdown list.
*** Certificate Profile Name**	Select the certificate profile name from the dropdown list.
**: Mandatory fields*	

5. Enter/Select the **CSR Parameters**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the CSR parameters

Field	Description
Common Name	The common name is one of the key values of Certificate Signing Request (CSR) to be present in the certificate. For example, <appviewx>. No special characters allowed except en dash (_) and hyphen (-). **Note:** The common name field is made optional. You can now enroll and perform CLM actions for code signing certificates without a common name.
Subject Alternative Name	You can see the count of subject alternative names (SAN) available for a certificate in the CSR parameter section, inventory grid, and CA connector page. Select the subject alternative subject name from the dropdown list. The possible options are, • Select all • DNS • IP Address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property pop-up window from the holistic view.
***Organization**	The organization name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	Organization Unit name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Locality	The locality name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The state name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	Country name is one of the CSR parameters to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a 2-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Validity**	Enter the number in this field and select the entered validity list to be in Days, Months, and Years from the dropdown list.
Challenge Password	Challenge password is one of the CSR parameters to be present in the certificate. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	Reenter the same password to confirm that is entered in the Challenge Password field.
***Hash Function**	The Hash function with which the CSR has to be signed. Any information specific to any CA or vendor has to be covered in the Note section. This field will be auto-filled and editable based on the configuration in the selected group's policy. **Note:** For **Certificate Authority** = **HydrantID**, irrespective of the hash function selected, by default, the CA returns a certificate with SHA256. Therefore, admins must restrict users from creating a certificate with a hash function other than SHA256. To accomplish this, create policy with a single hash value (SHA256).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Key Type**	From the dropdown list, select the cryptogrpahic algorithm that will be used for generating the certificate's key pair. The dropdown list is populated based on the CA policy configured for the selected CA.
***Bit Length**	From the dropdown list, select the required key size (in bits). The dropdown list is populated based on the CA policy configured for the selected CA.
***ECDSA curve**	For **Key Type** = **EC**, from the dropdown list, select the elliptic curve that will be used to create the public and private key pairs.
**: Mandatory fields*	

6. In the **Attachments** section, upload any additional documents that are relevant to the enrollment of the certificate (for example, approval emails).

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the Upload button to select the file.

7. Other than the CSR fields, you can add organization-specific values along with CSR. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes as well. In the Certificate Attributes can be added under Administration > certificate attributes, it will be reflected on the enrollment page:
8. Enter the relevant details in the **Generic Fields**. These are default fields for maintaining the IP address and device information, if required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Generic Fields

Field	Description
Device Name	Enter the name of the device.
Application IP Address	Enter the IP address of the application.
Tracking ID	A free-form business alpha-numerical identifier, included in the audit logs, that may be used to correlate audit log entries (typically enrollment and revocation events)
Certificate holder Email	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). An email address that may be used to send notifications to certificate holder depending on the notification policies configured for the requested workflow
First name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). First name (as a metadata) associated with the certificate to be enrolled
Last name	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Last name (as a metadata) associated with the certificate to be enrolled
Organization	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Organization name (as a metadata) associated with the certificate to be enrolled
Comment	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Additional information (as a metadata) associated with the certificate to be enrolled
UUID	**Note:** For the IDnomic CA, this field is displayed only when the selected CA account has been configured using a Registration Authority (RA). Universal Unique Identifier, or UUID, (as a metadata) associated with the certificate to be enrolled

9. In the **Vendor-Specific Details** section, enter the CA-specific details. Some of the CAs will expect additional details other than CSR parameters for their operational purposes.

Field descriptions for the common vendor specific details

Field	Description
Certificate ID	The **Certificate ID** is auto-populated based on the value entered in the **Common Name** field (in the **CSR Parameters** section). • The **Certificate ID** can be modified by the user. • If the user edits the **Certificate ID**, any change to the **Common Name** will not reflect in the **Certificate ID**. • If the user deletes the **Certificate ID**, the value of the **Certificate ID** field is set to the **Common Name** suffixed with the timestamp.

Field descriptions for the DigiCert CA vendor specific details

Field	Description
***Server Type**	From the dropdown list, select the server on which the application that requires the requested certificate is hosted.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Payment Method**	From the dropdown list, select one from the following payment methods: • **Bill To Account Balance**: This option allows you to pay for the DigiCert certificate using the available balance in your DigiCert account. **Note:** Ensure that the option to bill to account balance is enabled for the account and the account has sufficient balance. • **Bill To Default Credit Card**: This option will charge the cost of the DigiCert certificate to the credit card set as the default payment method in your DigiCert account. **Note:** Ensure that a credit card is configured as the default payment method for your account.
Additional Email	Enter email addresses that will receive notifications for renewals, reissues, and duplicates for the specified order.
Renewal Message	Enter a custom message that will be sent with the renewal notifications.
Notes	Enter a custom note that will be sent with the order.
**: Mandatory fields*	

Field descriptions for the Hydrant ID CA vendor specific details

Field	Description
Expiry Emails	Enter a comma-separated list of email addresses that will receive the certificate expiry notification from HydrantID. **Note:** HydrantID CA does not accept updates to these email addresses during the renewal process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Nexus CA vendor specific details

Field	Description
Procedures	The **Procedures** dropdown list will display only the procedures mapped to the server and the default procedure. From the dropdown list, select the required procedure.

10. Click **Add**.
    Once the details are added, you will be redirected to a page where the CSR and CA details are added as a connector. This page is called the holistic view and from here, any action on the certificate can be performed including provisioning the certificate to a server.
11. On the holistic view, click the **Submit** button to trigger the request.
    The submit action is triggered and the **Submit** dialog box is displayed.
12. Enter your comments in the text field and click **Yes**.
    If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
13. Click **Approve** to proceed.
    The **Approve** dialog box is displayed.
14. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

15. Click **Yes**.
    Once the approval process is completed, the **Implement** option is displayed in the holistic view.
16. Click **Implement**.
    The **Implement** dialog box is displayed.
17. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
18. Click **Yes**.
    CSR Submission to CA is in progress.

    Once the CSR submission is successful, the request state will be changed to **Submit** certificate - retrieval in progress state.

    If the enrollment request is compliant with conditions defined and auto-approval enabled in the targeted CA, the certificate will be fetched in a few seconds.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If auto-approval disabled in the targeted CA, you will have to be logged into the CA and approve the request.

Once the certificate is issued successfully, the certificate will be retrieved into AppViewX.

What's Next?

To automate certificate lifecycle management for enrolled certificates:

- Enable auto regeneration of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Renewing Certificates

Digital certificates are issued with a limited validity period. Before the expiration of their validity, the certificates have to be renewed and placed on the server for service continuity. The renewal process is specific to CAs, depending on their operations. The result is be the issuance of the certificate with extended validity. CERT+ enables you to trigger certificate renewal in different ways. You can trigger renewal from the certificate inventory or the certificate details and its provisioned details can be verified and trigger the renewal from a holistic view. Group policy auto-renewal takes care of the certificate renewal automatically and it can be combined with auto-push for hassle-free automation.

You can renew the certificates via the Certificate Inventory section also.

Note: v2021.1.0 onwards, AppViewX provisions the renewal functionality for certificates issued via Google CA. This is done by utilizing the certificate's existing CSR or private key details.

Note: GoDaddy SSL certificates can be managed only via the SSL credits in your GoDaddy account. To renew GoDaddy certificates, refer the instructions given here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Renewing a Server Certificate
- Bulk Renewing Server/Client Certificates
- Renewing a Client Certificate
- Tracking Certificate Renewal via the Process Explorer
- Enabling Auto Renewal for Discovered Certificates

Renewing a Server Certificate

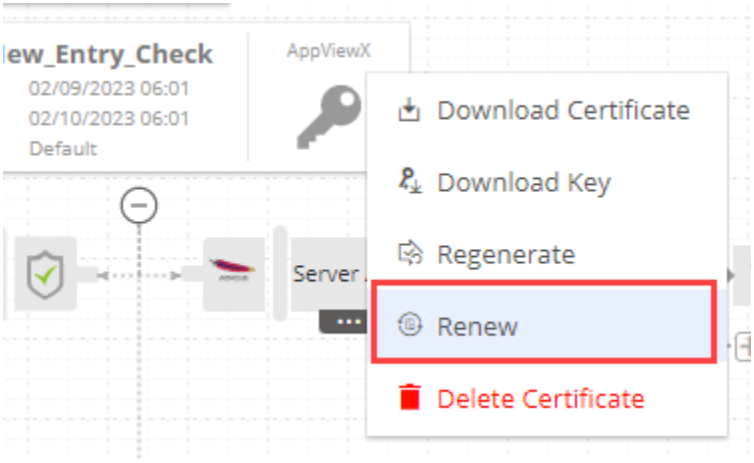
Note: From v2021.1.0, AppViewX provisions the renewal functionality for certificates issued via Google CA. This is done by utilizing the certificate's existing CSR or private key details.

Important: To renew Microsoft Azure Enterprise Application self-signed certificates, follow the instructions given here.

If you are renewing a single certificate, you can trigger the renewal from the holistic view as they can verify all the details before initiating the renewal.

To renew a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Renew Certificate** > **Server**.
   The **Server Certificate** page is displayed.
2. To open the holistic view of a certificate, under **Common Name**, select the required certificate name.
3. From the **(More)** menu for the certificate, click **Renew**.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Server Certificate** > **Renew** page is displayed. The fields on this page are displayed depending on the type of certificate and the issuing certificate authority.

4. On the **Server Certificate > Renew** page, update the renewal details if and as required.
   For field descriptions, you can refer to the instructions for enrolling a server certificate.

> **Note:** Starting version 2023.1.0 FP2, for certificates issued by Entrust and Microsoft, you can upload a new CSR in the **CSR Generation** field.
> • If you are uploading a new CSR, ensure that the new and existing **Common Name** in the **CSR Parameters** are the same.

5. Click **Renew**.
   The **Renew** dialog box is displayed.
6. Enter your comments in the text field and click **Yes**.
   A request ID, which is the work order ID, is generated automatically, and work order status is displayed adjacent to the certificate in the holistic view. If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
7. Click **Approve** to proceed.

   The **Approve** dialog box is displayed.
8. Enter your comments in the text field.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

9. Click **Yes**.
   Once the approval process is complete, the **Implement** option is displayed in the holistic view.
10. Click **Implement**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Implement** dialog box is displayed.

11. Enter your comments in the text field.
    If the workflow request has to be implemented automatically in the future, click **Schedule later** .
12. Click **Yes**.
    The renewal process is triggered. After renewal is completed, the workflow status updates to **Completed**.

Bulk Renewing Server/Client Certificates

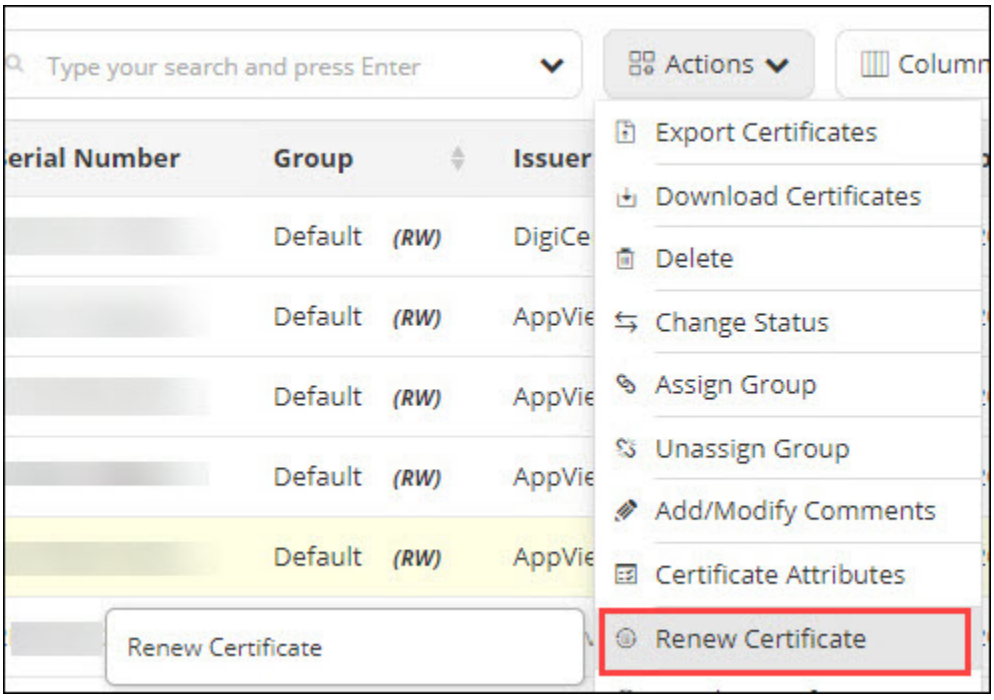
Note: v2021.1.0 onwards, AppViewX provisions the renewal functionality for certificates issued via Google CA. This is done by utilizing the certificate's existing CSR or private key details.

Bulk renewal of the certificates can be triggered from the inventory by selecting more than one certificate.

To renew server certificates in bulk:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Renew Certificate** > **Server** / **Client**.
   The **Server/Client Certificate** page is displayed.
2. Under **Common Name**, select the checkboxes corresponding to all the certificates you want to renew.
3. From the **Actions** dropdown menu, click **Renew Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The **Renew Certificate** dialog box is displayed.

4. From the following options, select when do you want to **Renew Selected Certificate(s)**:

   a. To immediately renew the selected certificate(s), select **Now**.

   • Certificate renewal request, for the selected certificate(s), will be triggered immediately.

> **Note:**
> • Certificates with the work order status in progress or with read-only permission will be skipped.
> • In case of Digicert certificates, the certificates will be auto-reissued unless the Order validity is expired.

OR

   b. To schedule an automatic renewal for a later time, select **Set auto-renew**.

   c. In the **Renew Certificates** _____ **Days before Expiry** field, to specify how many days before their expiry the selected certificate(s) should be renewed, enter a value between **1** and **120**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Assuming that you have entered **120** in this text field, certificates with validity less than 120 days will be triggered for renewal within the next **6 hours**.

> **Note:**
> - Certificates with the work order status in progress or with read-only permission will be skipped.
> - In case of Digicert certificates, the certificates will be auto-reissued unless the Order validity is expired.

5. Click **Submit**.
   Depending on the selections made in the **Renew Certificate** dialog box, the certificate renewal process will be triggered.

> **Note:** The status of the renewal process is monitored using the **Process explorer**.

Renewing a Client Certificate

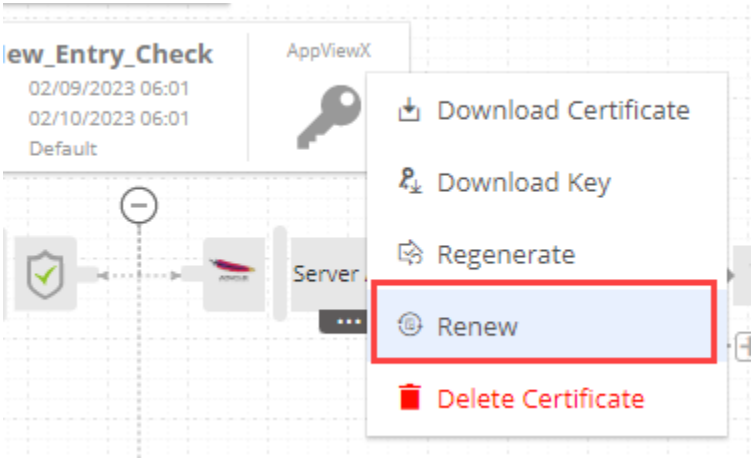
Note: v2021.1.0 onwards, AppViewX provisions the renewal functionality for certificates issued via Google CA. This is done by utilizing the certificate's existing CSR or private key details.

If you are renewing a single certificate, you can trigger the renewal from the holistic view as they can verify all the details before initiating the renewal.

To renew a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Renew Certificate** > **Client**.
   The **Client Certificate** page is displayed.
2. To open the holistic view of a certificate, under **Common Name**, select the required certificate name.
3. From the **(More)** icon for the certificate, click **Renew**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

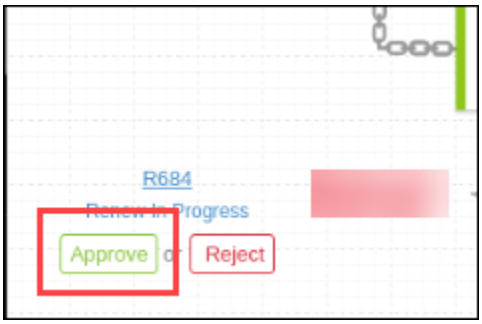


The **Client Certificate** > **Renew** page is displayed. The fields on this page are displayed depending on the type of certificate and the issuing certificate authority.

4. On the **Client Certificate > Renew** page, update the renewal details if and as required.

> **Note:** Starting version 2023.1.0 FP2, for certificates issued by Entrust and Microsoft, you can upload a new CSR in the **CSR Generation** field.
> - If you are uploading a new CSR, ensure that the new and existing **Common Name** in the **CSR Parameters** are the same.

5. Click **Renew**.
   The **Renew** dialog box is displayed.
6. Enter your comments in the text field and click **Yes**.
   A request ID, which is the work order ID, is generated automatically, and work order status is displayed adjacent to the certificate in the holistic view. If the approval required option is enabled in the CA policy, the request is moved to the **Approve** and **Implementation** stages.
7. Click **Approve** to proceed.



The **Approve** dialog box is displayed.

8. Enter your comments in the text field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** If the workflow request has to be approved automatically in the future, click the **Schedule later** button .

9. Click **Yes**.
   Once the approval process is complete, the **Implement** option is displayed in the holistic view.
10. Click **Implement**.

   The **Implement** dialog box is displayed.
11. Enter your comments in the text field.
   If the workflow request has to be implemented automatically in the future, click **Schedule later** .
12. Click **Yes**.
   The renewal process is triggered. After renewal is completed, the workflow status updates to **Completed**.

Tracking Certificate Renewal via the Process Explorer

The **Process Explorer** is a listing of all certificates scheduled for renewal on present day and certificates awaiting approval for renewal. Once a certificate is renewed, it is removed from this listing. The **Process Explorer** is useful for monitoring the renewal status especially in the case of bulk renewals.

To access the process explorer:

Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Renew Certificate** > **Process Explorer**.
The **Renew Certificate** page with the listings is displayed.

Enabling Auto Renewal for Discovered Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Enabling Auto Renewal

To enable auto renewal of certificates, you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for pushing that certificate.

Note: While you can enable auto push for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto push for a server certificate.

1. To enable auto renewal for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Renew Automatically** toggle button.

   d. Click **Update**.

2. To enable auto renewal for the certificate connector:

   a. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.

   b. From the inventory, for the certificate you want to enable auto renew for, click the common name.
   The holistic view of the selected certificate is displayed.

   c. For an existing CA connector for the certificate, hover over .

   d. From the menu displayed, click **Edit**.
   The certificate details are displayed.

   e. Under **CA Details**, turn on the **Renew Automatically** toggle.

   f. In the **Start Renewing** field, enter the number of days before expiration when the certificate should be renewed.

   g. Click **Update**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The holistic view of the selected certificate is displayed.

> **Note:** For the auto renewal process to take effect, set the auto push in the application connector. For instructions, refer to the Enabling Auto Push section.

What's Next?

For automating the certificate lifecycle management, in addition to auto renewal, you can:

- Enable auto regeneration of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Pushing Certificates to Devices

Pushing certificates refers to the automated distribution and deployment of digital certificates. You can enable certificates to be pushed at the time of adding an application connector.

> **Note:** Users can push certificates to Akamai CPS only when the CSR is generated on the end point.

- Adding Application Connectors
- Pre - and Post - Push Script Usage Steps
- Pushing a Server Certificate to a Device
- Pushing a Client Certificate to a Device
- Pushing an Intermediate Certificate to a Device
- Pushing a Root Certificate to a Device
- Enabling Auto Push of Certificates to Endpoints
- Bulk Push for Intermediate/Root Certificates

Adding Application Connectors

An application connector is a software application running on a server. To add the application connector, the application should be managed under the AppViewX device inventory. All the supported devices in the AppViewX inventory can be provisioned with the certificate by adding the connector. The connector enables certificate provisioning for cloud-managed devices.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Users can push certificates to Akamai CPS only when the CSR is generated on the end point.

- Adding Application Connectors for Servers
- Adding Application Connectors for Cloud Connectors
- Adding Application Connectors for Cloud Devices
- Adding Application Connectors for Firewalls
- Adding Application Connectors for MDMs
- Adding Application Connectors for ADC Devices

Adding Application Connectors for Servers

AppViewX supports creating an application connector for the following server vendors:

- ABAP
- ADFS Server
- Akamai CPS
- Arbor
- Apache (Linux)
- Apache (Windows)
- Cisco CallManager
- CiscoIOS
- CiscoISE
- CiscoUCS
- IBM Client (Linux)
- IBM Client (Windows)
- IBM Data Power
- IBM Domino
- IIS
- ILO
- iPlanet
- Java
- JBoss

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Linux Server
- Microsoft PC
- Microsoft Server
- MQServer
- MQClient (Windows)
- MQServer (Windows)
- MS SQL
- MySQL
- Nginx
- Rabbit MQServer
- VMWare
- Web Dispatcher
- Weblogic (Linux)
- Weblogic (Windows)
- Websphere (Linux)
- Websphere (Windows)
- Tomcat (Linux)
- Tomcat (Windows)
- PingFederate

ABAP

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **ABAP**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ABAP server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Service Restart	To restart the ABAP service immediately after the certificate is pushed, enable this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For ABAP, this field is enabled by default and is non-editable.

5. Enter the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

ADFS Server

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **ADFS Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ADFS Server devices already onboarded in AppViewX.

3. Enter the **Certificate Details**.

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the ADFS server, or a URL from where the ADFS server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***Key File Name**	The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***KeyStore Name**	This field is displayed when **Certificate Type** = any of the JKS certificate formats. For JKS certificates, a keystore is a repository used for storing private keys and certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the **KeyStore Name** field, enter the name of the JKS keystore in which the certificate to be pushed is stored.
***KeyStore Password**	This field is displayed when **Certificate Type** = any of the JKS certificate formats. Enter the password required to access the keystore that contains the JKS certificate to be pushed.
User	Enter the details of the user that has the necessary permissions to push the certificate.
Group	Enter the details of the user group that has the necessary permissions to push the certificate.
Password Version	Enter the version of the algorithm that is used to encrypt the password for accessing the ADFS server.
Alias Name	This field is displayed when **Certificate Type** has one of the following values: • PKCS#12 (*.pfx) • PKCS#12 (***.p12)*** • PKCS#12 (_Cert) • CERTDB (*.db) Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate File Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the name of the intermediate certificate file.
***CA File Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the name of the root certificate file.

Based on the information populated here, the **Server selection** section is populated with the list of available ADFS Server devices already onboarded in AppViewX.

4. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Push Details**.

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. The script that automates the push operation is called a push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script Parameters	Enter the values that will be passed to the pre-push script.
***Push Script File Name**	Enter the name of the push script.
Push Script Parameters	Enter the values that will be passed to the push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post Push Script Parameters	Enter the values that will be passed to the post-push script.
Post Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Rollback Location	To recover from a conflict or failure during a push operation, copies of the certificate and configuration file are stored in a directory or storage location. In the **Rollback Location** field, enter the path to this location.
Rollback Parameters	Enter the rollback parameters (settings) used to initiate the rollback process.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Akamai CPS

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Akamai CPS**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Akamai CPS server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed. For Akamai CPS, by default, the **PEM (*.pem)** certificate is selected and the dropdown list is non-editable.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox. For Akamai CPS, this feature is enabled by default and the field is non-editable.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For Akamai CPS, this feature is enabled by default and the field is non-editable.

5. Enter the **Push Details**.

Field	Description
***Vendor**	From the dropdown list, select **CiscoUCS**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Cisco UCS devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Key ring**	A key ring configuration stores the keys and certificates used for encryption and authentication. Enter the name of the key ring configuration on the Cisco UCS server.
Trust point	A trustpoint configuration is used to manage certificates on a Cisco UCS server. In the **Trust point** field, enter the name of the trustpoint configured on the Cisco UCS server(s) to which the certificate will be pushed.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

IBM Client (Linux)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **IBMClient**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available IBM Client (Linux) devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the IBM Client server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.

Field	Description
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

IBM Client (Windows)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows IBMClient**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Windows IBM Client devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the Windows IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Windows IBM Client server, this feature is enabled by default and the field is non-editable.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

IBM Data Power

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **IBMDataPower**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available IBM data Power devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Push Location	From the dropdown list, select the file type of the certificate to be pushed.
Certificate Location	Enter the path to the location on your local system where the certificate file to be pushed is stored.
Key Location	The private key associated with a certificate is stored in a key file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
Intermediate Location	Enter the path to the location on your local system where the intermediate certificate file (for the end certificate being pushed) is stored.
Root Location	Enter the path to the location on your local system where the root certificate file (for the end certificate being pushed) is stored.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.

   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

IIS

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **IIS**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Push Certificate Type**	Select from the following options: • **Push Certificate** You can only push certificates to the Certificate store or Centralized File System. • **Push and Bind Certificate** You can push a certificate to the Certificate store and bind it to the IIS site.

Based on the information entered here, the **Server selection** section is populated with the list of available IIS devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select where the certificate to be pushed is located: • **Certificate Store**: A repository that stores certificates and their associated keys • **Centralized file system**: A file server that stores certificate files
Certificate Store	This option is displayed only when **Location Type** = **Certificate Store**. Within the certificate store, select the location where the certificates are stored from the following options: • **Personal store**: A location where user-specific certificates, such as those used for encryption and authentication, are stored • **Web hosting store**: A location where certificates used for web server configurations are stored
***Friendly name**	Enter the certificate friendly name assigned in the CSR generated for requesting/ enrolling the certificate
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Bind type**	**Note:** This field is displayed when the **Push Certificate Type** is selected as **Push and Bind Certificate**. To manage the SSL/TLS certificates for websites, select a bind type from the following options: • **Update Certificate Only**: Update the SSL/TLS certificate used by an existing site binding on the web server. It replaces the current certificate with a new one without modifying any other settings associated with the site binding (such as the hostname or port). • Update Site Binding: Update the SSL/TLS settings for an existing site binding on the web server. It allows you to update not only the certificate but also other settings associated with the site binding, such as the hostname, port, and SSL/TLS protocol settings. • **Create New Site Binding**: Create a new site binding on the web server for the specified hostname, port, and IP address (if applicable) and associates it with the specified SSL/TLS certificate. This is typically used when you want to add a new website or domain to the web server and configure SSL/TLS settings for it.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- **Certificate Store Push**
  - If the certificate is created **at the endpoint** (private key on the device):
    - The **server certificate** is pushed in **.pem** format.
    - The **root and intermediate certificates** are pushed in **.pfx** format.
  - If the certificate is created **in AppViewX** (private key within AppViewX):
    - The **server**, **root**, and **intermediate certificates** are all pushed in **.pfx** format.
- **File System Push**
  - Only a **single .pfx file** (containing the certificate, private key, and root/intermediate certificates if available) is pushed to the specified file system location.
- **Supported Certificate type for File System Push**
  - PKCS#12 (.pfx)
- When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:
  - **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
  - **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings
- File system push is supported only when the Centralized File System option is enabled on the onboarding page.
  - The Certificate Location field is optional. By default, the certificate will be pushed to the directory specified during onboarding.
  - The password for the certificate pushed to the file system is retrieved from the vault configured during onboarding.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system. **Note:** Overwrite option is disabled by default for Microsoft IIS.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

ILO

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **ILO**.

Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Java

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Java**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Based on the information entered here, the **Server selection** section is populated with the list of available Java devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the server, or a URL from where the server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***Key File Name**	The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***KeyStore Name**	This field is displayed when **Certificate Type** = any of the JKS certificate formats. For JKS certificates, a keystore is a repository used for storing private keys and certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	In the **KeyStore Name** field, enter the name of the JKS keystore in which the certificate to be pushed is stored.
***KeyStore Password**	This field is displayed when **Certificate Type** = any of the JKS certificate formats. Enter the password required to access the keystore that contains the JKS certificate to be pushed.
User	Enter the details of the user that has the necessary permissions to push the certificate.
Group	Enter the details of the user group that has the necessary permissions to push the certificate.
Password Version	Enter the version of the algorithm that is used to encrypt the password for accessing the ADFS server.
Alias Name	This field is displayed when **Certificate Type** has one of the following values: • **PKCS#12 (*.pfx)** • **PKCS#12 (*.p12)** • **PKCS#12 (_Cert)** • **CERTDB (*.db)** Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate File Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the name of the intermediate certificate file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***CA File Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the name of the root certificate file.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. The script that automates the push operation is called a push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script Parameters	Enter the values that will be passed to the pre-push script.
***Push Script File Name**	Enter the name of the push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Script Parameters	Enter the values that will be passed to the push script.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post Push Script Parameters	Enter the values that will be passed to the post-push script.
Post Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Rollback Location	To recover from a conflict or failure during a push operation, copies of the certificate and configuration file are stored in a directory or storage location. In the **Rollback Location** field, enter the path to this location.
Rollback Parameters	Enter the rollback parameters (settings) used to initiate the rollback process.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

JBoss

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **JBoss**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available JBoss devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Use Existing Configuration	If the **Use Existing Configuration** option is enabled,the existing **server.xml** file is used to create the application connector. (By default, this option is selected.) If it is disabled, the server configuration XML file will be overwritten with the values specified in the fields below (displayed only if this option is disabled). **Note:** After discovery, on editing the application connector, the use existing checkbox will be the selected/enabled state
Certificate Type	This field is displayed when **Use Existing Configuration** is enabled. From the dropdown list, select the file type of the certificate to be pushed.
***KeyStore Location**	This field is displayed when **Use Existing Configuration** is enabled and **Certificate Type** = **JKS (*.jks)**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***Password**	This field is displayed when **Use Existing Configuration** is disabled and **Certificate Type** = **JKS (*.jks)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
***Alias Name**	This field is displayed when **Use Existing Configuration** is disabled and **Certificate Type** = **Default JKS (*.jks)** or **JKS (*.jks)**. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Linux Server

Important: If the certificate is generated with CSR generation at endpoint, if an application connector is created for the certificate, the following fields will be auto-populated/selected and cannot be modified:

- **Category**
- **Vendor**
- **Key Location**
- **Private key in Device**

Additionally, the available profiles will be filtered for the device profile selected at the time of certificate enrollment here.

1. On the client (or) server certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **LinuxServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Tip: AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Linux Server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Enable Truststore Update	This field is displayed for all **PEM** certificate types. Click the radio button to enable the Update System TrustStore option for root and intermediate certificates. **Note:** By default, this option is disabled. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Update System TrustStore**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Certificate Ownership & Permission	Enable the toggle button to customize the certificate ownership and define the file permissions for the certificates. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Certificate Ownership & Permission**.  Field descriptions for the Certificate Ownership & Permission Details
Custom Push	This field is displayed for all **PEM** and **DER** certificate types. From the following options, select the method of pushing certificates: • **Chain**: The full certificate chain, which includes the end, intermediate, and root certificates, will be pushed to the server. • **Issuer & Server**: The server's certificate and its issuer's certificates will be pushed to the server. • **Server Only**: Only the server's certificate will be pushed to the server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Linux Server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Certificate Location	This field is displayed for all PEM, DER and PKCS#7 certificates. Enter the path to the location on your local system where the certificate file to be pushed is stored.
Key Location	This field is displayed for all PEM, DER and PKCS#7 certificates. The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***KeyStore Location**	This field is displayed for the PKCS#12 and JKS certificates. A keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the keystore file, for the certificate to be pushed, is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KeyStore Password**	This field is displayed for the PKCS#12 and JKS certificates. Enter the password required to access the keystore file for the certificate to be pushed.
***Alias Name**	This field is displayed for the PKCS#12 and JKS certificates. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Truststore Location	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the certificates to be pushed, is stored. **Note:** Truststore Location can be specified without the file extension as well.
Truststore password	This field is displayed for the JKS certificates. Enter the password required to access the truststore file for the JKS certificate to be pushed.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

Field descriptions for the Certificate Ownership & Permission Details

Field	Description
Owner	Enter the username for certificate ownership on the target device.
Owner Permission	Select the owner permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
User Group	Enter name of the user group that requires access to the certificate.
User Group Permission	Select the group permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Other User Permission	Select the other user permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Microsoft PC

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Vendor**	From the dropdown list, select **Microsoft PC**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Certificate Store Location** section is populated with the list of available Microsoft PC devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Certificate Store Location**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate File Name**	Enter the file name of the certificate to be pushed.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.

Note:

When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings

5. Enter the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Microsoft Server

Prerequisistes: When adding connectors using the Exchange Server, note the following points:

- During Microsoft Server device addition ensure that the username is added with the domain in the format—<username>@<domain>.
- The **iisreset.exe** file is expected at the default location. (C:\Windows\System32) to support IIS Service restart.
- For the certificate being enrolled, **Country name** must be provided in order to renew the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Microsoft Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ABAP server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, from the dropdown list, select one of the following options:
   - **MS Server**
   - **Exchange Server**
   - **Windows Gateway**

Note: If you have selected **Exchange Server**, profiles will be displayed in the format, **Server type : Service name : Node details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

For MS Server: Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select the location to which the certificate will be pushed: • **File System** (a storage location on your computer) • **Certificate Store** (a specialized location within the operating system for managing digital certificates)
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Credential Type**	This field is displayed for the JKS certificates. From the dropdown list, select the source of the access credentials.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the server, or a URL from where the server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	This field is displayed for the **PEM**, **DER**, and **PKCS#7** certificates. The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***KeyStore Password**	This field is displayed for JKS certificate types.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the password required to access the keystore that contains the JKS certificate to be pushed.
Alias Name	This field is displayed for the PKCS#12 and CERTDB certificate types. Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Private key entry password	This field is displayed for the JKS certificates. Enter the password required to decrypt the private key associated with the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate Certificate Alias Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. This field is not displayed for the JKS certificate types. Enter the alias name of the intermediate certificate file.
***Root Certificate Alias Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the alias name of the root certificate file.

For Exchange Server: Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	The certificate type is defaulted to the following values • For AppViewX CSR generation - certificates which have private key, **PKCS#12(*.p12)** is the supported certificate format. • For Endpoint CSR generation **PKCS#7(*.p7b)** is the supported certificate format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The password field in not set for **PKCS#12(*.p12)** since its a transactional password and handled by AppViewX.
***Friendly Name**	• For **PKCS#12(*.p12)** it is the user specified input. • For **PKCS#7(*.p7b)** certificate type, the friendly name is the common name of the certificate specified at the time of Endpoint CSR generation. During the push operation the common name is populated in the friendly name field (it is not editable).
Services	From the dropdown list, select one from the following services: • **POP** • **IIS** • **SMTP** • **IMAP**
Restart Service	This field is displayed only when **Services** = **IIS**. To restart the IIS service after the certificate is pushed, to ensure all changes have taken effect as required, select this checkbox.

For Windows Gateway: Field descriptions for the Certificate Details

Field	Description
Location Type	The **Certificate Store** option is selected by default—a specialized location within the operating system for managing digital certificates. (**File system** is disabled).
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. **Note:** Root and intermediate names cannot be entered for this CSR/Certificate. If auto-push is enabled for CSR, try again after the certificate is generated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings This is applicable for all service/devices such as Microsoft Server, Microsoft Exchange Server, Windows Gateway.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

MQServer

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **MQServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Windows Apache devices already onboarded in AppViewX.

3. Under **SSL templates**:

   a. Based on the functionality required, select the **Profile**.

   b. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***KDB File Name**	This field is displayed only for the **Create KDB** profile. Enter the name of the KDB certificate file that will be pushed to the server.
***KDB password**	This field is displayed only for the **Create KDB** profile. Enter the password required to access the KDB certificate file.
QManager Name	This field is displayed only for the **Create KDB** profile. From the dropdown list, select the name of the MQServer's queue manager.
Server Certificate Label	This field is displayed only for the **Create KDB** and **Override** profiles. This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the MQServer, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Private key in device	This field is displayed for the **Create Label** profile.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
***Private key Location**	This field is displayed when the **Private Key in Device** option is selected. Enter the path to the location of the private key on the hardware device.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

MQClient (Windows)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows MQClient**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Windows MQClient devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the Windows IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Windows IBM Client server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
***Private key Location**	This field is displayed when the **Private Key in Device** option is selected. Enter the path to the location of the private key on the hardware device.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

MQServer (Windows)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows MQServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Windows MQServer devices already onboarded in AppViewX.

3. Under **SSL templates**:

   a. Based on the functionality required, select the **Profile**.

   b. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***KDB File Name**	This field is displayed only for the **Create KDB** profile. Enter the name of the KDB certificate file that will be pushed to the server.
***KDB password**	This field is displayed only for the **Create KDB** profile. Enter the password required to access the KDB certificate file.
QManager Name	This field is displayed only for the **Create KDB** profile. From the dropdown list, select the name of the MQServer's queue manager.
Server Certificate Label	This field is displayed only for the **Create KDB** and **Override** profiles. This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the MQServer, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Private key in device	This field is displayed for the **Create Label** profile.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
***Private key Location**	This field is displayed when the **Private Key in Device** option is selected. Enter the path to the location of the private key on the hardware device.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

MS SQL

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **MSSQL**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available MS SQL devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed. AppViewX supports only PEM (*.crt) type as the certificate is imported to certificate store irrespective of the certificate type.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on the **MS SQL machine**, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Key Location**	This field is displayed when the **Private Key in Device** option is selected. Enter the file path to the **private key** location on the **MS SQL machine**.
Service Restart	Enabling this option will restart the SQL Server service to apply the configuration changes. **Note:** • By default, this setting is enabled based on the global device configuration. To modify, go to: **CERT+** > **Device Management** > **Server** > **Device Settings** > **Vendors** > **Microsoft SQL**. • This feature requires Windows Gateway version v2024.1.0.0 or later. In earlier versions, the service restarts automatically by default.
Force Encryption	Enabling this option enforces encryption for all SQL server connections. **Note:** • By default, this setting is enabled based on the global device configuration. To modify, go to: **CERT+** > **Device Management** > **Server** > **Device Settings** > **Vendors** > **Microsoft SQL**. • This feature requires Windows Gateway version v2024.1.0.0 or later. In earlier versions, the service restarts automatically by default.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: **Bind Operation in AppViewX for MS SQL:** During the **bind operation**, AppViewX updates the registry with the following keys: • **Certificate Thumbprint Key**: Stores the thumbprint of the pushed certificate. • **ForceEncryption Key**: Set to **1** to enable encryption for the SQL instance. After updating these keys, the **SQL service is restarted** to apply the changes.

Note:
When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.

   The connector is displayed on the certificate holistic view.

VMWare

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **VMWare**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available VMware devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Selected devices** list is updated automatically.

4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Certificate Type	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Web Dispatcher

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **WebDispatcher**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Web Dispatcher devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
PSE Type	From the dropdown list, select the file type of the certificate to be pushed.
Service Restart	To restart the Web Dispatcher service immediately after the certificate is pushed, enable this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For the Web Dispatcher server, this field is enabled by default and is non-editable.

5. Enter the **Push Details**.

Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Weblogic devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
Customize Push Location	To push the selected certificates to a new directory or existing location that is associated with http-listeners, select this checkbox.
***Certificate Type**	This field is displayed only when **Customize Push Location** is selected. From the dropdown list, select the certificate file type.
***KeyStore Location**	This field is displayed only when **Customize Push Location** is selected and for the JKS certificates. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***KeyStore Password**	This field is displayed only when **Customize Push Location** is selected and for the JKS certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the password required to access the keystore file for the JKS certificate to be pushed.
***Truststore Location**	This field is displayed only when **Customize Push Location** is selected and for the JKS certificates. For JKS certificates, the root and intermediate certificates are stored in a truststore file. In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the JKS certificate to be pushed, is stored. **Note:** The AppConnector cannot be saved if the KeyStore and TrustStore locations are the same.
***Truststore Password**	This field is displayed only when **Customize Push Location** is selected and for the JKS certificates. Enter the password required to access the truststore file for the JKS certificate to be pushed.
Configuration Restart	To restart the server after pushing the certificate, select this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Key Location	This field is displayed when the **Private Key in Device** option is selected. Enter the path to the location of the private key on the hardware device.
Alias Name	Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Weblogic (Windows)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Field	Description
***KeyStore Location**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***Password**	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
Alias Name	This field is displayed when **Use Existing Configuration** is not selected and when **Certificate Type** = **JKS (*.jks)/Default JKS (*.jks)**. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Service Restart	To restart the Tomcat service immediately after the certificate is pushed, enable this checkbox.
Push Root and Intermediate Certificates	This field is displayed when **Use Existing Configuration** is not selected. To push the root and intermediate certificates, along with the end certificate, select this checkbox.
***Root Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Pem (*.crt)/Pem (*.cer)/Pem (*.pem)**. Enter the path to the location on your local system where the root certificate file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Intermediate Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Pem (*.crt)/Pem (*.cer)/Pem (*.pem)**. Enter the path to the location on your local system where the intermediate certificate file is stored.
***Truststore Location**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **JKS (*jks)**. For JKS certificates, the root and intermediate certificates are stored in a truststore file. In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the JKS certificate to be pushed, is stored.
***Truststore Password**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **JKS (*jks)**. Enter the password required to access the truststore file for the JKS certificate to be pushed.
***Truststore File Name**	This field is displayed when **Use Existing Configuration** is not selected, when **Push Root and Intermediate Certificates** is enabled, and when **Certificate Type** = **Default JKS (*jks)**. Enter the name of the truststore file for the JKS certificate to be pushed.

5. Enter/select the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

6. Click **Save**.

   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

- To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Tomcat (Windows)

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Windows Tomcat**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Tip: AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available Windows Tomcat devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, in the **Server selection** section, from the dropdown list in **Available Devices**, select one of the following:
   - **Tomcat**: This selection displays device profiles for Tomcat. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: Tomcat: 8443 : localhost:localhost**
   - **Default**: This selection displays the push-only profiles. The bind operation is not supported.

     The profile names use the following naming convention: **WIN_DEVICE :: Default:**
   - **ADManager**: This selection displays device profiles for ADManager. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: ADManager: 8443 : localhost:localhost**
   - **ADSelfService**: This selection displays device profiles for ADSelfService. The server.xml files are updated based on the profile and the inputs selected/entered in the rest of the fields.

     The profile names use the following naming convention: **WIN_DEVICE :: ADSelfService: 8443 : localhost:localhost**

   Profiles are displayed based on the selection made. The **Selected devices** list is updated automatically.
4. From the profiles displayed, to select the required profiles, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Certificate Details

Field	Description
Use Existing Configuration	If the **Use Existing Configuration** option is enabled, the existing **server.xml** file is used to create the application connector. If this option is disabled, the server configuration XML file will be overwritten with the values specified in the fields below (displayed only if this option is disabled).
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate directory**	Enter the path to the location on your local system where the certificate file (to be pushed to the server) is stored.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key directory**	The private key associated with a certificate is stored in a key file. In the **Key directory** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***Key File Name**	Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***KeyStore Location**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. For JKS certificates, a keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the JKS keystore file, for the certificate to be pushed, is stored.
***KeyStore File Name**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)**. Enter the file name of the keystore file that contains the private keys and the associated certificates. The extension **.key** is automatically populated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Password**	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. Enter the password required to access the keystore file for the JKS certificate to be pushed.
Alias Name	This field is displayed when **Certificate Type** = **Default JKS (*.jks)/PKCS#12 (*.p12)/PKCS#12 (*.pfx)**. Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Service Restart	To restart the Windows Tomcat service immediately after the certificate is pushed, enable this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***CA File Name**	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the file name of the root certificate.
Intermediate File or Bundle Name	This field is displayed when **Push Root and Intermediate Certificates** is enabled. Enter the file name of the intermediate certificate.
***Truststore Location**	This field is displayed when **Certificate Type** = **JKS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. For JKS certificates, the root and intermediate certificates are stored in a truststore file. In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the JKS certificate to be pushed, is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Truststore Password**	This field is displayed when **Certificate Type** = **JKS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. Enter the password required to access the truststore file for the JKS certificate to be pushed.
***Truststore File Name**	This field is displayed when **Certificate Type** = **Default KS (*.jks)** and **Push Root and Intermediate Certificates** is enabled. Enter the name of the truststore file for the JKS certificate to be pushed.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

PingFederate

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **PingFederate**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name <PingFederate connector> for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.
*: *Mandatory fields*	

Based on the information entered here, the **Server selection** section is populated with the list of available PingFederate devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, in the **Server selection** section, from the dropdown list in **Available Devices**, select one of the following:
   - **SSL Authentication Certificate Profile**: TThis profile requires a certificate that must be associated from the Client Inventory. If a certificate enrolled under the Server, Code Signing, or Client category in AVX is associated, it will be pushed to the device's Client Inventory. Hence, the appropriate certificate should be bound from the Client Inventory.

     The profile names use the following naming convention: **{DeviceName:SPConnectionName:SSL Authentication Certificate}**.
   - **SSL Verification Certificate Profile**: This profile allows association with any certificate permitted by the device, but only one certificate stays active while others remain non-active. It maintains a separate inventory from Client, Server, and Code Signing. Non-active certificates use a default connector that supports push only operations. Only the certificate, not the key, can be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Active Certificate**: Only one certificate can be active.

  The profile names use the following naming convention: **{DeviceName:SPConnectionName:SSL Verification Certificate:Active}**

- **Non-active certificates**: All remaining certificates.

  Profile Name: {DeviceName:SPConnectionName:SSL Verification Certificate}

- **Digital Signature Settings Profile**: This profile requires a certificate that must be associated from the Signing Inventory of the PingFederate device. When a server, client, or code signing certificate is pushed, it is placed in the device's Signing Inventory. Since the device accepts all certificates regardless of their EKU, the binding process can proceed as long as the certificate resides in the Signing Inventory. Certificates can be associated with either the Primary or the optional Secondary signing certificate profiles.

  - **Primary Signing Certificate Profile**: The profile names use the following naming convention: **{ DeviceName:SPConnectionName:Digital Signature Settings:Primary }**

  - **Secondary Signing Certificate Profile**: The profile names use the following naming convention: **{ DeviceName:SPConnectionName:Digital Signature Settings:Secondary }**

- In addition to associating certificates with specific profiles, they are also pushed to the corresponding inventories based on their certificate category.

  The profile names use the following naming convention: **{ DeviceName }**

- **SSL Verification Certificate Profile**: This profile allows association of any certificate, as permitted by the device. Only one certificate can be active as Primary and one as Secondary at a time; others are classified as Active or Non-Active. Active certificates can be promoted to Primary or Secondary. The profile uses a separate inventory, distinct from Client, Server, and Code Signing inventories. Certificates (excluding Primary and Secondary) are supported by a default connector for push-only operations. Only certificates, not keys, can be pushed to this profile.

  - **Primary Active Certificate**: Only one certificate can be primarily active.

    Profile Naming : { DeviceName:SPConnectionName:Signature Verification Certificate:Primary }

  - **Secondary Active Certificate**: Only one certificate can be secondarily active.

    Profile Naming: { DeviceName:SPConnectionName:Signature Verification Certificate:Secondary }

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Active / Non-active certificates**: All remaining certificates.

  Profile Naming: { DeviceName:SPConnectionName:Signature Verification Certificate:Active }

- **Non-Active - Profile Naming: { DeviceName:SPConnectionName:Signature Verification Certificate }**

Profiles are displayed based on the selection made. The **Selected devices** list is updated automatically.

4. From the profiles displayed, to select the required profiles, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Private key in device	Select the checkbox if required.
*: *Mandatory fields*	

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device.
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a server certificate to the device:

• To push a server certificate to a device, see Pushing a Server Certificate to a Device.

Adding Application Connectors for Cloud Connectors

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **Internal**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Cloud Connector**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **SSL profiles** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

2. To select the device(s) to which the certificate will be pushed, under **SSL profiles**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.

4. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Adding Application Connectors for Cloud Devices

AppViewX supports creating an application connector for the following Cloud device vendors:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- AWS
- Azure
- GCP

AWS

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **AWS**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
Service Types	From the dropdown list select, one of the following: • ACM • IAM • Cloudfront • ELB
***Connector Name**	Enter a name for this connector, to be able to identify it later.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Tip: AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate Location**	This field is displayed when **Vendor** = **AWS** and **Service Types** = **Cloudfront**. For CloudFront, certificates can be stored in either AWS Certificate Manager (ACM) or AWS Identity and Access Management (IAM). From the options given, select the certificate location.
Certificate ARN	This field is displayed when **Certificate Location** = **ACM**. The ARN (Amazon Resource Name) is a unique identifier assigned to each certificate that is managed by ACM. It is used to reference the certificate in API calls, policies, and so on. In this field, enter the ARN of the certificate to be pushed.
***Certificate File Name**	This field is displayed when **Certificate Location** = **IAM**. In this field, enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For AWS, this field is enabled by default and is non-editable.
Default Certificate	In the event that a certificate cannot be pushed, a default certificate is pushed as a fall back option. To enable this, select the **Default Certificate** checkbox.

5. Enter the **Certificate Tags**.
   A certificate tag is a label that you can assign to a certificate. To capture any details relevant to a certificate, you can associate certificate tags with a certificate. Certificate tags are key-value pair attributes that you can pass when you assume an IAM role or federate a user in AWS STS. These tags will be pushed along with the certificate to the endpoints. On certificate discovery, the tags associated with the certificate will be populated in the certificate inventory.

   To enter the certificate tags:

   a. **Enter Key** and **Enter Value**, in the respective fields, for the tag.

   b. Click **Add**.
      The tag, as a key-value pair, is listed in the table shown below the fields.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

Azure

For Azure Services except Virtual Machines

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Azure**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
Service Types	From the dropdown list select, one of the following: • Key vault • Application gateway • App service • Enterprise Application • Api Management • App Registration • Front Door

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Target Profile	A target profile is a configuration that defines the details for integrating and pushing certificates to the target system.
	For application gateway From the dropdown list, from the following options, select a target profile for pushing a certificate to the application gateway: • **Gateway SSL Profile** (Configure TLS/SSL encryption for secure communication between gateway and clients.) • **Gateway Listener Profile** (Accept incoming HTTP/HTTPS requests on specific ports and paths.) • **Gateway Backend Settings Profile** (Route requests to specific application servers based on routing rules.)
	For app service From the dropdown list, from the following options, select a target profile for pushing a certificate to the app service: • **Bring Your Own Certificate (.pfx)** (Upload your own **.pfx** certificate, along with its private key.) • **Public Key Certificates** (Upload only the public certificate without the private key, for scenarios where the certificate will be used only for verification purposes.)
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.
**: Mandatory fields*	

Based on the information entered here, the **SSL templates** section is populated with the list of available Microsoft Azure devices already onboarded in AppViewX.

3. To select the device(s)/profile(s) and domain(s), for Azure Front Door, to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click . The **Selected devices** list is updated automatically.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed. For **Service Types** = **Enterprise Application**, by default, the **PKCS#12 (*.pfx)** certificate type is selected and the field is disabled for editing.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
Keyvault Object Type	This field is displayed when **Service Types** = **Key vault**. From the following options, select the key vault object to which the certificate will be pushed: • **Certificates** (The Azure key vault can store x509 certificates for securing communications and establishing the identity of services.) • **Secrets** (The Azure key vault secret is a secure object used for storing sensitive information, such as passwords and cryptographic keys.)
Certificate Status Enabled	This field is displayed only when **Keyvault Object Type** = **Secrets**. To enable the certificate after it is pushed to the target system, select **Yes**.
Set activation date	This field is displayed only when **Keyvault Object Type** = **Secrets**. To set an activation date for the certificate being pushed: a. Select the **Set activation date** checkbox. b. Use the calendar widget and time zone dropdown list to set the date and time for the certificate activation.
Set expiration date	This field is displayed only when **Keyvault Object Type** = **Secrets**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To set an expiration date for the certificate being pushed: a. Select the **Set expiration date** checkbox. b. Use the calendar widget and time zone dropdown list to set the date and time for the certificate expiry.
Make Certificate Active	This field is displayed when **Service Types** = **Enterprise Application**. To make the certificate being pushed the active certificate for the Enterprise Application service, select this checkbox. An active certificate is the default certificate used for securing communication, authentication, and encryption. The rest of the certificates associated with this service are categorized as inactive certificates.
Notification Email Addresses	This field is displayed when **Service Types** = **Enterprise Application**. To enter email addresses that will be notified when this certificate is pushed and/or made active: a. Click . b. Enter the required email address and press **Enter**. c. To add multiple email addresses, repeat steps **a** and **b**. Alternatively, you can use the search field to add an already entered email address.
Certificate Push Type	Certificate push type specifies the mechanism that will be used for pushing certificates to the targeted service.
	For application gateway Select one from the following options: • **Upload a Certificate to Gateway** (for uploading a new certificate) • **Replace/Update existing Certificate in Gateway** (for renewing/ replacing an existing certificate)
	For app service

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	For Azure app service, certificate push type has the following values: • **Upload a Certificate to App Service** (for uploading a new certificate) • **Replace/Update existing Certificate in App Service** (for renewing/replacing an existing certificate) **Important:** However, for Azure app service, this field is disabled for editing and the **Upload a Certificate to App Service** is selected by default.
	For Api Management For the Azure Api management service, certificate push type has the following values: • **Upload a Certificate to Api Management** (for uploading a new certificate) • **Replace/Update existing Certificate in Api Management** (for renewing/replacing an existing certificate) **Important:** However, for the Azure Api management service, this field is disabled for editing and the **Upload a Certificate to App Service** is selected by default.
Certificate Location	**For the Azure Application Gateway** From the following options, select where the certificate will be stored after it is pushed: • **Upload directly to Application Gateway**: Upload certificates directly to the Application Gateway • **Choose from Azure Key Vault**: Store certificates in Azure Key Vault and then reference them in the Application Gateway configuration.
	For Azure App Service

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From the following options, select where the certificate will be stored after it is pushed: • **Upload directly to App Service** • **Choose from Azure Key Vault**: Store certificates in Azure Key Vault and then reference them in the App Service configuration.
	For Azure Api Management From the following options, select where the certificate will be stored after it is pushed: • **Upload directly to Api Management**: Upload certificates directly to the Application Gateway • **Choose from Azure Key Vault**: Store certificates in Azure Key Vault and then reference them in the Api Management configuration.
***Secret Name**	This field is displayed when **Service Type** = **Front Door**. Enter the name of the secret in Azure Key Vault that stores the certificate to be pushed to Azure Front Door.
***Key Vault Subscription ID**	This field is displayed when **Service Type** = **Front Door**. Enter (a new)/Select (from an existing list) the Azure subscription ID for the Key Vault from which the certificate is to be retrieved.
***Key Vault Name**	This field is displayed when **Service Type** = **Front Door**. From the dropdown list, select the name of the Key Vault in which the certificate is stored.
Replace Certificate in Key Vault	This field is displayed when **Service Type** = **Front Door**. Use the toggle key to specify whether an existing certificate in the specified Key Vault should be overwritten with the new one during the push operation.
***Key Vault Certificate Name**	This field is displayed when **Service Type** = **Front Door**. Enter the logical name under which the certificate is stored in the Key Vault.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

For Azure Virtual Machines

For Linux-based Virtual Machines

Important: If the certificate is generated with CSR generation at endpoint, if an application connector is created for the certificate, the following fields will be auto-populated/selected and cannot be modified:

- **Category**
- **Vendor**
- **Key Location**
- **Private key in Device**

Additionally, the available profiles will be filtered for the device profile selected at the time of certificate enrollment here.

1. On the client (or) server certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **LinuxServer**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Linux Server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Enable Truststore Update	This field is displayed for all **PEM** certificate types. Click the radio button to enable the Update System TrustStore option for root and intermediate certificates. **Note:** By default, this option is disabled. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Update System TrustStore**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Certificate Ownership & Permission	Enable the toggle button to customize the certificate ownership and define the file permissions for the certificates. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** > **Vendor Specific Details** section > **Certificate Ownership & Permission**.  Field descriptions for the Certificate Ownership & Permission Details
Custom Push	This field is displayed for all **PEM** and **DER** certificate types. From the following options, select the method of pushing certificates: • **Chain**: The full certificate chain, which includes the end, intermediate, and root certificates, will be pushed to the server. • **Issuer & Server**: The server's certificate and its issuer's certificates will be pushed to the server. • **Server Only**: Only the server's certificate will be pushed to the server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KDB File Name**	Enter the name of the KDB certificate file that will be pushed to the IBMClient server.
***KDB password**	Enter the password required to access the KDB certificate file.
Server Certificate Label	This field is disabled when the **Private key in device** checkbox is selected. Enter the label for the server certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. For the Linux Server, this feature is enabled by default and the field is non-editable.
Intermediate Certificate Label	If an intermediate certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Root Certificate Label	If a root certificate is available in the KDB file, the system will retain the existing label. The given label name will not be used.
Certificate Location	This field is displayed for all PEM, DER and PKCS#7 certificates. Enter the path to the location on your local system where the certificate file to be pushed is stored.
Key Location	This field is displayed for all PEM, DER and PKCS#7 certificates. The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***KeyStore Location**	This field is displayed for the PKCS#12 and JKS certificates. A keystore is a repository used for storing private keys and certificates. In the **KeyStore Location** field, enter the path to the location on your local system where the keystore file, for the certificate to be pushed, is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KeyStore Password**	This field is displayed for the PKCS#12 and JKS certificates. Enter the password required to access the keystore file for the certificate to be pushed.
***Alias Name**	This field is displayed for the PKCS#12 and JKS certificates. Enter the certificate alias assigned in the CSR generated for requesting/enrolling the certificate.
Truststore Location	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the certificates to be pushed, is stored. **Note:** Truststore Location can be specified without the file extension as well.
Truststore password	This field is displayed for the JKS certificates. Enter the password required to access the truststore file for the JKS certificate to be pushed.
Private key in device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

Field descriptions for the Certificate Ownership & Permission Details

Field	Description
Owner	Enter the username for certificate ownership on the target device.
Owner Permission	Select the owner permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
User Group	Enter name of the user group that requires access to the certificate.
User Group Permission	Select the group permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Other User Permission	Select the other user permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

For Windows-based Virtual Machines

Prerequisistes: When adding connectors using the Exchange Server, note the following points:

- During Microsoft Server device addition ensure that the username is added with the domain in the format—<username>@<domain>.
- The **iisreset.exe** file is expected at the default location. (C:\Windows\System32) to support IIS Service restart.
- For the certificate being enrolled, **Country name** must be provided in order to renew the certificate.

1. On the certificate holistic view, click **Add Connector**.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Server**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **Microsoft Server**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **Server selection** section is populated with the list of available ABAP server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, from the dropdown list, select one of the following options:
   - **MS Server**
   - **Exchange Server**
   - **Windows Gateway**

   Note: If you have selected **Exchange Server**, profiles will be displayed in the format, **Server type : Service name : Node details**.

4. Under **Server selection**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
5. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For MS Server: Field descriptions for the Certificate Details

Field	Description
Location Type	From the following options, select the location to which the certificate will be pushed: • **File System** (a storage location on your computer) • **Certificate Store** (a specialized location within the operating system for managing digital certificates)
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Credential Type**	This field is displayed for the JKS certificates. From the dropdown list, select the source of the access credentials.
***Push Location**	Enter the endpoint where the certificate will be pushed. This can be a network location or directory on the server, or a URL from where the server can retrieve the certificate.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	This field is displayed for the **PEM**, **DER**, and **PKCS#7** certificates. The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***PFX Password**	This field is displayed when **Certificate Type** = **PKCS#12 (*.pfx)** and **PKCS#12 (*.p12)**. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
***KeyStore Password**	This field is displayed for JKS certificate types. Enter the password required to access the keystore that contains the JKS certificate to be pushed.
Alias Name	This field is displayed for the PKCS#12 and CERTDB certificate types.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Private key entry password	This field is displayed for the JKS certificates. Enter the password required to decrypt the private key associated with the certificate.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox.
***Intermediate Certificate Alias Name 1**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. This field is not displayed for the JKS certificate types. Enter the alias name of the intermediate certificate file.
***Root Certificate Alias Name**	This field is displayed only when **Push Root and Intermediate Certificates** is enabled. Enter the alias name of the root certificate file.

For Exchange Server: Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	The certificate type is defaulted to the following values • For AppViewX CSR generation - certificates which have private key, **PKCS#12(*.p12)** is the supported certificate format. • For Endpoint CSR generation **PKCS#7(*.p7b)** is the supported certificate format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The password field in not set for **PKCS#12(*.p12)** since its a transactional password and handled by AppViewX.
***Friendly Name**	• For **PKCS#12(*.p12)** it is the user specified input. • For **PKCS#7(*.p7b)** certificate type, the friendly name is the common name of the certificate specified at the time of Endpoint CSR generation. During the push operation the common name is populated in the friendly name field (it is not editable).
Services	From the dropdown list, select one from the following services: • **POP** • **IIS** • **SMTP** • **IMAP**
Restart Service	This field is displayed only when **Services** = **IIS**. To restart the IIS service after the certificate is pushed, to ensure all changes have taken effect as required, select this checkbox.

For Windows Gateway: Field descriptions for the Certificate Details

Field	Description
Location Type	The **Certificate Store** option is selected by default—a specialized location within the operating system for managing digital certificates. (**File system** is disabled).
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificates, select this checkbox. **Note:** Root and intermediate names cannot be entered for this CSR/Certificate. If auto-push is enabled for CSR, try again after the certificate is generated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: When pushing certificates , the system now automatically selects the appropriate PKCS12 encryption algorithm based on the target Windows Server version:

- **Windows Server 2016 and earlier**: Uses **TripleDES** encryption for compatibility
- **Windows Server 2019 and later**: Uses the encryption algorithm from General Settings This is applicable for all service/devices such as Microsoft Server, Microsoft Exchange Server, Windows Gateway.

6. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

7. Click **Save**.
   The connector is displayed on the certificate holistic view.

GCP

1. On the certificate holistic view, click **Add Connector**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	From the dropdown list, select **Cloud**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select **GCP**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
Service Types	From the dropdown list select, one of the following: • Classic Certificates • Certificate Manager • Load Balancer
***Connector Name**	Enter a name for this connector, to be able to identify it later. **Tip:** AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available AWS cloud devices already onboarded in AppViewX.

3. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, for the required device(s), click .
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Certificate Details

Field	Description
Upload Certificate as	• **New**: If you are uploading a new certificate to the GCP Certificate Manager, select this option. • **Update**: If you are updating a certificate existing in the GCP Certificate Manager, select this option.
Certificate Location	For **Service Types = Load Balancer**, this field is set to **Classic Certificates** and is disabled for editing. This field comes with the following options: • **Classic Certificates**: Upload your certificate and private key directly to the load balancer's configuration. • **Certificate Manager**: Reference certificates managed by Certificate Manager in your load balancer configuration.
Certificate Name	Enter the name of the certificate being pushed.
Scope of Certificate	From the following option, select the scope of the certificate being pushed: • **Global** (Certificate is available for use across all regions within a GCP project) • **Regional** (Certificate is limited to a specific region within a GCP project)
Certificate Description	Enter additional details related to the certificate being pushed.

5. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	From GCP, the script files can be stored only in AppViewX.
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Adding Application Connectors for Firewalls

AppViewX supports creating an application connector for the following Firewall device vendors:

- CheckPoint
- Cisco
- Fortinet
- PaloAlto

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **Firewall**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select the required firewall vendor. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Based on the information populated here, the **Profile Selection** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

2. To select the device(s) to which the certificate will be pushed, under **Profile Selection**:

   a. For **CheckPoint** Vendor, to filter the available profiles, from the dropdown menu for Available profiles, select a value from the following options:
   - **Admin Portal**
   - **HTTPS Inspection**.

   b. For **PaloAlto** vendor, to filter the available profiles, from the dropdown menu for Available profiles, select a value from the following options:
   - **PaloAlto Firewall**
     - Shared location
     - SSL/TLS Service profile
     - IKE Gateways
     - SSL Inbound Inspection Profiles
     - Authentication Profiles.
   - **Panorama**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Shared location
- SSL/TLS Service profile
- IKE Gateways
- SSL Inbound Inspection Profiles
- Authentication Profiles.

c. From the list of **Available Devices** displayed, to select the target device(s) for pushing the certificate, click .

The **Selected devices** list is updated automatically.

3. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Trust Point Name**	A trustpoint configuration is an element that includes details related to a certificate such as the certificate file, the private key file, the CA certificate, and other settings related to the certificate. In the **Trustpoint Name** field, enter the name of the trustpoint configured on the target system to which the certificate will be pushed.
Alias Name	Enter the certificate alias assigned in the CSR generated for requesting/ enrolling the certificate.
Password	Enter the password required to access the certificate file/trust store.
Private Key Passphrase	Enter the password required to access the private key file associated with the certificate.
Push to Firewall	To push the certificate when it is updated directly to the firewall, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Trust Type	**Important:** Trust type is applicable only for server certificates issued by private CAs with a customized template that issues certificate to the PaloAlto device with **Key Usage** as **Certificate Signing** for certificates that have a private key. **Trust Type** defines how a firewall handles SSL/TLS traffic based on whether a certificate is trusted or untrusted. Select a trust type status from the following values: • **Forward Trust** Select this option to establish the firewall as a trusted third party (proxy) to the session between the client and the server. For **Trust Type** = **Forward Trust**, if the server's certificate is valid (trusted) and signed by a known, trusted CA (like VeriSign, DigiCert, etc.), the firewall decrypts the traffic, inspects it, and then re-encrypts it using its own certificate, which is trusted by the client due to the configured CA. • **Forward Untrust** Select this option for the firewall to notify to clients when the server certificate is signed by a CA that the firewall does not trust. For **Trust Type** = **Forward Untrust**, if the server's certificate is self-signed or from an unknown CA, the firewall may re-encrypt the traffic using an untrusted certificate, causing the client to see a warning that the connection is not secure. **Note:** If the certificate trust type was already specified when configuring the certificate on the device, then upon discovery in AppViewX, the trust type field will reflect the same value as configured in the device port.

4. Enter the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

What's Next

After adding the connector, you can proceed with pushing a firewall certificate to the device:

- To push a firewall certificate to a device, see Pushing a Server Certificate to a Device.

Adding Application Connectors for MDMs

AppViewX supports creating an application connector for the following MDM vendors:

- MobileIron

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Enter the **General Information** for the connector.

Field	Description
***Category**	From the dropdown list, select **MDM**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select the required vendor. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

   Based on the information populated here, the **Device Groups** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.
2. To select the device(s) to which the certificate will be pushed, under **Device Groups**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Configuration name**	Enter the name of the configuration profile that includes the certificate to be pushed. A configuration profile defines the policies for managed devices.
***Certificate Category**	Enter the name of the certificate group to which the certificate to be pushed belongs.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
***PFX Password**	This field is displayed for the PKCS#12 certificates. Enter the password that will be required to access the **.pfx** and the **.p12** certificate files.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox.

4. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox. **Note:** The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Adding Application Connectors for ADC Devices

AppViewX supports creating an application connector for the following ADC device vendors:

- A10
- Array
- AVI
- Citrix
- F5
- HAProxy
- NginxPlus
- Radware

1. Enter the **General Information** for the ADC devices.

Field descriptions for the Certificate Details

Field	Description
***Category**	From the dropdown list, select **ADC**. If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the category selected at the time of certificate enrollment.
***Vendor**	From the dropdown list, select the ADC device vendor (for the device to which this certificate will be pushed). If the certificate being pushed was enrolled with CSR generation at endpoint, this field is auto populated with the vendor selected at the time of certificate enrollment.
***Connector Name**	Enter a name for this connector, to be able to identify it later. AppViewX recommends naming connectors according to use cases so they are easily distinguishable.
Description	Enter any additional details you want to record for this connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Based on the information populated here, the **SSL Templates/Server selection/Virtual server selection/SSL profiles** section is populated with the list of available devices for the specified vendor that are already onboarded in AppViewX.

Note: The name of this section is populated based on the **Vendor** selected.

2. To select the device(s) to which the certificate will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   The **Selected devices** list is updated automatically.
3. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed.
Activate Certificate	To activate the certificate after it has been pushed, select this checkbox.
Service Action	From the dropdown list, select the required value: • **Restart** (stops and starts the process) • **Reload** (informs the daemon to reload only the configurations) • **None** **Note:** After device addition, if there are managed HAProxy certificates in the certificate inventory, by default, **Service Action** is set to **None**.
***Certificate File Name**	Enter the file name of the certificate to be pushed. The file extension is auto-populated based on the **Certificate Type** selected.
***Key File Name**	The private key associated with a certificate is stored in a key file. Enter the name of the file that contains the private key associated with the certificate to be pushed. The file extension **.key** is automatically populated.
***Certificate Location**	Enter the path to the location on your local system where the certificate file to be pushed is stored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

***Key Location**	The private key associated with a certificate is stored in a key file. In the **Key Location** field, enter the path to the location on your local system where the private key file for the certificate to be pushed is stored.
***Certificate key pair name**	Enter the key-pair name used to identify the certificate and its associated private key.
Enable SNI Push for Certificate	To enable SNI push in the virtual server, select this checkbox.
Enable SNI in Virtual Server	To enable SNI in the virtual server, select this checkbox.
Push Root and Intermediate Certificates	To push the root and intermediate certificates, along with the end certificate, select this checkbox. For the Web Dispatcher server, this field is enabled by default and is non-editable.
Service Restart	To restart the device service immediately after the certificate is pushed, enable this checkbox.
Private Key in Device	If the private key associated with the certificate being pushed has been stored on a hardware device, select this checkbox.

4. Enter the **Push Details**.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Overwrite	The **Overwrite** option is used to specify if existing certificates on the target system will be overwritten with the certificate being pushed. If this option is enabled, the certificate being pushed will overwrite any existing certificates with the same identifier on the target system. This will also ensure that only the latest version of the certificate is available on the target system. If it is disabled, the push operation will fail in the event of conflicts with the certificates on the target system.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: The auto push feature for a certificate works only if enabled for the certificate application connector as well the associated certificate group. To enable this feature at the certificate group level, refer the instructions here.
Secure Push	The **Secure Push** option ensures that the certificate is pushed to the target system securely, protected from any unauthorized access.

5. Click **Save**.
   The connector is displayed on the certificate holistic view.

Pre - and Post - Push Script Usage Steps

Prerequisites

- If the scripts are written using Python:
  - Scripts for the on-prem deployment should start with

```
#!/appviewx/dependencies/appviewx_addons/Python/bin/python
```

  - Scripts for the SaaS deployment should start with

```
#!/usr/bin/python
```

- The script input can be consumed using the command line argument `sys.argv[1]`
- The script output should be in the JSON format, generated only using the `print` statement.
-

Script Output	Script Execution Status
`AppResponseCode:0`	Success
`AppResponseCode:-1` or any other script errors	Failure

- The script should be code-signed. Please contact AppViewX Support (help@appviewx.com) to get the script code signed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Using Scripted Integrations for On-prem

1. Get the code-signed script from the AppViewX support team (help@appviewx.com). This will be a **.zip** file that includes the script and the signature.
2. Save the code-signed **.zip** file in all the AppViewX vendors pods running node file system.

   Default path: **<home>/appviewx/appviewx_dependencies/aps/**
3. Mention in the **.zip** filename in all the relevant fields in the CERT+ user interface.

> **Note:** The folder path for the file is not required. Custom folder paths are restricted.

Sample success script for the on-prem deployment:

```
#!/appviewx/dependencies/appviewx_addons/Python/bin/python

print({"status":"AppResponseCode:0"})
```

Using Scripted Integrations for SaaS

1. Get the code-signed script from the AppViewX support team (help@appviewx.com). This will be a **.zip** file that includes the script and the signature.
2. Save the **.zip** file in all machines with the AppViewX Cloud Connector at the following location: **<CC_INSTALLATION_PATH>/deps/aps/**.
3. Mention in the **.zip** filename in all the relevant fields in the CERT+ user interface.

> **Note:** The folder path for the file is not required. Custom folder paths are restricted.

Sample success script for the SaaS deployment:

```
#!/usr/bin/python

print({"status":"AppResponseCode:0"})
```

Troubleshooting Script Usage Issues

Error	Cause	Resolution
File not found	The python path mentioned in the script file is not correct.	Check the path in the vendors pod or the mid-server-platform pod.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Error	Cause	Resolution
		For Python scripts: • Scripts for the on-prem deployment should start with `#!/appviewx/dependencies/appviewx_addons/Python/bin/python` • Scripts for the SaaS deployment should start with `#!/usr/bin/python`
...bin/python^M: bad interpreter	The `^M` is a carriage return character. Linux uses the line feed character to mark the end of a line, whereas Windows uses the two-character sequence CR LF. Your file has Windows line endings, which is confusing Linux	Remove the spurious CR characters and then code sign the script. You can remove these characters using the command: `sed -i -e 's/\r$//' scriptname.py`

Pushing a Server Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Server**.
   The **Server Certificate** page is displayed.
2. To push a certificate, under **Common Name**, click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.

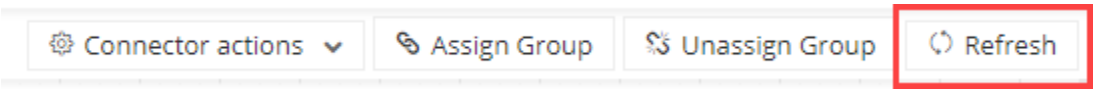
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.
8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

   To refresh the certificate topology view, from the top-right corner of the screen, click **Refresh**.



Color Codes Status

The topological view follows a color codes scheme to identify certificate status.

Full list of color codes and their descriptions

Color	Description
Green	The certificate is available and valid.
Red	.The certificate has expired
Gray	Certificate push action failed.
Blue	The certificate will expire in 90 days.
Yellow	The certificate will expire in 30 days.
Orange	The certificate will expire in 10 days.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Full list of color codes and their descriptions (continued)

Color	Description
Black	The certificate has been revoked.
Mid Purple	The certificate associated with profiles is manually removed.

What's Next

After pushing a server certificate to a device, you can proceed with configuring expiry alerts:

- To set up expiry alerts and be notified of certificate statuses, see Configuring Expiry Alerts.

Pushing a Client Certificate to a Device

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Client**.
   The **Client Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.
3. Click **Push to Device**. The Push to Device option will be shown if the app connector is already added to the certificate otherwise add the app connector and then proceed.

   Note: The **Push to Device** option is displayed only after an app connector is added to certificate.

   The **Confirmation** dialog box is displayed.
4. Enter your comments, if required, in the text field.
5. Click **OK**.
   - The approval process is triggered. The current flow is based on the default policy of two-level approvals.
   - A request ID and work order ID are generated automatically and the work order status is displayed alongside the connector in the certificate topology view.
6. To approve the push request, from the certificate topology view, click **Approve**.
7. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The work order status displayed beside the connector updates to **Push-Review In Progress**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. To implement the push request, from the certificate topology view, click **Implement**.
9. In the **Confirmation** dialog box:
   a. In the **Manual Implementation** field, to choose the mode of implementation, use the **On**/**Off** toggle.
   b. If you select **Off**, set the date and time to schedule the certificate push.
   c. Enter your comments in the text field and click **Yes**.

   The push action is triggered. After the push action is completed, the status updates to **Completed**.

Colour Codes Status

The topological view follows a colour codes scheme to identify certificate status.

Full list of color codes and their descriptions

Colour	Description
Green	The certificate is available and valid.
Red	The certificate has expired.
Gray	Certificate push action failed.
Blue	The certificate will expire in 90 days.
Yellow	The certificate will expire in 30 days.
Orange	The certificate will expire in 10 days.
Black	The certificate has been revoked.
Mid Purple	The certificate associated with profiles is manually removed.

Pushing an Intermediate Certificate to a Device

In the case of intermediate CA certificates or trust certificate renewal, the same should be pushed to the device in order to update the trust chain for the SSL communication. If this is not done, the SSL handshake will fail.

To push an intermediate certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Intermediate**.
   The **Intermediate Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.
   The certificate topology view is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. On the certificate topology page, click **Add Connector**.

4. Enter/select the **General Information** required for adding a connector.

Field descriptions for the General Information section

Field	Description
Category	Select the category from the dropdown list. The possible categories are: • ADC • Cloud • Firewall • MDM • Server • WAF.
Vendor	Select the desired vendor from the dropdown list.
Connector Name	Enter a name for the connector that is descriptive enough when viewed within the Certificate topology.
Description	Enter the description in this field.

5. From the **SSL Template** section, to select a device listed under **Available devices**, click .
   The selected device is listed under the **Selected devices** list.

Pushing a Root Certificate to a Device

There can be renewal or change of root certificate in the trust store. In such occurrences, the user can push the root certificate to the desired endpoints to avoid the SSL handshake failure.

To push a root certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Push to Device** > **Root**.
   The **Root Certificate** page is displayed.
2. To push a certificate, under **Common Name**, double click the required certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The certificate topology view is displayed.

3. On the certificate topology page, click **Add Connector**.

4. Enter the **General Information** required for adding a connector.

Field descriptions for the General Information section

Field	Description
Category	Select the category from the dropdown list. The possible categories are: • ADC • Cloud • Firewall • MDM • Server • WAF.
Vendor	Select the desired vendor from the dropdown list.
Connector Name	Enter a name for the connector that is descriptive enough when viewed within the Certificate topology.
Description	Enter the description in this field.

5. From the **SSL Template** section, to select a device listed under **Available devices**, click .
The selected device is listed under the **Selected devices** list.

Enabling Auto Push of Certificates to Endpoints

After setting the auto renew/regenerate in the CA connector, you must now enable the auto push in the application connector to ensure the renewed/regenerated certificates are pushed to the end device.

To enable auto push of certificates, **you need to enable the corresponding option for the group to which the certificate in question belongs, as well as the connector created for that certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. To enable auto push for the certificate group:

   a. Go to **Menu** > **CERT+** > **Groups & Policies** > **Groups**.
   The **Group** page is displayed.

   b. From the **Name** field, select the required certificate group.
   The **Group : Modify : <group name>** page is displayed.

   c. From the **Other Details** section of this certificate group, turn on the **Push Certificate Automatically** toggle button.

   d. Click **Update**.

2. To enable auto push for the certificate connector:

   a. From the holistic view, for an existing application connector for the certificate, hover over **(More)** icon.
   To add an application connector, follow the instructions given here.

   b. From the menu displayed, click **Edit**.
   The **Edit Application Connector** pop-up is displayed.

   c. Select the **Push automatically** checkbox.

   > **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function.

   d. Click **Save**.
   The holistic view of the selected certificate is displayed.

   > **Note:** An **Auto Renew Certificates** job is scheduled to run every 6 hours. It auto renews the configured certificates based on the number of days before expiry. AppViewX will disable the push automatically option in the Parent certificate application connector and enable it in the renewed certificate application connector.

   > **Note:** An **Auto Regenerate Certificates** job is scheduled every day. It auto regenerates the configured certificates based on the number of days before expiry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

For automating the certificate lifecycle management, in addition to enabling auto push of certificates, you can

- Enable auto regeneration of certificates.
- Enable auto renewal of certificates.
- Set alerts to be notified of all events and statuses of the certificates.

After automating the Auto Renew/Regenerate and enabling the Auto Push, you can proceed with configuring expiry alerts:

- To set up expiry alerts and be notified of certificate statuses, see Configuring Expiry Alerts.

Bulk Push for Intermediate/Root Certificates

Bulk push of the certificates can be triggered from the inventory by selecting more than one certificate. To push intermediate and root certificates in bulk:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Actions** > **Bulk Push**.
   The **Intermediate/Push Certificate** > **Add Connector** page is displayed.
2. Enter the **General Information** for the connector.

Field descriptions for the connector General Information

Field	Description
***Category**	Select the required category from the dropdown list. The available options are: • **ADC** • **Server**.
***Vendor**	The **Vendor** field appears as follows based on the selected category: • By default, if the category is selected as **ADC**, the Vendor field will apear with **F5**. • By default, if the category is selected as **Server,** the Vendor field will apear with **LinuxServer**.
***Process Name**	For future reference, enter the process name (for example, **F5 bulk push**).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Allowed characters: • All alphanumeric characters (**a-z, A-Z, 0-9**) • All special characters **except** <, >, ", ;, and `
Description	Enter any additional details you want to record for this connector.

Based on the information entered here, the **SSL templates** section is populated with the list of available Linux Server devices already onboarded in AppViewX.

3. To select the device(s) to which the certificates will be pushed, under **SSL templates**, from the list of **Available Devices**, click .
   You can use the **Available Devices** dropdown list to filter devices based on functionality.
   The **Selected devices** list is updated automatically.
4. Enter the **Certificate Details**.

Field descriptions for the Certificate Details

Field	Description
***Certificate Type**	From the dropdown list, select the file type of the certificate to be pushed. The supported certificate types are: • PEM (*.crt) • PEM (*.cer) • PEM (*.pem) • JKS (*.jks) • JKS (*.keystore) • PEM (Extensionless) • JKS (Extensionless).
Truststore Location	In the **Truststore Location** field, enter the path to the location on your local system where the truststore file, for the certificates to be pushed, is stored. **Note:** The alias names of JKS certificates in the truststore follow the format: <common name>_<thumbprint> of the certificate.
Truststore password	Enter the password required to access the truststore file for the JKS certificate to be pushed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed for the JKS certificates.
Enable Truststore Update	This field is displayed for all **PEM** certificate types. Click the radio button to enable the Update System TrustStore option for root and intermediate certificates. **Note:** By default, this option is disabled. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** <⚙> **Vendor Specific Details** section > **Update System TrustStore**. Certificate Ownership & Permission	Enable the toggle button to customize the certificate ownership and define the file permissions for the certificates. **Note:** The toggle button will be enabled by default for Linux devices if it is activated in the Device Settings under the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **Device Settings** <⚙> **Vendor Specific Details** section > **Certificate Ownership & Permission**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	 Field descriptions for the Certificate Ownership & Permission Details

Field descriptions for the Certificate Ownership & Permission Details

Field	Description
Owner	Enter the username for certificate ownership on the target device.
Owner Permission	Select the owner permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
User Group	Enter name of the user group that requires access to the certificate.
User Group Permission	Select the group permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).
Other User Permission	Select the other user permission level from the dropdown list. • Read (r) • Read-Write (rw) • Read-Write-Execute (rwx).

5. Enter the **Push Details**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Push Details

Field	Description
***Script Location**	Script files are commonly used to perform certain tasks required to be completed before and/or after a certificate is pushed to the target system. The script to be run before the certificate is pushed is called a pre-push script and the script to be run after the push is called a post-push script. From the following options, select the location of the script file(s): • In AppViewX • In Device.
Pre - Push Script File Name	Enter the file name of the pre-push script. **Important:** Read the pre and push script usage instructions here.
Pre - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the pre-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Name	Enter the file name of the post push script. **Important:** Read the pre and push script usage instructions here.
Post - Push Script File Path	This field is displayed when **Script Location** = **In Device**. Enter the location on your local system where the post-push script file is stored. **Important:** Read the pre and push script usage instructions here.
Push Automatically	To automatically push the certificate after it is renewed/reissued to the target system, enable this checkbox.

6. Click **Save**.
   The connector is displayed on the certificate holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Reissuing Certificates

To update or modify its parameters, a certificate can be reissued by the same certificate authority that issued it. A common use case will be the addition of SAN names.

Note: Reissuing certificates will not be considered as a new order to the CA.

Note: You can reissue the certificates via the Certificate Inventory section also.

- Reissuing a Server Certificate
- Reissuing a Client Certificate

Reissuing a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Reissue Certificate** > **Server**.
   The **Server Certificate** page is displayed.
2. To reissue a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Reissue**.

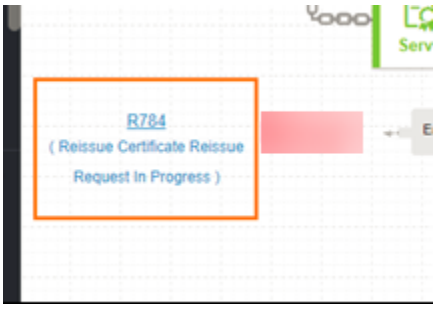
   The **Server Certificate** > **Reissue** page is displayed.

   On the **Server Certificate** > **Reissue** page, if required, you can edit the **Subject Alternate Names**. The **Key Type, Bit Length, Vendor Specific Details**, **Attachments**, **Generic Fields**, **Vendor-Specific Details**, and **Custom Attributes** can also be modified.

4. Click **Reissue**.
5. In the **Reissue** dialog box, enter the **Reason** for removal and any additional details as **Comments.**
6. Click **Yes**.

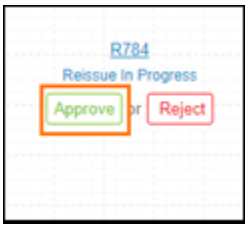
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The reissue process is initiated, as is displayed in the certificate topology view, alongside the connector



If the **Approval Required** checkbox is enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.

7. To approve the reissue request, from the certificate topology view, click **Approve**.



8. In the **Approve**dialog box, enter your **Comments**.
9. Click **Yes**.
10. If the workflow request has to be approved automatically in the future, click **Schedule later**.
11. Click **Implement**.

12. In the **Implement** dialog box, enter your **Comments.**
13. Click **Yes**.
14. If the workflow request has to be approved automatically in the future, click **Schedule later**.

After the certificate is reissued, the status updates to **Completed**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Reissuing a Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Reissue Certificate** > **Client**.
   The **Client Certificate** page is displayed.
2. To reissue a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Reissue**.

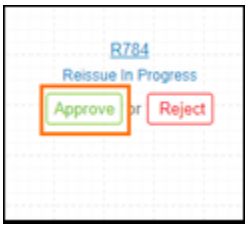
   The **Client Certificate** > **Reissue** page is displayed.

   On the **Client Certificate** > **Reissue** page, if required, you can edit the **Subject Alternate Names**. The **Key Type, Bit Length, Vendor Specific Details**, **Attachments**, **Generic Fields**, **Vendor-Specific Details**, and **Custom Attributes** can also be modified.

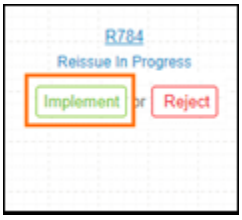
4. Click **Reissue**.
5. In the **Reissue** dialog box, enter the **Reason** for removal and any additional details as **Comments.**
6. Click **Yes**.
   The reissue process is initiated, as is displayed in the certificate topology view, alongside the connector

   If the **Approval Required** checkbox is enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.
7. To approve the reissue request, from the certificate topology view, click **Approve**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



8. In the **Approve**dialog box, enter your **Comments**.
9. Click **Yes**.
10. If the workflow request has to be approved automatically in the future, click **Schedule later**.
11. Click **Implement**.



12. In the **Implement** dialog box, enter your **Comments.**
13. Click **Yes**.
14. If the workflow request has to be approved automatically in the future, click **Schedule later**.

    After the certificate is reissued, the status updates to **Completed**.

Revoking Certificates

Revocation is the process of making a certificate invalid. For example, you might need to revoke a certificate if the certificate is no longer required (or) certificate's private key is compromised. Make sure that you have permission to revoke a certificate and submit a request to the certificate authority. As soon as the certificate is revoked, it is not considered to be a trusted certificate. Revoked certificates are listed in the Certificate Revocation List (CRL) maintained by each certificate authority.

Important: Due to IDnomic API limitations, AppViewX is not notified when a certificate revocation request is declined. Hence, work orders for certificate revocation may still be shown as failing even if they are declined. This limitation will be addressed in the subsequent release versions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Revoking a Server Certificate
• Revoking a Client Certificate
• Revoking a Device Certificate
• Revoking a Code Signing Certificate

Revoking a Server Certificate

Note: For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

Important: Due to IDnomic API limitations, AppViewX is not notified when a certificate revocation request is declined. Hence, work orders for certificate revocation may still be shown as failing even if they are declined. This limitation will be addressed in the subsequent release versions.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revoke Certificate** > **Server**.
   The **Server Certificate** page is displayed.
2. To revoke a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Revoke**.

   The **Certificate Revoke** dialog box is displayed.

4. **Note:** This step is applicable only for revoking DigiCert CA certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

In the **Certificate Revoke** dialog box, from the following options, select one to specify the certificate revoke **Type**:

- **Certificate**

  Selecting this option will only revoke the certificate that was selected from the inventory. On the DigiCert CA portal, the order status will remain **Active**.

- **Order ID**

  Selecting this option will display the **Order ID** field that is auto-populated with the order ID for the selected certificate.

  Revoking via this type will revoke all certificates belonging to this order ID.

5. In the **Certificate Revoke** dialog box, from the dropdown list, select the reason for revoking the certificate.
6. Enter your comments in the **Comments** text field (optional) and click **Yes**.
   The revoke process is initiated for the selected certificate.

   If the **Approval Required** checkbox was enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.
7. On the certificate topology view, click **Approve** to proceed.

8. In the **Approve** dialog box, enter your **Comments**.
9. Click **Yes**.
10. If the workflow request has to be approved automatically in the future, click **Schedule later**.
11. On the certificate topology view, click the **Implement** button to proceed.
12. In the **Implement** dialog box, enter your **Comments.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

13. Click **Yes**.
14. If the workflow request has to be approved automatically in the future, click **Schedule later**.
    After the certificate is revoked, the status updates to **Completed**.

Revoking a Client Certificate

Note: For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

Important: Due to IDnomic API limitations, AppViewX is not notified when a certificate revocation request is declined. Hence, work orders for certificate revocation may still be shown as failing even if they are declined. This limitation will be addressed in the subsequent release versions.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revoke Certificate** > **Client**.
   The **Client Certificate** page is displayed.
2. To revoke a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Revoke**.

   The **Certificate Revoke** dialog box is displayed.

4. **Note:** This step is applicable only for revoking DigiCert CA certificates.

   In the **Certificate Revoke** dialog box, from the following options, select one to specify the certificate revoke **Type**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Certificate**

  Selecting this option will only revoke the certificate that was selected from the inventory. On the DigiCert CA portal, the order status will remain **Active**.

- **Order ID**

  Selecting this option will display the **Order ID** field that is auto-populated with the order ID for the selected certificate.

  Revoking via this type will revoke all certificates belonging to this order ID.

5. In the **Certificate Revoke** dialog box, from the dropdown list, select the reason for revoking the certificate.
6. Enter your comments in the **Comments** text field (optional) and click **Yes**.
   The revoke process is initiated for the selected certificate.

   If the **Approval Required** checkbox was enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.
7. On the certificate topology view, click **Approve** to proceed.

8. In the **Approve** dialog box, enter your **Comments**.
9. Click **Yes**.
10. If the workflow request has to be approved automatically in the future, click **Schedule later**.
11. Click **Implement**.
12. Click the **Implement** button to proceed.
13. In the **Implement** dialog box, enter your **Comments.**
14. Click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

15. If the workflow request has to be approved automatically in the future, click **Schedule later**.
    After the certificate is revoked, the status updates to **Completed**.

Revoking a Device Certificate

> **Note:** For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revoke Certificate** > **Device**.
   The **Device Certificate** page is displayed.
2. To revoke a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Revoke**.
   The **Certificate Revoke** dialog box is displayed.
4. In the **Certificate Revoke** dialog box, from the dropdown list, select the reason for revoking the certificate.
5. Enter your comments in the **Comments** text field (optional) and click **Yes**.
   The revoke process is initiated for the selected certificate.

   If the **Approval Required** checkbox was enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.
6. On the certificate topology view, click **Approve** to proceed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. In the **Approve** dialog box, enter your **Comments**.
8. Click **Yes**.
9. If the workflow request has to be approved automatically in the future, click **Schedule later**.
10. Click **Implement**.
11. Click the **Implement** button to proceed.
12. In the **Implement** dialog box, enter your **Comments.**
13. Click **Yes**.
14. If the workflow request has to be approved automatically in the future, click **Schedule later**.

    After the certificate is revoked, the status updates to **Completed**.

Revoking a Code Signing Certificate

Note: For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

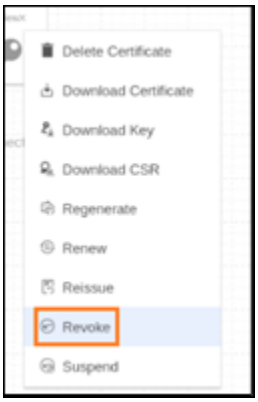
Important: Due to IDnomic API limitations, AppViewX is not notified when a certificate revocation request is declined. Hence, work orders for certificate revocation may still be shown as failing even if they are declined. This limitation will be addressed in the subsequent release versions.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revoke Certificate** > **Code Signing Certificate**.

   The **Code Signing Certificate** page is displayed.
2. To revoke a certificate,under **Common Name**, select the required certificate name.

   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Revoke**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The **Certificate Revoke** dialog box is displayed.

4. **Note:** This step is applicable only for revoking DigiCert CA certificates.

   In the **Certificate Revoke** dialog box, from the following options, select one to specify the certificate revoke **Type**:

   - **Certificate**

     Selecting this option will only revoke the certificate that was selected from the inventory. On the DigiCert CA portal, the order status will remain **Active**.

   - **Order ID**

     Selecting this option will display the **Order ID** field that is auto-populated with the order ID for the selected certificate.

     Revoking via this type will revoke all certificates belonging to this order ID.

5. In the **Certificate Revoke** dialog box, from the dropdown list, select the reason for revoking the certificate.
6. Enter your comments in the **Comments** text field (optional) and click **Yes**.
   The revoke process is initiated for the selected certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If the **Approval Required** checkbox was enabled on the **Certificate Policy** page, the request goes to the **Approve** and **Implementation** stages.

7. On the certificate topology view, click **Approve** to proceed.

8. In the **Approve** dialog box, enter your **Comments**.
9. Click **Yes**.
10. If the workflow request has to be approved automatically in the future, click **Schedule later**.
11. Click **Implement**.
12. Click the **Implement** button to proceed.
13. In the **Implement** dialog box, enter your **Comments.**
14. Click **Yes**.
15. If the workflow request has to be approved automatically in the future, click **Schedule later**.

After the certificate is revoked, the status updates to **Completed**.

Regenerating Certificates

Important: The **Regenerate Certificate** CLM action is displayed in the CERT+ menu only for authorized user roles. For more context, refer to the Configuring Role and Resource-Based Access Control and Creating a Role sections in the Platform User Guide.

Certificate regeneration allows you to create a new certificate with the same parameters as an existing certificate. Certificate regeneration will be a new order to the Certificate authority. This will come in handy if the user wants to switch the CA for a certificate.

- Regenerating a Server Certificate
- Regenerating a Client Certificate
- Regenerating a Code Signing Certificate
- Tracking Certificate Regeneration via the Process Explorer

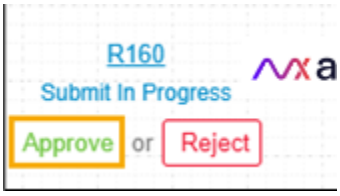
Regenerating a Server Certificate

Important: The **Regenerate Certificate** CLM action is displayed only for authorized user roles. For more context, refer to the **Configuring Role and Resource-Based Access Control** and **Creating a Role** sections in the Platform User Guide.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. To regenerate a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Regenerate**.
   The **Server Certificate > Regenerate** page is displayed.
4. On the **Server Certificate > Regenerate** page, modify the required details in the **General Information**, **CA Details**, **CSR Parameters**, **Attachments**, **Generic Fields**, **Vendor-Specific Details**, and **Custom Attributes** sections.

   Note: For field descriptions, you can refer to the instructions for enrolling a server certificate.

5. Click **Regenerate**.
   The regenerate process is initiated.
6. On the certificate topology view, click **Approve** to proceed.



7. In the **Approve** dialog box, enter your **Comments**.
8. Click **Yes**.
9. If the workflow request has to be approved automatically in the future, click **Schedule later**.
   a. Select the **Implementation Time** from the calendar field.
   b. Enter the comments in the field.
   c. Click **Yes**.
   The approval process is initiated.
10. On the certificate topology view, click the **Implement** button to proceed.
11. In the **Implement** dialog box, enter your **Comments.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. Click **Yes**.
13. If the workflow request has to be approved automatically in the future, click **Schedule later**.
    a. Select the **Implementation Time** from the calendar field.
    b. Enter the comments in the field.
    c. Click **Yes**.

    After the certificate regeneration is complete, the status updates to **Completed**.

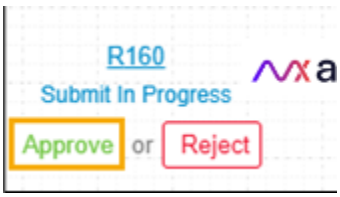
Regenerating a Client Certificate

Important: The **Regenerate Certificate** CLM action is displayed only for authorized user roles. For more context, refer to the **Configuring Role and Resource-Based Access Control** and **Creating a Role** sections in the Platform User Guide.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
   The **Client Certificate** page is displayed.
2. To regenerate a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Regenerate**.
   The **Client Certificate > Regenerate** page is displayed.
4. On the **Client Certificate > Regenerate** page, modify the required details in the **General Information**, **CA Details**, **CSR Parameters**, **Attachments**, **Generic Fields**, **Vendor-Specific Details**, and **Custom Attributes** sections.

   Note: For instructions on entering inputs in the above sections, click here.

5. Click **Regenerate**.
   The regenerate process is initiated.
6. On the certificate topology view, click **Approve** to proceed.



7. In the **Approve** dialog box, enter your **Comments**.
8. Click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. If the workflow request has to be approved automatically in the future, click **Schedule later**.
   a. Select the **Implementation Time** from the calendar field.
   b. Enter the comments in the field.
   c. Click **Yes**.

   The approval process is initiated.
10. On the certificate topology view, click the **Implement** button to proceed.
11. In the **Implement** dialog box, enter your **Comments.**
12. Click **Yes**.
13. If the workflow request has to be approved automatically in the future, click **Schedule later**.
    a. Select the **Implementation Time** from the calendar field.
    b. Enter the comments in the field.
    c. Click **Yes**.

    After the certificate regeneration is complete, the status updates to **Completed**.

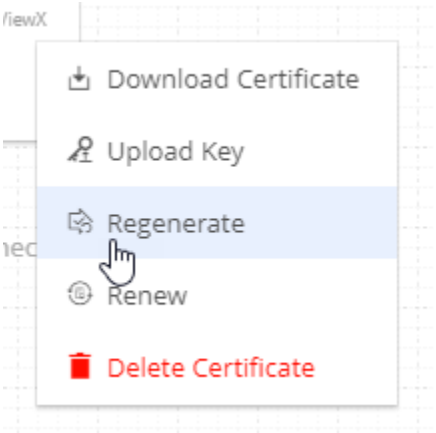
Regenerating a Code Signing Certificate

> **Important:** The **Regenerate Certificate** CLM action is displayed only for authorized user roles. For more context, refer to the **Configuring Role and Resource-Based Access Control** and **Creating a Role** sections in the Platform User Guide.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.

   The **Code Signing Certificate** page is displayed.
2. To regenerate a certificate, under **Common Name**, select the required certificate name.

   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Regenerate**.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Code Signing Certificate > Regenerate** page is displayed.

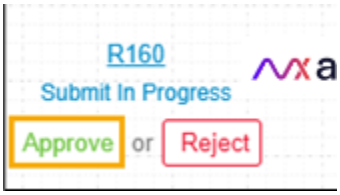
4. On the **Code Signing Certificate > Regenerate** page, modify the required details in the **General Information**, **CA Details**, **CSR Parameters**, **Attachments**, **Generic Fields**, **Vendor-Specific Details**, and **Custom Attributes** sections.

> **Note:** For instructions on entering inputs in the above sections, click here.

5. Click **Regenerate**.

   The regenerate process is initiated.

6. On the certificate topology view, click **Approve** to proceed.



7. In the **Approve** dialog box, enter your **Comments**.
8. Click **Yes**.
9. If the workflow request has to be approved automatically in the future, click **Schedule later**.
   a. Select the **Implementation Time** from the calendar field.
   b. Enter the comments in the field.
   c. Click **Yes**.

   The approval process is initiated.

10. On the certificate topology view, click the **Implement** button to proceed.
11. In the **Implement** dialog box, enter your **Comments.**
12. Click **Yes**.
13. If the workflow request has to be approved automatically in the future, click **Schedule later**.
    a. Select the **Implementation Time** from the calendar field.
    b. Enter the comments in the field.
    c. Click **Yes**.

    After the certificate regeneration is complete, the status updates to **Completed**.

Tracking Certificate Regeneration via the Process Explorer

The **Process Explorer** is a listing of all certificates scheduled for regeneration on present day and certificates awaiting approval for regeneration. Once a certificate is regenerated, it is removed from this listing. The **Process Explorer** is useful for monitoring the regeneration status.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To access the process explorer:

Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Regenerate Certificate** > **Process Explorer**.

Important: The **Regenerate Certificate** CLM action is displayed in the CERT+ menu only for authorized user roles. For more context, refer to the **Configuring Role and Resource-Based Access Control** and **Creating a Role** sections in the Platform User Guide.

The **Regenerate Certificate** page with the listings is displayed.

Enabling Auto Regeneration for Certificates

Enabling Auto Regeneration for a Certificate Group

You can enable and configure the auto regeneration feature at the certificate group level, which will apply to all certificates assigned to that group.

For details and instructions to enable auto regeneration at the certificate group level, click here.

Enabling Auto Regeneration at the Certificate Level

Enabling Auto Regenerate for Certificate Enrollment

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

For details and instructions to enable auto regeneration at the time of server certificate enrollment, click here.

Enabling Auto Regenerate for Discovered Certificates

While you can enable auto regenerate for all types of certificates, for clarity, in this section, we'll look at the instructions for enabling auto regenerate for a server certificate.

1. Go to **Menu** > **CERT+** > **Certificate Inventory** > **Server**.
   The **Server Certificate** inventory is displayed.
2. From the inventory, for the certificate you want to enable auto push for, click the common name.
   The holistic view of the selected certificate is displayed.
3. For an existing CA connector for the certificate, hover over ⋯.
4. From the menu displayed, click **Edit**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The certificate details are displayed.

5. Under **CA Details**, turn on the **Regenerate Automatically** toggle.
6. In the **Start Regenerating** field, enter the number of days before expiration when the certificate should be regenerated.
7. Click **Update**.
   The holistic view of the selected certificate is displayed.

> **Note:** For the auto regenerate process to take effect, set the auto push in the application connector. Refer to the Enabling Auto Push section.

What's Next?

For automating the certificate lifecycle management, in addition to auto regeneration, you can:

- Enable auto renewal of certificates.
- Enable auto push of certificates to endpoints. To do this, add an application connector to push the certificate to an AWS device and select the **Push Automatically** checkbox.
- Set alerts to be notified of all events and statuses of the certificates.

Reinstating Certificates

Reinstate is an action that can be applied only on the suspended certificate. Suspend is a temporary revocation of a certificate where the user is unsure about certificate usage. Once reinstated, the certificate will get resumed to serve its purpose normally. The suspend and reinstate are the actions supported only by a few CAs such as Microsoft, Entrust, and so on.

> **Note:** Only the certificates issued by the Microsoft and EJBCA certificate authorities can be reissued.

- Reinstating a Server Certificate
- Reinstating Client Certificate
- Reinstating Code Signing Certificate

Reinstating a Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To reinstate a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Reinstate**.
   The **Certificate Reinstate** dialog box is displayed.
4. In the **Certificate Reinstate** dialog box, from the dropdown list, select a reason for reinstating the certificate.
5. Enter you **Comments** in the text field and click **Yes**.

Reinstating Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
   The **Client Certificate** page is displayed.
2. To reinstate a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Reinstate**.

   The **Certificate Reinstate** dialog box is displayed.
4. In the **Certificate Reinstate** dialog box, from the dropdown list, select a reason for reinstating the certificate.
5. Enter you **Comments** in the text field and click **Yes**.

Reinstating Code Signing Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
   The **Code Signing Certificate** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. To reinstate a certificate,under **Common Name**, select the required certificate name.
   The certificate topology view for the selected certificate is displayed.
3. From the **(More)** menu for the certificate, click **Reinstate**.

   The **Certificate Reinstate** dialog box is displayed.
4. In the **Certificate Reinstate** dialog box, from the dropdown list, select a reason for reinstating the certificate.
5. Enter you **Comments** in the text field and click **Yes**.

Duplicating Certificates

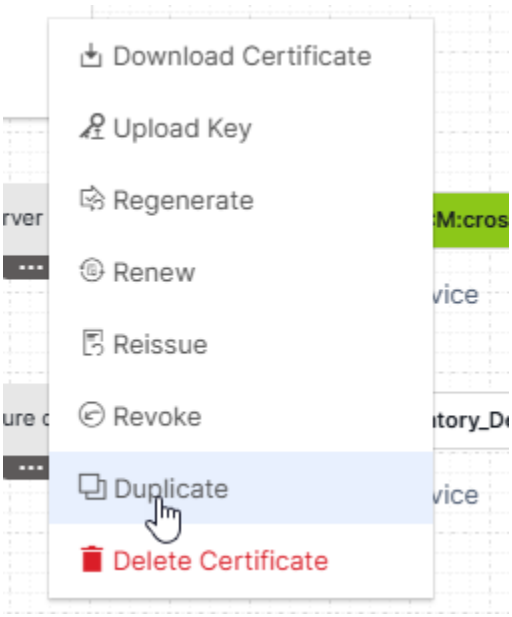
Certificate duplication refers to the process of creating a copy of an existing certificate while maintaining its original attributes and key usage information. This action is typically used when a new certificate with similar properties is required for a different application or system without altering or renewing the original certificate.

Important: Currently, this feature is supported for only DigiCert certificates. For the full list of DigiCert certificate types that can be duplicated, click here.

To duplicate a certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. To open the holistic view of a certificate, under **Common Name**, select the required certificate name.
3. From the **(More)** menu for the certificate, click **Duplicate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The **Server Certificate > Duplicate** page is displayed for the selected certificate.

For duplicating a certificate:

- The uneditable fields are displayed, which means these are attributes you cannot change for a duplicate certificate.

  For field descriptions of the editable fields, click here.
- While the common name for the duplicate certificate can be updated, it is valid only if it conforms with the SAN/DNS selected for the parent certificate.
- A duplicate certificate can only be:
  - Downloaded
  - Duplicated
  - Revoked (at the certificate level as well as at the order level)

4. Click **Duplicate**.
   The message **Cert duplicate triggered successfully** is displayed.

   You will be redirected to the holistic view of the certificate.
5. Refresh to view the certificate in the holistic view and the certificate inventory.

DigiCert CA Certificate Types Supported for Duplication

Currently, only the following DigiCert CA certificate types can be duplicated:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- GeoTrust TrueBusiness ID OV
- Thawte SSL Webserver EV
- Thawte SSL Webserver OV
- Private Multi-Domain SSL
- Private SSL Wildcard
- Private SSL OV

Running Revocation Check-OCSP

A sophisticated method of detecting revoked certificates is the Online Certificate Status Protocol (OCSP). Instead of downloading and parsing the entire CRL, the client can send the certificate in question to the CA. And then, the CA replies status of the certificate is good, revoked, or unknown. This method involves far less overhead than CRL and is also more reliable.

- Running Revocation Check for Server Certificate
- Running Revocation Check for Client Certificate
- Running Revocation Check for Device Certificate
- Running Revocation Check for Code Signing Certificate

Running Revocation Check for Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revocation Check - OCSP** > **Server**. The **Server Certificate** page is displayed.
2. To run the revocation check for a certificate,under **Common Name**, select the checkbox corresponding to the required certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Tip:** You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **Revocation Check**.
   The **Revocation Check** dialog box is displayed.
4. To perform revocation validation, in the **Revocation Check** dialog box, click **OK**.
   Revocation check for the selected certificate(s) will be initiated.

   Once the revocation has been validated, the color code (displayed along with the **Common name** of the certificate) will be updated.

   The status of the revoked certificate is displayed in the **Valid to (GMT)** column.

Running Revocation Check for Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revocation Check - OCSP** > **Client**.
   The **Client Certificate** page is displayed.
2. To run the revocation check for a certificate,under **Common Name**, select the checkbox corresponding to the required certificate.

> **Tip:** You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **Revocation Check**.
   The **Revocation Check** dialog box is displayed.
4. To perform revocation validation, in the **Revocation Check** dialog box, click **OK**.
   Revocation check for the selected certificate(s) will be initiated.

   Once the revocation has been validated, the color code (displayed along with the **Common name** of the certificate) will be updated.

   The status of the revoked certificate is displayed in the **Valid to (GMT)** column.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Running Revocation Check for Device Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revocation Check - OCSP** > **Device**.
   The **Server Certificate** page is displayed.
2. To run the revocation check for a certificate,under **Common Name**, select the checkbox corresponding to the required certificate.

   Tip: You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **Revocation Check**.
   The **Revocation Check** dialog box is displayed.
4. To perform revocation validation, in the **Revocation Check** dialog box, click **OK**.
   Revocation check for the selected certificate(s) will be initiated.

   Once the revocation has been validated, the color code (displayed along with the **Common name** of the certificate) will be updated.

   The status of the revoked certificate is displayed in the **Valid to (GMT)** column.

Running Revocation Check for Code Signing Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Revocation Check - OCSP** > **Code Signing Certificate**.
   The **Code Signing Certificate** page is displayed.
2. To run the revocation check for a certificate,under **Common Name**, select the checkbox corresponding to the required certificate.

   Tip: You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **Revocation Check**.
   The **Revocation Check** dialog box is displayed.
4. To perform revocation validation, in the **Revocation Check** dialog box, click **OK**.
   Revocation check for the selected certificate(s) will be initiated.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once the revocation has been validated, the color code (displayed along with the **Common name** of the certificate) will be updated.

The status of the revoked certificate is displayed in the **Valid to (GMT)** column.

Generating Certificate Signing Request (CSR)

CERT+ can be used as a CSR generation tool where you can choose either the keys that can be generated in the filesystem or any HSM device integrated with AppViewX. CSR, or Certificate Signing Request, consists of requester info in a standardized way. Based on an organization's needs and the business model, the CSR generation and approval flow can be customized.

- Generating Manual CSR for Server Certificate
- Generating Manual CSR for Code Signing Certificate

Generating Manual CSR for Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Generate CSR** > **Server**.
   The **Generate CSR : Server** page is displayed.
2. In the **Group details** section, from the **Assign Group** dropdown list, select the group of certificates you want to assign the CSR to.
3. Enter the **CSR details**.

Field descriptions for the CSR details section

Option	Description
***CSR Selection**	Select the key generation of CSR as required. The possible selections are: • AppViewX • HSM
***Device Type**	Select the type of device as required: Options are: • **HSM Devices** • **ADC Devices**
***Device**	Select the device from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Option	Description
***Key Handler Name**	Enter the name of the key handler.
***Key Reference Name**	Enter the name of the key reference.
***Common Name**	Name that is to be present in the certificate. **Note:** No special characters allowed except en dash (_) and hyphen (-).
Subject Alternative Name	Enter the alternative subject name. For example, DNS or IP address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property window from the holistic view.
***Organization**	The Organization name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	The Organization Unit name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The Locality name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The State name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	The Country name that is to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a two-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Validity**	Enter the number in this field and select the entered validity list to be in **Days**, **Months**, and **Years** from the dropdown lists.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Option	Description
Challenge Password	The challenge password for the certificate. Enter if it is applicable. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	The password to confirm the Challenge Password entered and match with the Challenge Password.
***Hash Function**	The Hash function with which the CSR has to be signed. For Microsoft Enterprise CA, the targeted CA decides the hash function while issuing the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
**: Mandatory fields*	

4. In the **Attachments** section, upload any attachments relevant to the CSR generation process.

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the **Upload** button to select the file.
Note: Maintains if there are any additional documents to be maintained in AppViewX. These documents will not be submitted to CA. It is a non-mandatory section.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Tip: You can use **the Search** option to find the attachments from the attachment list.

5. To generate the CSR and add it to the intended group, click **Add**.

Generating Manual CSR for Code Signing Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **Generate CSR** > **Code Signing Certificate**.
   The **Generate CSR : Code Signing** page is displayed.
2. In the **Group details** section, from the **Assign Group** dropdown list, select the group of certificates you want to assign the CSR to.
3. Enter the **CSR details**.

Field descriptions for the CSR details section

Option	Description
***CSR Selection**	Select the key generation of CSR as required. The possible selections are: • AppViewX • HSM.
***Device Type**	Select the type of device as required: Options are: • **HSM Devices** • **ADC Devices.**
***Device**	Select the device from the dropdown list.
***Key Handler Name**	Enter the name of the key handler.
***Key Reference Name**	Enter the name of the key reference.
***Common Name**	Name that is to be present in the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Option	Description
	Note: No special characters allowed except en dash (_) and hyphen (-).
Subject Alternative Name	Enter the alternative subject name. For example, DNS or IP address. **Note:** • Multiple values must be separated by a comma. • The cumulative count SANs appears in the certificate property window from the holistic view.
***Organization**	The Organization name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Organization Unit	The Organization Unit name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
Locality	The Locality name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
State	The State name that to be present in the certificate. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Country**	The Country name that is to be present in the certificate. This field will be auto-filled and editable based on configuration. It must be a two-letter country code (for example, US, and so on).
Email Address	The email contact details of the person responsible for maintaining the certificate. Enter the valid e-mail address.
***Validity**	Enter the number in this field and select the entered validity list to be in **Days**, **Months**, and **Years** from the dropdown lists.
Challenge Password	The challenge password for the certificate. Enter if it is applicable. Password must contain at least one alphabet (uppercase and lowercase), one number, and one special character.
Confirm Password	The password to confirm the Challenge Password entered and match with the Challenge Password.
***Hash Function**	The Hash function with which the CSR has to be signed. For Microsoft Enterprise CA, the targeted CA decides the hash function while issuing the certificate. This field

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Option	Description
	will be auto-filled and editable based on the configuration in the selected group's policy.
***Key Type**	The key type is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
***Bit Length**	The bit length is used while creating a private and public key pair. This field will be auto-filled and editable based on the configuration in the selected group's policy.
**: Mandatory fields*	

4. In the **Attachments** section, upload any attachments relevant to the CSR generation process.

Field descriptions for the Attachments section

Field	Description
Name	Enter the alternate name for the document to be uploaded.
Comments	Enter the comments in this field. **Note:** Character limit: **2000 characters**
Upload File	Click the **Upload** button to select the file.
Note: Maintains if there are any additional documents to be maintained in AppViewX. These documents will not be submitted to CA. It is a non-mandatory section.	

Tip: You can use **the Search** option to find the attachments from the attachment list.

5. To generate the CSR and add it to the intended group, click **Add**.

Migrating CAs (CA Switch)

The CA Switch feature in the **Inventory** module allows you to re-enroll certificates from one CA to another CA. Once triggered, the certificate migration readiness for every certificate will be shown in the **Process Explorer**, which needs to be validated before the CA switch is performed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Migrating the CA for Server Certificate
• Migrating the CA for Client Certificate
• Migrating the CA for Code Signing Certificates

Migrating the CA for Server Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **CA Switch** > **Server**.
   The **Server Certificate** page is displayed.
2. To run the revocation check for a certificate, under **Common Name**, select the checkbox corresponding to the required certificate.

> **Tip:** You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **CA Switch**.
   The **CA Switch** dialog box is displayed.
4. Enter/Select the switch-related details.

Field descriptions for the CA Switch details

Options	Description
***Target CA**	From the dropdown list, select the target CA for the CA switch operation.
***Settings**	From the dropdown list, select the CA setting that will be applied to the CA switch operation.
***Name**	Enter a unique name for the CA switch operation. This will help to identify the CA switch process within the system. **Constraints**: • Valid special characters for CA switch name: space, **.**, **-**, _ • CA switch name cannot start with a special character.

5. Click **Save**.
   The **CA Switch Summary** page is displayed.

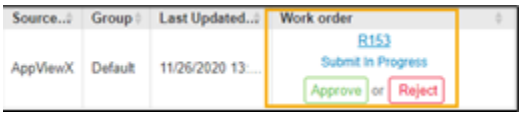
Understanding the CA Switch Summary

Options	Description
	Allows you to delete the certificates from the list if decided not to migrate.
	Refreshes the CA Switch summary page.
	Displays the number of certificates displayed on the current page.
	Allows you to move to the next and previous page if more pages exist.
Search	Searches for the given keyword in the field and results in the feature that matches the search keyword.
Color Coding Status	The color code on the top-right indicates the status of the certificate on the CA Switch summary page.

6. For the certificate you want to migrate, select the corresponding checkbox.
7. In the **Common Name** column, click the eye icon to view certificate details.
8. In the **CSR details** column, click **Update CSR** to review the details.
9. In the **Validation log** column, click **View** to display the events recorded during the CA switch.
10. Click **Submit**.
11. Perform the required actions in the Work order column.



12. In the **Work order** column, click **Approve**.
    The **Approve**dialog box is displayed.
13. If the workflow request has to be approved automatically in the future, click **Schedule later**.
14. Select the **Implementation Time** from the calendar field.
15. Enter the **Comments**.
16. Click **Yes**.
17. In the **Work order** column, click the status if you want to see the **Summary** and **Details** of the progress.
    The **View Work order Status** page is displayed.

18. In the **Work order** column, click **Implement**.
    The **Implement** dialog box appears.
19. If the workflow request has to be approved automatically in the future, click **Schedule later**.
20. Select the **Implementation Time** from the calendar field.
21. Enter the **Comments** in the field.
22. Click **Yes**.
23. In the **Work order** column, click the status if you want to see the **Summary** and **Details** of the progress.
    The **View Work order Status** page is displayed.
24. Click the refresh icon on the top-right of the page to update the Work Order status.
    After the CA Switch is completed, the Work order status changes to **Completed**.

Bulk Migrating the CA for Server Certificates

Important: Currently, the bulk CA switch feature has been enabled only for switching from:

- All CAs to Microsoft CA (Enterprise and Standalone)
- Microsoft CA (Enterprise and Standalone) to Microsoft CA (Enterprise and Standalone)

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **CA Switch** > **Server**.
   The **Server Certificate > Server Certificate** page is displayed.
2. Select the checkboxes corresponding to the certificates for which the CA has to be migrated.
3. From the **Actions** menu, select **CA Switch**.
   The **CA Switch** dialog box is displayed.
4. Enter/Select the switch-related details.

Field descriptions for the CA Switch details

Options	Description
***Target CA**	From the dropdown list, select **Microsoft Enterprise CA**/**Microsoft Standalone CA**.
***Settings**	From the dropdown list, select the CA setting that will be applied to the CA switch operation.
***Name**	Enter a unique name for the CA switch operation. This will help to identify the CA switch process within the system.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options	Description
	Constraints: • Valid special characters for CA switch name: space, **.**, **-**, _ • CA switch name cannot start with a special character.

5. Click **Save**.
   The **CA Switch Summary** page is displayed.

   This page lists all the CA switch requests pending approval.
6. To bulk approve CA switch requests, select the checkboxes corresponding to the required requests.
   The **Bulk Update CSR** and **Actions** buttons are enabled.
7. Click **Bulk Update CSR**.
   The **Update Connector Details** dialog box is displayed.
8. Update the connector details, as required.
9. Click **Update**.
   You will be redirected to the CA switch summary page. The **Certificate Status** is updated to **Ready to migrate**.
10. Select the required CA switch requests.
11. Click **Submit**.
    The message **Selected certificates have been submitted.** is displayed.

    Work order details of the selected requests are updated to display the work order number, and the **Approve** and **Reject** buttons.
12. Select the required CA switch requests.
13. To approve the CA switch request, from the **Actions** menu, select **Proceed Further**.
14. In the **Confirmation** dialog box displayed, click **Yes**.
15. To implement the CA switch requests, from the **Actions** menu, again, select **Proceed Further**.
16. In the **Confirmation** dialog box displayed, click **Yes**.
17. Once the CA switch requests are processed, the **Work Order status** is updated to **Completed**.

Migrating the CA for Client Certificate

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **CA Switch** > **Client**.
   The **Client Certificate** page is displayed.
2. To run the revocation check for a certificate,under **Common Name**, select the checkbox corresponding to the required certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Tip: You can run the revocation check for more than one certificate at the same time. To do this, select the checkboxes corresponding to all the required certificates.

3. From the **Actions** menu, select **CA Switch**.
   The **CA Switch** dialog box is displayed.
4. Enter/Select the switch-related details.

Field descriptions for the CA Switch details

Options	Description
***Target CA**	From the dropdown list, select the target CA for the CA switch operation.
***Settings**	From the dropdown list, select the CA setting that will be applied to the CA switch operation.
***Name**	Enter a unique name for the CA switch operation. This will help to identify the CA switch process within the system. **Constraints**: • Valid special characters for CA switch name: space, **.**, **-**, _ • CA switch name cannot start with a special character.

5. Click **Save**.
   The **CA Switch Summary** page is displayed.

Understanding the CA Switch Summary

8. Update the connector details, as required.
9. Click **Update**.
   You will be redirected to the CA switch summary page. The **Certificate Status** is updated to **Ready to migrate**.
10. Select the required CA switch requests.
11. Click **Submit**.
    The message **Selected certificates have been submitted.** is displayed.

    Work order details of the selected requests are updated to display the work order number, and the **Approve** and **Reject** buttons.
12. Select the required CA switch requests.
13. To approve the CA switch request, from the **Actions** menu, select **Proceed Further**.
14. In the **Confirmation** dialog box displayed, click **Yes**.
15. To implement the CA switch requests, from the **Actions** menu, again, select **Proceed Further**.
16. In the **Confirmation** dialog box displayed, click **Yes**.
17. Once the CA switch requests are processed, the **Work Order status** is updated to **Completed**.

Running the SSL Checker for a Certificate

SSL certificate deployment can be validated using the SSL checker feature in AppViewX. This validates the SSL certificate deployment, trustchain, ciphersuites, and supported TLS versions for a given service endpoint.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE ACTION** > **SSL Checker**.
   The **SSL Checker** page is displayed.
2. Enter the **FQDN** and **IP address** details.
3. Click **Add**.
4. To run the SSL checker, click **Validate**.

Managing the Certificate Inventory

Note: The CERT+ certificate inventory is updated periodically. If you are looking for real-time updates, please refer to the documentation for CERT+ Insights.

The certificate inventory allows you to take inventory of, and proactively manage all your certificates. This will be a single source of truth for all the certificates in the organization. Every certificate action can be performed from the inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Take inventory of all your digital certificates
- Keeps you informed of impending expirations
- Creates certificate tasks via workflows to renew expiring certificates
- Creates incidents for already expired certificates
- Prioritizes certificate importance
- Helps you proactively manage your certificates
- Helps you avoid manually tracking a large volume of certificates
- Prevents security breaches due to expired or expiring certificates

In the Certificate Inventory section, you can:

- enroll a certificate
- renew a certificate
- push to device
- reissue a certificate
- revoke a certificate
- regenerate a certificate
- reinstate a certificate
- revocation check
- upload a certificate
- download a certificate.

- Managing the Server Certificate Inventory
- Managing the Client Certificate Inventory
- Managing the Code Signing Certificate Inventory
- Managing the Device Certificate Inventory
- Managing the Intermediate Certificate Inventory
- Managing the Root Certificate Inventory
- Uploading a Certificate
- Downloading Certificates
- Archiving Certificates

Managing the Server Certificate Inventory

Server certificate inventory is where all the server certificates with the EKU (Extended Key Usage) Server and Client authentication will be present. The certificates in this inventory will be shown to the user only based on role-based access control on the certificate group. From this inventory, the user can select one

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

or many certificates and perform bulk certificate renewal, bulk certificates CA migration, search and filter certificates, export certificates, download certificates, delete certificates, and so on.

On the **Certificate Inventory** > **Server** certificate page, all the server certificates are listed. You can perform the following actions:

Options available on the Server Certificate inventory page

Options	Description
Groups	Expanding this dropdown displays the certificate groups and the number of certificates in each group. Selecting a group will display the filtered list of certificates. Filter Summary	Displays the status of certificates according to expiry, compliance, validity, and so on. Advanced Search	Allows you to perform a quick search for specific data. Clicking on the search bar dropdown opens the **Advanced Search** window.
Actions	Displays the list of actions you can perform on the certificates The following certificate actions are supported:
Columns	Allows you to select the columns to be displayed on the Server Certificate inventory page **Note:** In the current implementation, the **Certificate Type** column is populated for only selected CAs. To populate it for the SwissSign CA, see the instructions here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options available on the Server Certificate inventory page (continued)

Options	Description
Toggle	Allows you to toggle between the following display options for the Server Certificate inventory: • **Reports**: Displays reports related to server certificates. For more information, click here. • **List**: Displays the list of server certificates.

The list of actions you can perform on the certificates are:

- Export Certificates - To export the server certificate.
- Download Certificates - To download a certificate from an inventory to a file (the private key, root, and intermediate certificates can be included in the download.
- Delete - To delete the server certificate.
- Change Status - To change the server certificate status.
- Assign Group - To assign a group to the certificate.
- Unassign Group - To unassign a group from the certificate.
- Add/Modify Comments - To add/modify comments to the certificate.
- Certificate Attributes - To update the certificate attributes.
- Bulk Update Attributes Value - To update the certificate attributes for certificates.
- Renew Certificates - To renew certificates before expiry.
- Revoke Certificates - To revoke certificates
- CA Switch - Switching to another Certificate Authority (CA) for your SSL needs.
- Revocation Check - To check the revocation status of the certificate.

Populating the Certificate Type Column for the SwissSign CA

In the current implementation, for the SwissSign CA, the certificate type column is not auto populated on display. To populate it:

1. Run the Certificate Authority discovery scan for SwissSign CA.
2. For the discovered certificates, manually modify the status to **Managed** or **Monitored**.

   The certificate type for each SwissSign certificate is added to the column.

   The data is additionally leveraged to generate reports for SwissSign CA, categorized by certificate type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

Once you have discovered certificates, you are ready to proceed with any of the following certificate actions:

- If you want to Auto Renew the Discovered Certificate.
- If you want to Auto Regenerate the Discovered Certificate.
- Exporting a Server Certificate
- Adding/Modifying Comments for Server Certificates
- Editing Server Certificate Details via the Connector
- Deleting Server Certificates
- Changing Server Certificate Status
- Assigning Certificate Group for Server Certificates
- Unassigning Certificate Group from Server Certificates
- Bulk Revoking Server Certificates
- Updating Certificate Attributes for Server Certificates
- Bulk Updating Certificate Attributes

Exporting a Server Certificate

You can export certificate(s) from the Server Certificate inventory in the form of columns and values. These certificates can be exported either in an **.xls** or **.csv** format. This can be used for reporting or making another inventory.

To export a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the certificate that you want to export.
3. From the **Actions** dropdown menu, select **Export Certificates**.
   The **Export** pop-up window is displayed.
4. Select the required **Options** and **Format**.
   The selected certificate is exported to your local machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Adding/Modifying Comments for Server Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. On the **Server Certificate** page, select the certificate that you want to revoke.
3. From the **Actions** dropdown, click **Add/Modify Comments**.
4. In the **Add/Modify Comments** dialog box that is displayed, enter a comment and click **Save**.

Editing Server Certificate Details via the Connector

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Open the holistic view of the certificate you want to edit.
3. In the holistic view, hover over the connector you want to edit.
4. From the menu displayed, click **Edit**.
   The **Server certificate > <certificate name>** page is displayed.
5. Edit the certificate details as required.
   For field descriptions and instructions see Enrolling a Server Certificate.

Deleting Server Certificates

AppViewX lets you delete individual certificates, selected certificates, and all certificates from the server certificate inventory.

Note: Once a certificate is deleted from the inventory, it will not be displayed in any reports and alerts.

Deleting Individual Server Certificates from the Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Server Certificate** inventory, for the certificate(s) you want to delete, select the corresponding checkboxes.
3. From the **Actions** dropdown menu, select **Delete**.

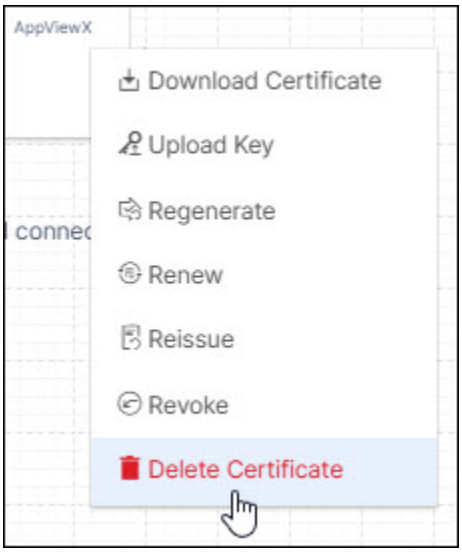
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   The selected certificate(s) will be deleted.

Deleting Individual Certificates from the Holistic View

Note: Via the holistic view, you can delete only one certificate at a time.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Server Certificate** inventory, click the **Common Name** of the certificate you want to delete.
   The holistic view of the selected certificate is displayed.
3. Hover your mouse over the (**More**) icon and from the menu displayed, click **Delete Certificate**.

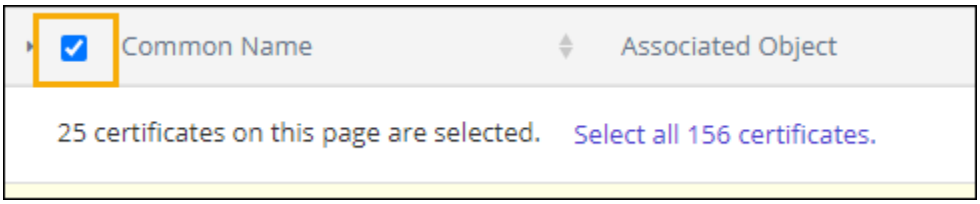


4. In the **Confirmation** dialog box that is displayed, click **Yes**.
   The server certificate is deleted from the AppViewX inventory.

Deleting all Server Certificates

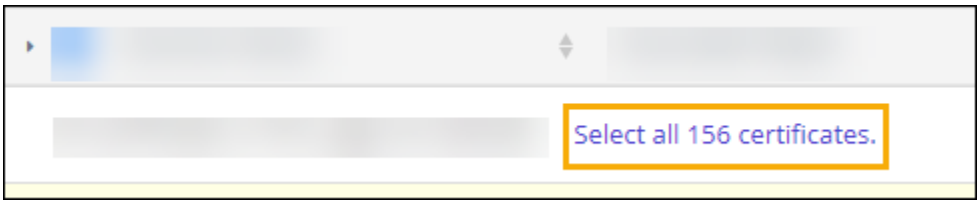
1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. In the **Server Certificate** inventory, select the checkbox next to the **Common Name** field label.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

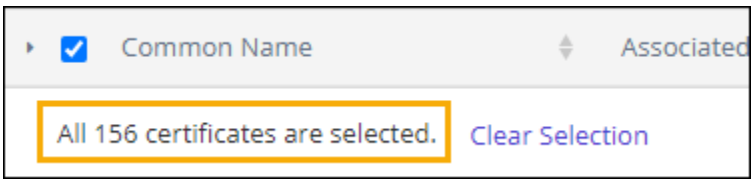


All certificates on the current page are selected.

3. To select all certificates in the server certificate inventory, click **Select all <no. of certificates> certificates**.



This will select all certificates across all pages in the server certificate inventory.



4. From the **Actions** dropdown menu, select **Delete**.
5. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   All certificates in the server certificate inventory are deleted.

> **Note:** The **Select all <no. of certificates> certificates** option does not allow deselecting individual certificates. If, after selecting all the certificates, you deselect a few certificates, only the remaining certificates on the current page will remain selected. The certificates on the other pages of the inventory will be deselected automatically.
>
> **Example**: Assume you have 150 certificates in your inventory and each page is set to display 25 records. If you select all 150 certificates and then deselect two certificates from the first page, only the remaining 23 certificates on the first page will be selected. The other 125 certificates will be deselected.

Changing Server Certificate Status

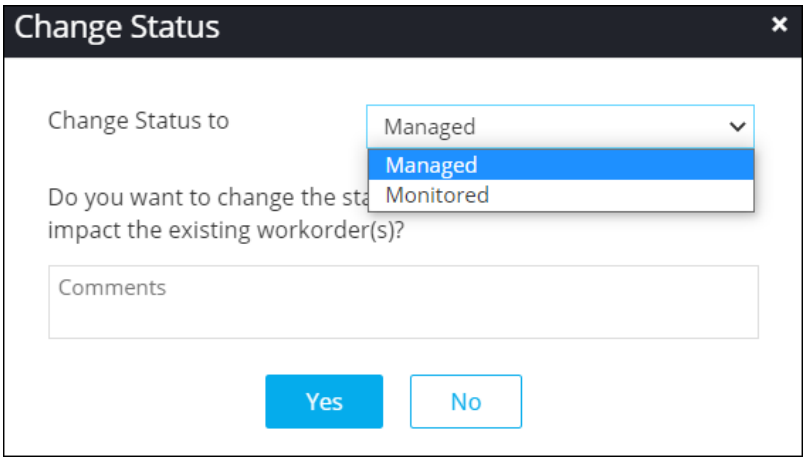
The status of a certificate can be set as monitored or managed during or after the certificate discovery process and also from the certificate inventory directly. When the certificates are set as Monitored, you can only view the certificate details in reports and in the inventory. When the certificates are set as

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Managed, the certificate-related actions along with push/bind operations can be performed along with viewing of the certificates in the reports and inventory.

To change the server certificate status:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the certificate for which you want to change the status.
3. From the **Actions** dropdown, click **Change Status**.
4. In the **Change Status** pop-up window that is displayed, in the **Change Status to** field, select the status of the certificate field as **Managed** or **Monitored**.



5. Enter the reason for changing the status, if required, and click **Yes**.
   The certificate status is changed as per the selection.

Assigning Certificate Group for Server Certificates

The certificates with common attributes can be grouped together to perform compliance checks against policy details, to enable auto-renewal and auto-push operations. You can also view certificates as groups.

To assign a server certificate to a group:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the certificate that you want to assign to a group to.
3. From the **Actions** dropdown, click **Assign Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **Assign to Group** pop-up window that is displayed, search for the group that you want this certificate to be assigned to.
5. Select the required certificate group.
6. Enter a reason for assigning the certificate to the selected certificate group, if required, and click **Assign**.
   The certificate is assigned to the selected group.

Unassigning Certificate Group from Server Certificates

You can unassign any certificates from a specific certificate group to the default group. The policy and actions of the default group will be applied to these certificates.

To unassign a certificate group assigned to a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. On the **Server Certificate** page, select the certificate that you want to unassign from a certificate group.
3. From the **Actions** dropdown, click **Unassign Group**.
4. In the **Unassign Group** window that is displayed, enter the reason for unassigning the certificate from the group and click **Unassign**.
   The selected certificate is now assigned to the default group.

Bulk Revoking Server Certificates

Note: For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

To bulk revoke server certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. Select the checkbox for the required certificate.
3. Click **Actions**, and then select **Revoke Certificate** from the list.
   The certificate revoke dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The following table describes the options available on the revoke certificate page:

Field descriptions for certificate revoke

Field	Description
***Reason**	The required option from the dropdown list. The possible options are, • **Key Compromise** • **Affiliation Changed** • **Superseded** • **Cessation of Operation**.
Comments	Enter any additional comments, if required.
**: Mandatory fields*	

4. Click **Yes**.

Updating Certificate Attributes for Server Certificates

Other than the fields that are defined for CSR, you can add organization-specific values to a request. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes.

To update the certificate attribute for a server certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. On the **Server Certificate** page, select the certificate for which you want to update attributes.
3. From the **Actions** dropdown, click **Certificate Attributes**.
4. Update the **Certificate Attributes** and click **Save**.

Bulk Updating Certificate Attributes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Bulk Updating Attributes using a CSV File

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **File Upload**.
4. Click **Download Template**.
   A **.csv** file will be downloaded to your system. This file has the format in which you need to specify the attributes and their corresponding updated values (along with the certificate identification details).
5. In the **Upload File** field, click **Upload**.
6. Navigate to the location where the updated **.csv** file is saved on your system and upload the file.
7. Click **Save**.

Bulk Updating Attributes for a Certificate Group

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **Based on Certificate Group**.
4. From the dropdown list, select the required **Certificate Group**.
5. From the dropdown list, select one or more **Cert Attributes** that you want to update.
   Corresponding text/list fields are displayed depending on the **Cert Attributes** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Enter the required value for each attribute selected in the corresponding field.
7. Click **Save**.

Downloading Failed Updates

From the **Bulk Update Attributes Value** dialog box, to view failed bulk updates to the certificate attributes, click **Download Failed Updates**.
A **.csv** file with a log of the failed updates is downloaded to your local system.

Managing the Client Certificate Inventory

Client certificate inventory displays all the client certificates with the EKU (Extended/enhanced key usage) client authentication, email protection. The certificates in this inventory will be shown to the user only based on role-based access control on the certificate group. From this inventory, the user can select one or many certificates and perform action such as bulk certificates renewal/revocation check/CA migration, search and filter certificates, export certificates, download certificates, delete certificates, and so on.

On the **Certificate Inventory** > **Client** certificate page, all the client certificates are listed. You can perform the following actions:

Options available on the Client Certificate inventory page

Options	Description
Groups	Expanding this dropdown displays the certificate groups and the number of certificates in each group. Selecting a group will display the filtered list of certificates. Filter Summary	Displays the status of certificates according to expiry, compliance, validity, and so on. 
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options available on the Client Certificate inventory page (continued)

Options	Description
Advanced Search	Allows you to perform a quick search for specific data. Clicking on the search bar dropdown opens the **Advanced Search** window.
Actions	Displays the list of actions you can perform on the certificates.
Columns	Allows you to select the columns to be displayed on the Client Certificate inventory page **Note:** In the current implementation, the **Certificate Type** column is populated for only selected CAs. To populate it for the SwissSign CA, see the instructions here.
Toggle	Allows you to toggle between the following display options for the Client Certificate inventory: • **Reports**: Displays reports related to client certificates. For more information, click here. • **List**: Displays the list of client certificates.

The list of actions you can perform on the certificates are:

- Export Certificates - To export the server certificate.
- Download Certificates - To download a certificate from an inventory to a file (the private key, root, and intermediate certificates can be included in the download.
- Delete - To delete the server certificate.
- Change Status - To change the server certificate status.
- Assign Group - To assign a group to the certificate.
- Unassign Group - To unassign a group from the certificate.
- Add/Modify Comments - To add/modify comments to the certificate.
- Certificate Attributes - To update the certificate attributes.
- Bulk Update Attributes Value - To update the certificate attributes for certificates.
- Renew Certificates - To renew certificates before expiry.
- Revoke Certificates - To revoke certificates
- CA Switch - Switching to another Certificate Authority (CA) for your SSL needs.
- Revocation Check - To check the revocation status of the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Populating the Certificate Type Column for the SwissSign CA

In the current implementation, for the SwissSign CA, the certificate type column is not auto populated on display. To populate it:

1. Run the Certificate Authority discovery scan for SwissSign CA.
2. For the discovered certificates, manually modify the status to **Managed** or **Monitored**.

   The certificate type for each SwissSign certificate is added to the column.

   The data is additionally leveraged to generate reports for SwissSign CA, categorized by certificate type.

What's Next

Once you have discovered certificates, you are ready to proceed with any of the following certificate actions:

- If you want to Auto Renew the Discovered Certificate.
- If you want to Auto Regenerate the Discovered Certificate.
- Exporting a Client Certificate
- Adding/Modifying Comments for Client Certificates
- Editing Client Certificate Details via the Connector
- Deleting Client Certificates
- Changing Client Certificate Status
- Assigning Certificate Group to Client Certificates
- Unassigning Certificate Group from Client Certificates
- Bulk Revoking Client Certificates
- Updating Certificate Attributes for Client Certificates
- Bulk Updating Certificate Attributes

Exporting a Client Certificate

Export certificate action allows the user to export certificate details in the form of columns and values. The user can export all the certificates in the inventory or select only specific certificates and export. The output of this action can be selected in **.xls** or **.csv** format. This can be used for reporting or creating an inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To export a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
   The **Server Certificate** page is displayed.
2. On the **Client Certificate** page, select the certificate that you want to export.
3. From the **Actions** dropdown menu, select **Export Certificates**.
   The **Export** dialog box is displayed.
4. Select the required **Options** and **Format**.
   The selected certificate is exported to your local machine.

Adding/Modifying Comments for Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. On the **Client Certificate** page, select the certificate that you want to revoke.
3. From the **Actions** dropdown, click **Add/Modify Comments**.
4. In the **Add/Modify Comments** pop-up window that is displayed, enter a comment and click **Save**.

Editing Client Certificate Details via the Connector

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
   The **Client Certificate** page is displayed.
2. Open the holistic view of the certificate you want to edit.
3. In the holistic view, hover over the connector you want to edit.
4. From the menu displayed, click **Edit**.
   The **Client certificate > <certificate name>** page is displayed.
5. Edit the certificate details as required.
   For field descriptions and instructions see Enrolling a Client Certificate.

Deleting Client Certificates

AppViewX lets you delete individual certificates, selected certificates, and all certificates from the server certificate inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Once a certificate is deleted from the inventory, it will not be displayed in any reports and alerts.

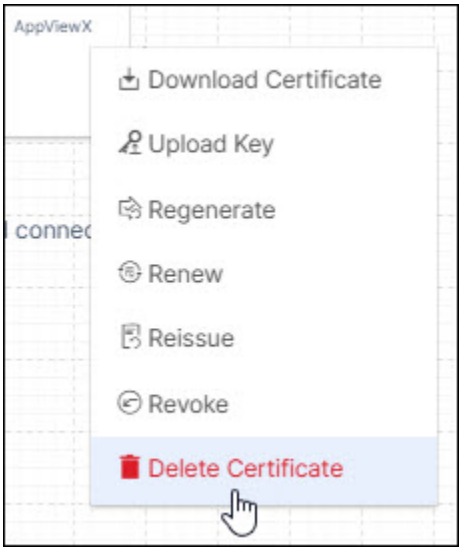
Deleting Individual Client Certificates from the Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. From the **Client Certificate** inventory, for the certificate(s) you want to delete, select the corresponding checkboxes.
3. From the **Actions** dropdown menu, select **Delete**.
4. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   The selected certificate(s) will be deleted.

Deleting Client Certificates from the Holistic View

Note: Via the holistic view, you can delete only one certificate at a time.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. From the **Client Certificate** inventory, click the **Common Name** of the certificate you want to delete.
   The holistic view of the selected certificate is displayed.
3. Hover your mouse over the (**More**) icon and from the menu displayed, click **Delete Certificate**.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

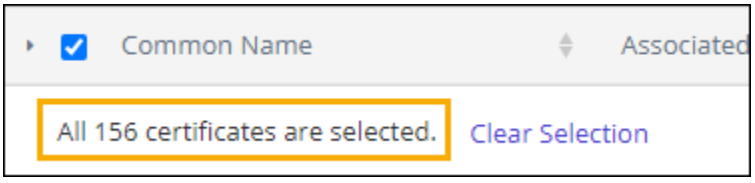
4. In the **Confirmation** dialog box that is displayed, click **Yes**.
   The client certificate is deleted from the AppViewX inventory.

Deleting all Client Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. In the **Client Certificate** inventory, select the checkbox next to the **Common Name** field.

   All certificates on the current page are selected.
3. To select all certificates in the client certificate inventory, click **Select all <no. of certificates> certificates**.

   This will select all certificates across all pages in the client certificate inventory.



4. From the **Actions** dropdown menu, select **Delete**.
5. From the **Delete Certificate** confirmation dialog box, click **Yes**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

All certificates in the client certificate inventory are deleted.

Note: The **Select all <no. of certificates> certificates** option does not allow deselecting individual certificates. If, after selecting all the certificates, you deselect a few certificates, only the remaining certificates on the current page will remain selected. The certificates on the other pages of the inventory will be deselected automatically.

Example: Assume you have 150 certificates in your inventory and each page is set to display 25 records. If you select all 150 certificates and then deselect two certificates from the first page, only the remaining 23 certificates on the first page will be selected. The other 125 certificates will be deselected.

Changing Client Certificate Status

The status of a certificate can be set as monitored or managed during or after the certificate discovery process and also from the certificate inventory directly. When the certificates are set as Monitored, you can only view the certificate details in reports and in the inventory. When the certificates are set as Managed, the certificate-related actions along with push/bind operations can be performed along with viewing of the certificates in the reports and inventory.

To change the client certificate status:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. On the **Client Certificate** page, select the certificate for which you want to change status.
3. From the **Actions** dropdown, click **Change Status**.
4. In the **Change Status** pop-up window that is displayed, in the **Change Status to** field, select the status of the certificate field as **Managed** or **Monitored**.
5. Enter the reason for changing the status, if required, and click **Yes**.
   The certificate status is changed as per the selection.

Assigning Certificate Group to Client Certificates

The certificates with common attributes can be grouped together to perform compliance checks against policy details, to enable auto-renewal and auto-push operations. You can also view certificates as groups.

To assign a client certificate to a group:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. On the **Client Certificate** page, select the certificate that you want to assign to a group.
3. From the **Actions** dropdown, click **Assign Group**.
4. In the **Assign to Group** pop-up window that is displayed, search for the group that you want this certificate to be assigned to.
5. Select the required certificate group.
6. Enter a reason for assigning the certificate to the selected certificate group, if required, and click **Assign**.

   The certificate is assigned to the selected group.

Unassigning Certificate Group from Client Certificates

The user can unassign any certificates from the specific group to the default group. The policy and actions of the default group will be applied to these certificates.

To unassign a certificate group assigned to a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.

   The **Client Certificate** page is displayed.
2. In the **Common Name** column certificate list, select the desired certificate(s) that you want to unassign the certificate group.
3. Click the **List** toggle button on the right top corner of the client certificate page.
4. Click **Actions**, and then select **Unassign Group** from the drop-down list.
5. The selected certificate is assigned to the default group.

   The following message is displayed: **<certificate_name> assign to undefined**.

Bulk Revoking Client Certificates

Note: For the DevOps users, the issuing CA may disable the revoke action. In this case, a pop-up message, informing the user of this, is displayed. For enterprise users, the revoke action is enabled.

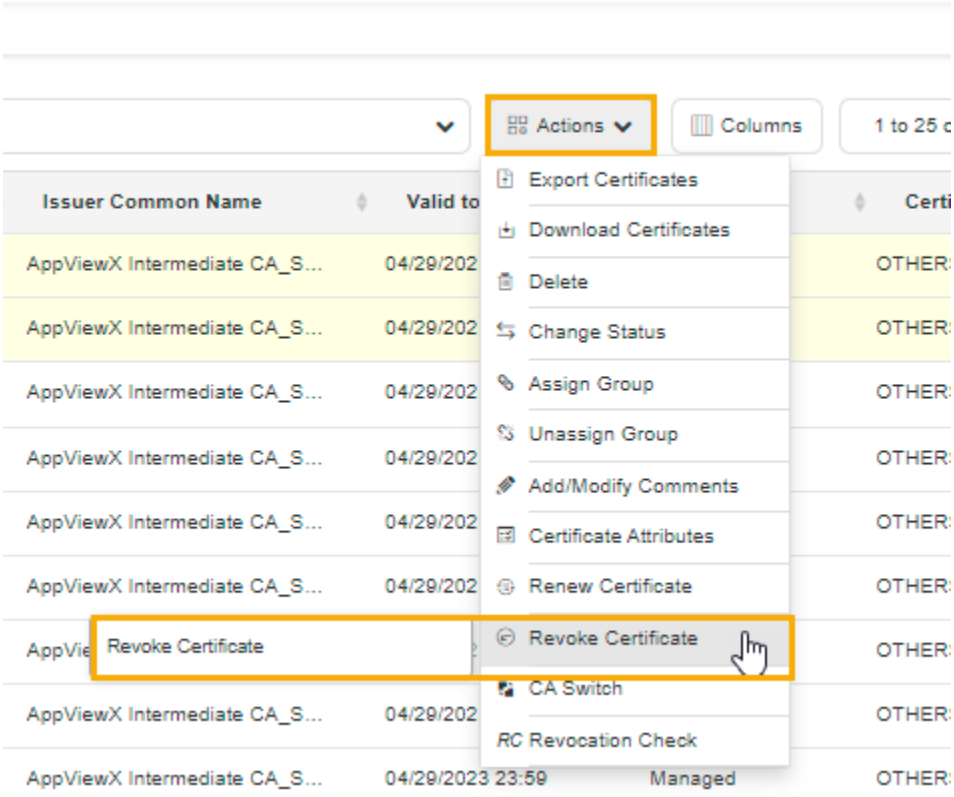
To bulk revoke a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.

   The **Client Certificate** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click the **List** toggle button on the right top corner of the server certificate page.



3. Select the required certificate check box.
4. Click **Actions**, and then select **Revoke Certificate** from the list.

   The certificate revoke dialog box is displayed.

   The following table describes the options available on the revoke certificate page:

Field description for certificate revoke

Field	Description
***Reason**	The required option from the dropdown list. The possible options are: • **Key Compromise** • **Affiliation Changed** • **Superseded** • **Cessation of Operation**.
Comments	Enter additional details, if required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
*: Mandatory fields	

5. Click **Yes**.

Updating Certificate Attributes for Client Certificates

Other than the fields that are defined for CSR, you can add organization-specific values to a request. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes.

To update the certificate attribute for a client certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
2. On the **Client Certificate** page, select the certificate for which you want to update attributes.
3. From the **Actions** dropdown, click **Certificate Attributes**.
4. Update the **Certificate Attributes** and click **Save**.

Bulk Updating Certificate Attributes

Bulk Updating Attributes using a CSV File

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **File Upload**.
4. Click **Download Template**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A **.csv** file will be downloaded to your system. This file has the format in which you need to specify the attributes and their corresponding updated values (along with the certificate identification details).

5. In the **Upload File** field, click **Upload**.
6. Navigate to the location where the updated **.csv** file is saved on your system and upload the file.
7. Click **Save**.

Bulk Updating Attributes for a Certificate Group

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **Based on Certificate Group**.
4. From the dropdown list, select the required **Certificate Group**.
5. From the dropdown list, select one or more **Cert Attributes** that you want to update.
   Corresponding text/list fields are displayed depending on the **Cert Attributes** selected.
6. Enter the required value for each attribute selected in the corresponding field.
7. Click **Save**.

Downloading Failed Updates

From the **Bulk Update Attributes Value** dialog box, to view failed bulk updates to the certificate attributes, click **Download Failed Updates**.
A **.csv** file with a log of the failed updates is downloaded to your local system.

Managing the Code Signing Certificate Inventory

Code signing certificate inventory displays all the code certificate with the EKU (Extended/enhanced key usage) code signing will be present. The certificates in this inventory will be shown to the user only based on role-based access control on the certificate group. From this inventory, the user can select one or many certificates and perform bulk certificates revocation check, search and filter certificates, export certificates, download certificates, delete certificates, and so on.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On the **Certificate Inventory** > **Code Signing** certificate page, all the code signing certificates are listed. You can perform the following actions:

Options available on the Code Signing Certificate page

Options	Description
Groups	Expanding this dropdown displays the certificate groups and the number of certificates in each group. Selecting a group will display the filtered list of certificates.
Filter Summary	Displays the status of certificates according to expiry, compliance, validity, and so on. Search bar	Allows you to search for a certificate(s) within the server certificate inventory using keywords.
Advanced Search	Allows you to perform a quick search for specific data. Clicking on the search bar dropdown opens the **Advanced Search** window.
Actions	Displays the list of actions you can perform on the certificates.
Columns	Allows you to select the columns to be displayed on the Code Signing Certificate inventory page.
Toggle	Allows you to toggle between the following display options for the Code Signing Certificate inventory: • **Reports**: Displays reports related to Code Signing certificates. For more information, click here. • **List**: Displays the list of server certificates.

The list of actions you can perform on the certificates are:

- Export Certificates - To export the server certificate.
- Download Certificates - To download a certificate from an inventory to a file (the private key, root, and intermediate certificates can be included in the download.
- Delete - To delete the server certificate.
- Change Status - To change the server certificate status.
- Assign Group - To assign a group to the certificate.
- Unassign Group - To unassign a group from the certificate.
- Add/Modify Comments - To add/modify comments to the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Certificate Attributes - To update the certificate attributes.
- Bulk Update Attributes Value - To update the certificate attributes for certificates.
- Revocation Check - To check the revocation status of the certificate.

What's Next

Once you have discovered certificates, you are ready to proceed with any of the following certificate actions:

- If you want to Auto Renew the Discovered Certificate.
- If you want to Auto Regenerate the Discovered Certificate.
- Exporting a Code Signing Certificate
- Adding/Modifying Comments for Code Signing Certificates
- Editing Code Signing Certificate Details via the Connector
- Deleting Code Signing Certificates
- Changing Code Signing Certificate Status
- Assigning Certificate Group for Code Signing Certificates
- Unassigning Certificate Group from Code Signing Certificates
- Updating Certificate Attributes for Code Signing Certificates
- Bulk Updating Certificate Attributes

Exporting a Code Signing Certificate

Export certificate action allows the user to export certificate details in the form of columns and values. The user can export all the certificates in the inventory or select only specific certificates and export. The output of this action can be selected in **.xls** or **.csv** format. This can be used for reporting or creating an inventory.

To export a code signing certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate that you want to export.
3. From the **Actions** dropdown menu, select **Export Certificates**.
   The **Export** dialog box is displayed.
4. Select the required **Options** and **Format**.
   The selected certificate is exported to your local machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Adding/Modifying Comments for Code Signing Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate that you want to revoke.
3. From the **Actions** dropdown, click **Add/Modify Comments**.
4. In the **Add/Modify Comments** pop-up window that is displayed, enter a comment and click **Save**.

Editing Code Signing Certificate Details via the Connector

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
   The **Code Signing Certificate** page is displayed.
2. Open the holistic view of the certificate you want to edit.
3. In the holistic view, hover over the connector you want to edit.
4. From the menu displayed, click **Edit**.
   The **Code signing certificate > <certificate name>** page is displayed.
5. Edit the certificate details as required.
   For field descriptions and instructions see Enrolling a Code Signing Certificate.

Deleting Code Signing Certificates

AppViewX lets you delete individual certificates, selected certificates, and all certificates from the server certificate inventory.

Note: Once a certificate is deleted from the inventory, it will not be displayed in any of the reports and alerts.

Deleting Individual Code Signing Certificates from the Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. From the **Code Signing Certificate** inventory, for the certificate(s) you want to delete, select the corresponding checkboxes.
3. From the **Actions** dropdown menu, select **Delete**.
4. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   The selected certificate(s) will be deleted.

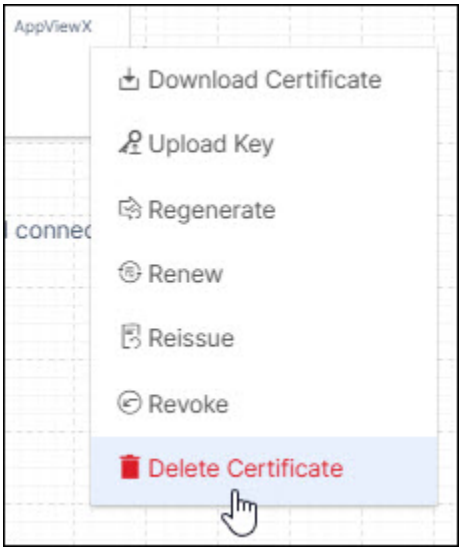
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Deleting Code Signing Certificates from the Holistic View

Note: Via the holistic view, you can delete only one certificate at a time.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. From the **Code Signing Certificate** inventory, click the **Common Name** of the certificate you want to delete.

   The holistic view of the selected certificate is displayed.
3. Hover your mouse over the (**More**) button and from the menu displayed, click **Delete Certificate**.



4. In the **Confirmation** dialog box that is displayed, click **Yes**.

   The code signing certificate is deleted from the AppViewX inventory.

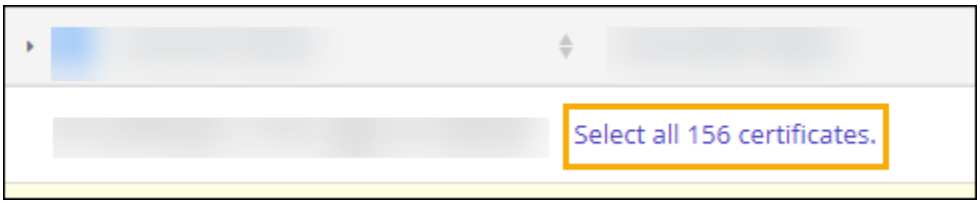
Deleting all Code Signing Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. In the **Code Signing Certificate** inventory, select the checkbox next to the **Common Name** field.

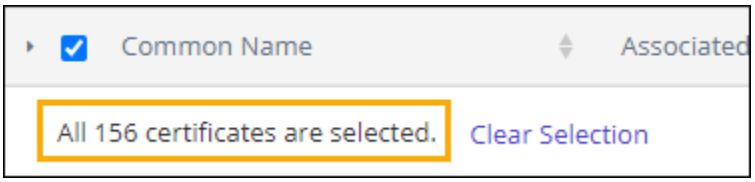
   All certificates on the current page are selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. To select all certificates in the code signing certificate inventory, click **Select all <no. of certificates> certificates**.



This will select all certificates across all pages in the code signing certificate inventory.



4. From the **Actions** dropdown menu, select **Delete**.
5. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   All certificates in the code signing certificate inventory are deleted.

> **Note:** The **Select all <no. of certificates> certificates** option does not allow deselecting individual certificates. If, after selecting all the certificates, you deselect a few certificates, only the remaining certificates on the current page will remain selected. The certificates on the other pages of the inventory will be deselected automatically.
>
> **Example**: Assume you have 150 certificates in your inventory and each page is set to display 25 records. If you select all 150 certificates and then deselect two certificates from the first page, only the remaining 23 certificates on the first page will be selected. The other 125 certificates will be deselected.

Changing Code Signing Certificate Status

The status of a certificate can be set as monitored or managed during or after the certificate discovery process and also from the certificate inventory directly. When the certificates are set as Monitored, you can only view the certificate details in reports and in the inventory. When the certificates are set as Managed, the certificate-related actions along with push/bind operations can be performed along with viewing of the certificates in the reports and inventory.

To change the code signing certificate status:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate for which you want to change status.
3. From the **Actions** dropdown, click **Change Status**.
4. In the **Change Status** dialog box that is displayed, in the **Change Status to** field, select the status of the certificate field as **Managed** or **Monitored**.
5. Enter the reason for changing the status, if required, and click **Yes**.
   The certificate status is changed as per the selection.

Assigning Certificate Group for Code Signing Certificates

The certificates with common attributes can be grouped together to perform compliance checks against policy details, to enable auto-renewal and auto-push operations. You can also view certificates as groups.

To assign a certificate group to a code signing certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate that you want to assign to a group.
3. From the **Actions** dropdown, click **Assign Group**.
4. In the **Assign to Group** dialog box that is displayed, search for the group that you want this certificate to be assigned to.
5. Select the required certificate group.
6. Enter a reason for assigning the certificate to the selected certificate group, if required, and click **Assign**.
   The certificate is assigned to the selected group.

Unassigning Certificate Group from Code Signing Certificates

You can unassign any certificates from a specific certificate group to the default group. The policy and actions of the default group will be applied to these certificates.

To unassign a certificate group assigned to a code signing certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate that you want to unassign from a certificate group.
3. From the **Actions** dropdown, click **Unassign Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **Unassign Group** window that is displayed, enter the reason for unassigning the certificate from the group and click **Unassign**.
   The selected certificate is now assigned to the default group.

Updating Certificate Attributes for Code Signing Certificates

Other than the fields that are defined for CSR, you can add organization-specific values to a request. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes.

To update the certificate attributes for a code signing certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
2. On the **Code Signing Certificate** page, select the certificate for which you want to update attributes.
3. From the **Actions** dropdown, click **Certificate Attributes**.
4. Update the **Certificate Attributes** and click **Save**.

Bulk Updating Certificate Attributes

Bulk Updating Attributes using a CSV File

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

   Note: Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **File Upload**.
4. Click **Download Template**.
   A **.csv** file will be downloaded to your system. This file has the format in which you need to specify the attributes and their corresponding updated values (along with the certificate identification details).
5. In the **Upload File** field, click **Upload**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Navigate to the location where the updated **.csv** file is saved on your system and upload the file.
7. Click **Save**.

Bulk Updating Attributes for a Certificate Group

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **Based on Certificate Group**.
4. From the dropdown list, select the required **Certificate Group**.
5. From the dropdown list, select one or more **Cert Attributes** that you want to update.
   Corresponding text/list fields are displayed depending on the **Cert Attributes** selected.
6. Enter the required value for each attribute selected in the corresponding field.
7. Click **Save**.

Downloading Failed Updates

From the **Bulk Update Attributes Value** dialog box, to view failed bulk updates to the certificate attributes, click **Download Failed Updates**.
A **.csv** file with a log of the failed updates is downloaded to your local system.

Managing the Device Certificate Inventory

Device certificate inventory displays all the management interface certificates. Currently, in this inventory, only F5 vendor certificates are shown.

On the **Certificate Inventory** > **Device** page, all the device certificates are listed. You can perform the following actions:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options available on the Device Certificate inventory page

Options	Description
Groups	Expanding this dropdown displays the certificate groups and the number of certificates in each group. Selecting a group will display the filtered list of certificates. Filter Summary	Displays the status of certificates according to expiry, compliance, validity, and so on. Advanced Search	Allows you to perform a quick search for specific data. Clicking on the search bar dropdown opens the **Advanced Search** window.
Actions	Displays the list of actions you can perform on the certificates.
Columns	Allows you to select the columns to be displayed on the Device Certificate inventory page.
Toggle	Allows you to toggle between the following display options for the Server Certificate inventory: • **Reports**: Displays reports related to server certificates. • **List**: Displays the list of server certificates.

The list of actions you can perform on the certificates are:

- Export Certificates - To export the server certificate.
- Delete - To delete the server certificate.
- Assign Group - To assign a group to the certificate.
- Unassign Group - To unassign a group from the certificate.
- Add/Modify Comments - To add/modify comments to the certificate.
- Certificate Attributes - To update the certificate attributes.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Bulk Update Attributes Value - To update the certificate attributes for certificates.
- Renew Certificates - To renew certificates before expiry.
- Revocation Check - To check the revocation status of the certificate.

- Exporting a Device Certificate
- Deleting Device Certificates
- Assigning Certificate Group to Device Certificates
- Unassigning Certificate Group from Device Certificate Groups
- Adding/Modifying Comments for Device Certificates
- Updating Certificate Attributes for Device Certificates
- Bulk Updating Certificate Attributes
- Downloading Failed Updates

Exporting a Device Certificate

Export certificate action allows the user to export certificate details in the form of columns and values. The user can export all the certificates in the inventory or select only specific certificates and export. The output of this action can be selected in **.xls** or **.csv** format. This can be used for reporting or creating an inventory.

To export a device certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. On the **Device Certificate** page, select the certificate that you want to export.
3. From the **Actions** dropdown menu, select **Export Certificates**.
   The **Export** dialog box is displayed.
4. Select the required **Options** and **Format**.
   The selected certificate is exported to your local machine.

Deleting Device Certificates

AppViewX lets you delete individual certificates, selected certificates, and all certificates from the server certificate inventory.

Note: Once a certificate is deleted from the inventory, it will not be displayed in any reports and alerts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Deleting Individual Device Certificates from the Inventory

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. From the **Device Certificate** inventory, for the certificate(s) you want to delete, select the corresponding checkboxes.
3. From the **Actions** dropdown menu, select **Delete**.
4. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   The selected certificate(s) will be deleted.

Deleting Device Certificates from the Holistic View

Note: Via the holistic view, you can delete only one certificate at a time.

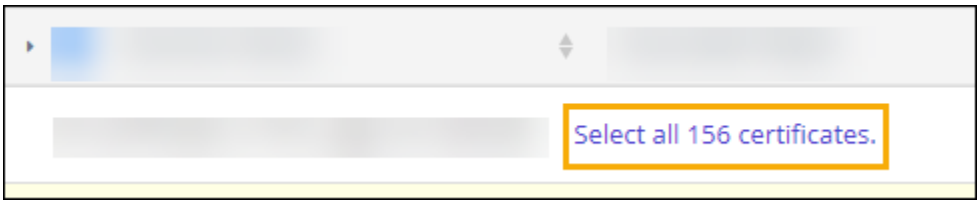
1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. From the **Device Certificate** inventory, click the **Common Name** of the certificate you want to delete.
   The holistic view of the selected certificate is displayed.
3. Hover your mouse over the (**More**) icon and from the menu displayed, click **Delete Certificate**.
4. In the **Confirmation** dialog box that is displayed, click **Yes**.
   The device certificate is deleted from the AppViewX inventory.

Deleting All Device certificates

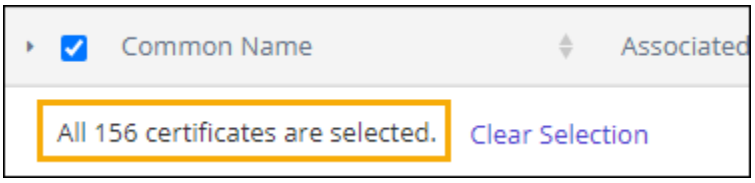
1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. From the **Device Certificate** inventory, select the checkbox next to the **Common Name** field.

   All certificates on the current page are selected.
3. To select all certificates in the device certificate inventory, click **Select all <no. of certificates> certificates**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



This will select all certificates across all pages in the device certificate inventory.



4. From the **Actions** dropdown menu, select **Delete**.
5. From the **Delete Certificate** confirmation dialog box, click **Yes**.
   All certificates in the device certificate inventory are deleted.

> **Note:** The **Select all <no. of certificates> certificates** option does not allow deselecting individual certificates. If, after selecting all the certificates, you deselect a few certificates, only the remaining certificates on the current page will remain selected. The certificates on the other pages of the inventory will be deselected automatically.
>
> **Example**: Assume you have 150 certificates in your inventory and each page is set to display 25 records. If you select all 150 certificates and then deselect two certificates from the first page, only the remaining 23 certificates on the first page will be selected. The other 125 certificates will be deselected.

Assigning Certificate Group to Device Certificates

The certificates with common attributes can be grouped together to perform compliance checks against policy details, to enable auto-renewal and auto-push operations. You can also view certificates as groups.

To assign a certificate group to device certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. On the **Device Certificate** page, select the certificate that you want to assign to a group.
3. From the **Actions** dropdown, click **Assign Group**.
4. In the **Assign to Group** pop-up window that is displayed, search for the group that you want this certificate to be assigned to.
5. Select the required certificate group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Enter a reason for assigning the certificate to the selected certificate group, if required, and click **Assign**.
   The certificate is assigned to the selected group.

Unassigning Certificate Group from Device Certificate Groups

You can unassign any certificates from a specific certificate group to the default group. The policy and actions of the default group will be applied to these certificates.

To unassign a certificate group assigned to a device certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. On the **Device Certificate** page, select the certificate that you want to unassign from a certificate group.
3. From the **Actions** dropdown, click **Unassign Group**.
4. In the **Unassign Group** window that is displayed, enter the reason for unassigning the certificate from the group and click **Unassign**.
   The selected certificate is now assigned to the default group.

Adding/Modifying Comments for Device Certificates

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. On the **Device Certificate** page, select the certificate that you want to revoke.
3. From the **Actions** dropdown, click **Add/Modify Comments**.
4. In the **Add/Modify Comments** dialog box that is displayed, enter a comment and click **Save**.

Updating Certificate Attributes for Device Certificates

Other than the fields that are defined for CSR, you can add organization-specific values to a request. These values will not be part of the certificate but will be available in the AppViewX inventory. For example, cost center. Inventory can be filtered based on these attributes.

To update the certificate attributes for a device certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
2. On the **Device Certificate** page, select the certificate for which you want to update attributes.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. From the **Actions** dropdown, click **Certificate Attributes**.
4. Update the **Certificate Attributes** and click **Save**.

Bulk Updating Certificate Attributes

Bulk Updating Attributes using a CSV File

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

> **Note:** Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **File Upload**.
4. Click **Download Template**.
   A **.csv** file will be downloaded to your system. This file has the format in which you need to specify the attributes and their corresponding updated values (along with the certificate identification details).
5. In the **Upload File** field, click **Upload**.
6. Navigate to the location where the updated **.csv** file is saved on your system and upload the file.
7. Click **Save**.

Bulk Updating Attributes for a Certificate Group

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. From the **Actions** menu, select **Bulk Update Attributes Value**.
   The **Bulk Update Attributes Value** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Before you bulk update the certificate attribute values, review the attribute and expiry configuration mapping to prevent errors. Ensure that no updates are made to attributes involved in an expiry alert. (To check this, go to (**Menu**) > **CERT+** > **Administration** > **Certificate Attributes**.)

3. From the options for **Update Method**, select **Based on Certificate Group**.
4. From the dropdown list, select the required **Certificate Group**.
5. From the dropdown list, select one or more **Cert Attributes** that you want to update.
   Corresponding text/list fields are displayed depending on the **Cert Attributes** selected.
6. Enter the required value for each attribute selected in the corresponding field.
7. Click **Save**.

Downloading Failed Updates

From the **Bulk Update Attributes Value** dialog box, to view failed bulk updates to the certificate attributes, click **Download Failed Updates**.
A **.csv** file with a log of the failed updates is downloaded to your local system.

Downloading Failed Updates

From the **Bulk Update Attributes Value** dialog box, to view failed bulk updates to the certificate attributes, click **Download Failed Updates**.
A **.csv** file with a log of the failed updates is downloaded to your local system.

Managing the Intermediate Certificate Inventory

Intermediate certificate inventory is where the issuer certificates apart from the root certificate will be displayed. In the chain of trust, if there is more than one layer of the intermediate certificate (excluding root and end certificate), all those certificates will be shown in this inventory. From this inventory, the user can get into the holistic view where the user can perform the push operation of the intermediate and its root certificates.

Options available on the Intermediate Certificate page

Options	Description
Search bar	Allows you to search for a certificate(s) within the server certificate inventory using keywords and by Certificate Authority.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Options available on the Intermediate Certificate page (continued)

Options	Description
Actions	Displays the list of actions you can perform on the certificates. **Note:** This dropdown is enabled only when you select at least one certificate from the inventory.
Columns	Allows you to select the columns to be displayed on the **Intermediate Certificate** page.

• Deleting an Intermediate Certificate

Deleting an Intermediate Certificate

You can delete a certificate from the intermediate certificate inventory in AppViewX. Once the certificate gets deleted from the inventory, the same will not be displayed in reports and alerts.

To delete an intermediate certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Intermediate**.
2. On the **Intermediate Certificate** page, select the certificate that you want to delete.
3. From the **Actions** dropdown menu, select **Delete**.
4. In the **Delete Certificate** dialog box that is displayed, click **Yes**.
   The intermediate certificate is deleted from AppViewX inventory.

Managing the Root Certificate Inventory

Root certificate inventory displays the root certificates for all the issuers. For any chain of trust certificates, there can be only one root certificate. From this inventory, you can get into the holistic view and perform the push operation for the root certificate only.

Options available on the Root Certificate page

Options	Description
Search bar	Allows you to search for a certificate(s) within the server certificate inventory using keywords and by Certificate Authority.

Options available on the Root Certificate page (continued)

Options	Description
Actions	Displays the list of actions you can perform on the certificates. **Note:** This dropdown is enabled only when you select at least one certificate from the inventory.
Columns	Allows you to select the columns to be displayed on the **Intermediate Certificate** page.

• Deleting a Root Certificate

Deleting a Root Certificate

You can delete a certificate from the root certificate inventory in AppViewX. Once the certificate gets deleted from the inventory, the same will not be displayed in reports and alerts.

To delete a root certificate:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Root**.
2. On the **Root Certificate** page, select the certificate that you want to delete.
3. From the **Actions** dropdown menu, select **Delete**.
4. In the **Delete Certificate** dialog box that is displayed, click **Yes**.
   The root certificate is deleted from AppViewX inventory.

Uploading a Certificate

You can upload either the end certificate or trust store certificates in the certificate inventory. Once uploaded, the certificate will be applied by the policy based on the associated certificate group.

To upload a certificate,

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Upload**.
   The **Upload Certificate** page is displayed.
2. Enter/Select the **Upload Certificate**details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions on for uploading a certificate

Field	Description
Certificate Type	Click the check box to select the desired certificate type. The possible types are: • End Certificate • CA Certificate.
Certificate Group	Select the desired group from the dropdown list.
***Certificate**	Click **Browse** to upload the certificate-key files from your computer.
Comments	Enter a description in this field. **Note:** Character limit: **2000 characters**

3. Click **Upload**.

Note: Ensure that the uploaded **Certificate-Keys** file is stored in the Certificate Group.

Downloading Certificates

- Downloading Code Signing Certificates from the Inventory
- Downloading Intermediate Certificates
- Downloading Root Certificates

Downloading Server Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Downloading Server Certificates from the Inventory

Server certificates can be downloaded from the server inventory as well as in the holistic view. In the server inventory, the user can select one or more certificates and download them in <.*crt*> format with/ without private keys and also with/without their respective trust store certificates.

To download server certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. In the **Common Name** column certificate list, select the desired certificate(s) that you want to download.
3. Click **Actions**, and then select **Download Certificates** from the list.
   The **Download Certificates** dialog box is displayed.
   a. In the **Download Certificate** pop-up window, select **Certificates Only** or **Certificates and Keys**.
   b. You can also enable/disable **the Download Truststore Certificates** option along with the end certificates.

   > **Note:** If you have permission to view the restricted content mentioned in Step 7, the certificate details are downloaded with <.zip> file. If you do not have the necessary permissions, the system creates and downloads an empty <.zip> file to the destination you specify.

   c. The system enables the **Secret Passphrase** field when you select **Certificates and Keys**. Enter a passphrase to encrypt the contents into a <.zip> file.
4. Click **Download**.
   The certificate is downloaded to your local machine.
5. To view details of the certificate, unzip the file and open the security certificate file.
6. Click **Details**.

Downloading Server Certificates from the Holistic View

Server certificates can be downloaded via holistic view only one certificate at a time in multiple formats as PEM, DER, PKCS#7, PKCS#12, and JKS. PKCS#12 and JKS can be downloaded only with the password-protected certificate.

To download server certificates via the holistic view:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Server**.
   The **Server Certificate** page is displayed.
2. On the **Server Certificate** page, click the **Common Name** of the certificate you want to download.
   The holistic view of the certificate is displayed.
3. Hover your mouse over and select **Download Certificate** from the options displayed.

   The **Download Certificate** pop-up window is displayed.
4. In the **Download Certificate** pop-up window that is displayed, select the file format from the **Certificate type** dropdown and click **Yes**.

> **Note:** For PEM and DER certificate types, you can turn the **Download Truststore Certificates** toggle On/Off.

   The certificate(s) is downloaded to your local machine.

Downloading Client Certificates from the Holistic View

Client certificates can be downloaded via holistic view only one certificate at a time in multiple formats as PEM, DER, PKCS#7, PKCS#12, and JKS. PKCS#12 and JKS can be downloaded only with the password-protected certificate.

To download client certificates via the holistic view:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Client**.
   The **Client Certificate** page is displayed.
2. On the **Client Certificate** page, click on the **Common Name** of the certificate that you want to download.
   The holistic view of the certificate is displayed.
3. Hover your mouse over and select **Download Certificate** from the options displayed.
   The **Download Certificate** dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Select the file format from the **Certificate Type** list.
b. For PEM and DER certificate types, you can use the toggle button to On/Off in the **Download Truststore Certificates** option along with end certificates.

4. In the **Download Certificate** pop-up window that is displayed, select the file format from the **Certificate type** dropdown and click **Yes**.

> **Note:** For PEM and DER certificate types, you can turn the **Download Truststore Certificates** toggle On/Off.

The certificate(s) is downloaded to your local machine.

Downloading Device Certificates from the Holistic View

Device certificates can be downloaded via holistic view only one certificate at a time in multiple formats as PEM, DER, PKCS#7, PKCS#12, and JKS. PKCS#12 and JKS can be downloaded only with the password-protected certificate.

To download device certificates via the holistic view:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Device**.
   The **Device Certificate** page is displayed.
2. On the **Device Certificate** page, click the **Common Name** of the certificate you want to download.
   The holistic view of the certificate is displayed.
3. Hover your mouse over and select **Download Certificate** from the options displayed.
   The **Download Certificate** dialog box is displayed.
4. In the **Download Certificate** pop-up window that is displayed, select the file format from the **Certificate type** dropdown and click **Yes**.

> **Note:** For PEM and DER certificate types, you can turn the **Download Truststore Certificates** toggle On/Off.

The certificate(s) is downloaded to your local machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Downloading Code Signing Certificates from the Inventory

Code Signing certificates can be downloaded via holistic view only one certificate at a time in multiple formats as PEM, DER, PKCS#7, PKCS#12, and JKS. PKCS#12 and JKS can be downloaded only with the password-protected certificate.

To download code signing certificates via the holistic view:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Code Signing Certificate**.
   The **Code Signing Certificate** page is displayed.
2. On the **Code Signing Certificate** page, select the certificate(s) that you want to download.
3. From the **Actions**dropdown, click **Download Certificates**.
   The **Download Certificates** pop-up window is displayed.
   a. In the **Download Certificate** pop-up window, select **Certificates Only** or **Certificates and Keys**.
   b. You can also enable/disable **Download Truststore Certificates** option along with the end certificates.

   > **Note:** If you have permission to view the restricted content, the certificate details are downloaded with <.zip> file. If you do not have the necessary permissions, the system creates and downloads an empty <.zip> file to the destination you specify.

   c. The system enables the **Secret Passphrase** field when you select the **Certificates and Keys** option. Enter a passphrase to encrypt the contents into a *<.ZIP>* file.
4. In the **Download Certificate** dialog box, enter or select the requested filed information.

Field Description for Download Certificate

Field	Description
Choose Download Type	Select the certificate download type as: • **Certificate Only** • **Certificate and Keys**
Download Truststore Certificates	Turn on this toggle to download truststore certificates.
Set Password for Keystore	Enter a passphrase to encrypt the contents into a **.zip** file.

   a. In the **Download Certificate** pop-up window, select **Certificates Only** or **Certificates and Keys**.
   b. You can also enable/disable **the Download Truststore Certificates** option along with the end certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** If you have permission to view the restricted content mentioned in Step 7, the certificate details are downloaded with <.zip> file. If you do not have the necessary permissions, the system creates and downloads an empty <.zip> file to the destination you specify.

c. The system enables the **Secret Passphrase** field when you select **Certificates and Keys**. Enter a passphrase to encrypt the contents into a <.zip> file.

5. Click **Download**.
6. To view details of the certificate, unzip the file and open the security certificate file.
7. Click **Details**.

Downloading Intermediate Certificates

Downloading Intermediate Certificates from the Inventory

You can download intermediate certificate(s) in PEM format with or without its trust store certificates.

To download intermediate certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Intermediate**.
   The **Intermediate Certificate** page is displayed.
2. On the **Intermediate Certificate** page, select the certificate(s) that you want to download.
3. From the **Actions**dropdown, click **Download**.
   The certificate is downloaded to your local machine.
4. To view details of the certificate, unzip the file and open the security certificate file.
5. Click **Details**.

Downloading an Intermediate Certificate from the Holistic View

Intermediate certificates can be downloaded via holistic view only one certificate at a time in multiple formats as PEM, DER, PKCS#7, PKCS#12, and JKS. PKCS#12 and JKS can be downloaded only with the password-protected certificate.

To download an intermediate certificate via the holistic view:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Intermediate**.
2. On the **Intermediate Certificate** page, click the **Common Name** of the certificate that you want to download from the holistic view.
   The holistic view of the certificate is displayed.
3. Hover your mouse over the (**More**) button and click **Download Certificate**.
4. In the **Download Certificate** pop-up window that is displayed, select the **Certificate type** from the options available in the dropdown.
5. For PEM and DER certificate types, turn on the **Download Truststore Certificates** toggle.
6. Click **Yes**.
   The certificate is downloaded to your local machine.

Downloading Root Certificates

Downloading Root Certificates from the Inventory

Download root certificate is the action to download root certificate, the certificate get downloaded in PEM **.*crt** format from the inventory.

To download root certificates from the inventory:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Root**.
   The **Root Certificate** page is displayed.
2. On the **Root Certificate** page, select the certificate(s) that you want to download.
3. From the **Actions**dropdown, click **Download**.
   The certificate is downloaded to your local machine
4. To view details of the certificate, unzip the file and open the security certificate file.
5. Click **Details**.

Downloading a Root Certificate from the Holistic View

Download root certificate is the action to download root certificate in PEM format with or without its trust store certificates.

To download a root certificate via the holistic view,

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Root**.
   The **Root Certificate** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. In the **Common Name** column certificate list, select the desired certificate that you want to download the CA.
   The holistic view is displayed.
3. Click the (**More**) icon in the holistic view, and then select **Download Certificate** from the list.
   The **Download Certificate**dialog box is displayed.
4. Select the file format from the **Certificate type** list.
5. Click **Yes**.
   The certificate is downloaded to your local machine.

Archiving Certificates

Certificate archival is a best practice that helps with post-lifecycle certificate management. Certificate archives are a historical record that are useful for legal, operational, and strategic requirements.

The feature enables automatic archival of certificates that have been renewed, revoked, regenerated, or expired, ensuring that older certificate versions are retained for reference and audit purposes without cluttering the active inventory. Archival actions can be triggered through manual UI operations, automation workflows, or API requests, with audit logs capturing the user and source details.

Archived certificates appear in the discovery inventory with **Status** = **Archived**. Unlike active certificates, they are not moved to the certificate category inventories but are instead stored in the Archived Certificates inventory.

Certificates in the archived inventory are excluded from discovery scans, issuance workflows, alerts, and active certificate counts, ensuring cleaner operational management while preserving a complete lifecycle history.

ACF Permissions Required for Certificate Archival and Recovery

For Archiving Certificates

1. Go to (**Menu**) > **Platform** > **Identity** . **Role**.
   The **Role** inventory is displayed.
2. To enable certificate archival for a role, click the corresponding role **Name**.
   The **Role > Modify :: <role name>** page is displayed.
3. Go to the **Authorized Functions** tab.
4. For the selected role:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- To enable certifcate archival for server certificates, go to **Cert+** > **Certificate Inventory** > **Server** and select the checkbox for **Archive Certificates**.
- To enable certifcate archival for client certificates, go to **Cert+** > **Certificate Inventory** > **Client** and select the checkbox for **Archive Certificates**.
- To enable certifcate archival for code signing certificates, go to **Cert+** > **Certificate Inventory** > **Code signing** and select the checkbox for **Archive Certificates**.

For Recovering Certificates

1. Go to (**Menu**) > **Platform** > **Identity** . **Role**.
   The **Role** inventory is displayed.
2. To enable certificate recovery for a role, click the corresponding role **Name**.
   The **Role > Modify :: <role name>** page is displayed.
3. Go to the **Authorized Functions** tab.
4. For the selected role, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **Restore**.
5. Click **Save**.

For Viewing the Archived Certificates Inventory

1. Go to (**Menu**) > **Platform** > **Identity** . **Role**.
   The **Role** inventory is displayed.
2. To enable viewing the certificate inventory for a role, click the corresponding role **Name**.
   The **Role > Modify :: <role name>** page is displayed.
3. Go to the **Authorized Functions** tab.
4. For the selected role, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **View inventory**.
5. Click **Save**.

For Managing Certificates in the Archived Certificates Inventory

1. Go to (**Menu**) > **Platform** > **Identity** . **Role**.
   The **Role** inventory is displayed.
2. To enable viewing the certificate inventory for a role, click the corresponding role **Name**.
   The **Role > Modify :: <role name>** page is displayed.
3. Go to the **Authorized Functions** tab.
4. For the selected role:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- To enable inventory view customization, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **Columns**.

  This will give the role the permission to show and hide columns in the Archived Certificates inventory, as required.

- To enable exporting certificates from the Archived Certificates inventory, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **Export**.
- To enable deletion of certificates from the Archived Certificates inventory, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **Delete**.

5. For the selected role, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **View inventory**.
6. Click **Save**.

For Configuring Auto Archival and Recovery Settings

1. Go to (**Menu**) > **Platform** > **Identity** . **Role**.
   The **Role** inventory is displayed.
2. To enable viewing the certificate inventory for a role, click the corresponding role **Name**.
   The **Role > Modify :: <role name>** page is displayed.
3. Go to the **Authorized Functions** tab.
4. For the selected role, go to **Cert+** > **Certificate Inventory** > **Archive** and select the checkbox for **Settings**.
5. Click **Save**.

Archiving Certificates

Ensure that you have the required ACF permissions for archiving certificates.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** and select the certificate type for viewing the inventory.
   For example, to view the certificate inventory for server certificates, under **CERTIFICATE INVENTORY**, select **Server**.
   The inventory page for the selected certificate type is displayed.
2. From the certificate inventory, select the checkbox for certificate you want to archive.
   You can also select multiple certificates.
3. From the **Actions** dropdown menu, select **Archive**.
   A confirmation dialog box is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. (Optional) From the **Reason** dropdown list, from the following options, select a reason for archiving the certificate:
   - **Renewed**
   - **Regenerated**
   - **Revoked**
   - **Expired**
   - **Deprecated**
   - **Others**

   The archived certificate is moved to the Archived Certificates inventory.

Viewing the Archived Certificates Inventory

Ensure that you have the required ACF permissions for viewing the Archived Certificates inventory.

Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Archived Certificates**.
The **Archived Certificates** inventory is displayed.

The **Archived Certificates** inventory structure is explained here.

Understanding the Archived Certificates Inventory

The table below explains the structure of the **Archived Certificates** inventory.

The inventory provides a comprehensive set of columns to display certificate metadata and supports pagination, search, and filter functionalities, making it easy to locate specific certificates and understand their archival context.

Archived Certificates Inventory Structure

Column/Field	Description
Groups	Use the **Groups** dropdown menu to filter the inventory and display only certificates associated with the selected groups.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Archived Certificates Inventory Structure (continued)

Column/Field	Description
	Search	Use the search field to execute a free text certificate search on certificate metadata such as common name, Subject Alternative Names, serial number, issuer, and so on.
	Use the **Actions** dropdown menu to: • **Recover** archived certificates. Ensure that you have the required ACF permissions to recover archived certificates. For instructions and post-recovery status details, see Recovering Archived Certificates. • **Export** archived certificates' data (in the CSV and XLSX formats, for all/selected columns). Ensure that you have the required ACF permissions to export certificates from the archived inventory. For indicative instructions, see Exporting Server Certificates. • **Delete** archived certificates from this inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Archived Certificates Inventory Structure (continued)

Column/Field	Description
	Ensure that you have the required ACF permissions to delete certificates from the archived inventory. For indicative instructions, see Deleting Individual Server Certificates from the Inventory and Deleting all Server Certificates. All user actions performed on or via the inventory are logged for auditing purposes.
	Use the archived certificates **Settings** to configure the behavior of the auto-archival and recovery features for archived certificates. Ensure that you have the required ACF permissions for configuring certificate archival settings. The instructions for configuring both features are covered in the Configuring Auto-Archival Settings and Recovering Archived Certificates sections.
	Use the **Columns** list to show/hide columns in the inventory. By default, the following columns are displayed: • **Common Name** • **Serial Number** • **Group** • **Issuer Common Name** • **Valid to (GMT)** • **Subject Alternative Names** • **Certificate Authority** • **Archive Reason** • **Archive Date** Ensure that you have the required ACF permissions to show/hide columns in the inventory.
	Use the pagination control dropdown to select the number of records that will be displayed per page of the inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Archived Certificates Inventory Structure (continued)

Column/Field	Description
	You can select to display 25, 50, 75, or 100 records per page of the inventory.
	Use the pagination navigation buttons to move between pages in the inventory.
	Use the **Refresh** button to reload the inventory to display the up-to-date records.

Configuring the Auto-Archival and Recovery Settings

Auto-archival of certificates esnures a clean active certificate inventory, minimizing manual overhead.

Ensure that you have the required ACF permissions for configuring certificate archival settings.

To configure the auto-archival rules and recovery behavior for certificates:

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Archived Certificates**.
   The **Archived Certificates** inventory is displayed.
2. From the **Archived Certificates** inventory, click **Settings**.
   The **Settings** dialog box is displayed.
3. In the **Auto-Archival Rules** section:
   a. (Mandatory) From the **Auto-Archive When** field, select the certificate status values that should trigger automatic archival.
   b. In the **Auto-Archive After** field, enter the number of days after which automatic archival will be triggered, for the certificate status values selected in the above step.
4. In the **Recovery** section:

   a. To allow certificates to be moved back from the archived state to th monitored, select the **Recover archived certs as Monitored** checkbox.
   If this checkbox is not selected, the archived certificate is restored to its original state after recovery.

   b. From the **Recover To Group** field, to specify which certificate group the archived certificate will be moved to after recovery, select one of the following options :

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Default Group**

  Recovers the certificate and places it in the default group (restricted to admin access only)

- **Source Group** (default)

  Recovers the certificate and places it in the group from which it was originally archived

This behavior comes into effect when the Recover action is selected in the certificate inventory.

5. Click **Save**.
   The **Archival settings updated** confirmation message is displayed.

Recovering Archived Certificates

Ensure that you have the required ACF permissions to recover archived certificates.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > **Archived Certificates**.
   The **Archived Certificates** inventory is displayed.
2. From the **Archived Certificates** inventory, select the checkboxes corresponding to the certificate(s) you want to recover.
3. From the **Actions** dropdown menu, select **Recover**.
   The selected archived certificates are restored according to the recovery behavior configured here.

Certificate Reporting and Monitoring

Once the certificates in the infrastructure are discovered in AppViewX, they can be monitored as the reports in the Dashboards. In the dashboards, the user can track the certificates expiry, compliance, security details as the reports in the dashboard.

Reporting and monitoring the certificates are essential for an administrator to get complete visibility of all the certificates across multiple vendors and data centers in one single window pane. Certificates have a finite life span and are set to expire at different dates and times. Due to advancements in cryptography, there are high chances that the infrastructure will carry the weaker algorithm certificates which will be vulnerable to several attacks which will cause business outages. Using the dashboards and reports, the administrator can continuously monitor the status of the certificates in terms of expiry, security, compliance and so on.

- Accessing the Dashboard

- Exporting Dashboard Information
- Importing a Dashboard

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Understanding Certificate Reports on the Dashboard
- Searching for Dashboard, Object, or Widget
- Deleting a Dashboard
- Insights
- Accessing the Discovery Summary Dashboard

Accessing the Dashboard

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The pinned or last viewed dashboard is displayed.
2. To go to the Dashboard inventory, from the top left corner of the screen, click **Dashboard**.

> **Note:** You can also click from the command bar.

The **Dashboard** page is displayed.

Dashboard page Actions

Options	Description
Search bar	Search using the required keyword(s) The research result is a list of items that match the specified keywords(s).
+	Allows users to create a **New** dashboard.
	Allows users to **Delete** a dashboard from the list.
	Allows users to **Export** a dashboard from the list.
	Allows users to **Import** a file to create a dashboard.
	Refresh the dashboard page
	Allows users to **Auto-sort** the dashboards alphabetically.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Creating a Dashboard

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The pinned or last viewed dashboard is displayed.
2. From the command bar on the top right corner of the page, click +.
   The **Create dashboard/widget** pop-up window is displayed.
3. In the **Create dashboard/widget** dialog box, enter or select the requested field information as described in the table below.

Field Description for Create dashboard/widget

Field	Description
***Dashboard name**	Enter the name of the dashboard.
***Select solution**	Select a solution from the options available in the dropdown.
***Widget type**	Select the type of the widget you want to create. The options are: • **Custom**: Select this option to create a customized Widget. • **Default**: Select this option to create a default Widget.
***Choose widgets**	Select the widget(s) from the options available in the dropdown. **Note:** This field is displayed only when you select **Widget type** as **Default**.
***Select widget**	Select the widget from the customized widgets displayed in the dropdown.
***Widget name**	Enter the name of the Widget.
Note: The asterisk (*) symbol indicates mandatory fields.	

4. Click **Create**.
   The dashboard is created.

Note: To discard the changes, click **Cancel**.

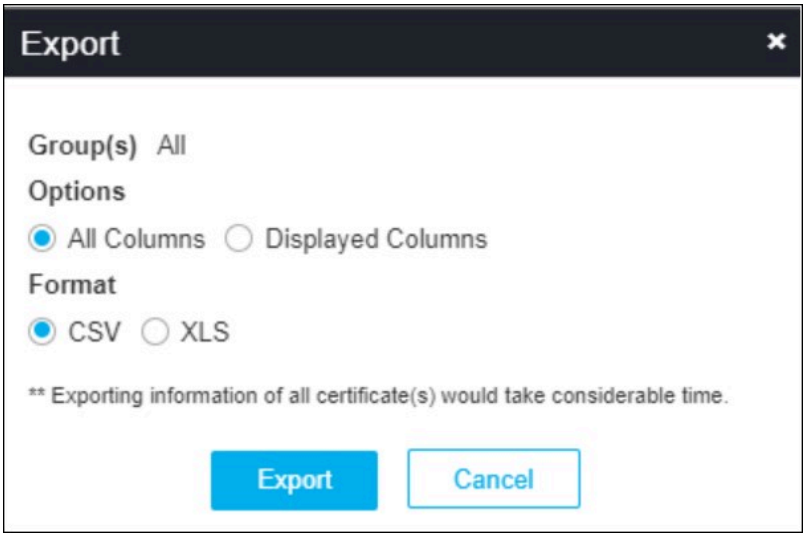
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Exporting Dashboard Information

You can export the dashboards in **.Cs** or **.json** format. The dashboards that are exported in the **.json** format can be imported to another build of the AppViewX platform.

To export dashboard information:

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The pinned or last viewed dashboard is displayed.
2. Select the dashboard to be exported and from the command bar at the top right corner of the screen, click the export icon.
   The **Export** pop-up window is displayed.



3. Select the required **Options** and **Format**.
   The selected dashboard(s) are exported to your local machine.

Importing a Dashboard

You can import the list of dashboards, which has the **Application View** widget. The import file must be in the **.text** and/or **.json** format and zipped.

To import a dashboard:

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The pinned or last viewed dashboard is displayed.
2. From the command bar at the top right corner of the dashboard page, click **Import**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Import** page is displayed.

3. Browse and open the dashboard import file in **.zip** format and click **Upload**.
4. Once the file is uploaded, click **Submit**.

   The selected dashboard(s) are imported to AppViewX platform.

Understanding Certificate Reports on the Dashboard

Certificate Reports give you visibility over all certificates and host information in the CERT+ inventory through different modes of discovery. With the available data, you can validate whether these certificates fall under the organization's security policy. CERT+ reports give insights on all important aspects of the product.

All these reports are categorized and available as multiple dashboards as default in AppViewX. Provided with that, custom dashboards with custom reports can also be created.

Viewing Certificate Reports

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE INVENTORY** > <type of certificate you want the reports for>.
   The certificate inventory page, for the selected certificate type, is displayed.
2. From the top right corner of the page, click the **Reports** toggle.
   Reports for selected certificate type are displayed.

Although each certificate report displays the data differently, the same set of data is used to generate each report.

The following reports are segregated and displayed as widgets in the report:

- **Report by Certificate Authority -** A bar chart that shows the total certificate count for each Certificate Authority (CA), made up of colored bars representing the following statuses:
  - Green - Valid certificates
  - Blue - Certificates with an expiry in 90 days
  - Yellow - Certificates with expiry in 30 days
  - Orange - Certificates with expiry in 10 days
  - Red - Expired certificates
  - Black - Revoked certificates
  - Gray - New certificates
- **Expiry Report by Month -** A bar chart that shows the total number of certificates expiring each month.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Policy Compliance -** A pie chart that shows the number of compliant and non-compliant certificates in the system, with each sector in the chart representing a different kind of policy such as Strict or Suggestive. You can also export the report details from the Policy Compliance Report widget.
- **Stale Certificate -** A pie chart that shows the number of expired and revoked certificates.
- **Certificate Summary -** A doughnut chart that categorizes the certificates based on expiration, with the total count of certificates made up of colored bars representing the same statuses listed for the Report by Certificate Authority widget. You can also configure the report settings from the Certificate Summary Report widget.
- **Count by Issuer -** A doughnut chart that shows the total number of certificates managed by the issuer such as Root CA or the Intermediate CA. You can also configure the report settings from the Count by Issuer widget.

Default Reports

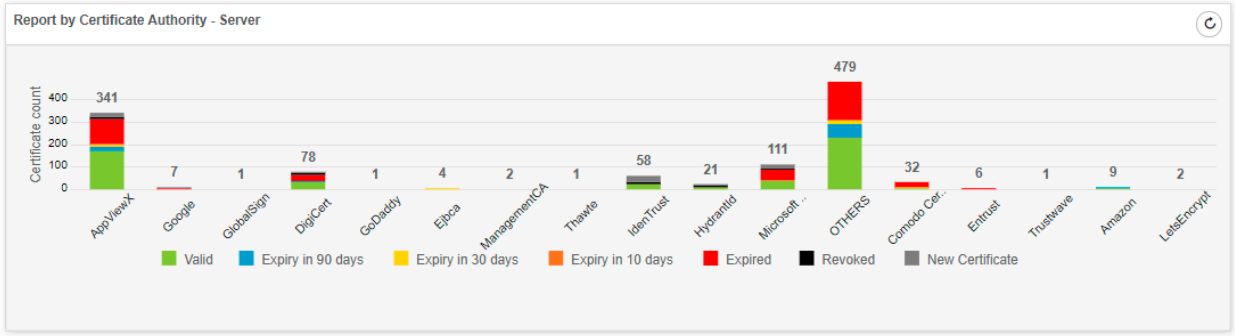
AppViewX CERT+ has a few in-built reports (recommended) that are available as default reports. These reports can be triggered directly to take necessary actions. The primary risk to be addressed is to enforce security compliance. Compliance reports that are provided as in-built reports can be used to categorize certificates based on the non-compliant parameter. This information (value addition) can be used to enforce the application team to onboard for automation.

Understanding the Server Certificate Dashboard

The certificates from the Server inventory will be shown in this dashboard as the following reports:

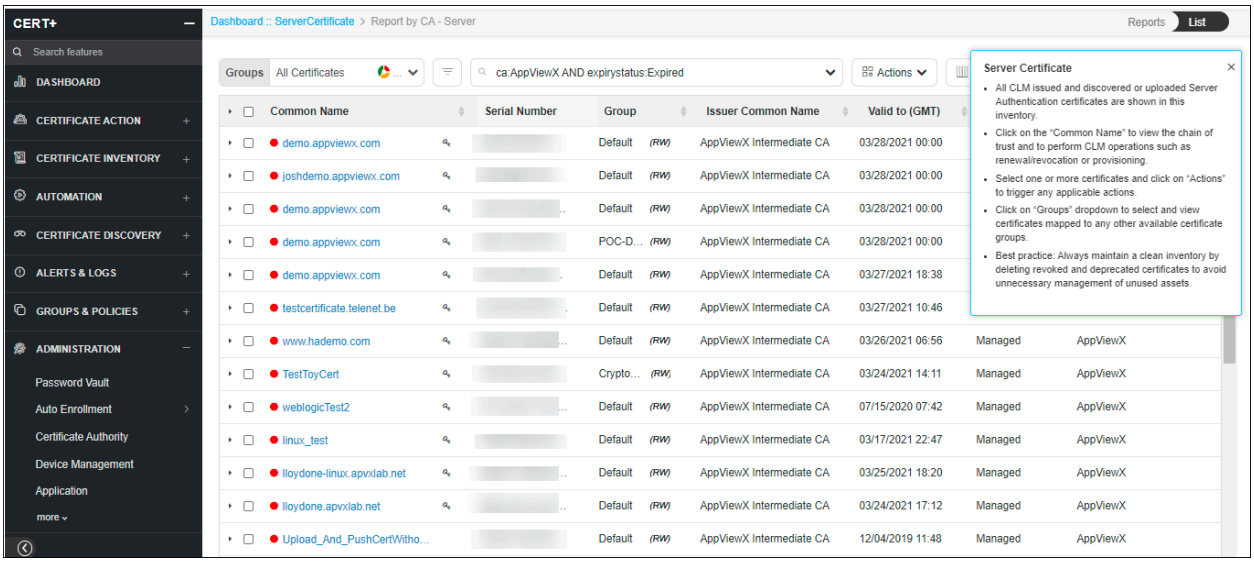
Report by Certificate Authority - Server

This report shows the count of certificates in the server inventory with respect to the certificate authorities and the expiry information.



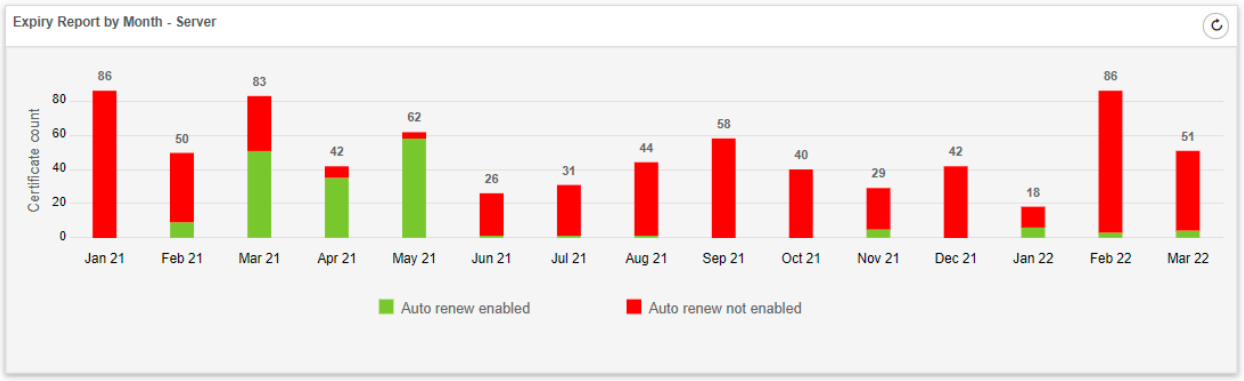
On click of any of the bar of this report, the filtered inventory view will be shown as below to proceed any further actions:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



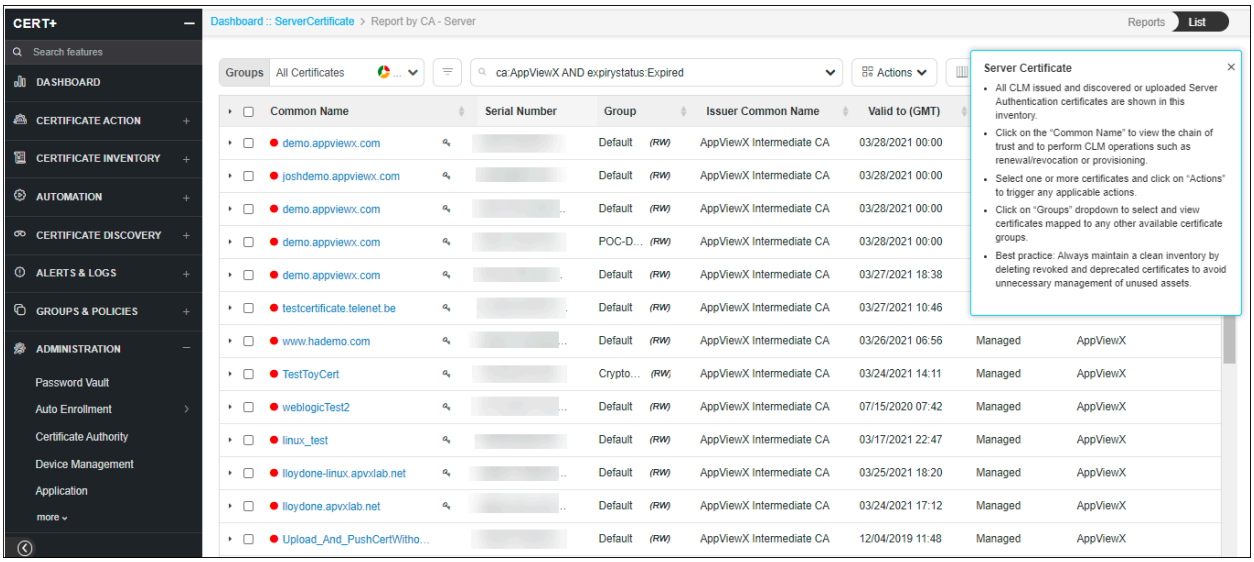
Expiry Report by Month

This report shows the count of certificates with respect to expiry month information.



On click of any of the bar, the filtered certificates inventory will be shown as below to perform any inventory actions:

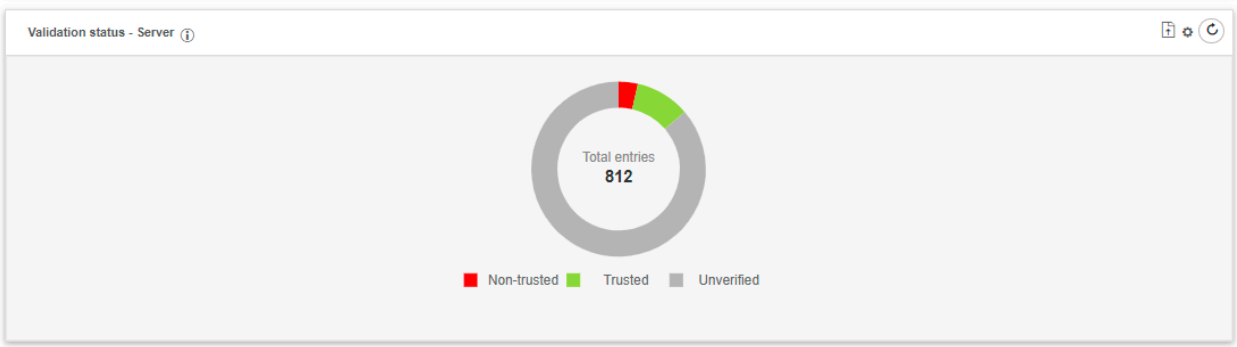
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Validation Status

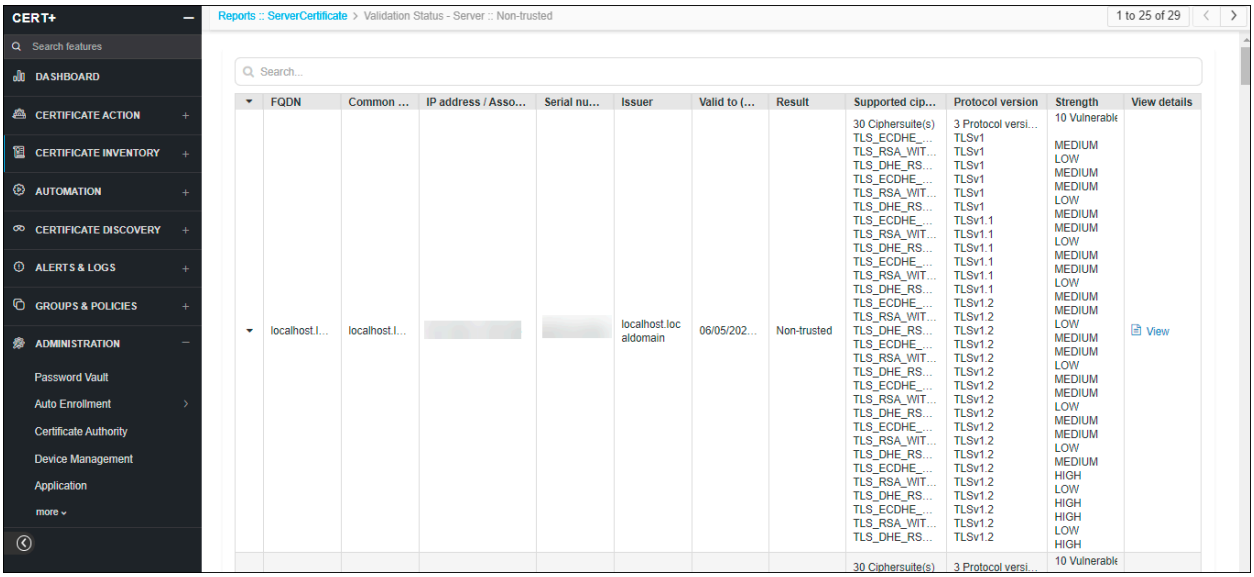
This report shows the count of server certificates with respect to the following:

- Trusted – When the chain of trust can be formed with the end server certificate it will be categorized as a trusted certificate.
- Non-trusted – When the chain of trust cannot be formed with the end server certificate it will be categorized as non-trusted.
- Unverified – When the server certificates are yet to be taken for validation, they will be categorized as unverified.



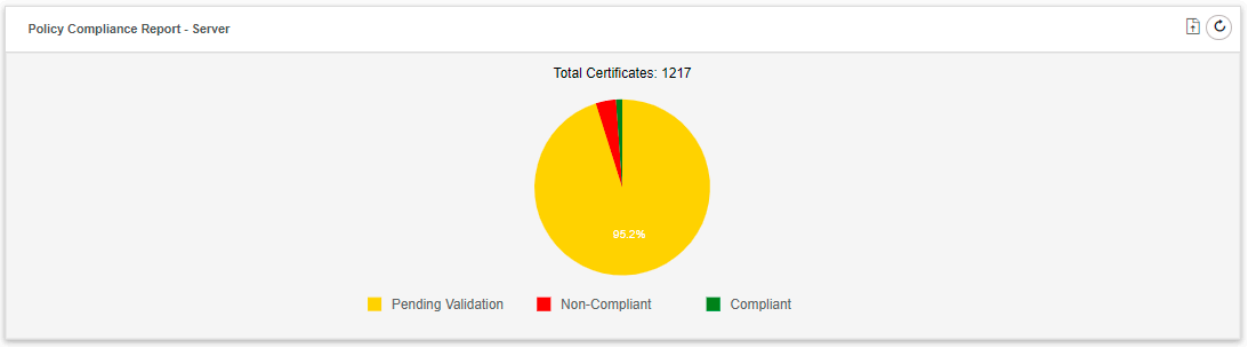
When a section of this pie chart is clicked, the corresponding filtered certificate data is displayed, as shown in the image below:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



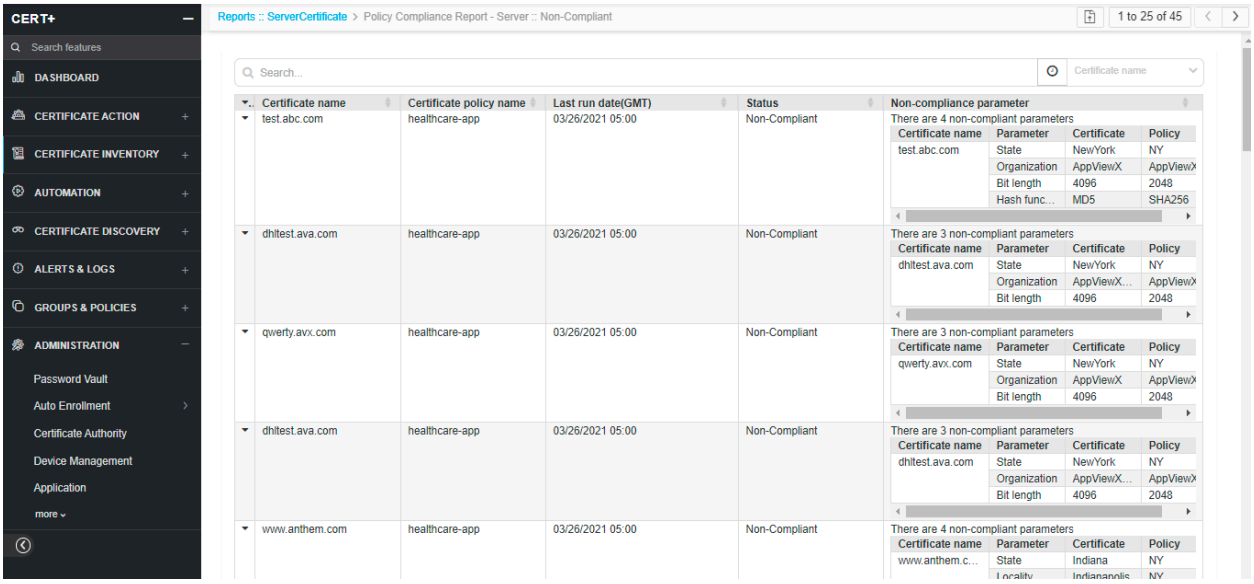
Policy Compliance Status

This report shows the count of server certificates as compliance or non-compliance based on the certificate group policy associated with the certificates.



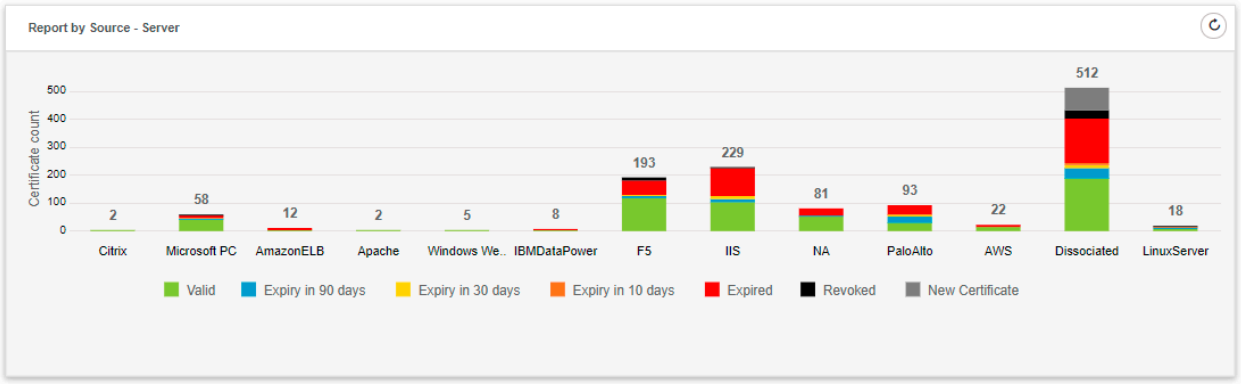
When a section of this pie chart is clicked, the corresponding filtered certificate data is displayed, as shown in the image below:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



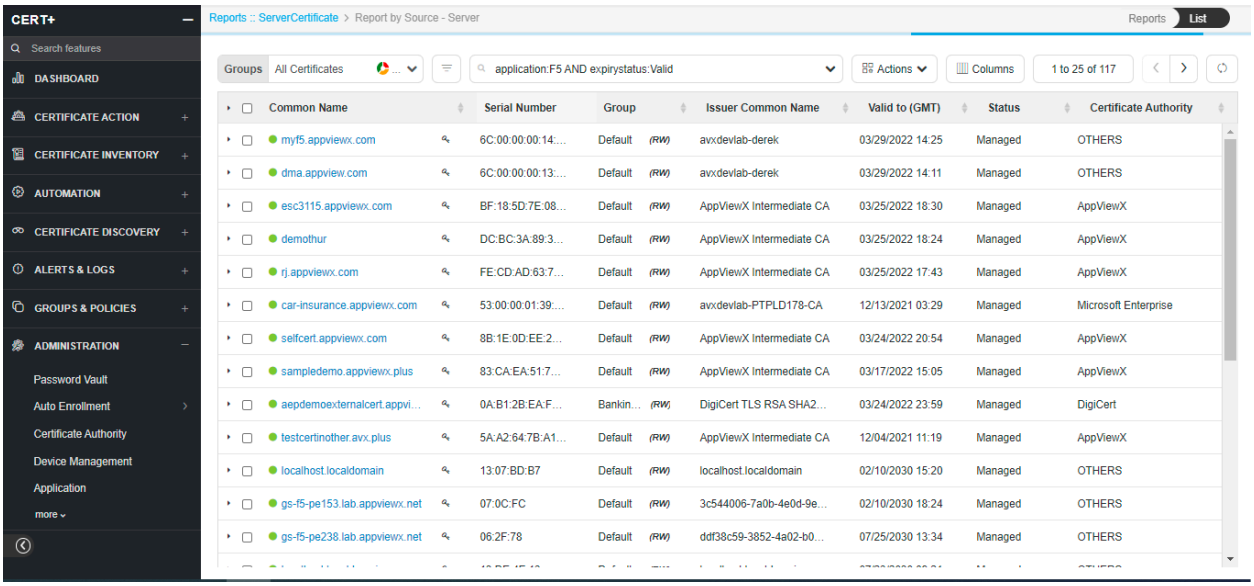
Report by Source

This report shows the count of server certificates with respect to the source from where the certificates are discovered along with the expiry status.



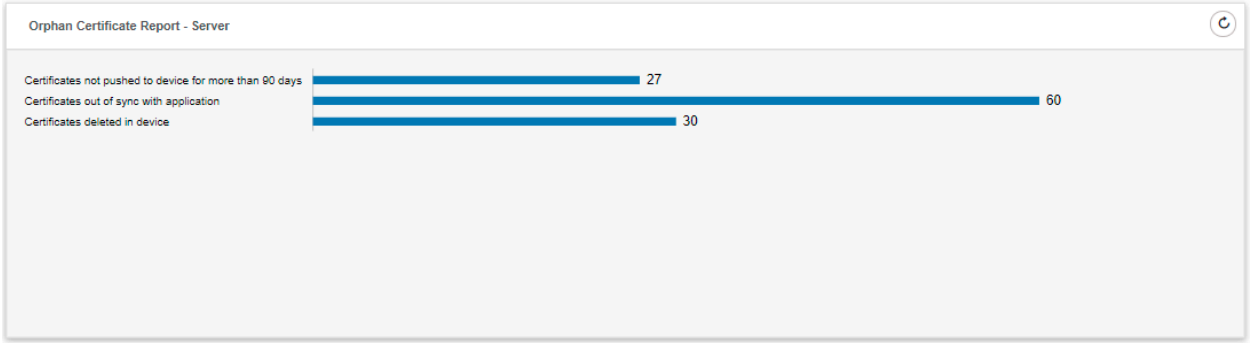
On click of anywhere in the bar chart, the filtered certificates data will be shown as below:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



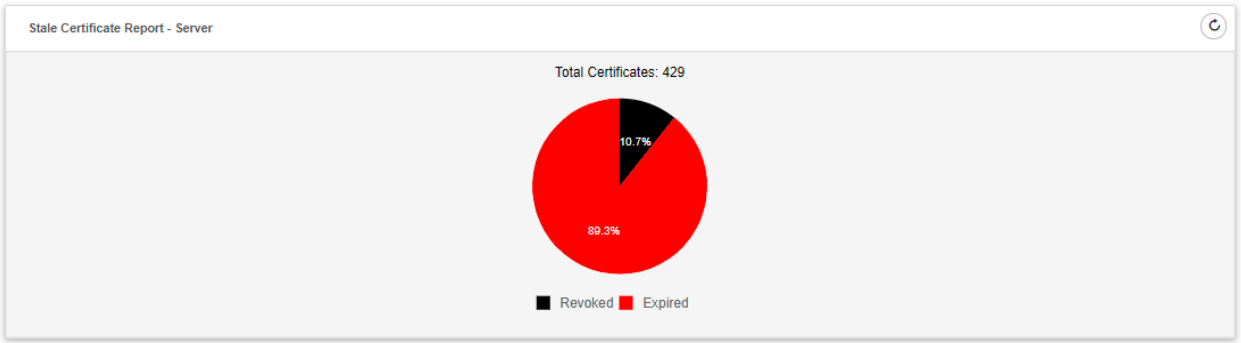
Orphan Certificate Report

This report shows the count of server certificates that are not associated/installed in any device/server.



Stale Certificate Report

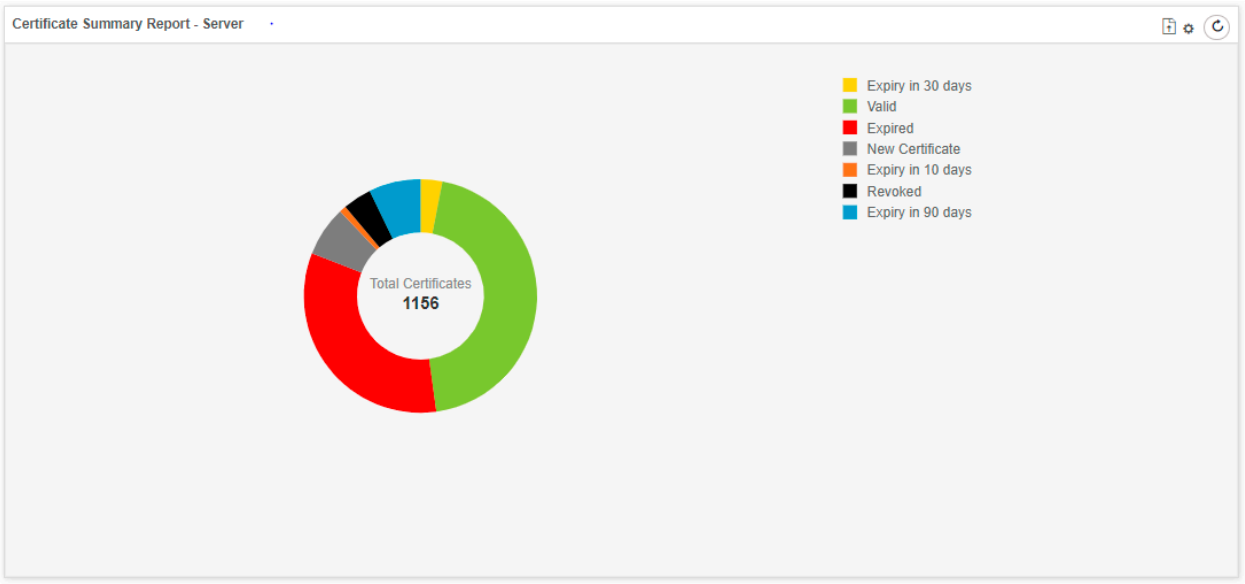
This report shows the count of server certificates that are either revoked or expired.



Certificate Summary Report

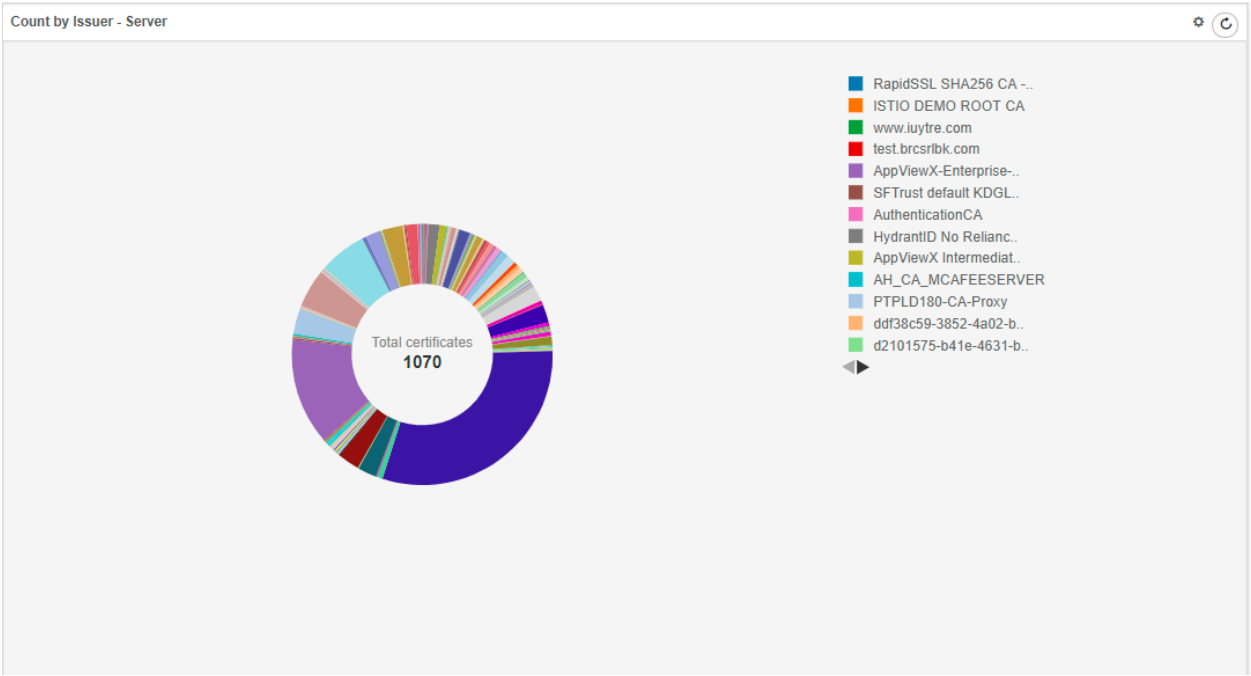
This report shows the count of certificates with respect to their expiry status.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Count by Issuer

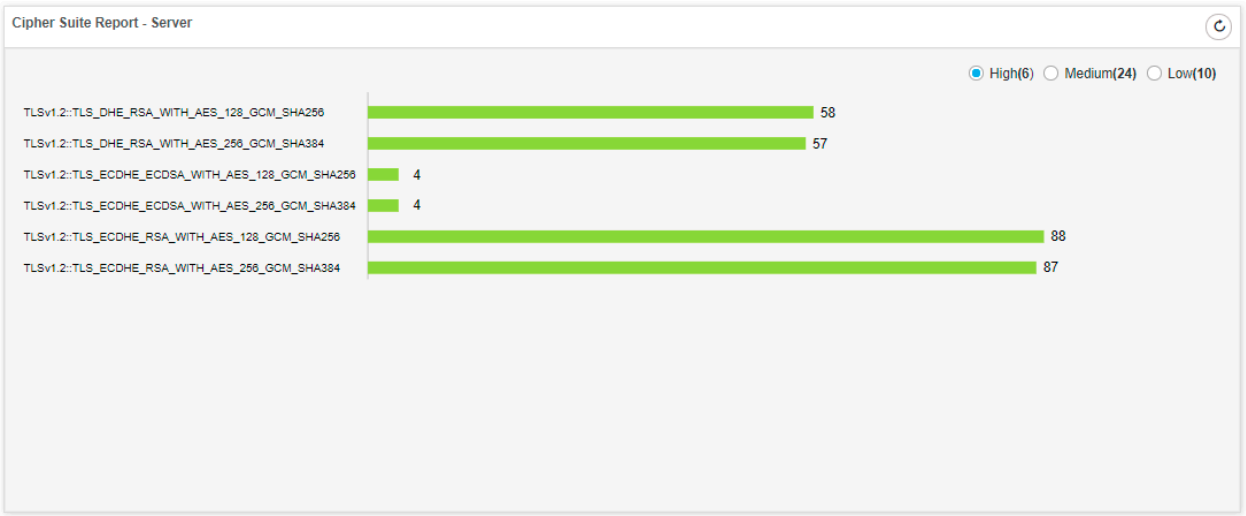
This report shows the count of certificates with respect to the issuer details.



Cipher Suite Report

This report shows the count of certificates with respect to the cipher suites. They are also categorized as Low, Medium, and High based on the cipher suites.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

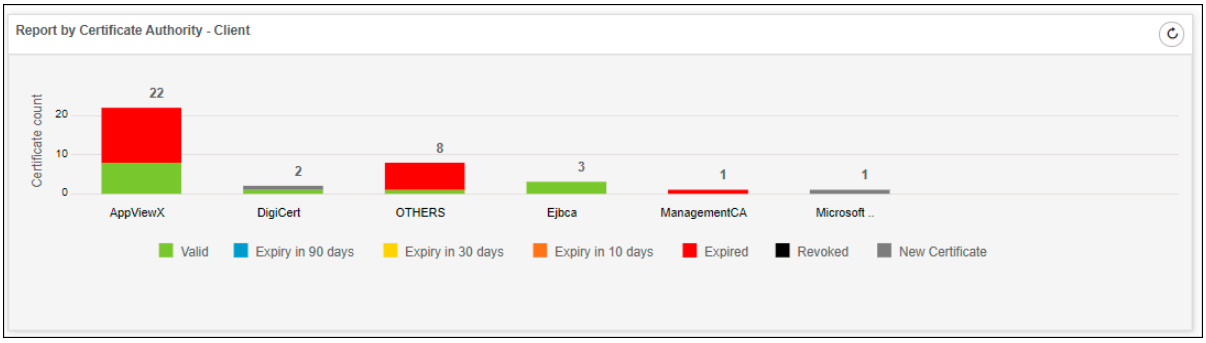


Understanding the Client Certificate Dashboard

This dashboard displays reports related to the certificates from the Client certificate inventory. You can also access this dashboard from the **Client Certificate** inventory page, by selecting **Reports** in the toggle at the top right corner of the page.

Report by Certificate Authority - Client

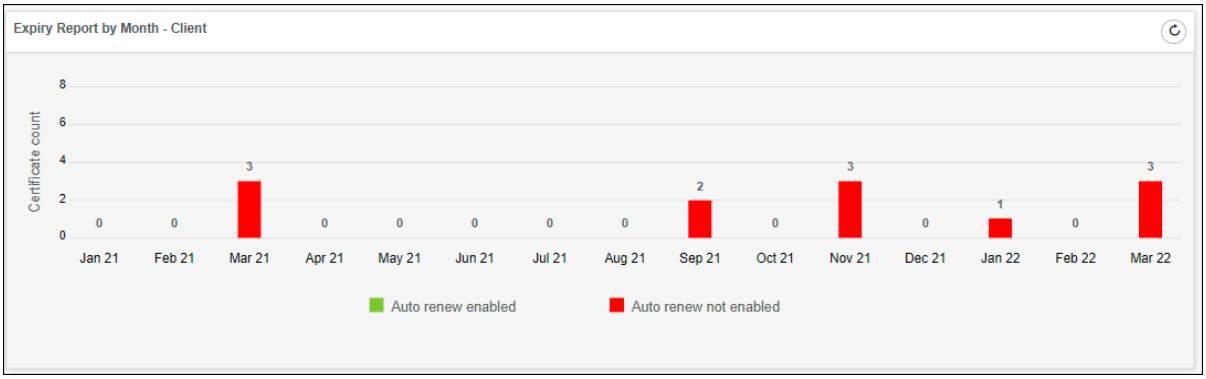
This report shows the count of certificates in the client inventory with respect to the certificate authorities and the expiry information.



Expiry Report by Month - Client

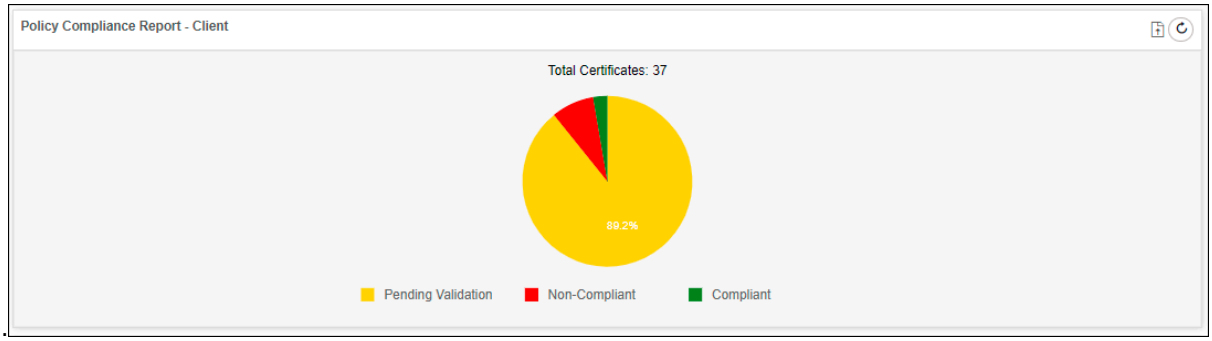
This report shows the count of certificates with respect to expiry month information.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



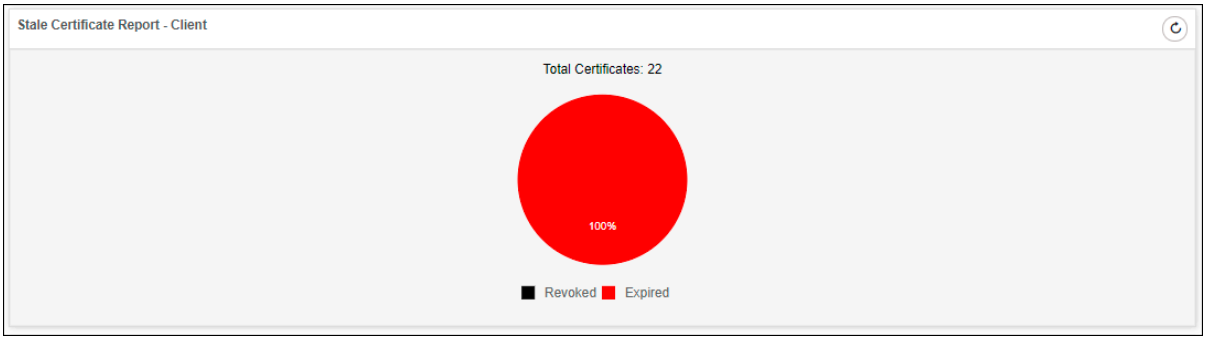
Policy Compliance Report - Client

This report shows the count of client certificates as compliant or non-compliant based on the group policy assigned to the certificate.



Stale Certificate Report - Client

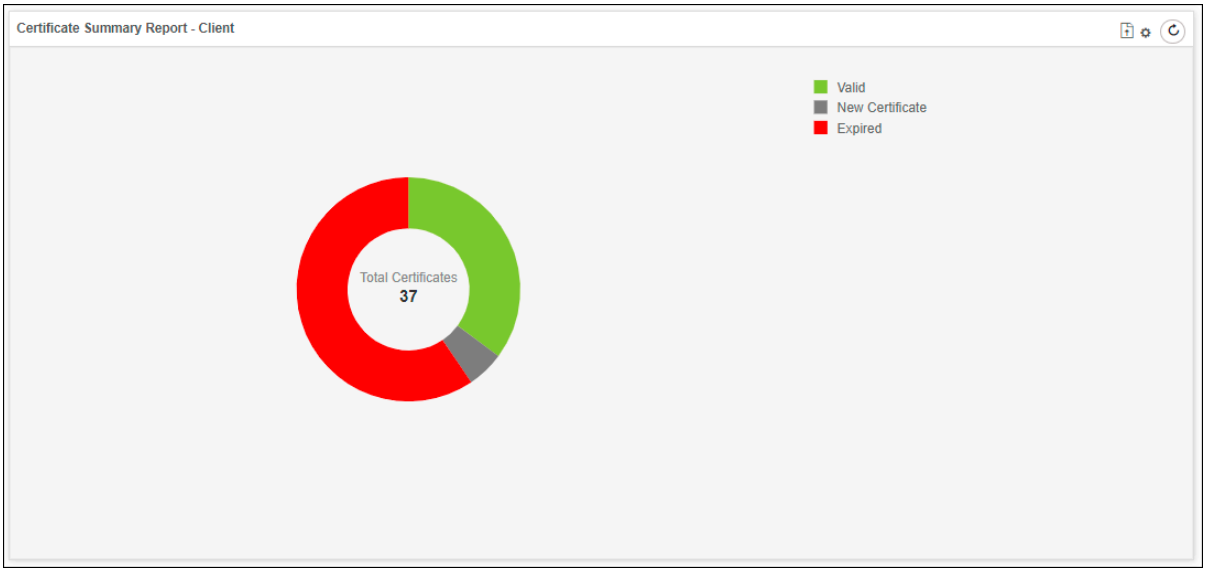
This report shows the count of client certificates that are either revoked or expired.



Certificate Summary Report - Client

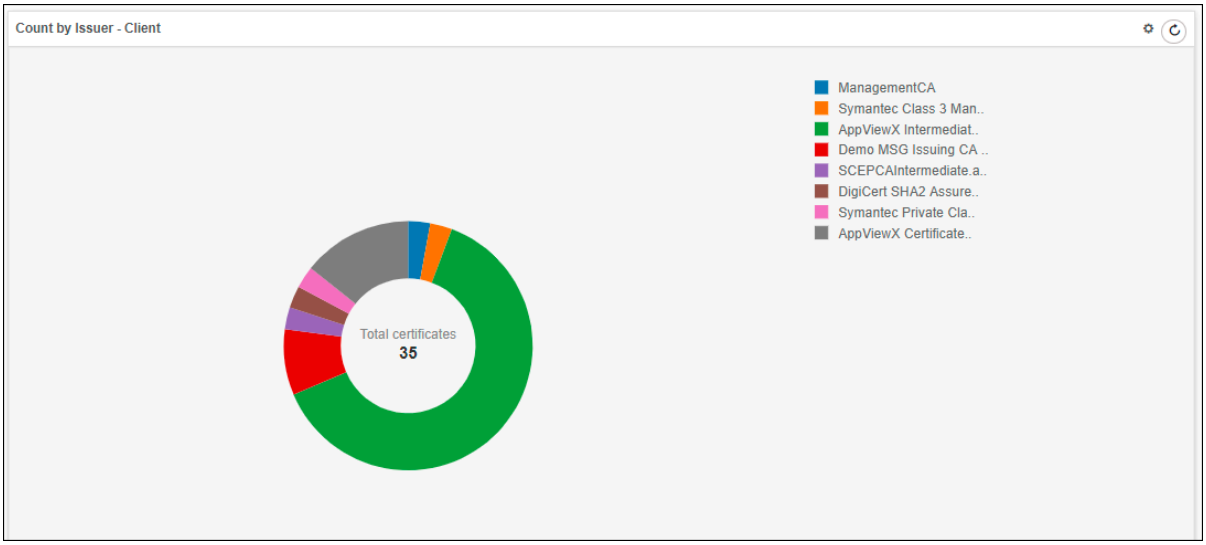
This report shows the count of certificates with respect to their expiry status.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Count by Issuer - Client

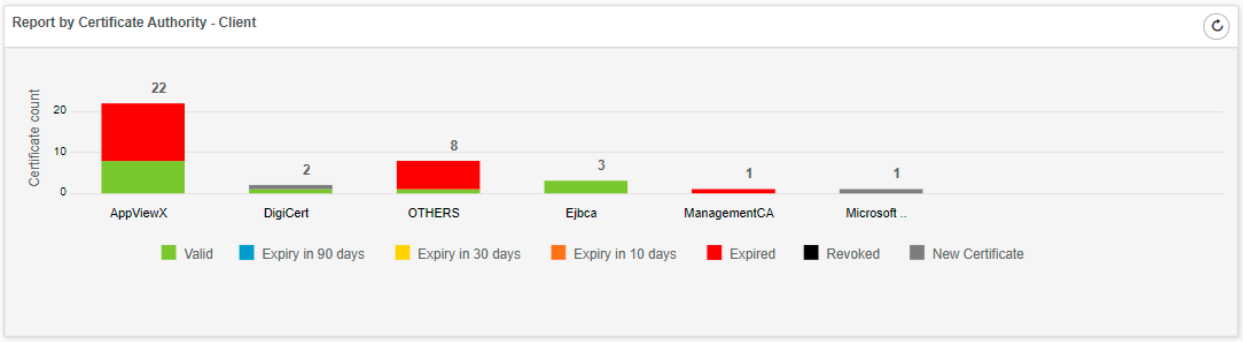
This report shows the count of client certificates with respect to the issuer details.



Report by Certificate Authority

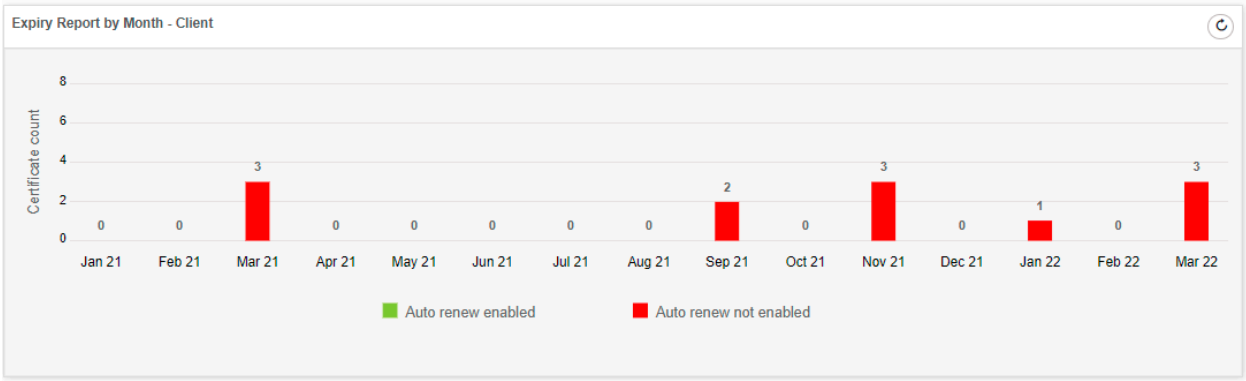
This report shows the count of certificates in the client inventory with respect to the certificate authorities and the expiry information.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



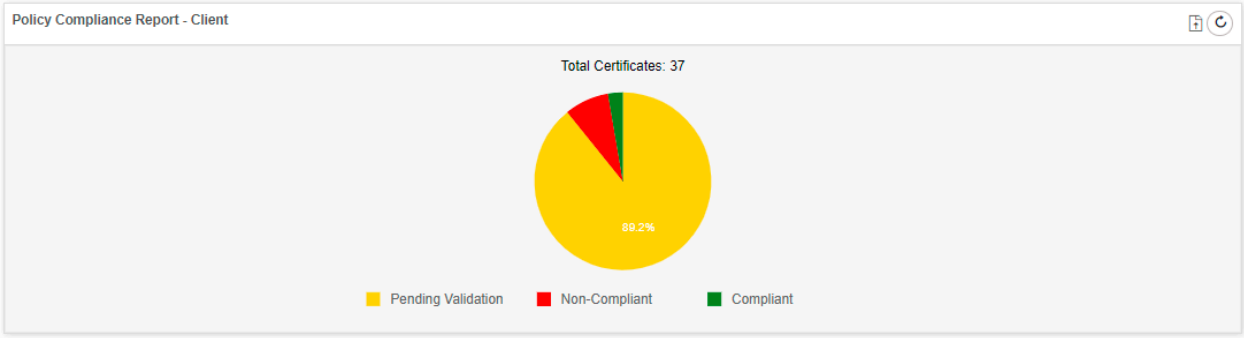
Expiry Report by Month

This report shows the count of certificates with respect to expiry month information.



Policy compliance status

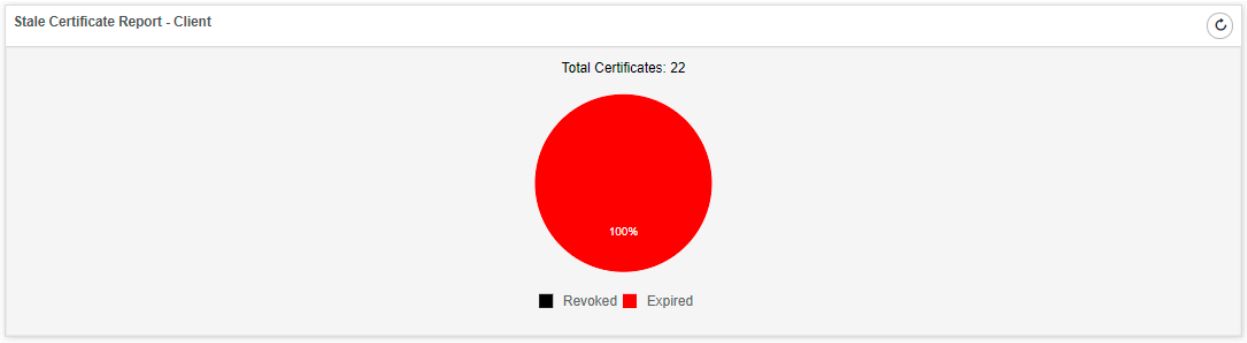
This report shows the count of client certificates as compliance or non-compliance based on the group policy assigned to the certificate.



Stale certificate report

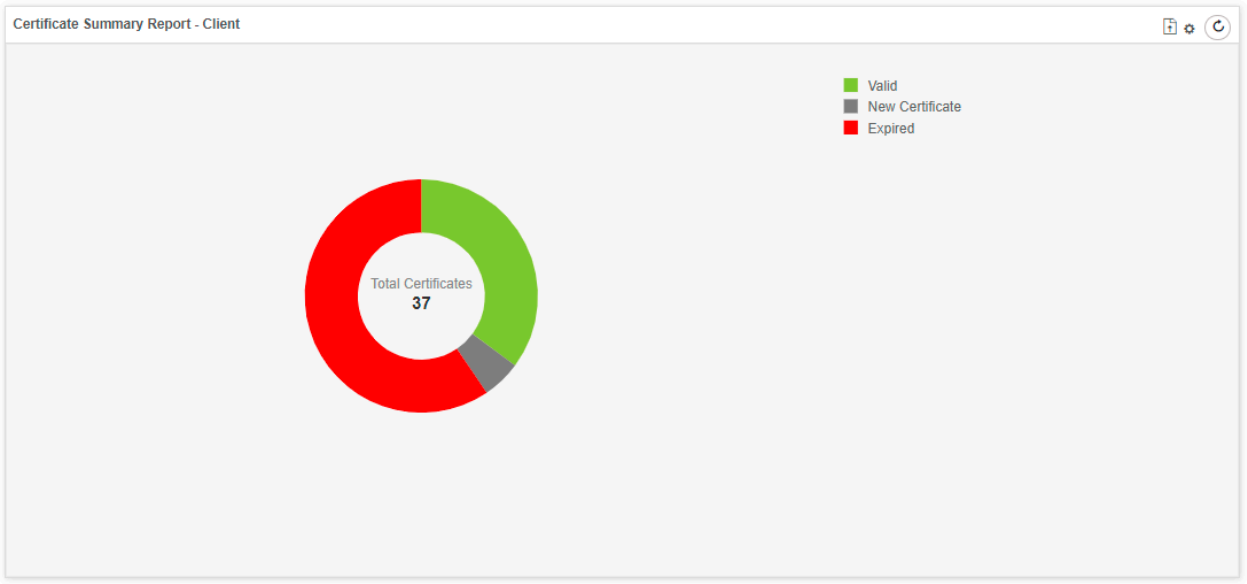
This report shows the count of client certificates that are either revoked or expired.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificate Summary Report

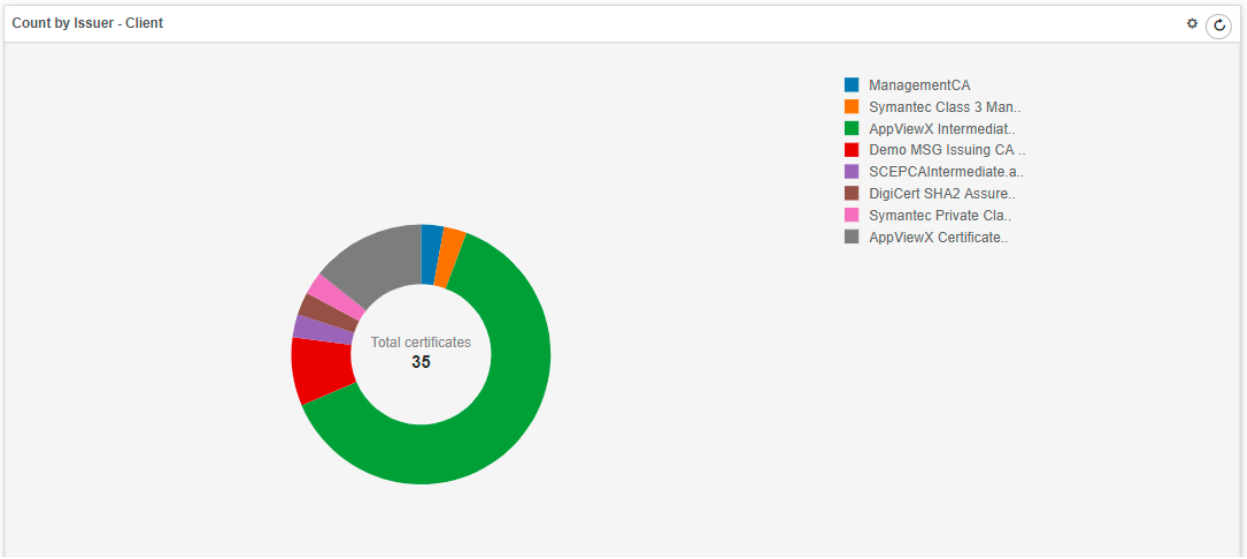
This report shows the count of certificates with respect to their expiry status.



Count of issuer

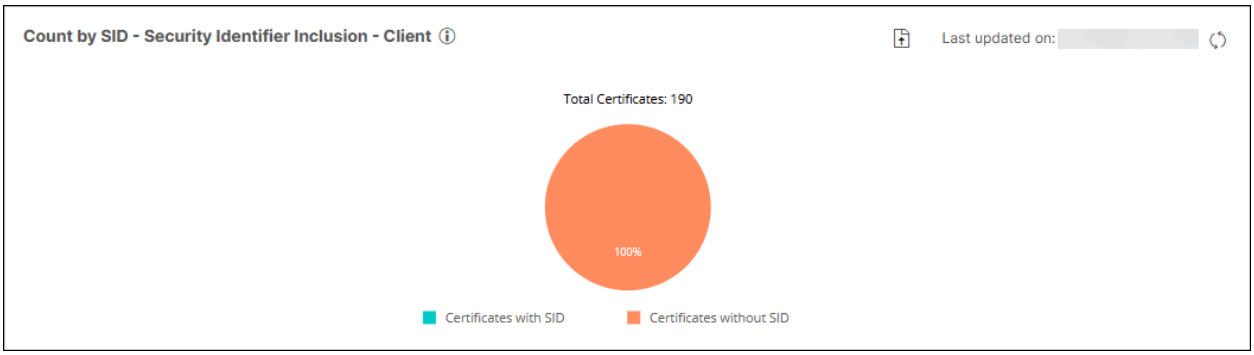
This report shows the count of client certificates with respect to the issuer details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Count by SID Report

This report shows the certificate count for certificates with and without an SID. A Security Identifier (SID) is a unique, immutable identifier assigned by Windows to each security principal.



The report uses a pie chart widget to show certificates with and without an SID.

The following certificates qualify as certificates with an SID:

- Certificates with the SID present in other extensions
- Certificates with the SID in the SAN (URI as well as other name) and having the following OIDs:
  - **1.3.6.1.4.1.311.25.2**
  - **1.3.6.1.4.1.311.25.2.1**

The (**Export** icon can be used to export the report as a **.csv** file.

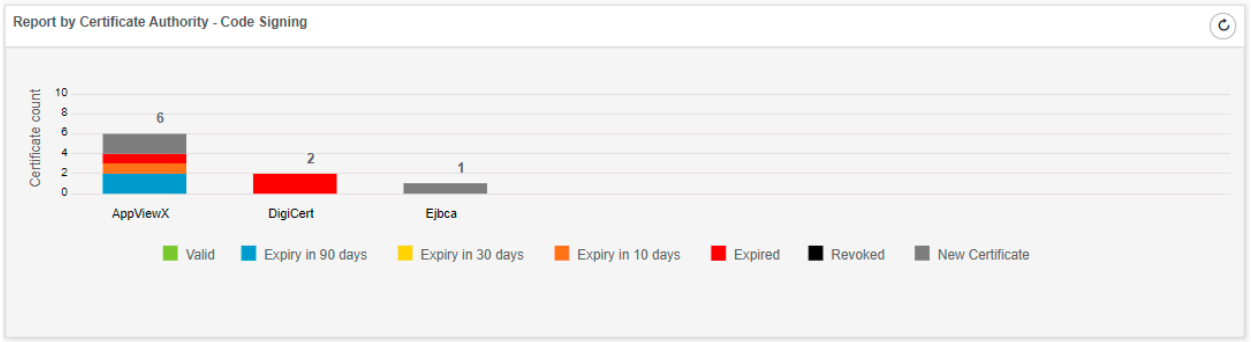
To be redirected to the certificate inventory filtered for certificates with/without the SID, click the corresponding pie slice.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To hide the representation of certificates with/without an SID, click the corresponding legend. To unhide it, click the corresponding legend again.

Report by Certificate Authority

This report shows the count of certificates in the code signing inventory with respect to the certificate authorities and the expiry information.



Understanding the Code Signing Dashboard

This dashboard displays reports related to the certificates from the Code Signing certificate inventory. You can also access this dashboard from the **Code Signing Certificate** inventory page, by selecting **Reports** in the toggle at the top right corner of the page.

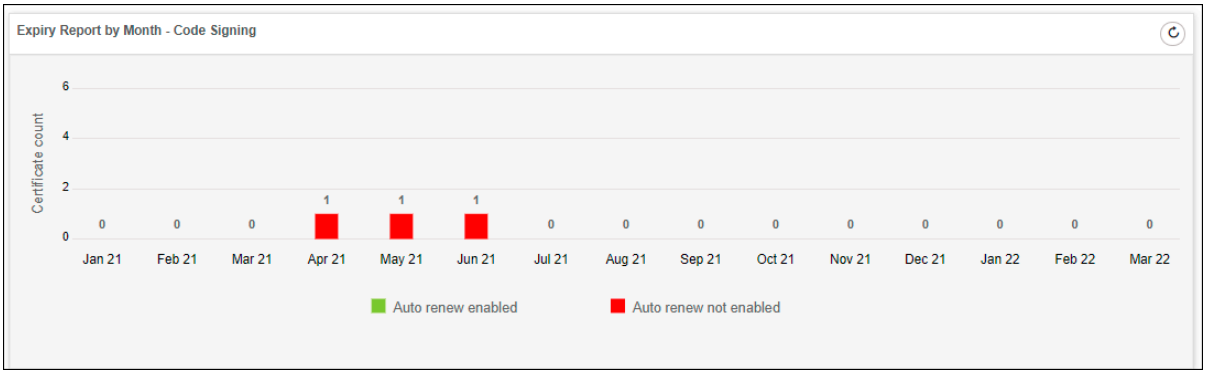
Report by Certificate Authority - Code Signing

This report shows the count of certificates in the code signing inventory with respect to the certificate authorities and the expiry information.

Expiry Report by Month - Code Signing

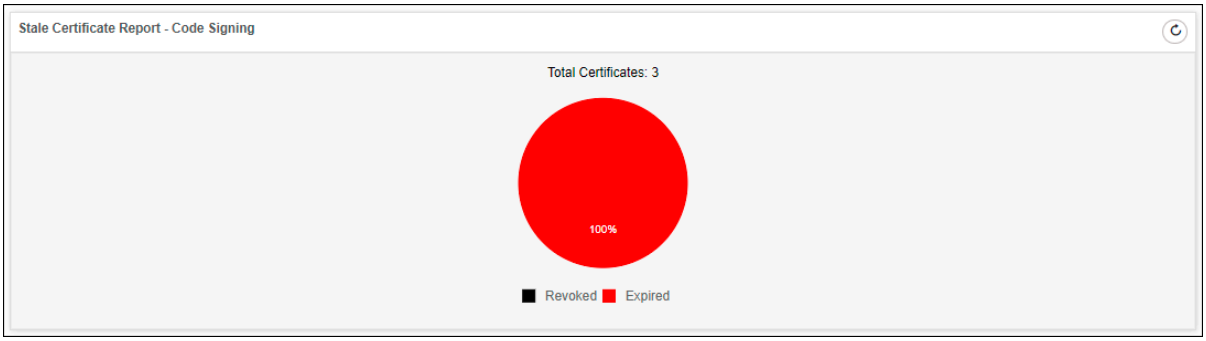
This report shows the count of code signing certificates with respect to expiry month information.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



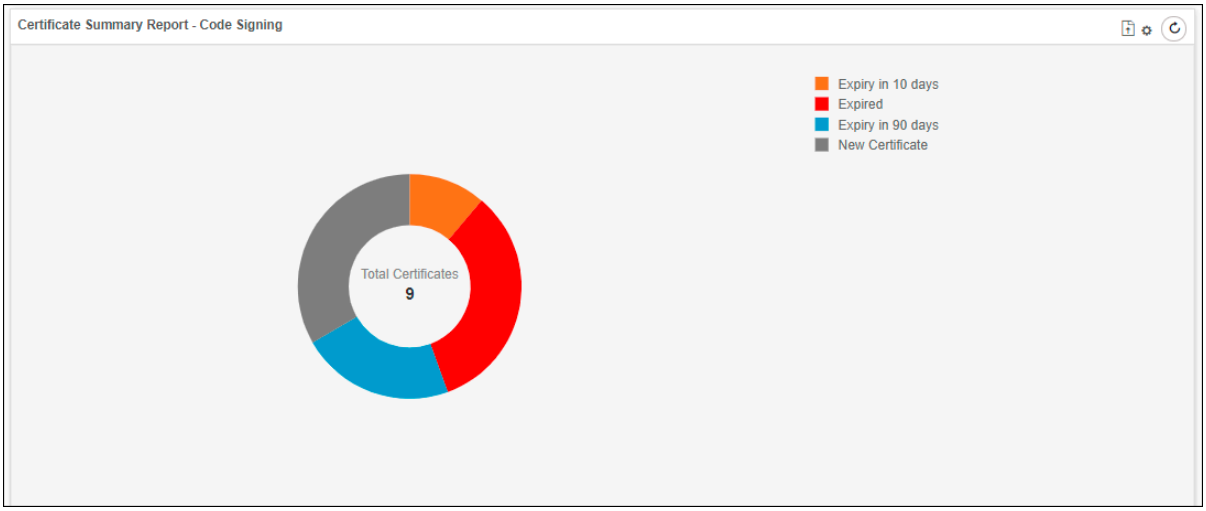
Stale Certificate Report - Code Signing

This report shows the count of code signing certificates that are either revoked or expired.



Count by Issuer - Code Signing

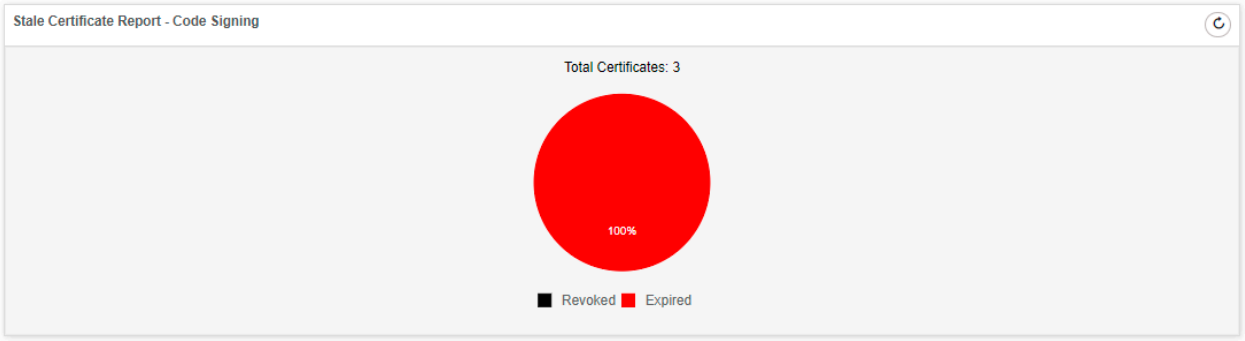
This report shows the count of client certificates with respect to the issuer details.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

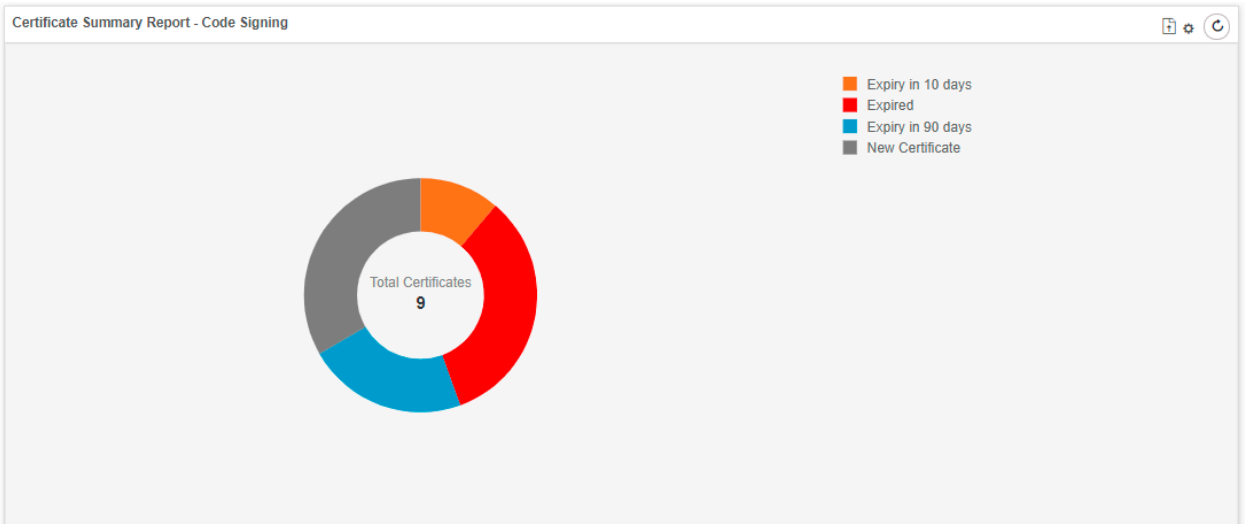
Stale Certificate Report

This report shows the count of code signing certificates that are either revoked or expired.



Count of issuer

This report shows the count of client certificates with respect to the issuer details.



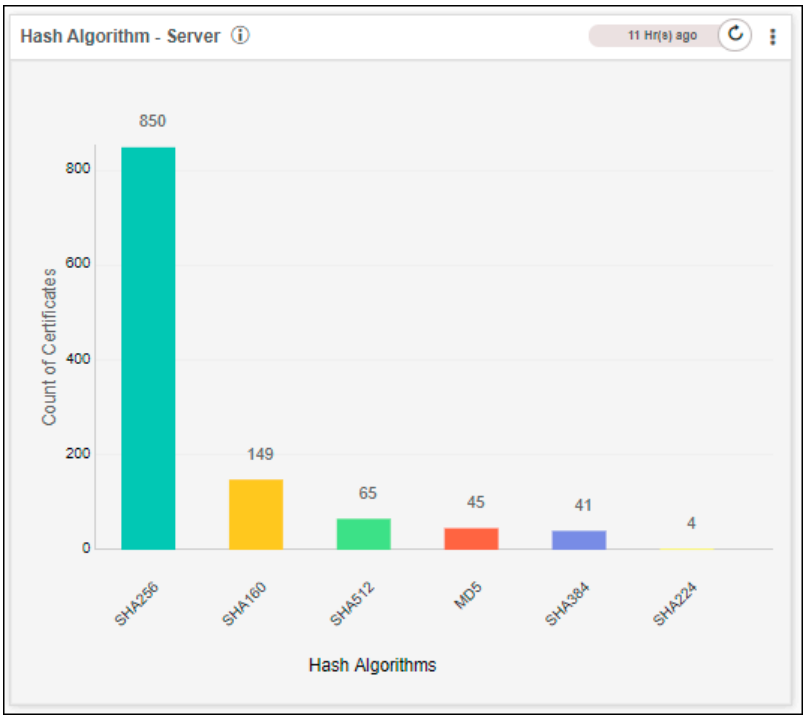
Server Certificate Security Dashboard

For the certificates in the Server inventory, this dashboard displays the following reports:

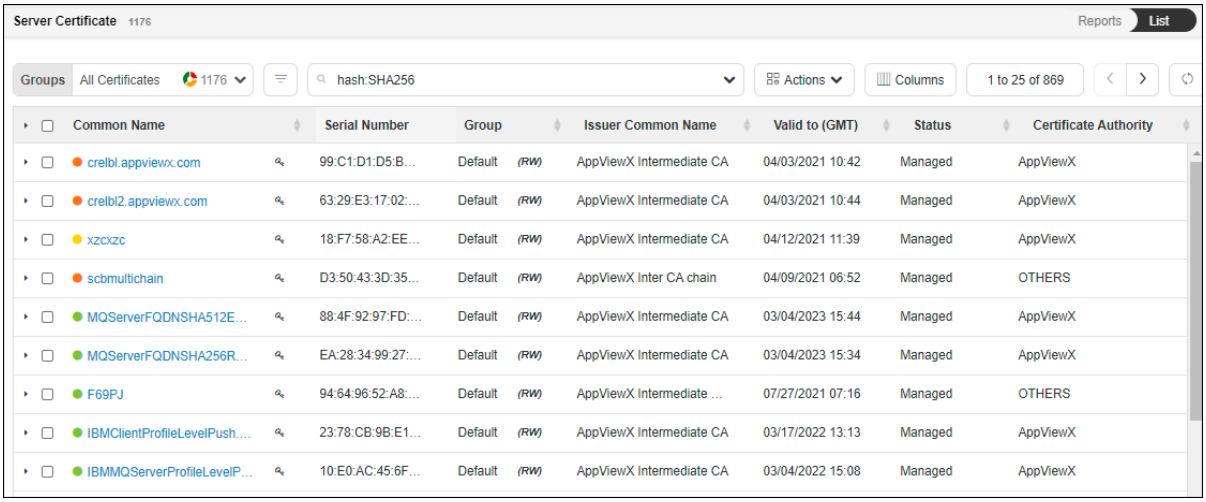
Hash Algorithm - Server

This report shows the count of certificates with respect to the hash algorithm available in the server inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



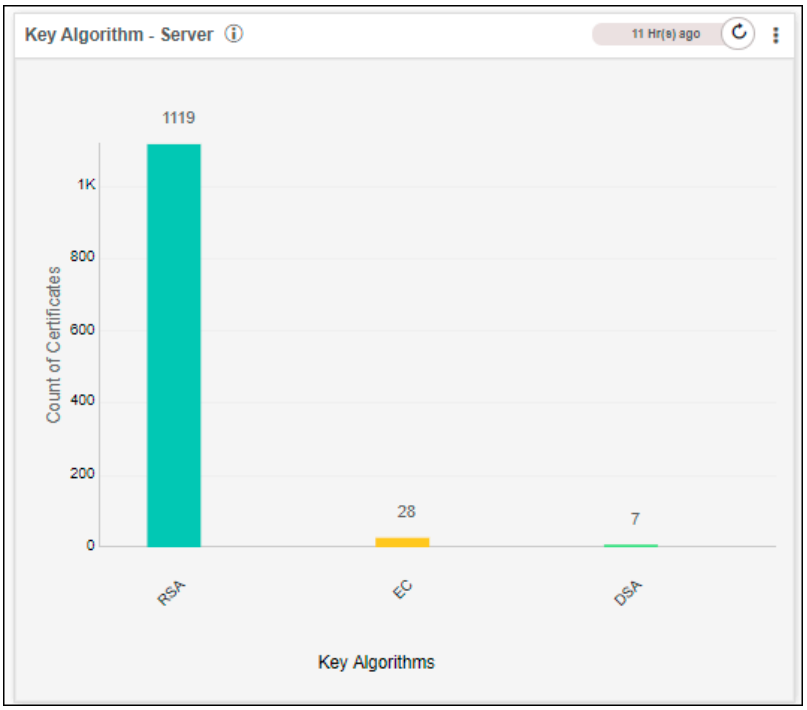
On clicking any bars of the report, the filtered data of certificates is displayed.



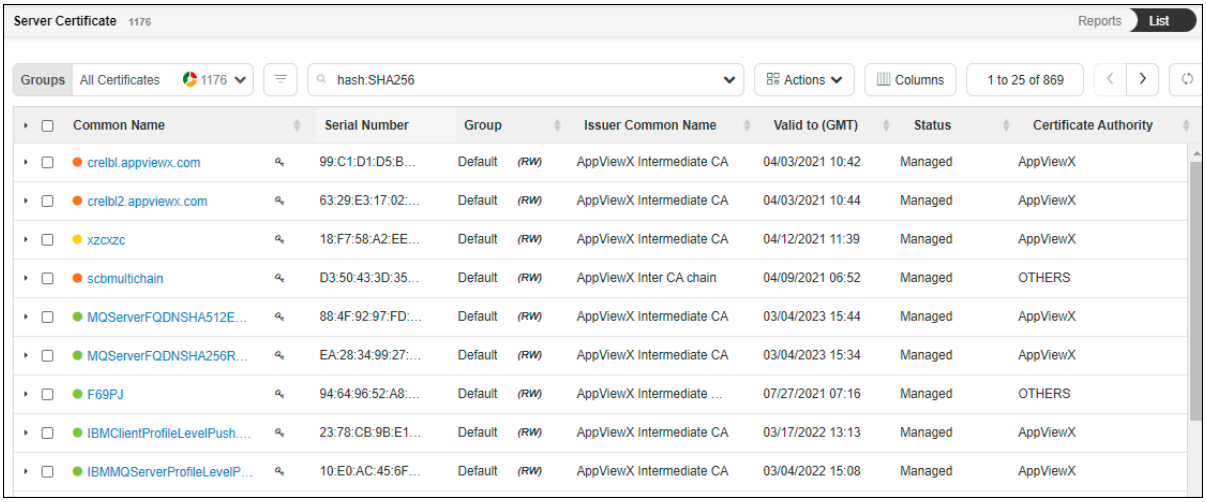
Key Algorithm - Server

This report shows the count of certificates with respect to the key algorithms available in the server inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



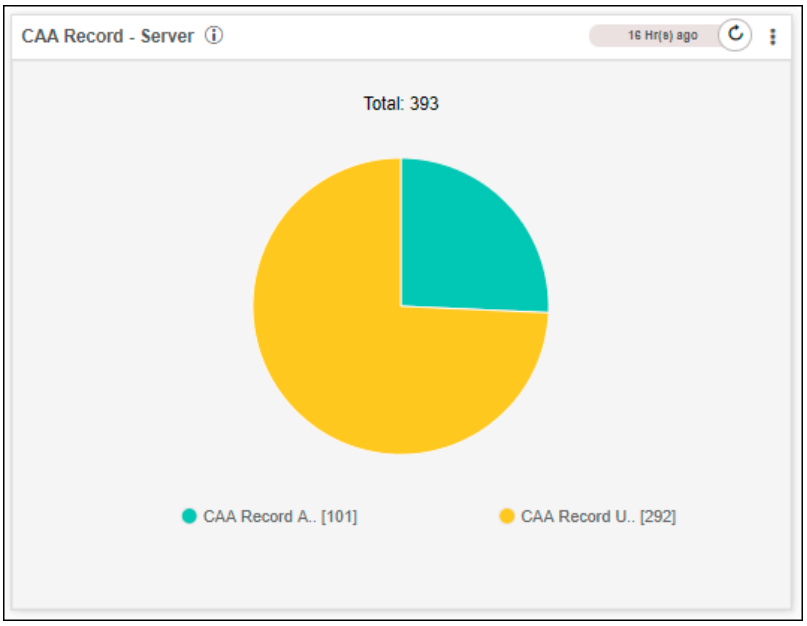
On clicking any bars of the report, the filtered data of certificates is displayed.



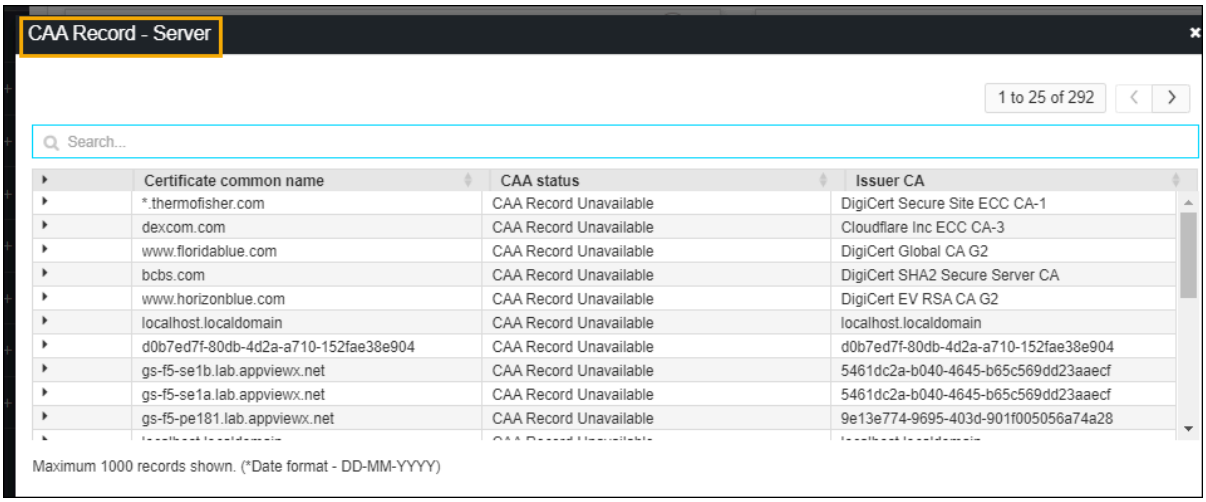
CAA Record - Server

This report shows the count of certificates with and without CAA records in the server inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



On clicking any parts of the report, the filtered data of certificates is displayed.

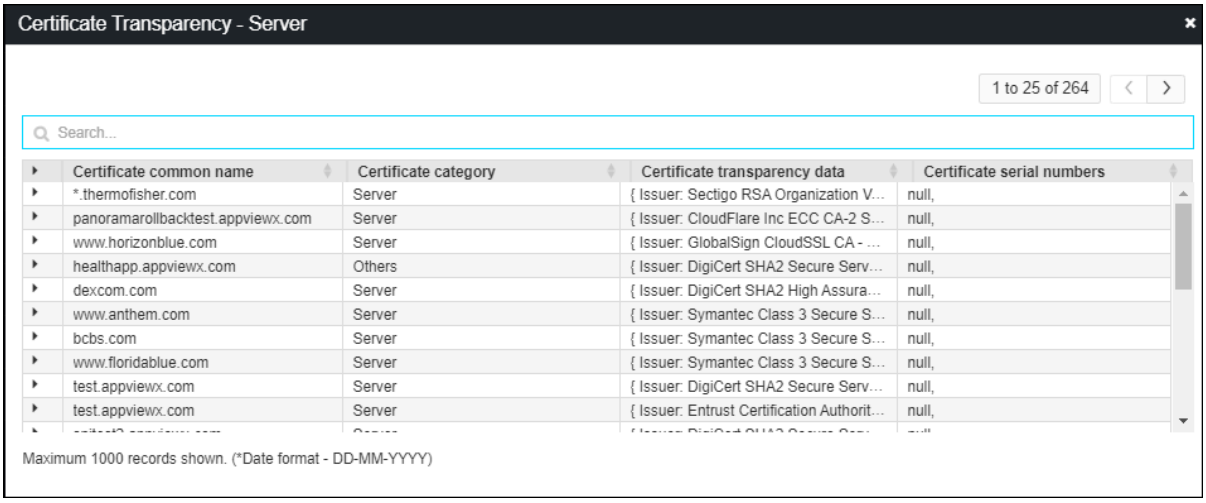


Certificate Transparency - Server

This report shows the count of application/FQDNs for which more certificates are available and only a few are managed/monitored in server certificate inventory. Currently the report is disabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On clicking any parts of the report, the filtered data of certificates is displayed.



Understanding the Client Certificate Security Dashboard

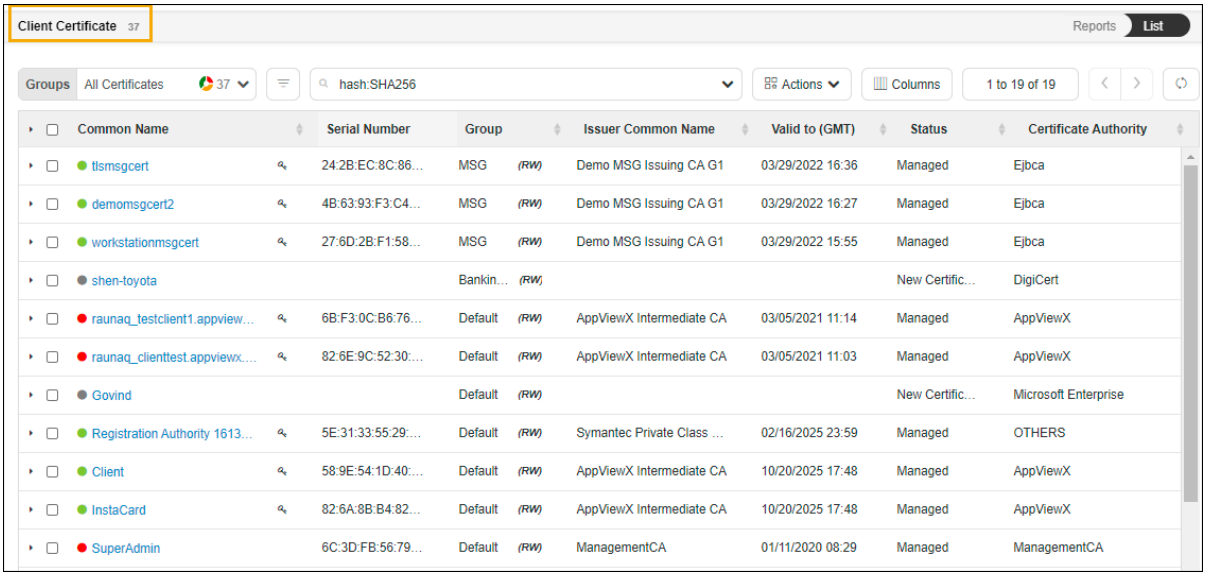
For the certificates in the Client inventory, this dashboard will be shown as the reports:

Hash Algorithm - Client

This report shows the count of certificates with respect to the hash algorithm available in the Client inventory.

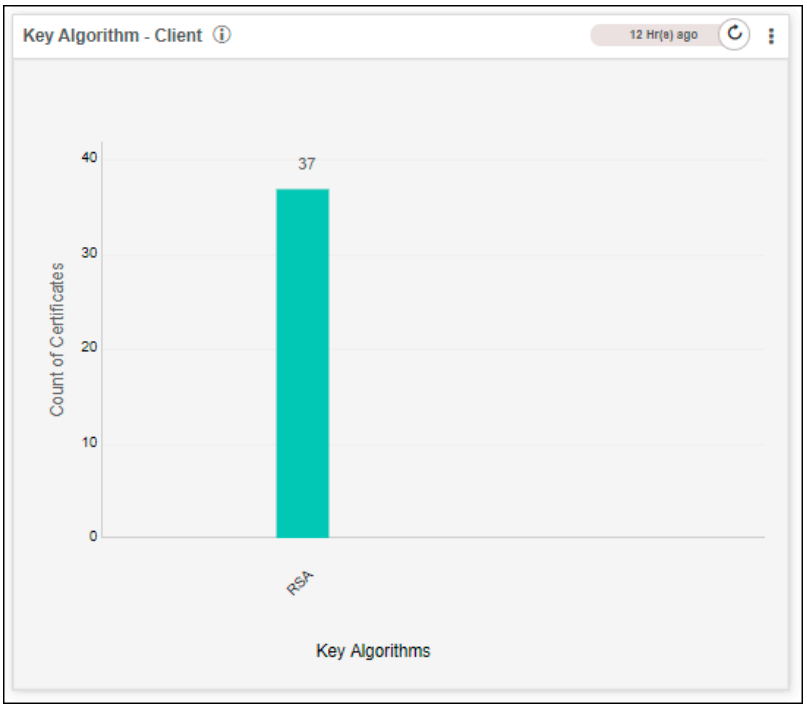
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On clicking any bars of the report, the filtered data of certificates is displayed.



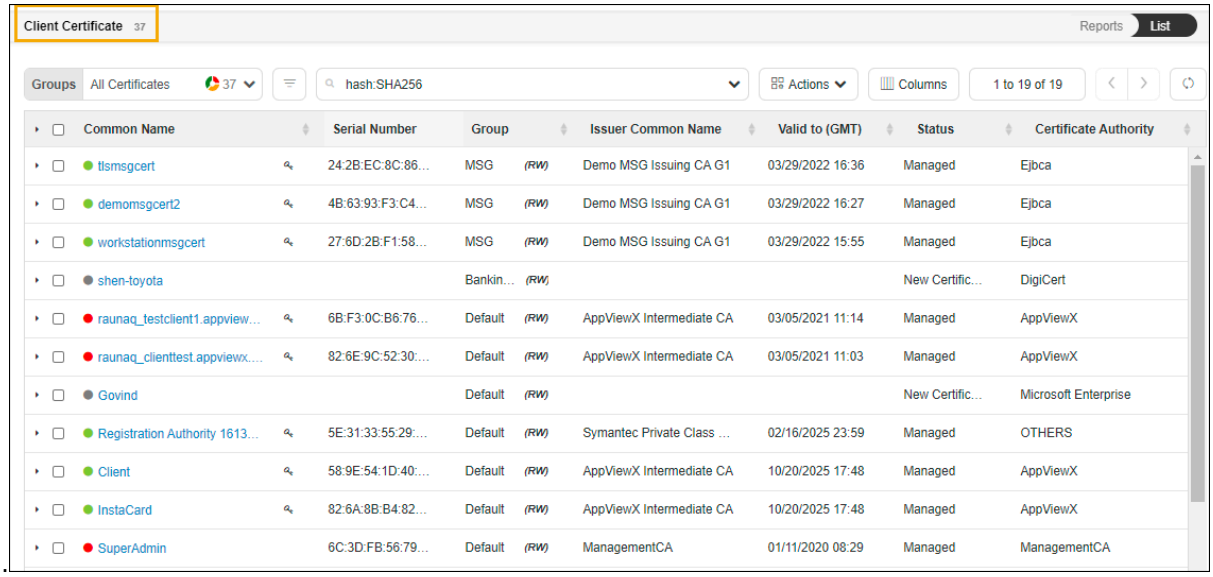
Key Algorithm - Client

This report shows the count of certificates with respect to the key algorithms available in the Client inventory.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

On clicking any bars of the report, the filtered data of certificates is displayed.

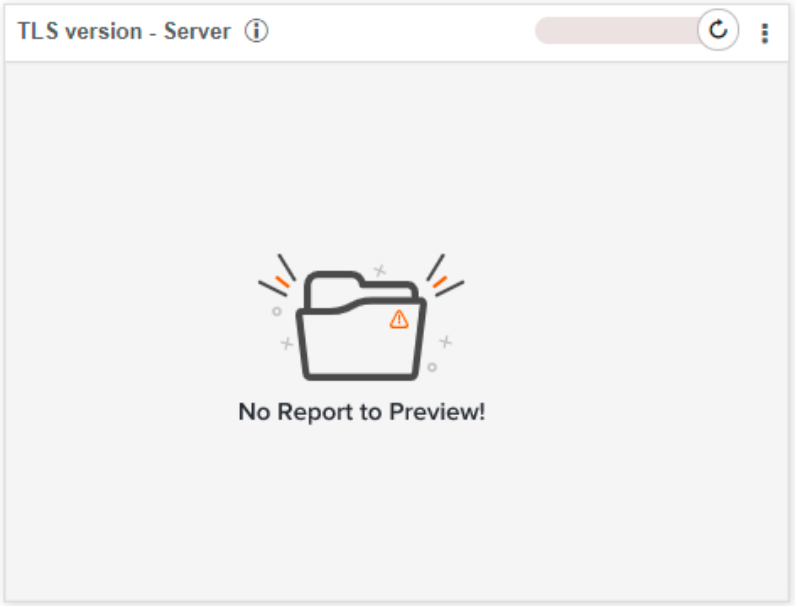


Understanding the Server Endpoint Security Dashboard

For the certificates in the Server inventory which are associated with the endpoints, from a security perspective, the following reports are available:

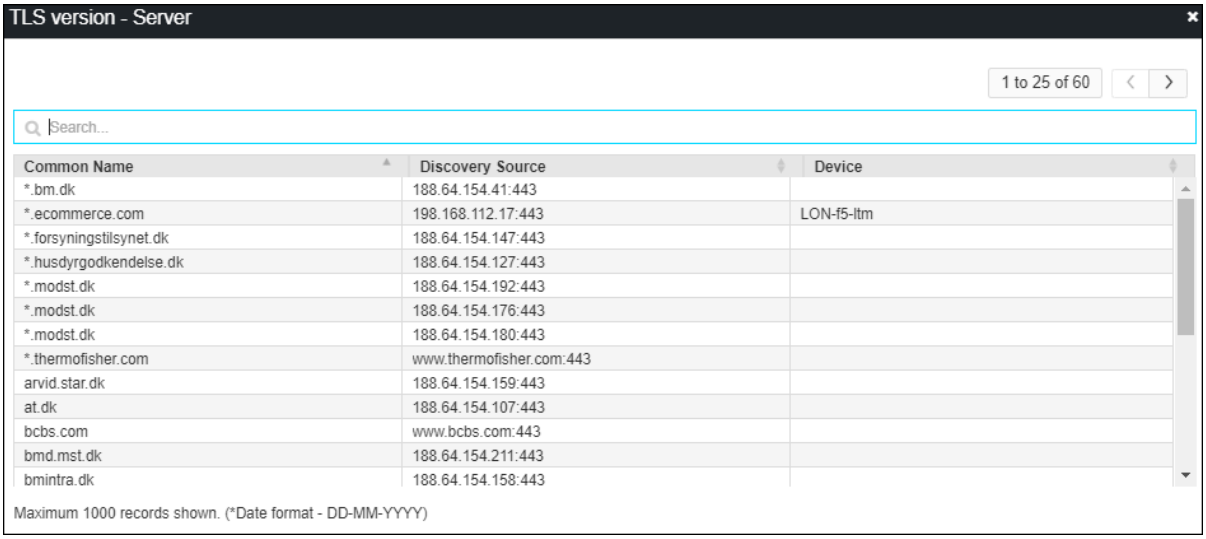
TLS Version - Server

This report shows the count of certificates with respect to the TLS versions available in the server inventory.



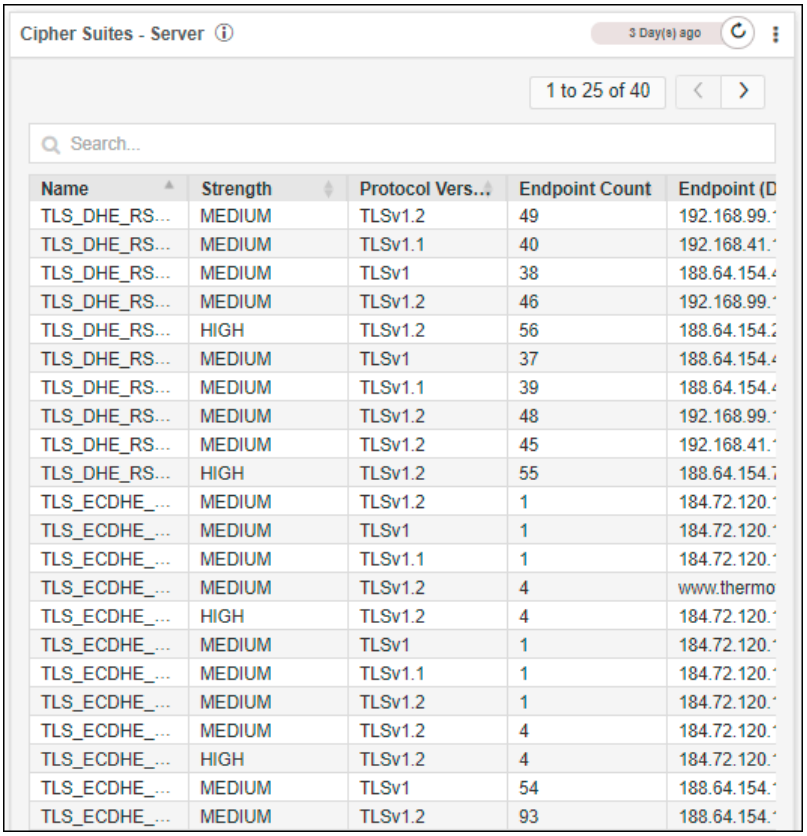
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Clicking the **Endpoint Count** value in the report displays the respective data of certificates.



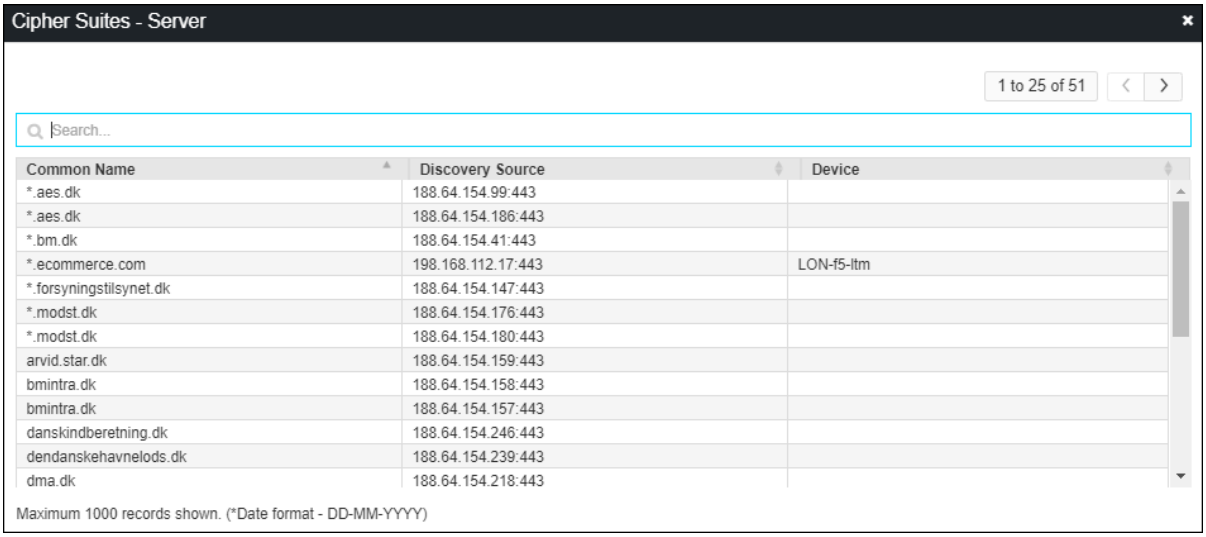
Cipher Suites - Server

This report shows the count of certificates with respect to the cipher suite details and the TLS versions. The cipher suites are shown based on the priority.



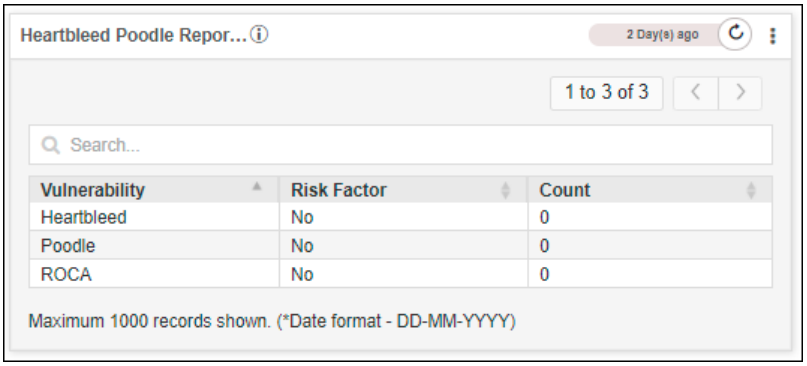
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Clicking on the **Endpoint Count** value in the report displays the respective data of certificates.



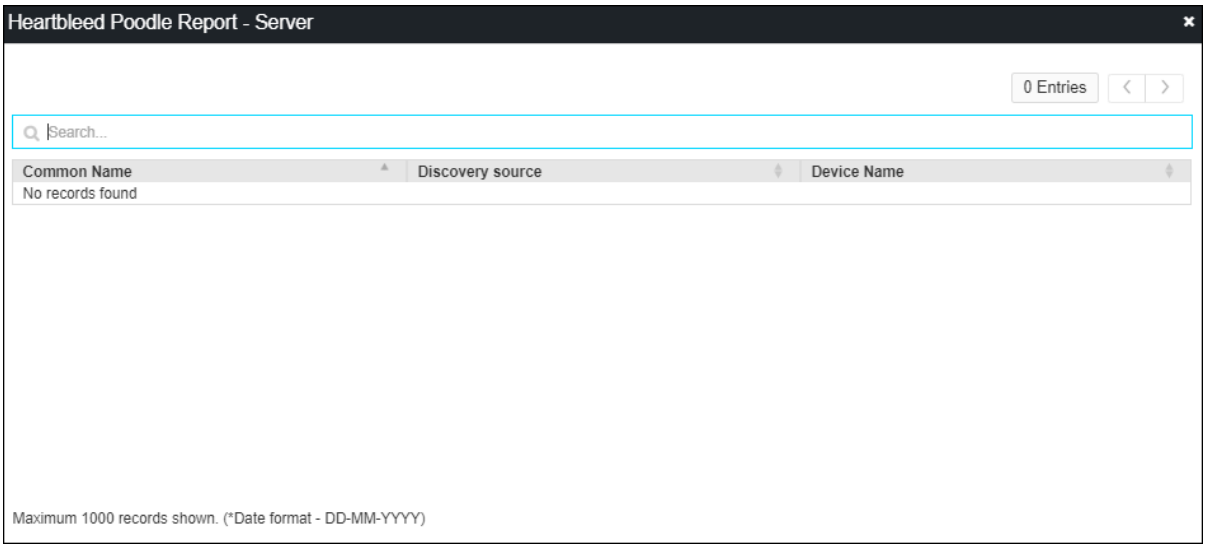
Heartbleed & Poodle Report - Server

This report shows the count of device endpoints are exposed to Heartbleed, Poodle, and ROCA vulnerabilities.



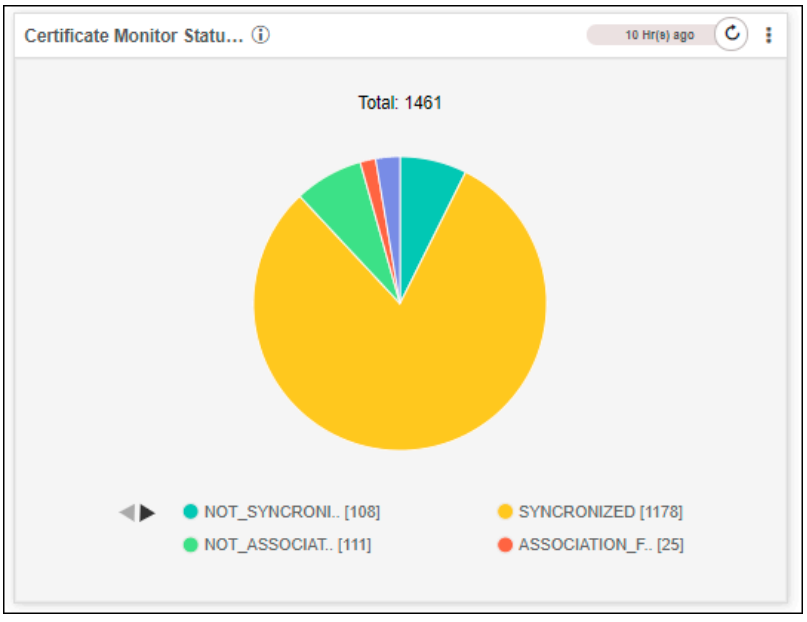
Click on the **Count** value in the report displays the respective data of certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



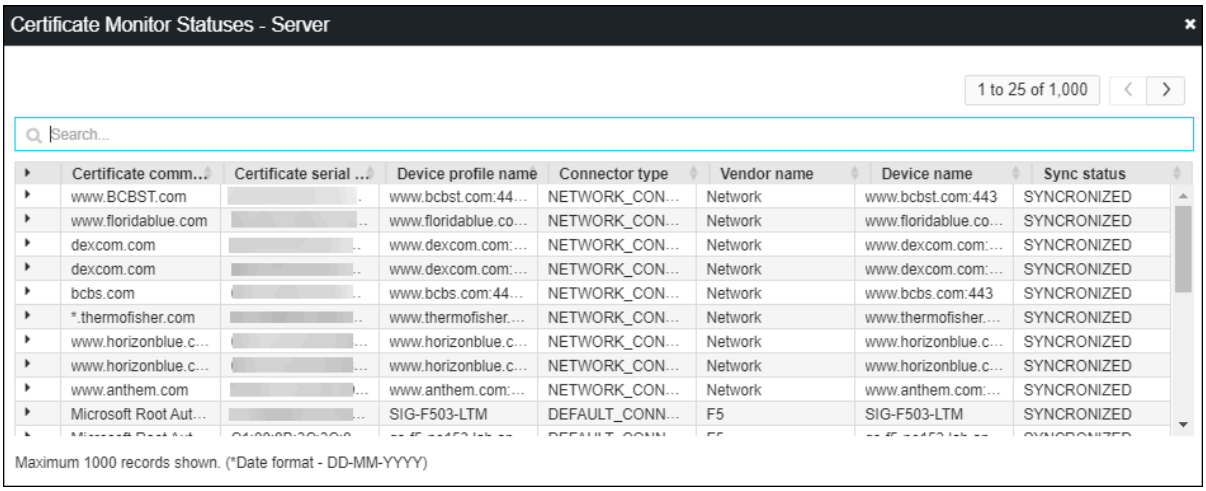
Certificate Monitor Statuses - Server

This report shows the count of domain names for which more certificates are available and only a few are managed/monitored in the Client certificate inventory.



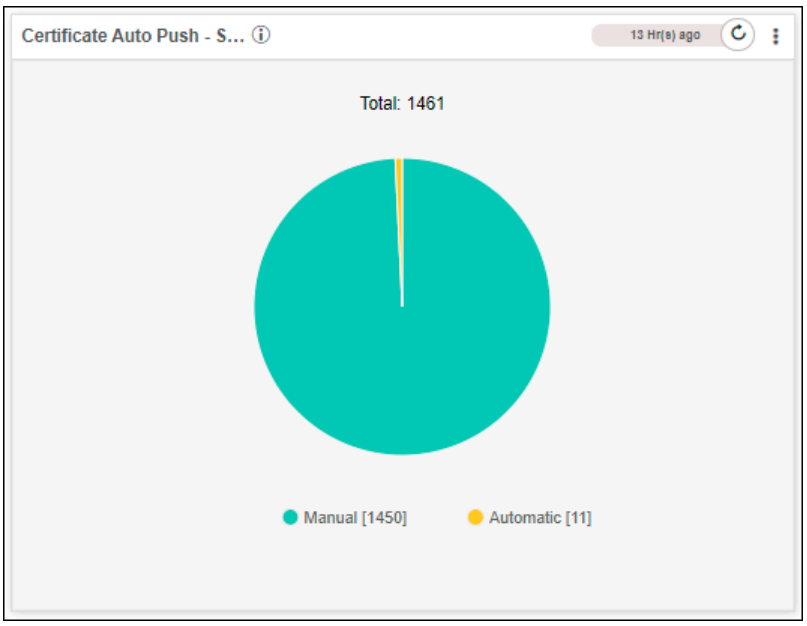
Clicking on any sections of the pie chart displays the respective data of certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificate Auto Push - Server

This report shows the count of certificates in the Server inventory which are enabled and not enabled with auto push feature.



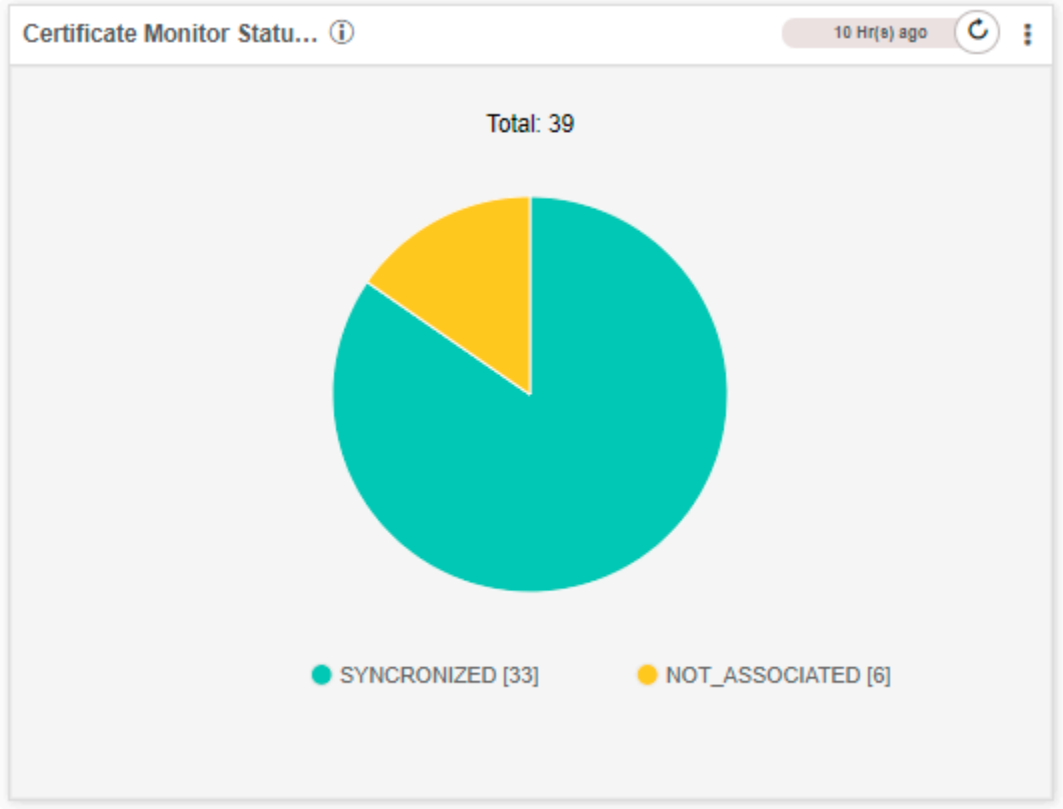
Understanding the Client Endpoint Security Dashboard

For the certificates in the Server inventory which are associated with the endpoints, from the security perspective, the following are the reports available:

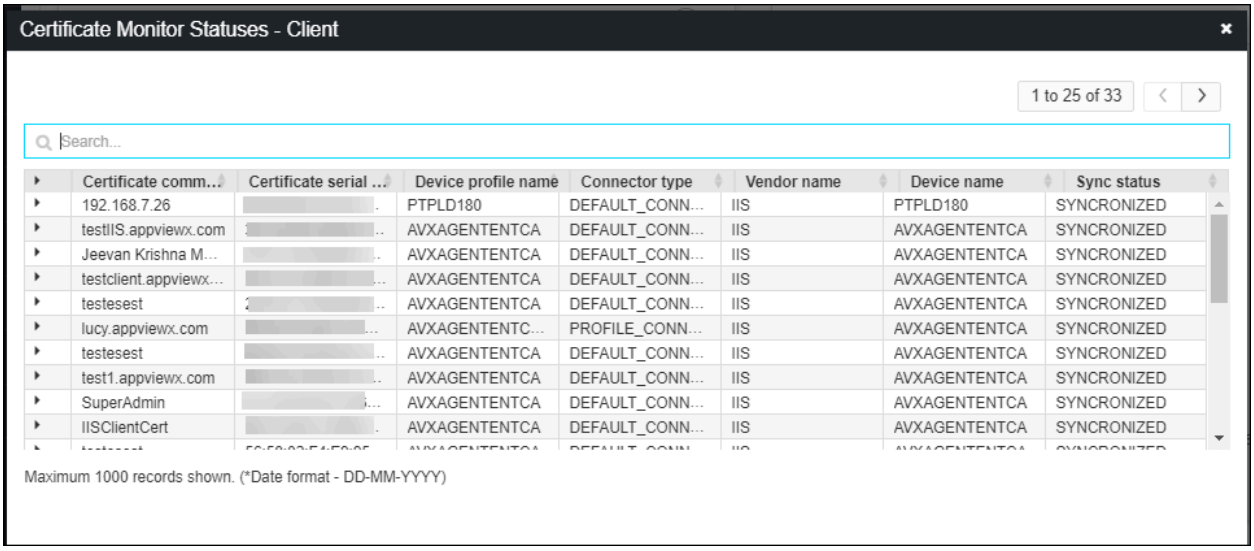
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Monitor Statuses - Client

This report shows the count of endpoints with respect to their certificate monitor statuses available in the client inventory.



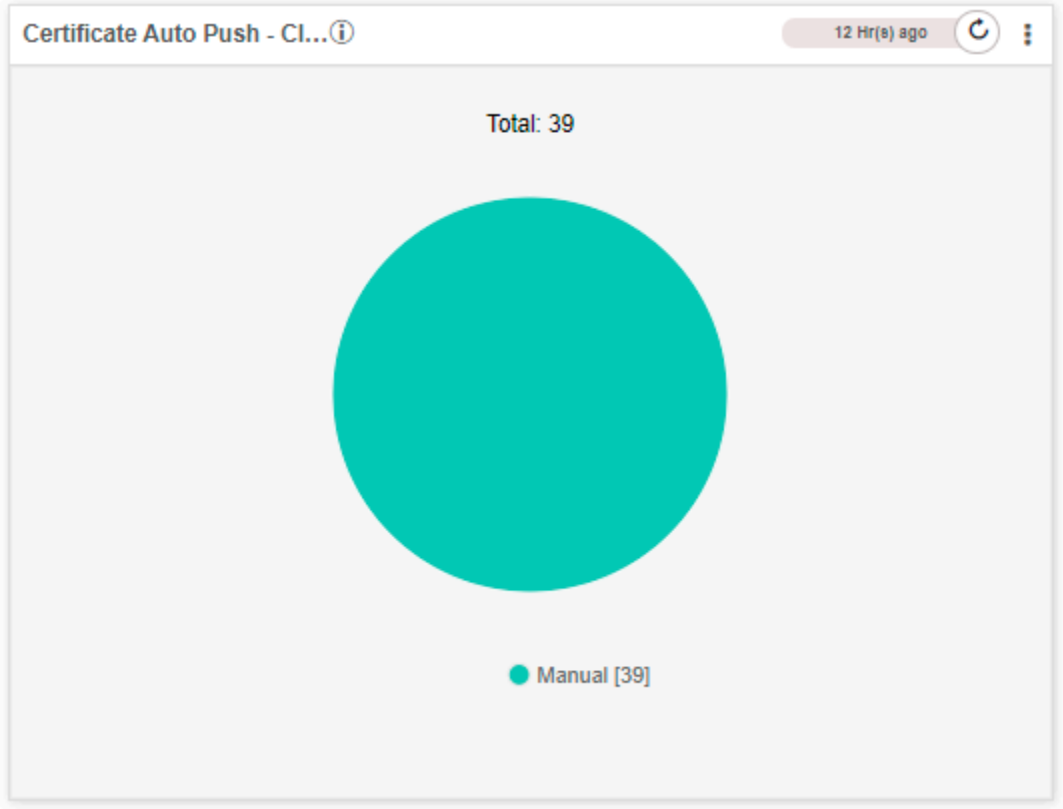
On click of this chart, the respective filtered data of certificates be shown as below:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

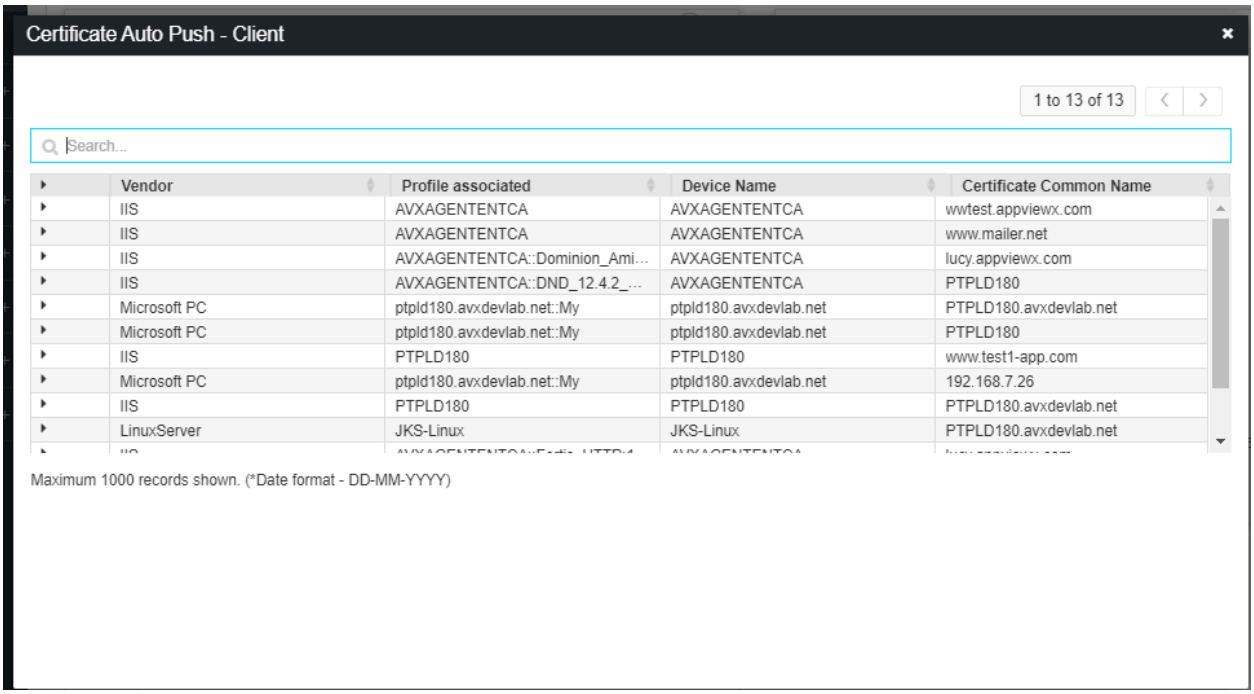
Certificate Auto Push - Client

This report shows the count of certificates in the client inventory which are enabled and not enabled with auto push feature.



On click of this chart, the respective filtered data of certificates be shown as below:

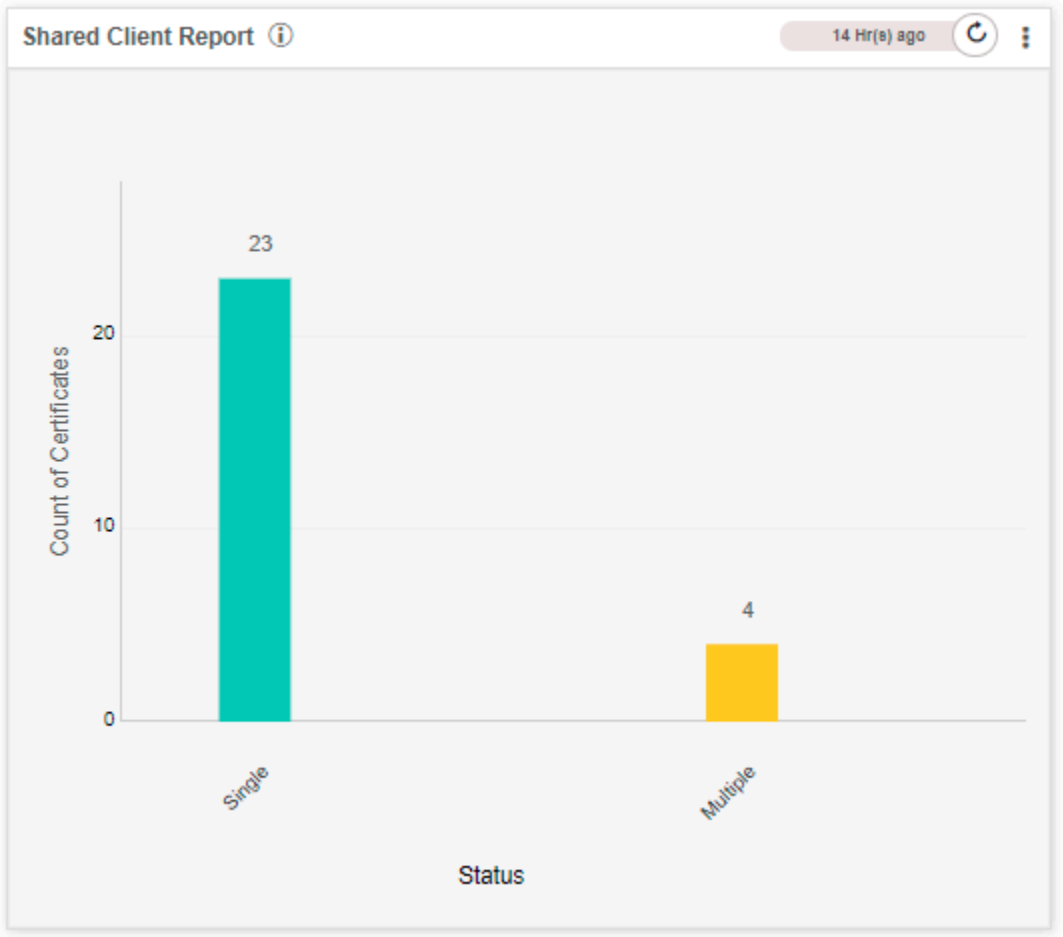
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



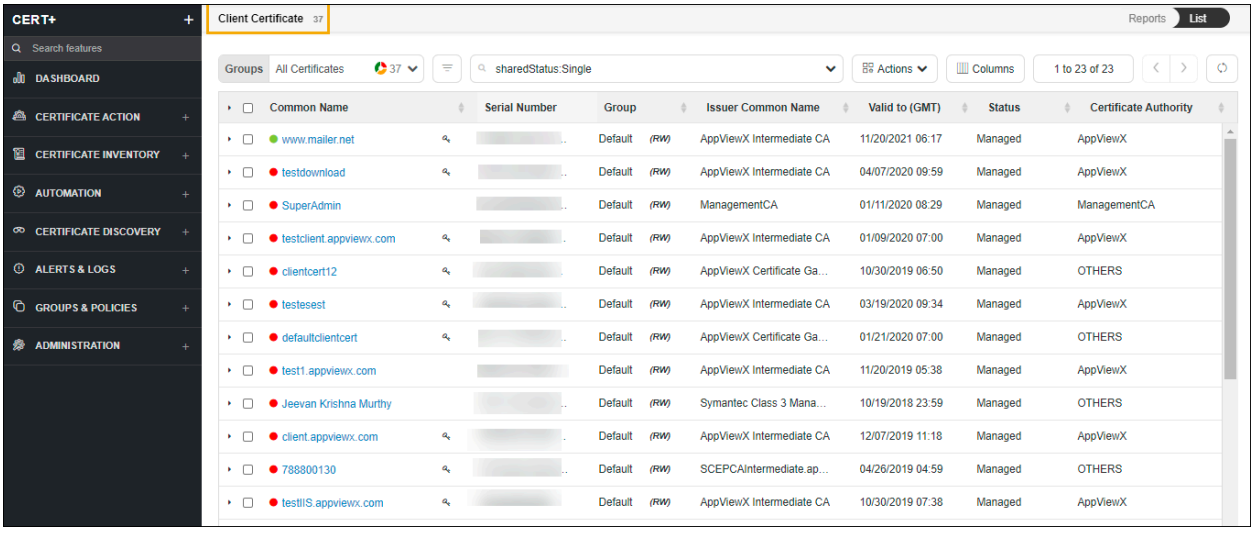
Shared Client Report

This report shows the count of certificates in the client inventory which are shared with a single endpoint or multiple endpoints.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



On click of this chart, the respective filtered data of certificates be shown as below:



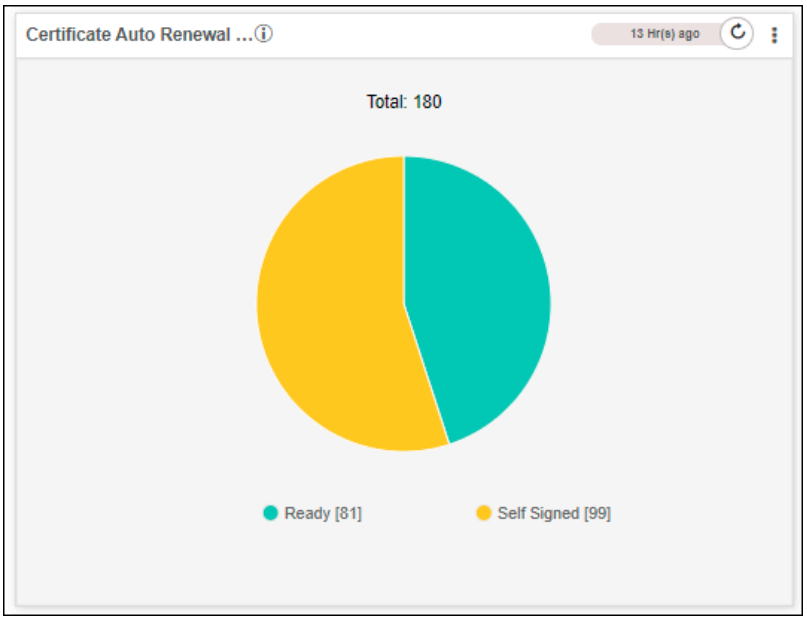
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Understanding the Server Standard Dashboard

For the certificates in the Server inventory, from the standard perspective, the following are the reports available in this dashboard:

Certificate Auto-Renewal Readiness - Server

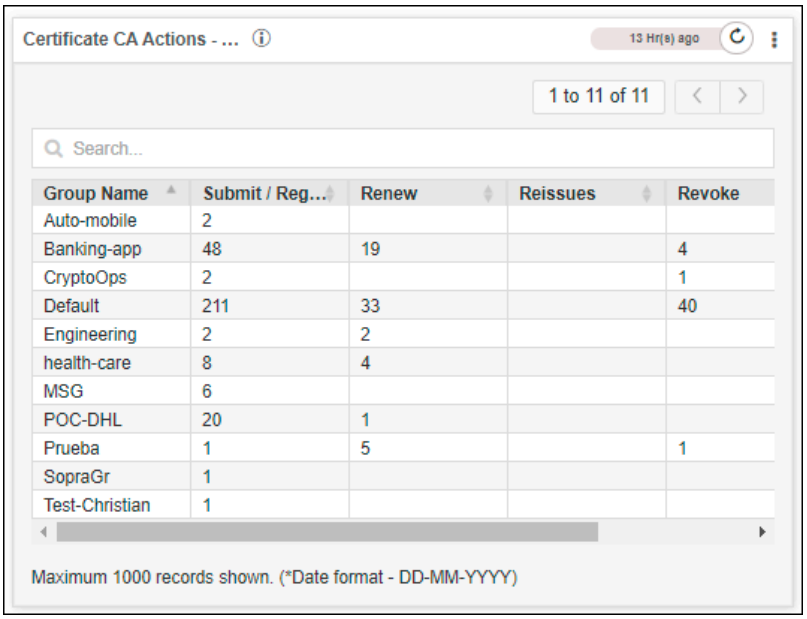
This report shows the count of certificates ready for the auto-renewal process available in the server inventory.



Certificate CA Actions - All Certificate Types

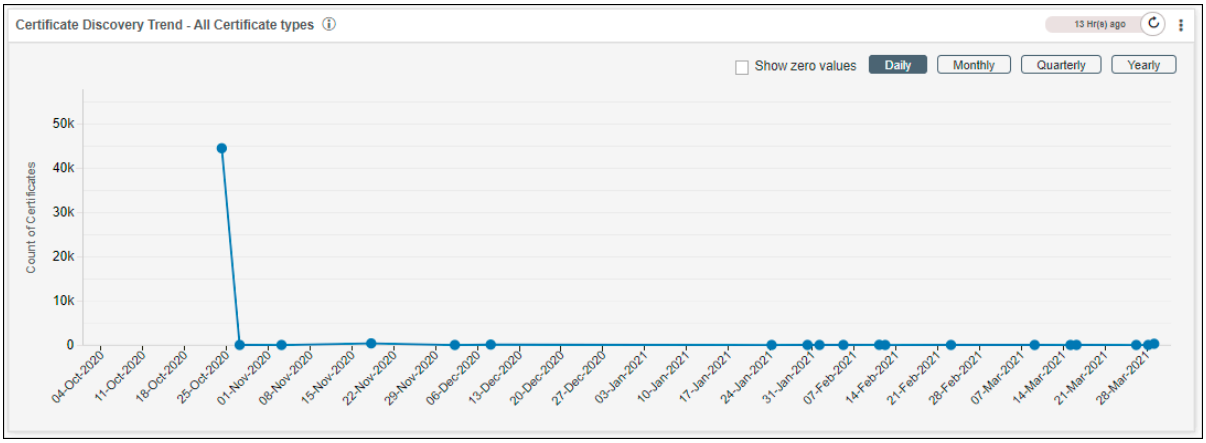
This report shows the count of CA actions performed with respect to the certificate groups available in the server inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificate Discovery Trend - All Certificate Types

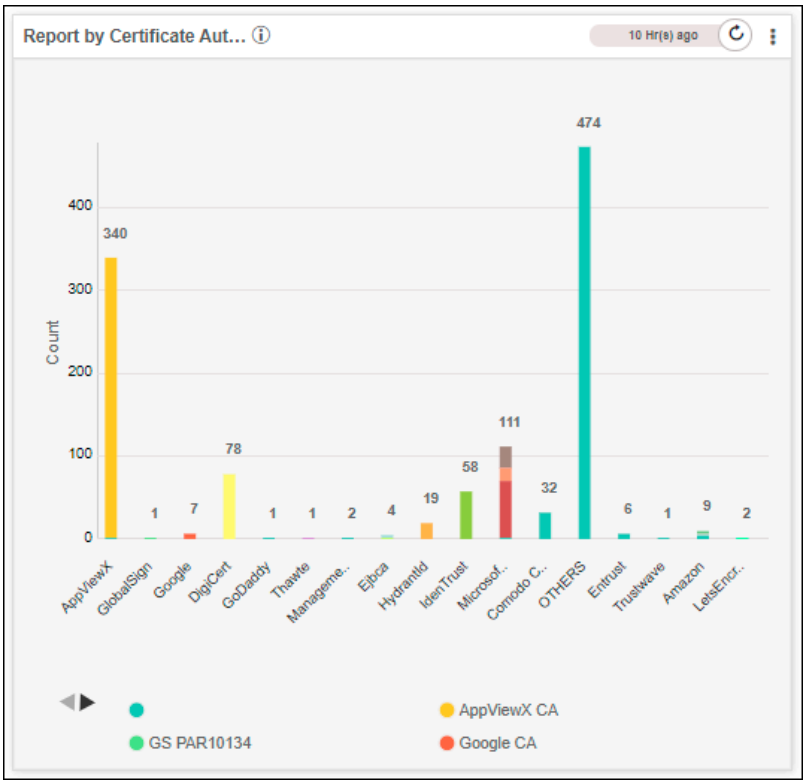
This report shows the trend of the count of certificates discovered into AppViewX in the last year.



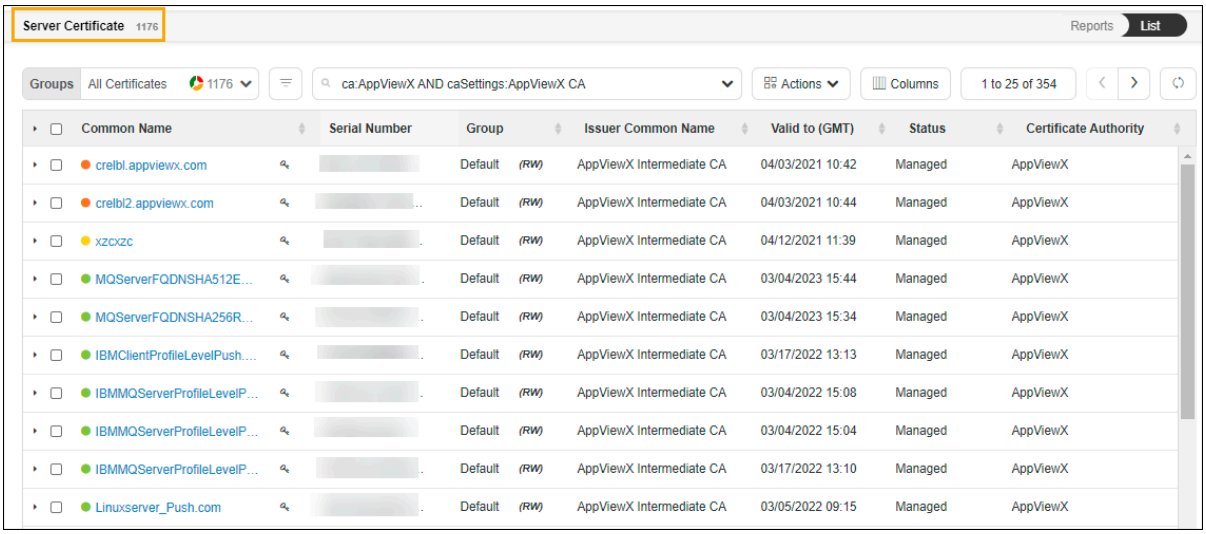
Report by Certificate Authority - Server

This report shows the count of certificates available in the server inventory with respect to the CA accounts.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



When you click of the chart, the filtered data of certificates are shown as below:



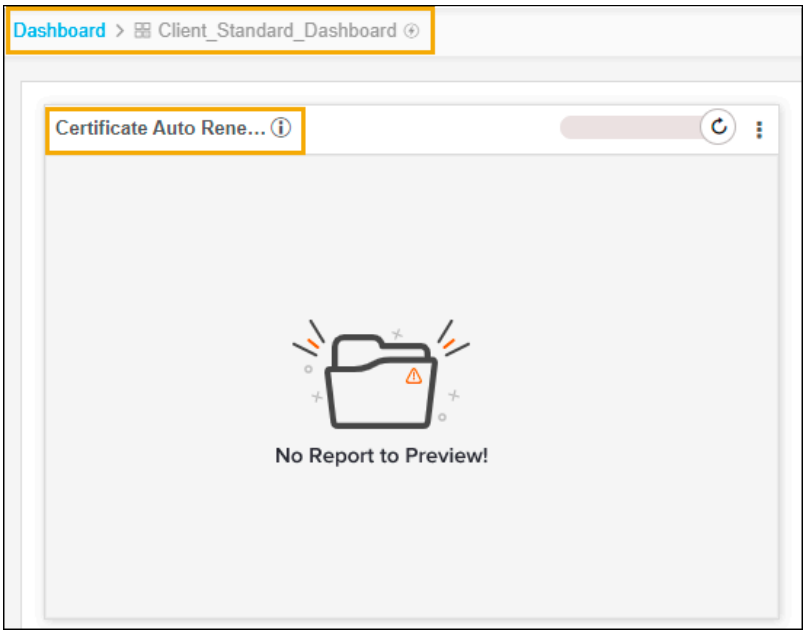
Understanding the Client Standard Dashboard

For the certificates in the Client inventory, from the standard perspective, the following are the reports available in this dashboard:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

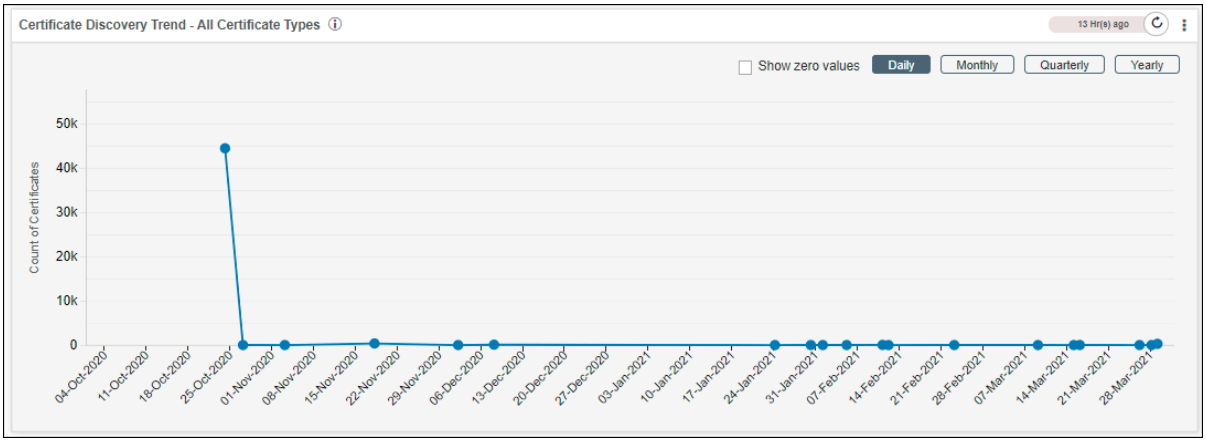
Certificate Auto-Renewal Readiness - Client

This report shows the count of certificates ready for the auto-renewal process available in the Client inventory.



Certificate Discovery Trend - All Certificate Types

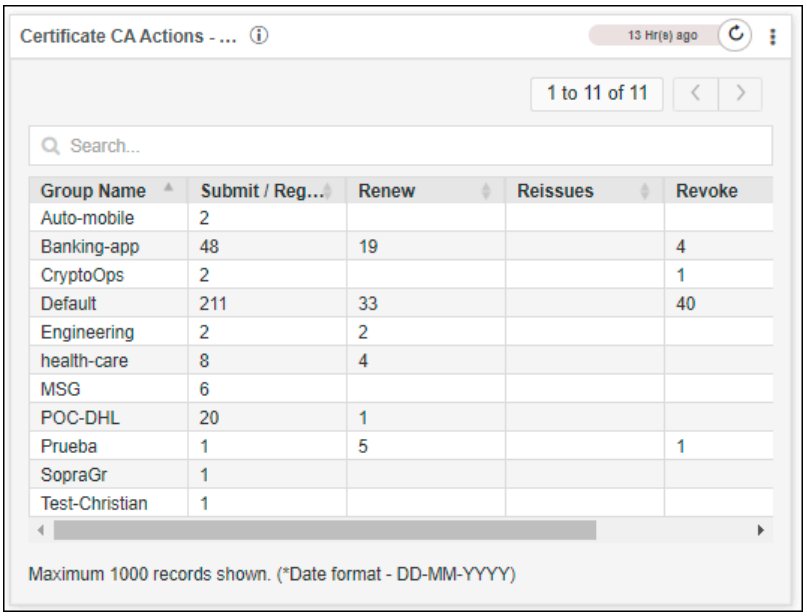
This report shows the trend of the count of certificates discovered in AppViewX in the last year.



Certificate CA Actions - All Certificate Types

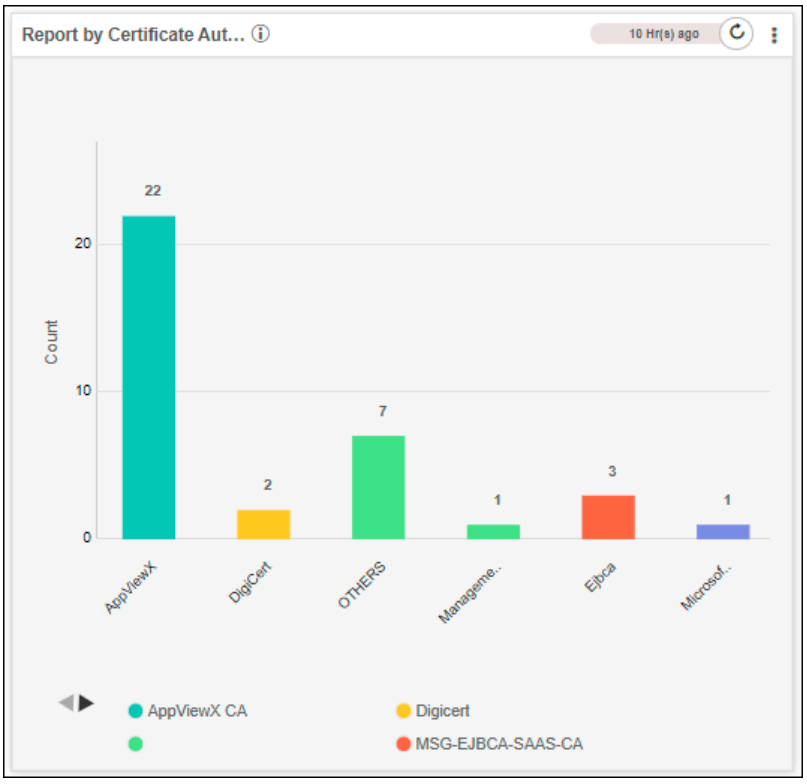
This report shows the count of CA actions performed with respect to the certificate groups available in the Client inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Report by Certificate Authority Accounts - Client

This report shows the count of certificates available in the client inventory with respect to the CA accounts.



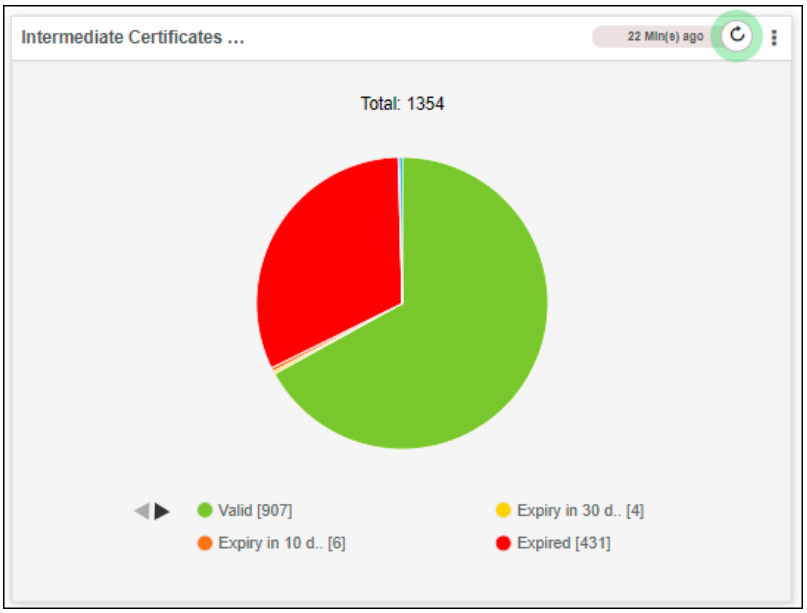
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Understanding the Trust Store Certificates Dashboard

For the certificates in the Root and Intermediate inventories, the following are the reports available in this dashboard:

Intermediate Certificates Expiry Statuses

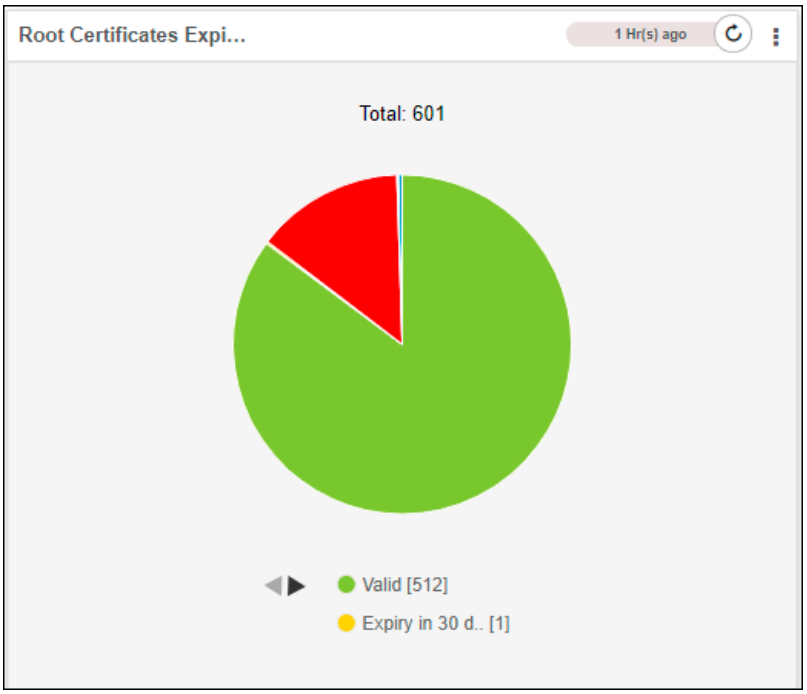
This report shows the count of certificates in the intermediate certificate inventory with respect to the valid and expiry status of the certificates.



Root Certificates Expiry Statuses

This report shows the count of certificates in the root certificate inventory with respect to the valid and expiry status of the certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Report Customization

AppViewX CERT+ allows you to customize your reports based on the organization's needs. Depending on the customization, reports are classified into:

- My Reports
- Store
- Widget

My Reports

Personalized reports can be generated based on a user account. This will be useful when an operator is assigned to do a specific task and has to generate reports on the same. To know more about **My Reports**, refer below.

Creating a New Report

1. Log in to AppViewX application with valid credentials.
2. Click the menu button located in the upper left corner of the screen.

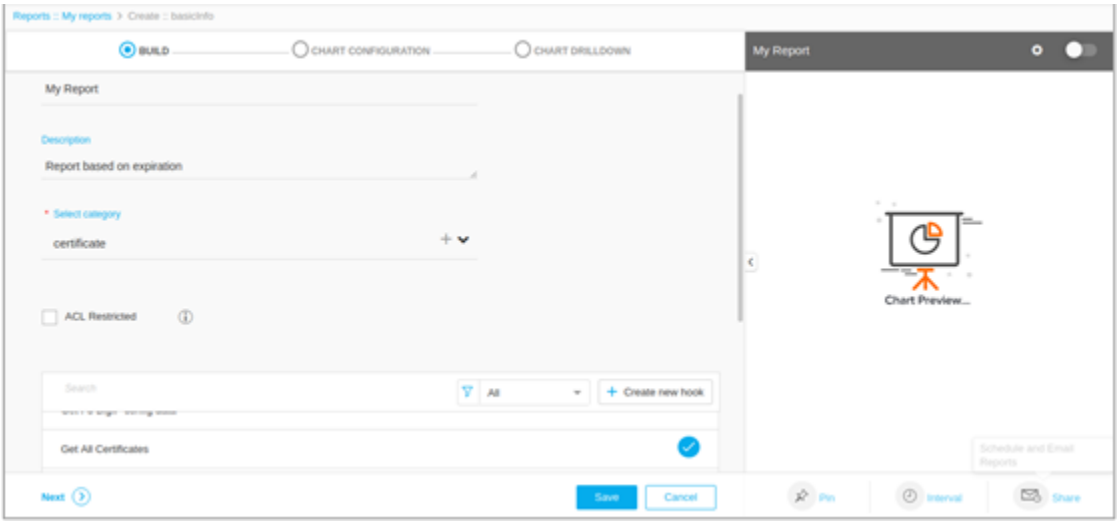
   The left navigation pane appears.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click **Platform > DATA STUDIO > Reports**.

   By default, **My Reports** page will be displayed.

4. Click **Create New Report** on the top-right.
5. On the **Create Report** page, enter the **Report Name**, **Description** and select a **Category** from the list.
6. Enable **ACL Restricted** option if you want the report to be visible based on the user's resource access.
7. Select a hook from the list of available hooks or click **Create New Hook**.
8. Click **Save** to save details.
9. Click **Next** at the bottom-left.



10. On the **Chart Configuration** page, select one of the following chart types:
    - Pie
    - Donut
    - Bar
    - Stacked Bar
    - Grid
    - Line
    - Metric

    - If you have selected **Pie** chart type, choose an option from the **Group By** and **Aggregation** dropdown.

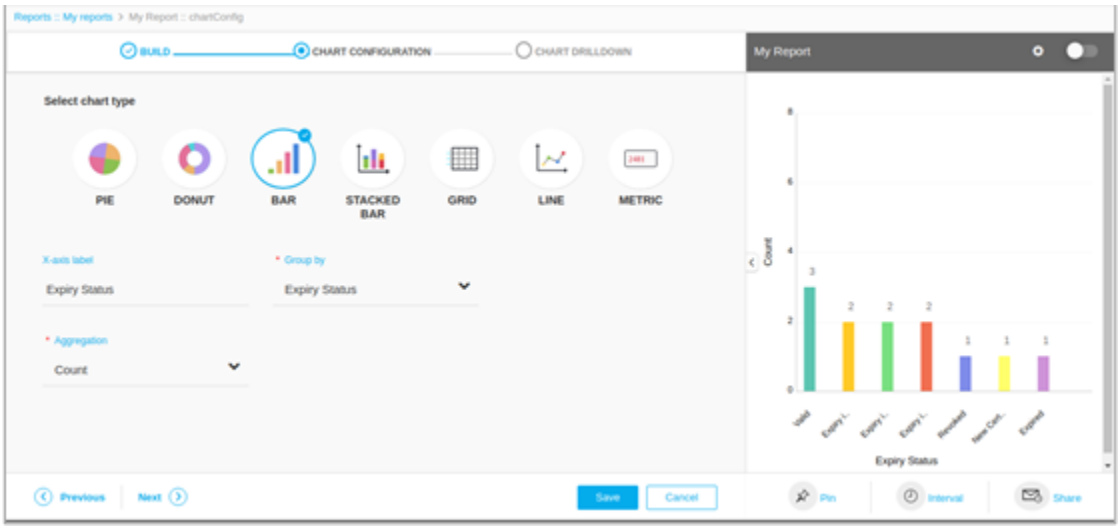
    - If you have selected **Donut** chart type, choose an option from the **Group By** and **Aggregation** dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- If you have selected the **Bar chart** type, fill the **X-axis Label** field and choose an option from the **Group By** and **Aggregation** dropdown.
- If you have selected **Stacked Bar** chart type, fill the **X-axis Label** field and choose an option from the **Group By**, **Aggregation**, and **Stacked By** dropdown.
- If you have selected **Grid** chart type, enable the **Show Column Headers** option if required. Then, under **Columns**, select columns or click the **Select All** option.

> **Note:** For the Select All option, only 10 columns can be selected.

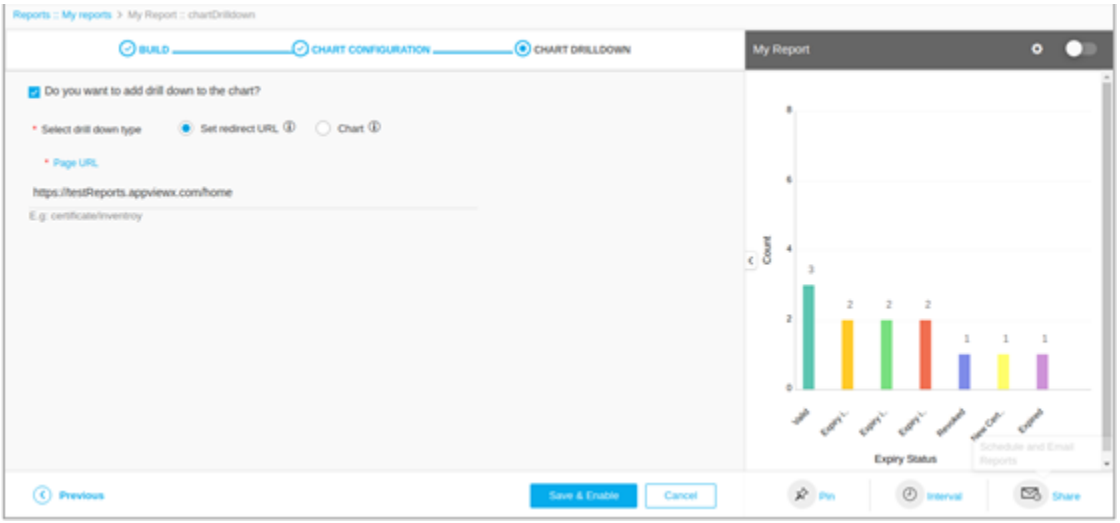
- If you have selected **Grid** chart type, fill the **X-axis Label** field, choose a **Date Format**, and choose an option from the **Group By** and **Aggregation** dropdown.
- If you have selected **Metric** chart type, enter a **Chart Title** and choose an option from the **Aggregation** dropdown. Under **Chart Formatting**, select a chart size, alignment, font color, and icon.



11. Click **Save**.
12. Click **Next** at the bottom-left.
13. On the **Chart Drilldown** page, enable the **Do you want to add drill down to the chart?** option to add drilldown.
14. Click **Save & Enable**.
    The graphical representation of the report will be displayed on the right.
15. To enable the generated report, click the enable icon on the top-right of the report window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

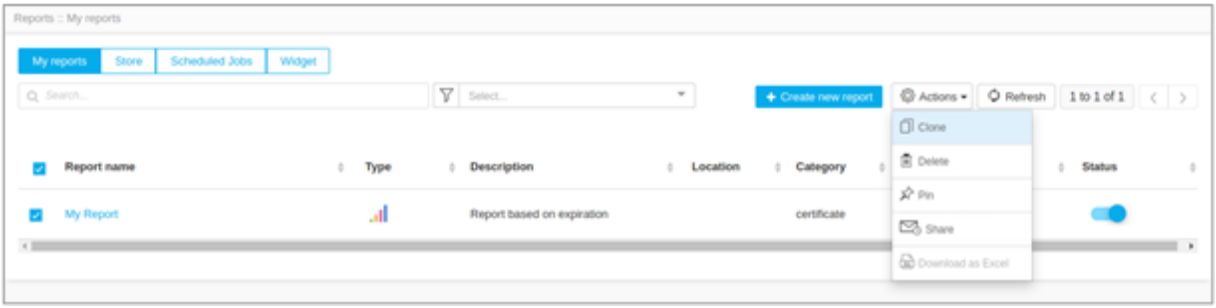
16. To pin the report to a dashboard page, click the **Pin** icon at the bottom right. Select Existing Dashboard or New Dashboard based on where it needs to be pinned.
17. To set the polling interval to collect data, click the **Interval** icon at the bottom right.
18. To share the report, click the **Share** icon at the bottom right.



Cloning a Report

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under **My Reports** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Clone**.
5. On the **Clone Report** pop-up window, enter a name.
6. Click **Save**.

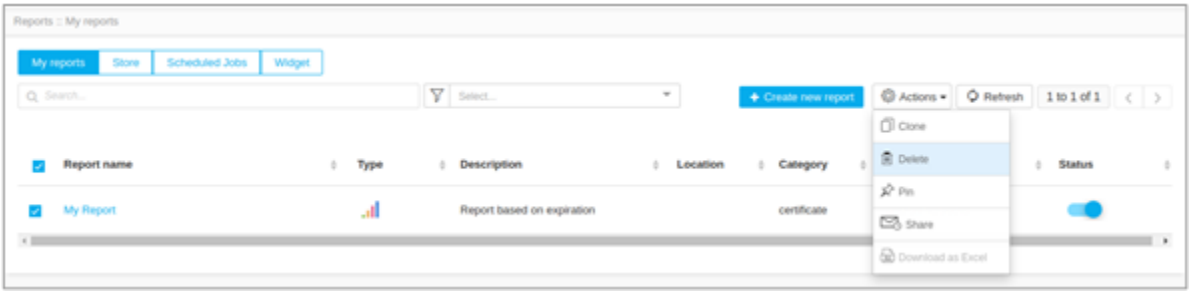
   The cloned reports will be displayed under the **My Reports** tab.



Deleting a Report

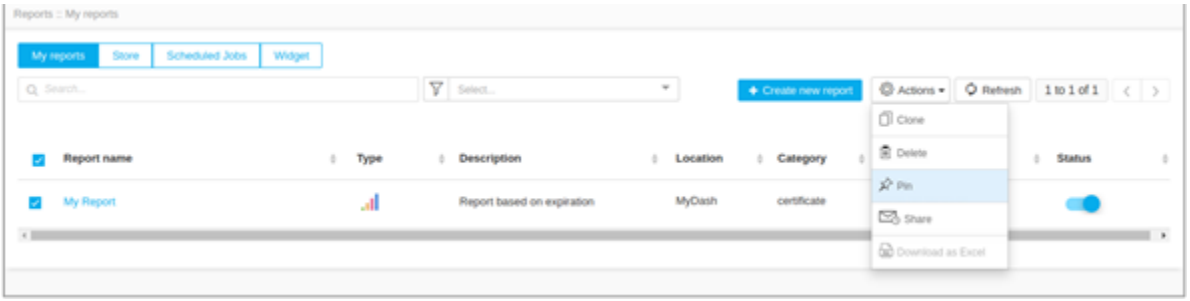
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under **My Reports** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Delete**.
5. On the **Confirm Delete** popup window, click **Yes**.



Pinning a Report

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under **My Reports** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Pin**.
5. On the **Pin report(s) to Dashboard** popup window, select Existing Dashboard or New Dashboard based on where it has to be pinned.

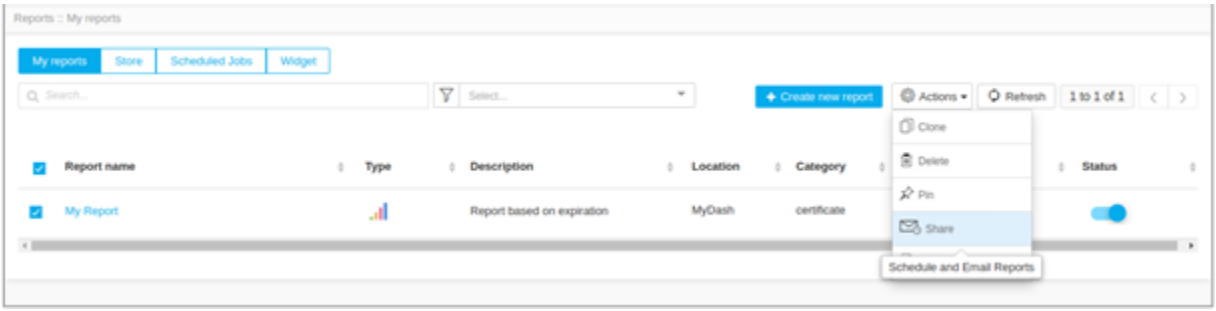


Sharing a Report

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under **My Reports** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Share** to schedule and email reports.
5. On the **Schedule reports** window, fill the **General** section for mail content and **Schedule** section for scheduling emails.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Click **Save**.

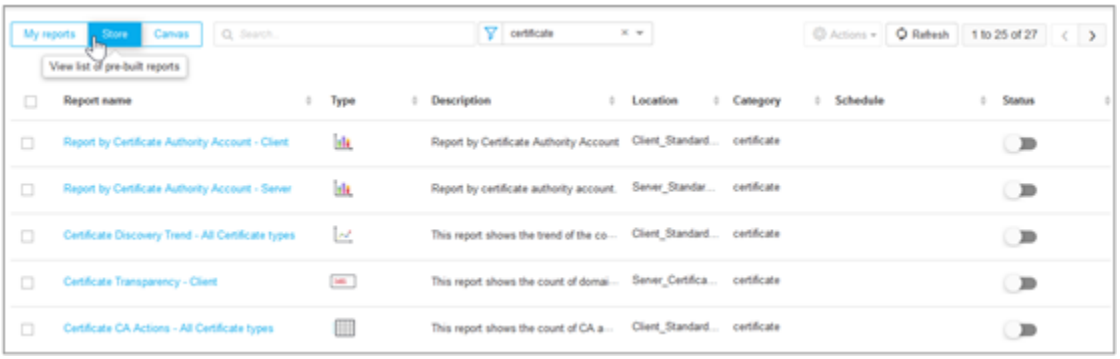


Store

There are a few pre-defined reports available in the store. These reports can be cloned and customized to have personalized reports, but cannot be modified. To know more about **Store**, refer below.

Viewing Pre-built Reports

1. Log in to AppViewX application with valid credentials.
2. Click the menu button located in the upper left corner of the screen.
   The left navigation pane appears.
3. Click **Platform > DATA STUDIO > Reports**.
   By default, the My Reports page will be displayed.
4. Click **Store** on the top-left.
   list of pre-built reports will be displayed.
5. You can search for reports and filter reports by category.

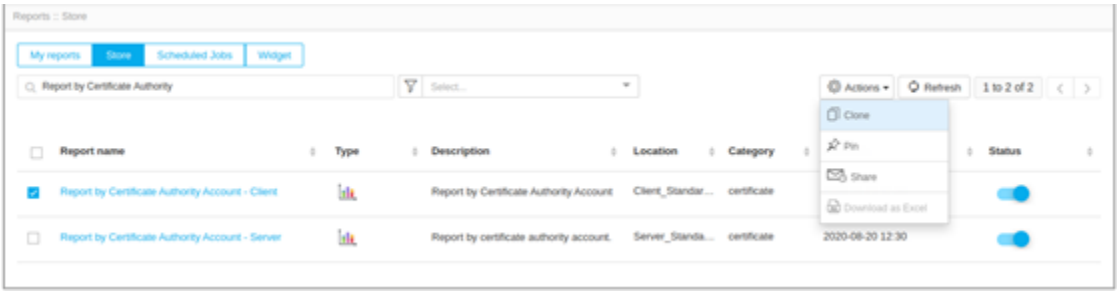


Cloning a Pre-built Report

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Under the **Store** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Clone**.
5. On the **Clone Report** pop-up window, enter a name.
6. Click **Save**.

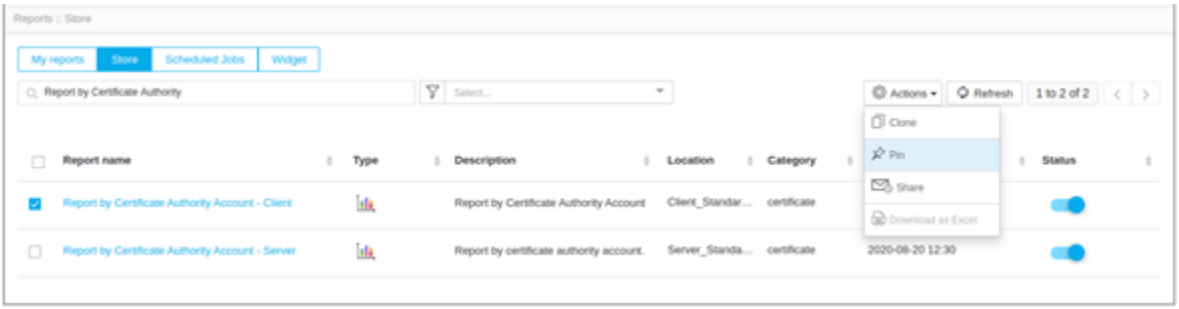


The cloned reports will be displayed under the **Store** tab.

Note: By default, store/pre-built reports are enabled. You cannot disable or delete it.

Pinning a Pre-built Report

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the **Store** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Pin**.
5. On the **Pin report(s) to the Dashboard** popup window, select Existing Dashboard or New Dashboard based on where it has to be pinned.



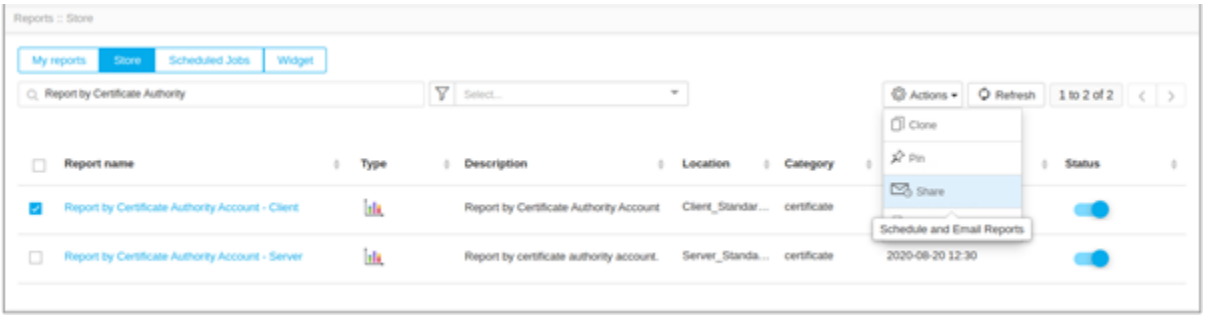
6. Click **Save**.

The pinned reports will be displayed in the dashboard.

Sharing a Pre-built Report

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the Store tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Share**.
5. On the **Schedule reports** window, fill out the **General** section for mail content and **the Schedule** section for scheduling emails.
6. Click **Save**.



Widget

Widget reports are useful when an operator creates their widget based on the business needs. These widgets display the count of a specific operation that is executed and pending in the system. To know more about **Widget**, refer below.

Viewing Custom Reports

1. Log in to AppViewX application with valid credentials.
2. Click the menu button located in the upper left corner of the screen.

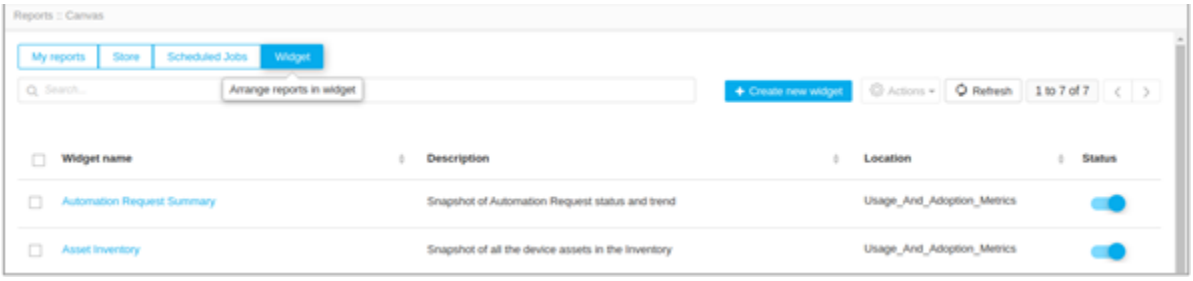
   The left navigation pane appears.
3. Click **Platform > DATA STUDIO > Reports**.

   By default, **the My Reports** page will be displayed.
4. Click **Widget** on the top-left.

   A list of custom reports with the Widget Name, Description, Location, and Status will be displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. You can search for reports and filter reports by category.



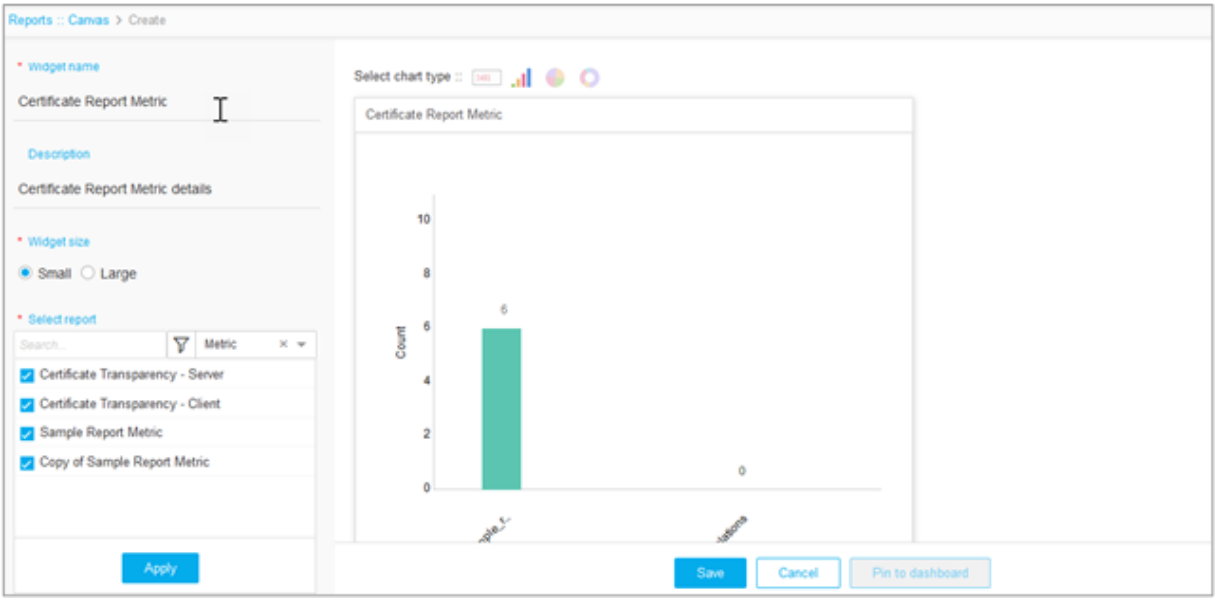
Creating a New Widget

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.

   By default, **the My Reports** page will be displayed.
3. Click **Widget** on the top-left.
4. Click **+ Create New Widget** on the top-right.
5. On the **Create Widget** page, enter a **Widget Name** and **Description**.
6. Select the **Widget Size**: **Small** or **Large**.
7. Under **Select Report**, select a report from the list or search for specific reports.
8. Click **Apply**.
9. Select a **Chart Type**: **Metric**, **Bar**, **Pie** or **Donut**.
10. Click **Save**.
11. Click **Pin to Dashboard** to pin the widget to the existing or new dashboard.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

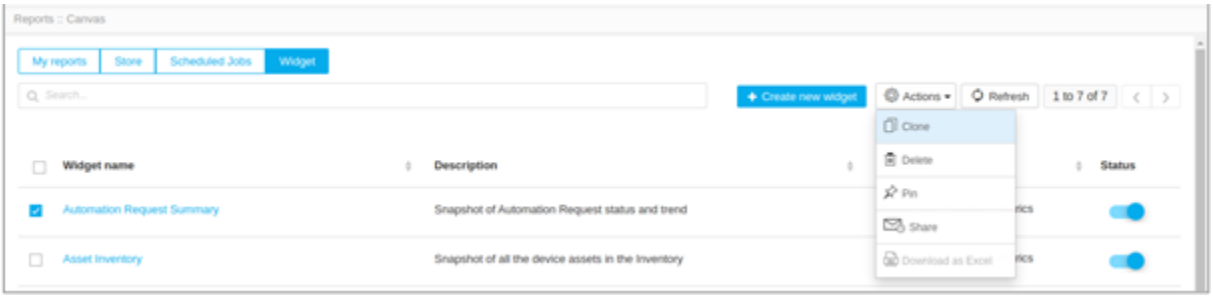
12. To enable the widget status, click the **Status** icon on the top-right.



Cloning a Widget

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the **Widget** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Clone**.
5. On the **Clone Report** pop-up window, enter a name.
6. Click **Save**.

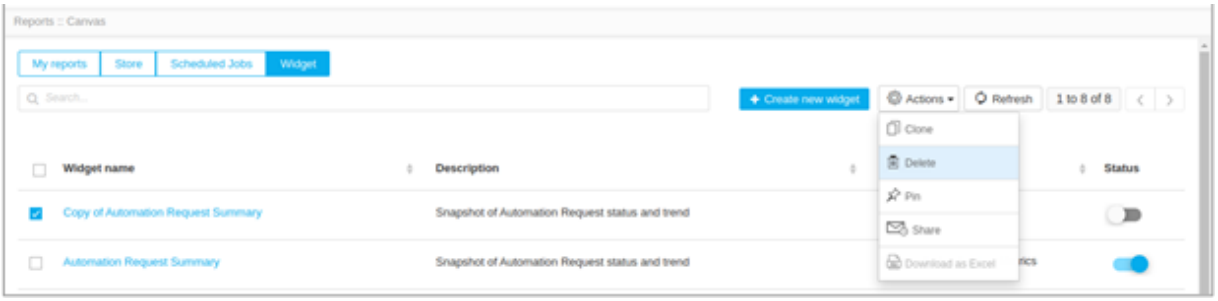
The Cloned reports will be displayed under the **Widget** tab.



Deleting a Widget

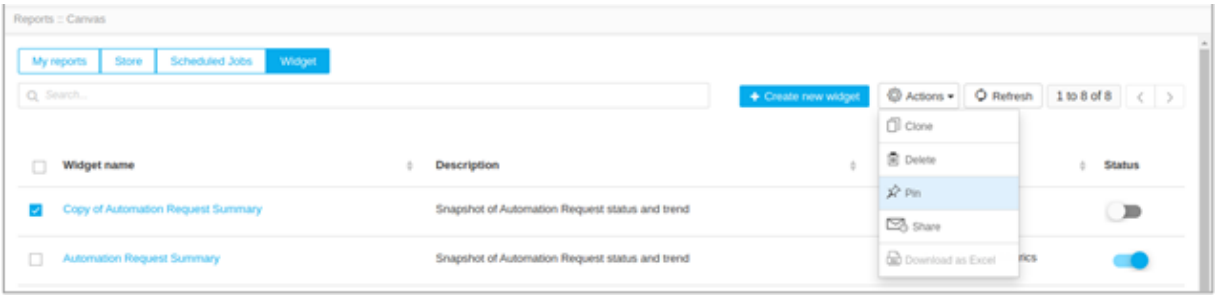
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the **widget** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Delete**.
5. On the **Confirm Delete** popup window, click **Yes**.



Pinning a Widget

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the **Widget** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Pin**.
5. On the **Pin report(s) to Dashboard** popup window, select Existing Dashboard or New Dashboard based on where it has to be pinned.



Sharing a Widget

1. Log in to the **AppViewX** application with valid credentials.
2. Click **Menu > Platform > DATA STUDIO > Reports**.
3. Under the **Widget** tab, enable the checkbox to select a report.
4. Click **Actions** dropdown on the top-right and select **Share**.
5. On the **Schedule reports** window, fill out the **General** section for mail content and **the Schedule** section for scheduling emails.

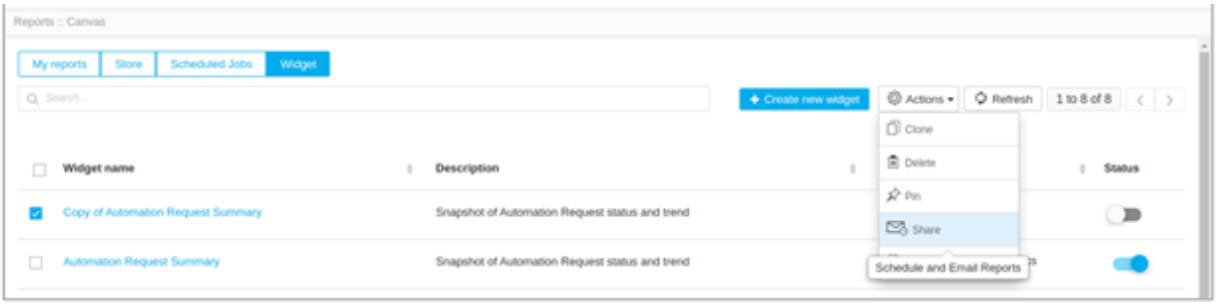
6. Click **Save.**



Security Posture Determination and Interpretation

Application security score reports, TLS, and Cipher suite reports allow you to identify the security level of service. To reduce security risks, change the application configuration to restrict the cipher suites and the TLS versions that are marked as LOW. Also for certain applications, OS upgrades will be applied to align with the security standard.

You can generate security reports through,

TLS Report

TLS report fetches data from SSL sessions and generates the report. It makes it easy for customers to check the protocol version of their servers based on this data. This report will generate data to identify vulnerable protocol versions. For example, in your infrastructure, there may be endpoints that still support TLSv1.0 and TLSv1.1 versions.

The **TLS version - Server** report is available on the **Server Endpoint Security** dashboard.

Cipher Suites Reports

Some ciphers use SHA1 that is still supported by servers. Cipher Report will discover servers that support these ciphers and provide data as per security standards. This report will generate data to identify vulnerable ciphers.

The **Cipher Suites - Server** report is available on the **Server Endpoint Security** dashboard.

Generating Application Score Reports

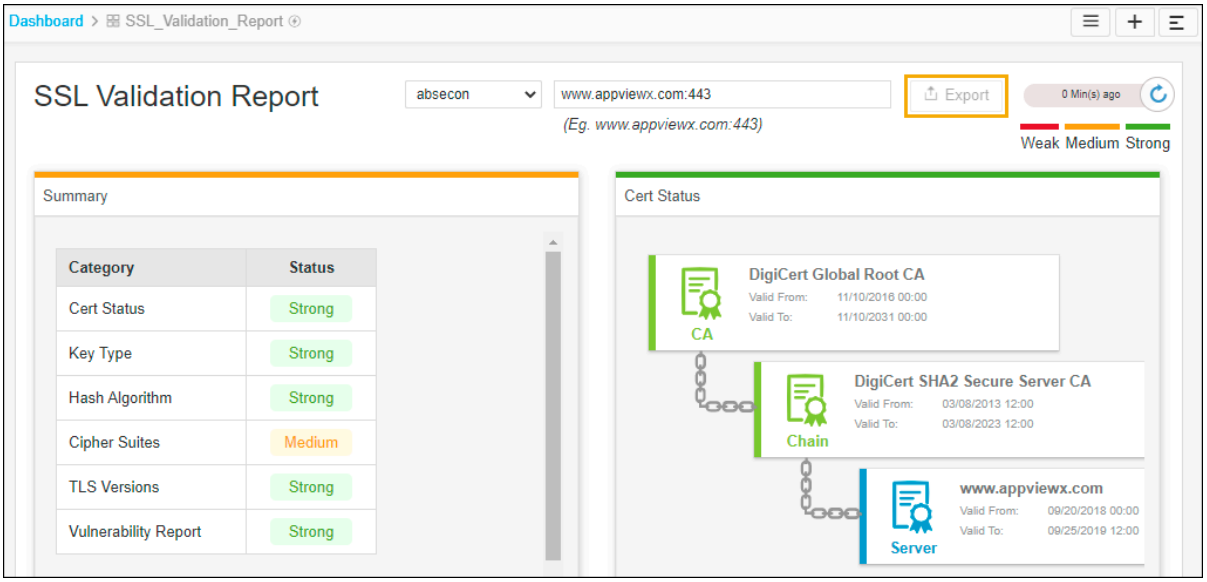
The application score report provides security scores of certificate parameters based on industry standards. You can get the score based on parameters such as Cert Status, Key Type, Hash Algorithm,

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CAA Record, TLS Version, and Vulnerability. Also, you can search for domains and check the security score. For example, you can check if the certificate name is valid through this report.

To generate application score reports:

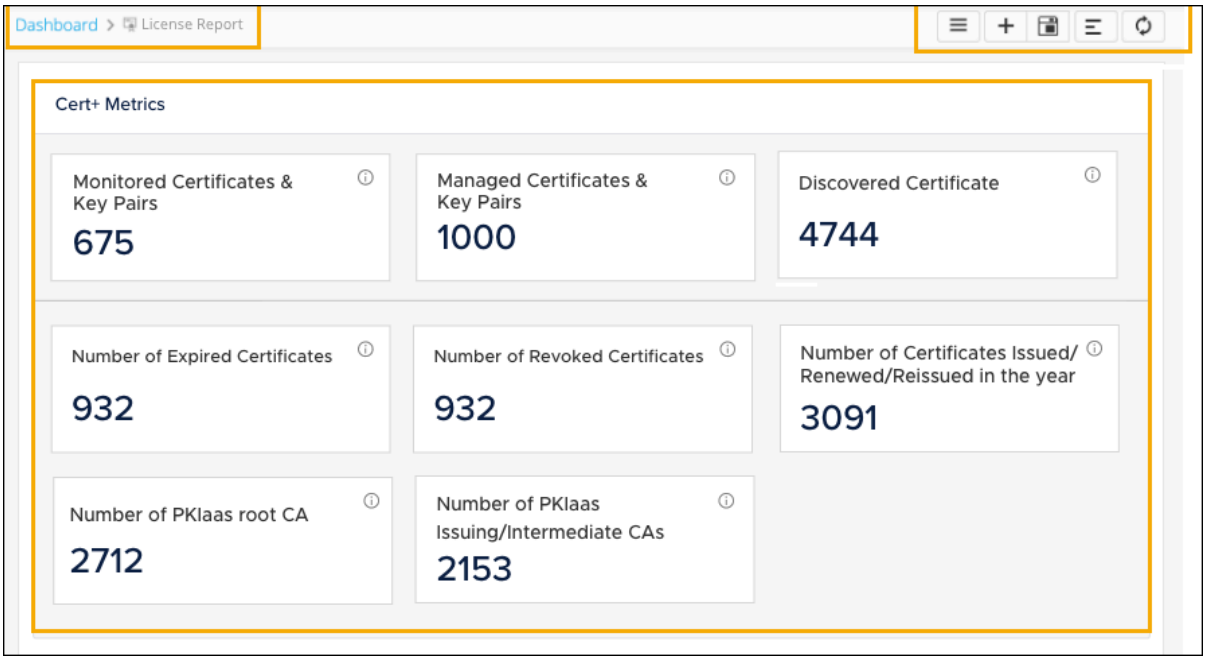
1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The list of dashboards is displayed.
2. On the dashboard page, click **SSL Validation Report**.
3. Select a data center from the first dropdown.
4. In the search bar, enter a domain name (www.appviewx.com:443) and press **Enter**.
   The report is generated with the summary and all required parameters.
5. To export this report as a PDF, click **Export**.



License Report

The License Report dashboard displays the usage count of all the key metrics related to the license. It can be accessed from the Dashboard page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Options available on the License Report dashboard

Options	Descriptions
	Go to Dashboard page where all the Dashboards are listed.
	Create a dashboard/widget.
	Save the widget changes.
	Align the widgets within the dashboard.
	Refresh a dashboard.

Discovery

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Searching for Dashboard, Object, or Widget

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The list of dashboards is displayed.
2. Enter the search keyword in the search field, and then press **Enter**.
   The dashboards, objects, or widgets that match with the specified keyword are displayed.

Deleting a Dashboard

The default dashboard cannot be deleted from the AppViewX platform. Only the customized dashboard can be deleted and deleting the dashboard includes the deletion of all the widgets on the dashboard also.

To delete a dashboard,

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The list of dashboards is displayed.
2. Select the checkbox corresponding to the dashboard you want to delete.
3. From the command bar, click .
4. In the **Confirmation** dialog box, click **Yes**.

> **Important:** Deleting a dashboard will delete all the widgets displayed for the dashboard.

Insights

- Accessing Insights
- Insights Summary
- Insights Operations
- Insights Risk and Crypto
- Insights Entrust Migration
- Google 90 Day Dashboard

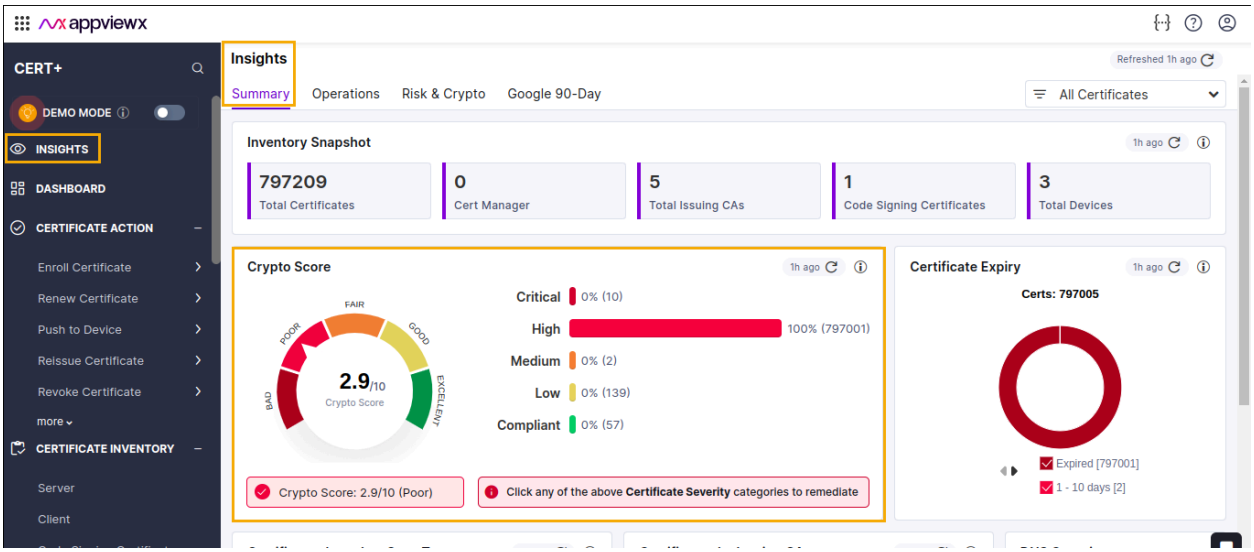
Accessing Insights

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The INSIGHTS menu provides comprehensive information and analytics regarding the overall certificates summary, operations, Risk & Crypto, and Google 90-Day delivered through the CERT+ infrastructure. The INSIGHTS menu populates with relevant data, once the certificates have been successfully onboarded and discovered. Each reports within the INSIGHTS menu refreshes every four hours at regular intervals.

To access the INSIGHTS page, navigate to **Menu** > **CERT** > **INSIGHTS**. These insights are organized into the following tabs:

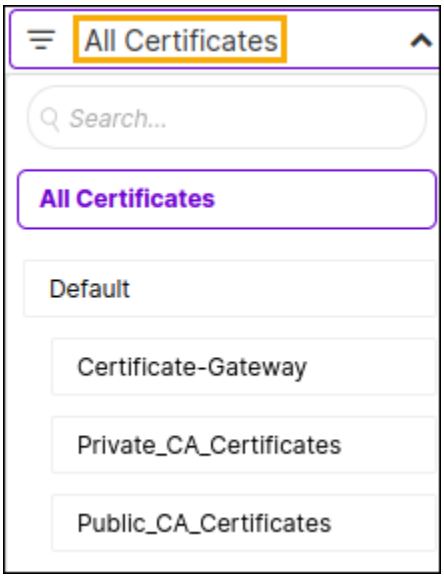
- Summary
- Operations
- Risk & Crypto
- Google 90-Day.



Group Level Filter

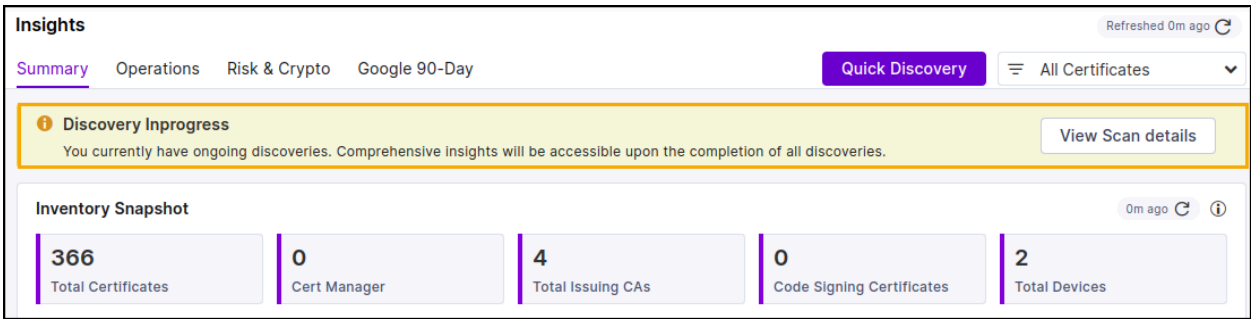
The group-level filter is available in the Insights section of the Summary, Operations, and Risk & Crypto pages. It allows you to filter the reports based on the groups.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Discovery In-progress Notification

On the Insights page, whenever the certificate on-demand discovery operation is in progress, a popup message will notify you on all Insights pages: **You currently have ongoing discoveries. Comprehensive insights will be accessible upon the completion of all discoveries**.



Note: All reports in the respective tab will be refreshed every one minute while the certificatediscovery is in progress, as long as users remain on the Insights page and the certificate count is less than 1 lakh

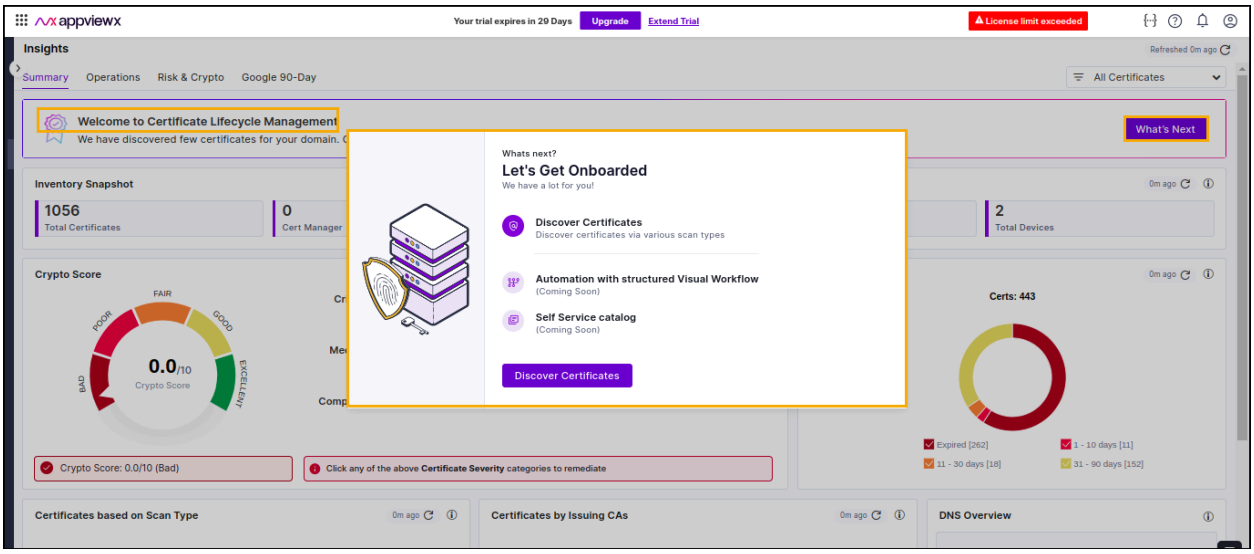
Clicking the "**View Scan Details**" button redirects you to the Discovery Status: On-demand page.

CT Logs Scan

When you onboard a new tenant, CT logs will be triggered for the user's domain. The snack-bar will display a Welcome message such as "**Welcome to Certificate Lifecycle Management**" for different

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

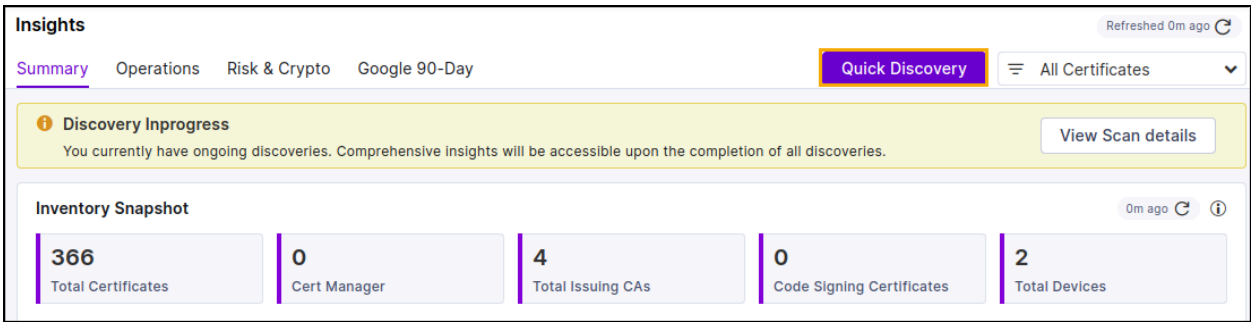
scenarios including Successful, In-progress, and Success or failure with zero certificates. This will appear in the Insights section of the Summary, Operations, Risk & Crypto pages, and Google 90-Day pages.



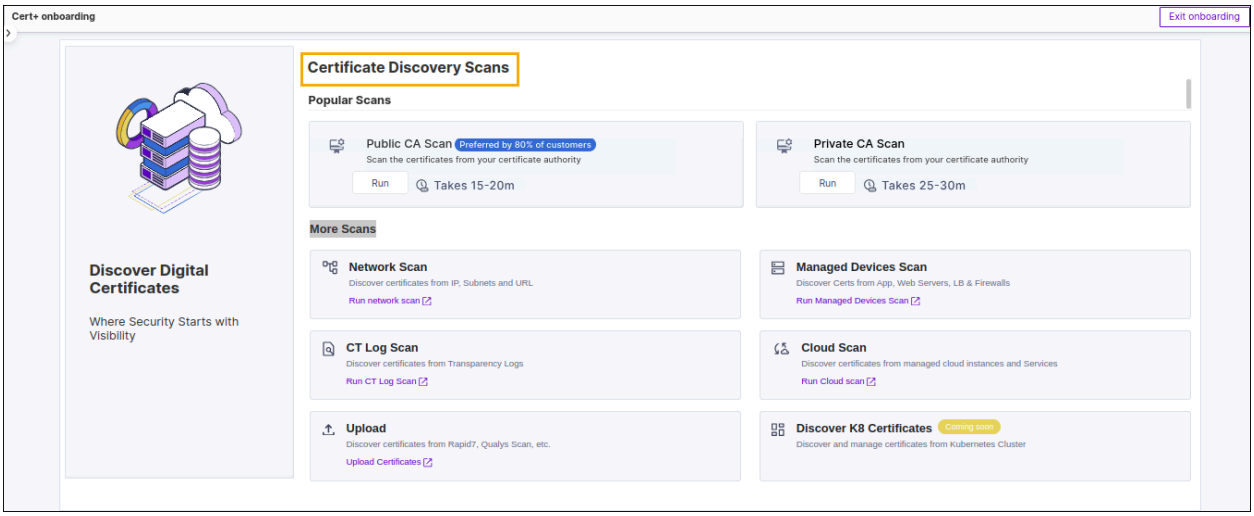
Quick Discovery

The "Quick Discovery" button allows you to access certificate discovery scans, listing all types as follows:

- Popular Scans:
  - Public CA Scan
  - Private CA Scan.
- More Scans:
  - Network Scan
  - Managed Devices Scan
  - CT Log Scan
  - Cloud Scan
  - Upload Scan
  - Discover K8 Certificates.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

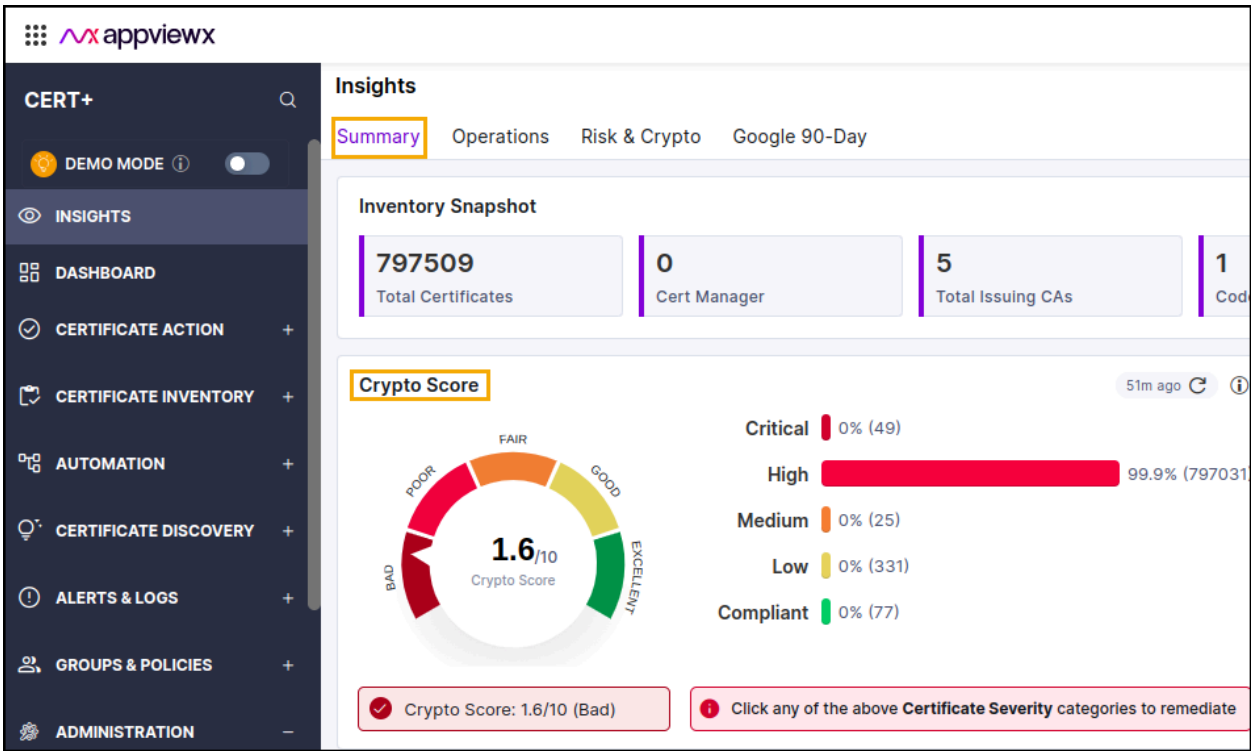


Insights Summary

The Insights Summary report presents a concise overview of the Inventory Snapshot, Crypto Score, Certificates Expiry, Certificates based on Scan Type, and issuing CAs managed within AppViewX. Click on any widget to access detailed information specific to that particular summary on the respective widgets popup. Within the popup window, you can view all the entries, export the content in the desired format if needed, and redirect to inventory. The Widgets within the Insights Summary report are:

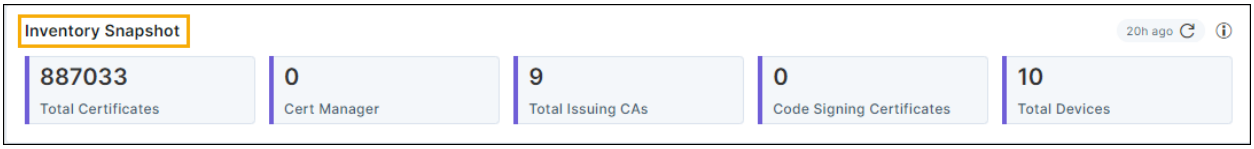
- **Inventory Snapshot**
- **Crypto Score**
- **Certificates Expiry**
- **Certificates based on Scan Type**
- **Certificates by issuing CAs**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Inventory Snapshot

The Inventory Snapshot widget displays the count of certificates, Cert manager, CAs, and Devices that are managed or monitored within AppViewX. The metrics within Inventory Snapshot widget are:

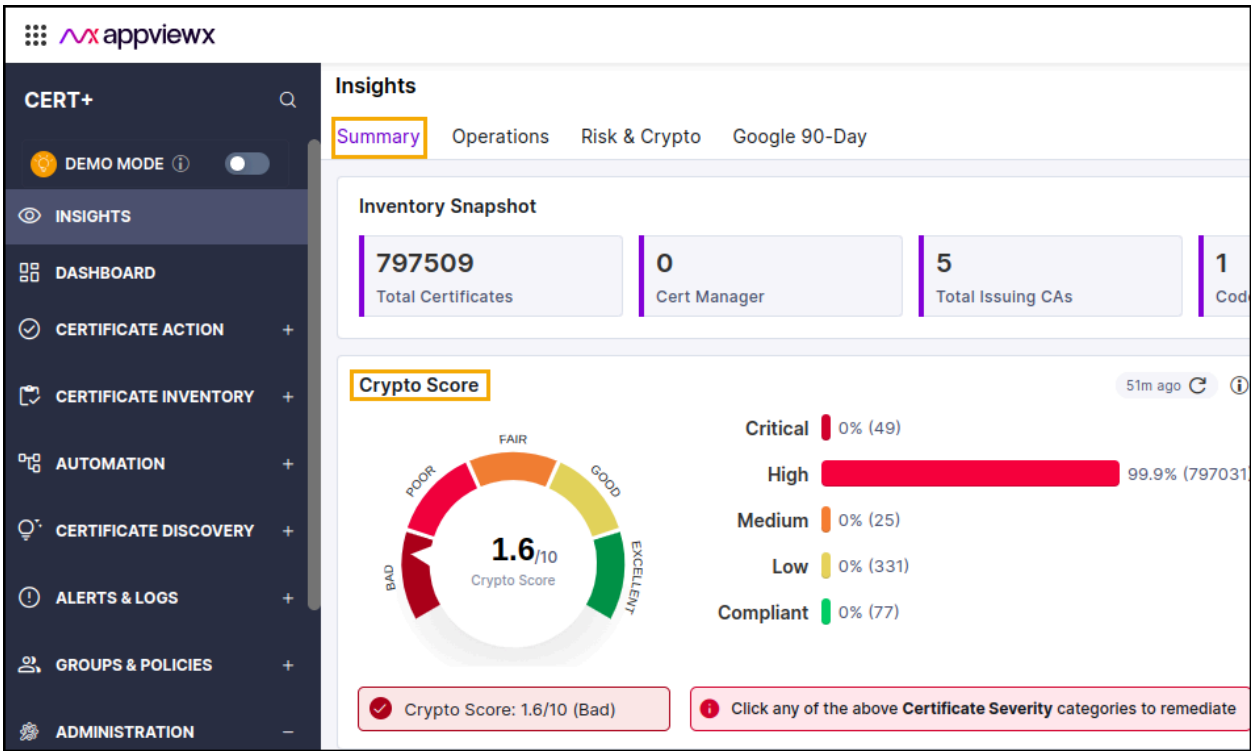


- **Total Certificates** - Displays the count of certificates such as Server, Client, and Code signing certificates.
- **Cert manager** - Displays the Up scaling tab.
- **Total Issuing CAs** - Total Issuing CAs report displays all the CA vendors that are currently managed or monitored.
- **Code Signing Certificates** - It displays the count of code signing certificates.
- **Total Devices** - The count of devices that are managed within AppViewX.

Crypto Score

The certificate score aligns with AppViewX compliance standards. This is a framework designed to streamline certificate management, assess foundational aspects, and gauge associated risks effectively.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

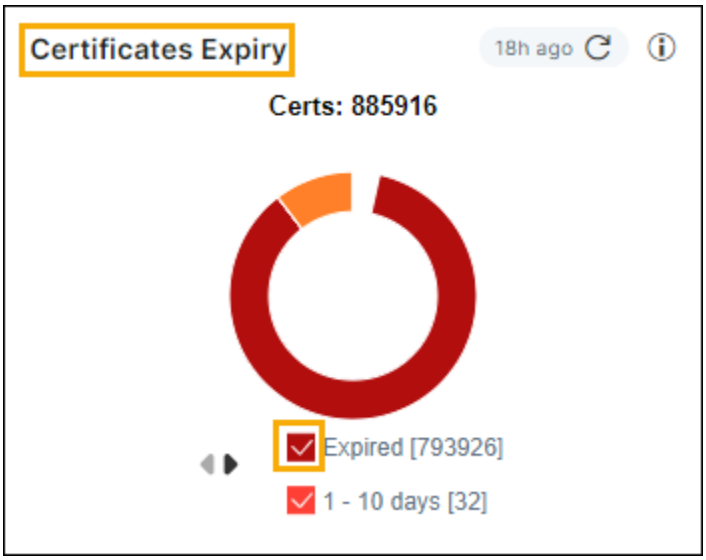


Certificate Expiry

The count of expired certificates such as Server, Client, and Code Signing certificates that are managed within AppViewX. You have the following options:

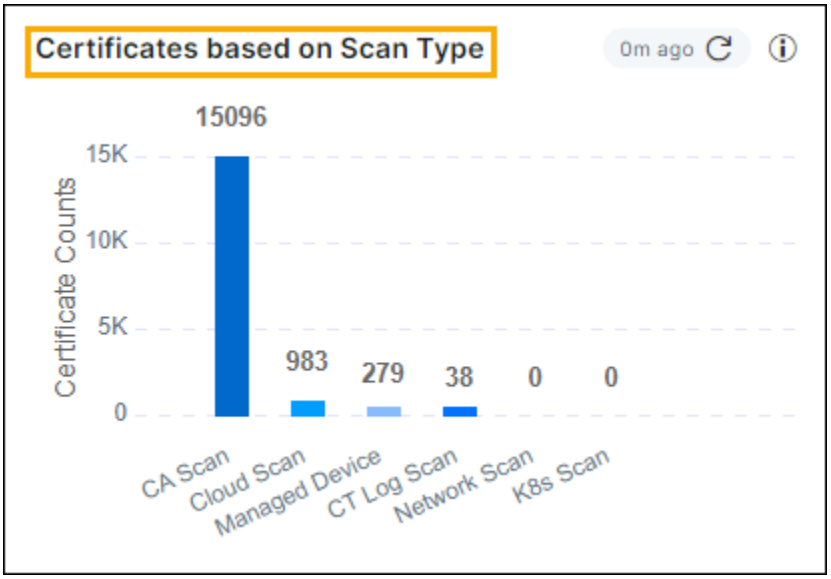
- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to intermediate page.
- Click the **Remediate** button to redirect to the Server/Client/Code signing certificate inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificates based on Scan Type

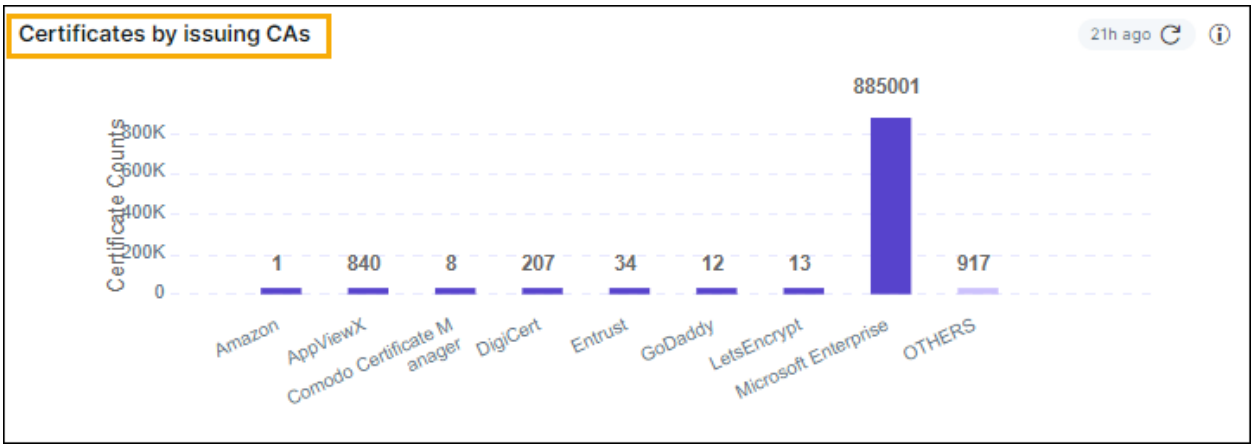
Certificates can be scanned and organized in various ways within the product. This widget provides a list of certificates scanned in each mode, tailored to the user's access. The X-axis represents the type of scan and Y-axis represents the number certificates per scan.



Certificates by issuing CAs

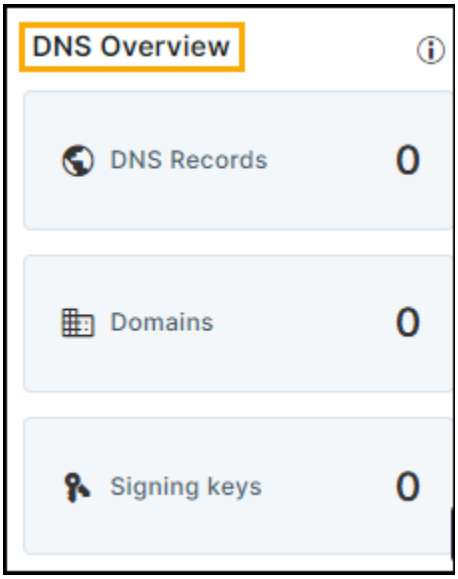
This report displays the count of issuing CAs. The X-axis represents the names of the vendors and Y-axis represents the number certificates per vendor.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



DNS Overview

DNS Overview displays a comprehensive review and analysis of the internet domains and sub-domains the organization owns and manages. This includes an understanding of DNS records, domains, and signing keys that are utilized within the company's digital ecosystem.



- **Domains**: These are the main web addresses the organization owns. For example, appviewx.com.
- **Sub-domains**: These are subdivisions of the primary domain used for specific functions. For example, support.appviewx.com.
- **DNS Records**: DNS records are crucial components that help route internet traffic to the correct server.
- **Signing Keys**: A layer of security to DNS by enabling the verification of DNS responses. This helps protect against attacks like DNS spoofing.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

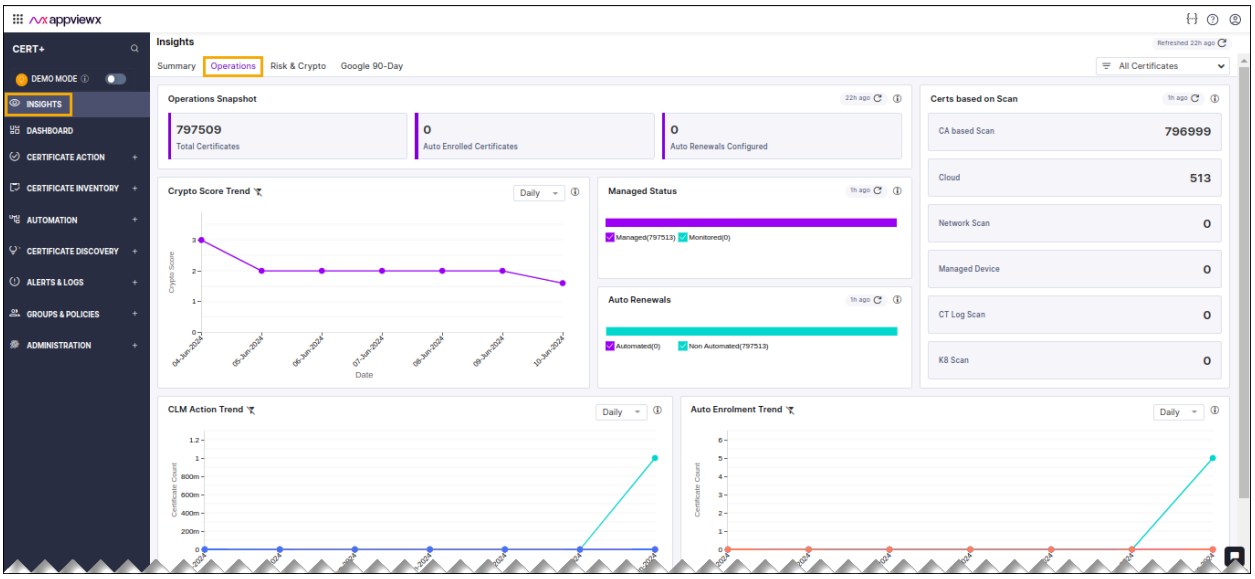
Threshold Limits

- For less than 100,000 certificates, live data will be displayed whenever the user navigates to the Insights page.
- For more than 100,000 certificates, a pre-calculated report will be shown with the last generated time indicated at the widget level.
- Users can click the widget level refresh to view the live data.

Insights Operations

The Insights Summary report presents a concise overview of the Operations Snapshot, Certs based on Scan, Crypto Score Trend, Managed Status, Crypto Score Trend, CLM Action Trend, Auto Renewals, and Auto Enrollment Trend managed within AppViewX. Click on any widget to access detailed information specific to that particular operations on the respective widgets popup. Within the popup window, you can view all the entries, export the content in the desired format if needed, and redirect to inventory. The Widgets within the Insights Summary report are:

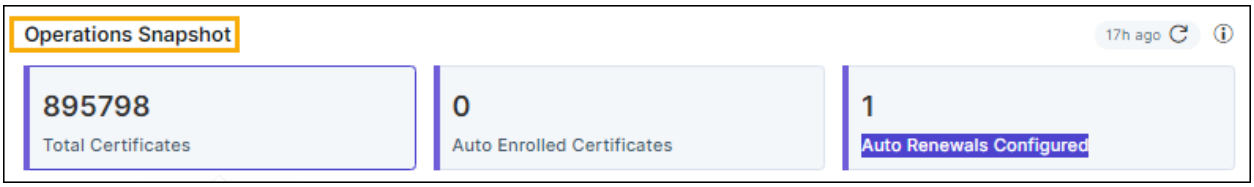
- **Operations Snapshot**
- **Certs based on Scan**
- **Managed Status**
- **Auto Renewals**
- **Crypto Score Trend**
- **CLM Action Trend**
- **Auto Enrolment Trend**



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operations Snapshot

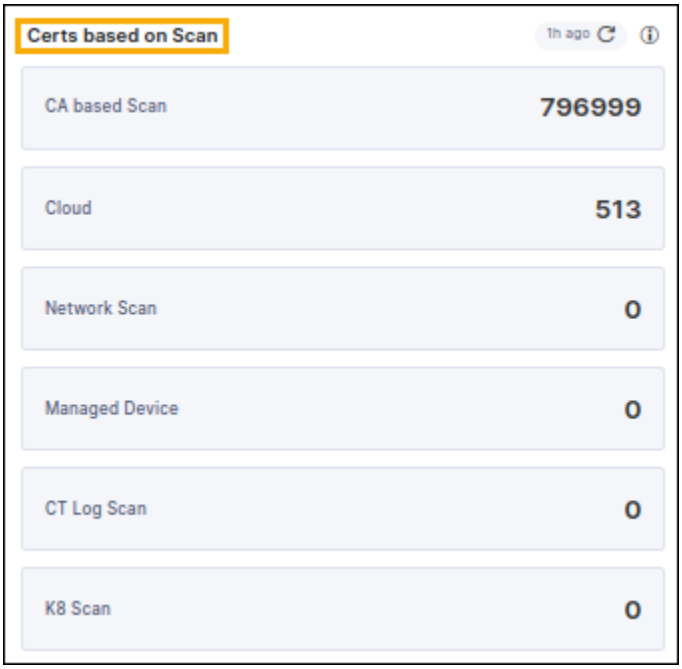
The Operations Snapshot widget displays the count of certificates, Auto Enrolled Certificates, and Auto Renewals Configured within AppViewX. The metrics within Operations Snapshot widget are:



- **Total Certificates** - Displays the count of certificates such as Server, Client, and Code signing certificates.
- **Auto Enrolled Certificates** - Displays the count of certificates that are enrolled using Auto Enrollment Protocol.
- **Auto Renewals Configured** - Displays the count of certificates currently configured for auto-renewal.

Certs based on Scan

This widget displays the count of certificates based on scan such as CA based scan, Managed device, CT Log scan, Cloud, Network Scan, External Tool, and K8s Scan.

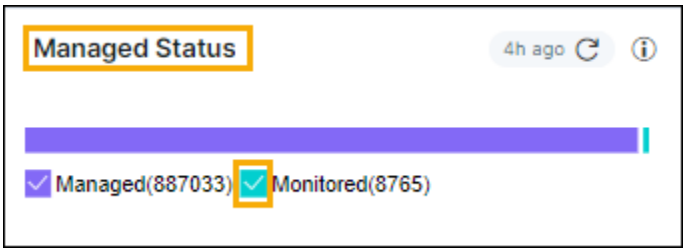


Managed Status

This widget shows the total count of certificates in both the managing and monitoring statuses. You have the following options:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

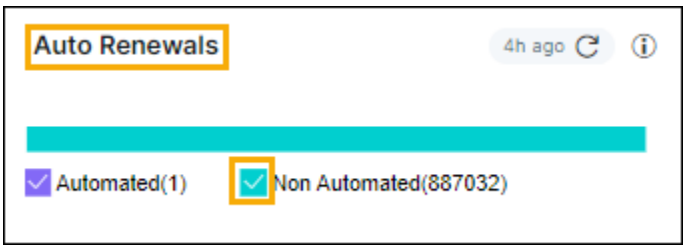
- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to intermediate page.
- Click the **Remediate** button to redirect to the Server/Client/Code signing certificate inventory.



Auto Renewals

This widget shows the total count of certificates in both the automated and Non automated. You have the following options:

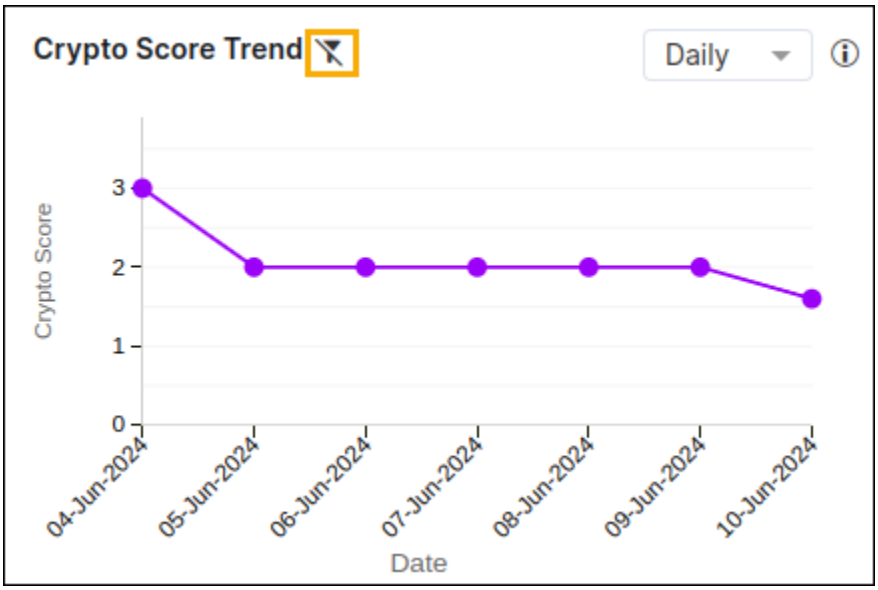
- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to intermediate page.
- Click the **Remediate** button to redirect to the Server/Client/Code signing certificate inventory.



Crypto Score Trend

This score indicates the security and condition of cryptographic components within a system, including certificates, encryption protocols, or cryptographic algorithms. You have the option to choose the trend chart format in various ways, including Daily, Weekly, Monthly, Quarterly, and Custom.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

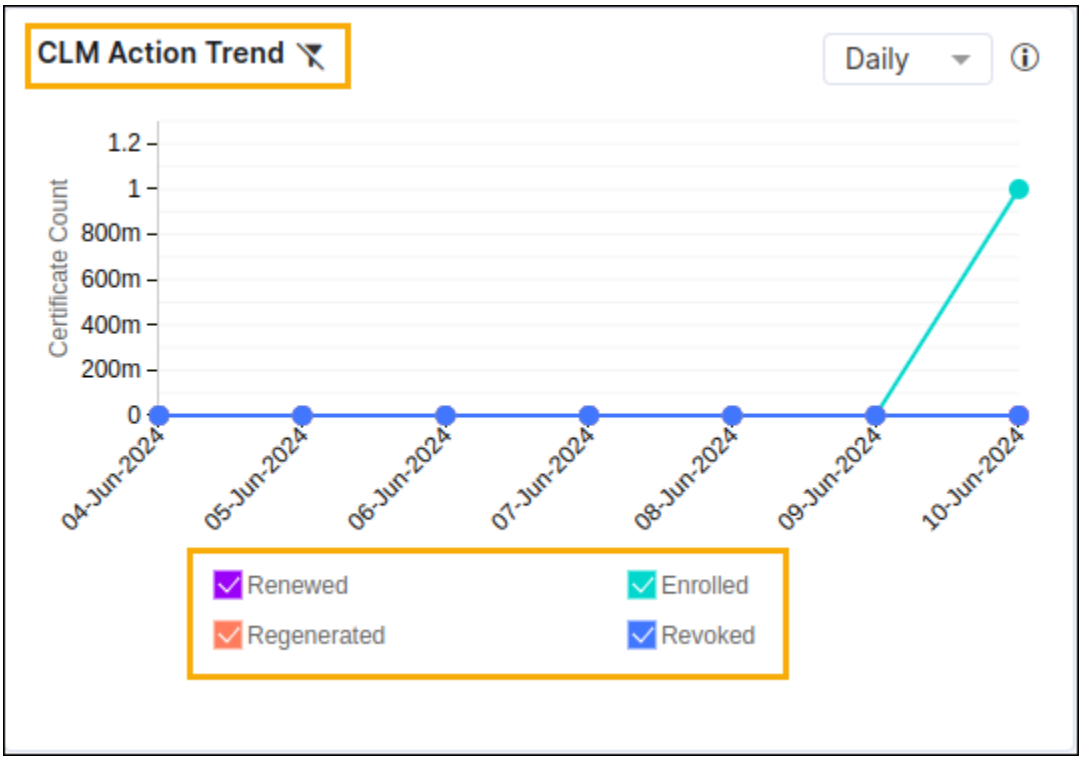


CLM Action Trend

This CLM action trend chart displays the count of renewed, enrolled, revoked, and regenerated certificates. You have the option to choose the trend chart format in various ways, including Daily, Weekly, Monthly, Quarterly, and Custom. You have the following more options:

- Select the check-box to view the specific portion, excluding unselected items.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

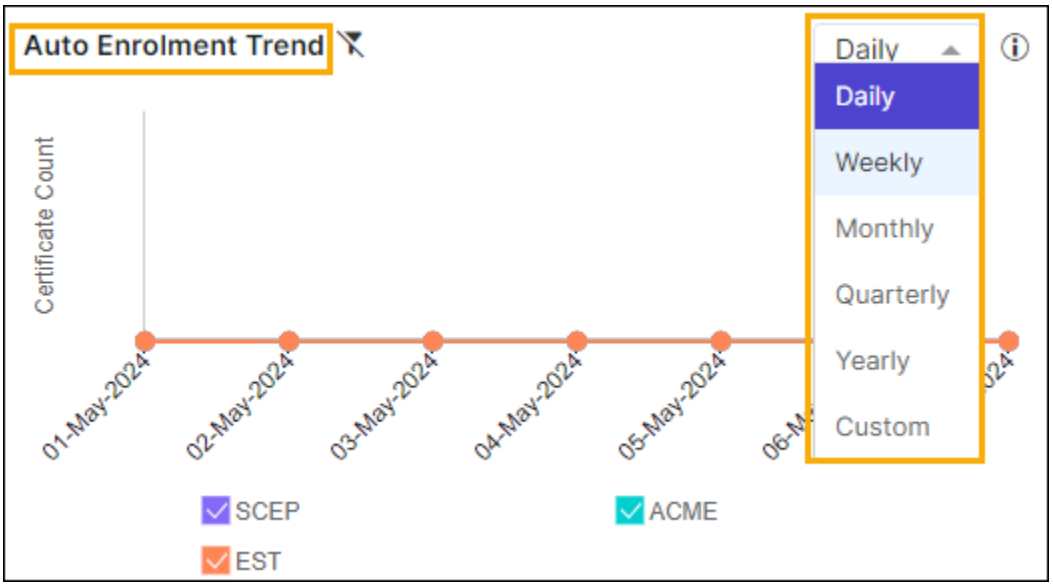


Auto Enrolment Trend

This trend displays the frequency or volume of certificates being automatically enrolled within a system. You have the option to choose the trend chart format in various ways, including Daily, Weekly, Monthly, Quarterly, and Custom. You have the following more options:

- Select the check-box to view the specific portion, excluding unselected items.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



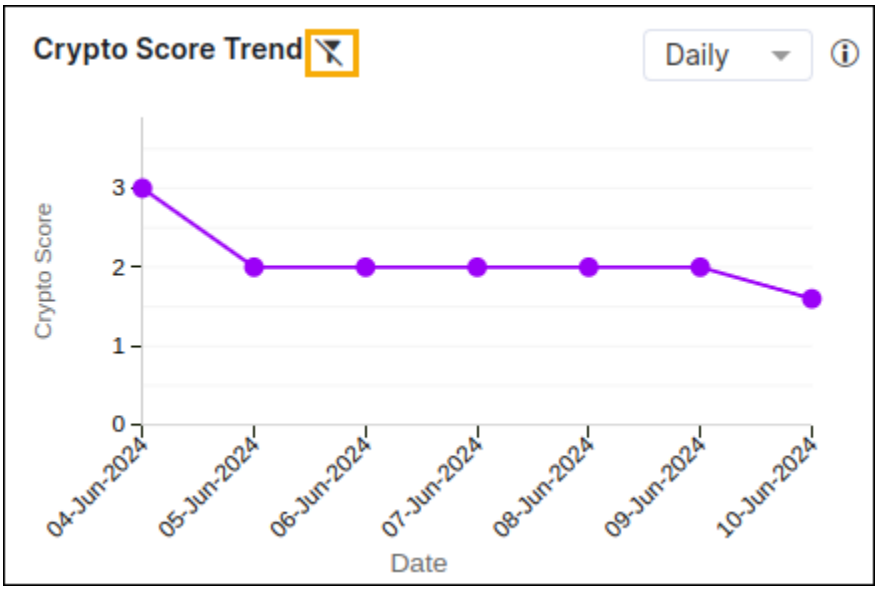
Threshold Limits

- For fewer than 100,000 certificates, live data will be displayed whenever the user navigates to the Insights page.
- For more than 100,000 certificates, a pre-calculated report will be shown with the last generated time indicated at the widget level.
- Users can click the widget level refresh to view the live data.

Trend Filter

It indicates that the group level filter is not applicable to this chart. The group level filter does not apply to the trend's filter and retains the same data for all users.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



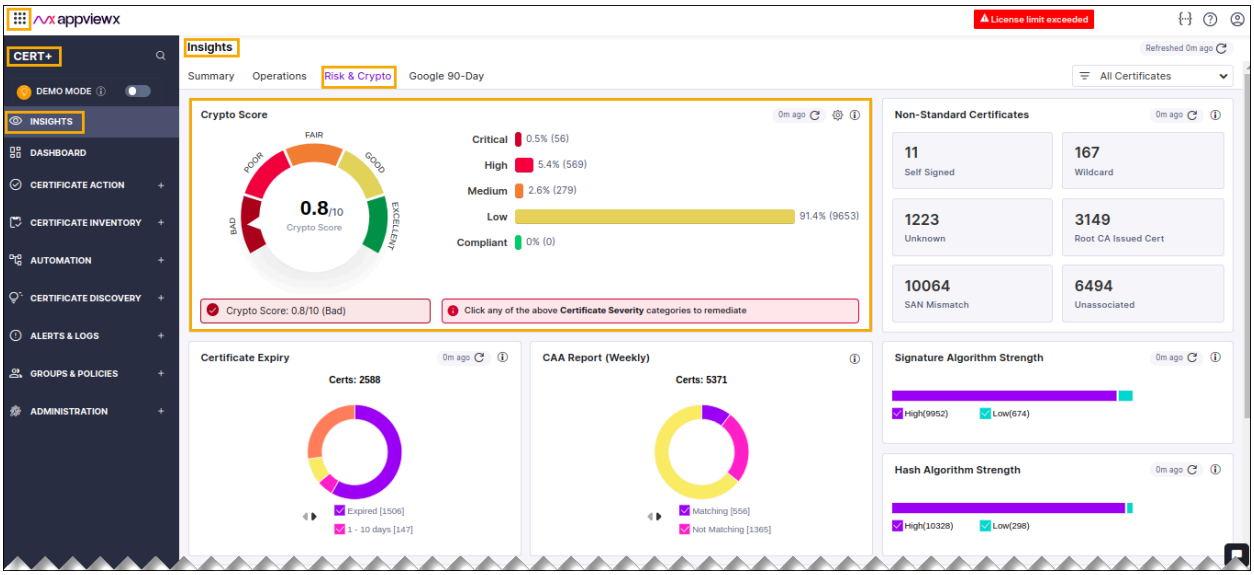
Insights Risk and Crypto

In Certificate Life Cycle Management, the "Crypto Score" typically refers to a metric or rating that assesses the security and health of cryptographic elements within the certificate ecosystem. This score evaluates factors such as certificate validity, strength of cryptographic algorithms, adherence to security best practices, and overall robustness of encryption protocols. It helps administrators monitor and maintain the security posture of certificates throughout their life cycle, identifying potential vulnerabilities or weaknesses that may need to be addressed.

The insights Risk and Crypto report presents a concise overview of the Crypto Score, Non-standard certificates, managed within AppViewX. Click on any widget to access detailed information specific to that particular operations on the respective widgets popup. Within the popup window, you can view all the entries, export the content in the desired format if needed, and redirect to inventory. The Widgets within the Insights Risk & Crypto report are:

- **Crypto Score**
- **Non-Standard Certificates**
- **Certificates Expiry**
- **CAA Report**
- **Signature algorithm strength**
- **Hash algorithm strength**
- **Crypto Score Trend**
- **Cipher Suite**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Crypto Score

The Crypto Score widget presents the average certificate score, including total score, critical risk certificates, high-risk certificates, medium-risk certificates, low-risk certificates, and good certificates, all based on the configured certificate compliance.

Crypto Score Calculation

The Crypto Score for a set of certificates is determined by combining each certificate's base score with the weighted priorities assigned to specific risk categories. Below is a step-by-step breakdown of the calculation process:

- **Determine the Base Score**: Each certificate is assigned a base score based on its attributes and usage. This score reflects factors such as:
  - Validity period
  - Key algorithm
  - Key size
  - Usage in applications or devices (for example, used for authentication).
- **Assign Priority Weights**: Each certificate is placed into a priority group based on its characteristics. Different priority groups have different weights:
- Each certificate is categorized into a priority group based on its characteristics, with each group representing a specific level of risk. The defined priority groups and their associated risks are as follows:
  - **Priority 0**: Expired/Revoked Certificates, Self-Signed Certificates, Wildcard Certificates
  - **Priority 1**: Weak Key Size, Weak CA Key Size

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Priority 2**: Weak Hashing Algorithms
- **Priority 3**: Unauthorized Certificate Authorities (CAs).

Each priority group is assigned a weight, which is factored into the overall Crypto Score calculation.

Calculate the Individual Score

The individual score for a certificate is calculated using the following formula:

Individual Score = ∑ (Priority Weight × Base Score)

The score is the sum of the products of each applicable priority group's weight and the certificate's base score, providing a weighted assessment of the certificate's overall risk.

Classify Certificate Severity

Based on the calculated individual score, the certificate is classified into one of the following **severity levels**:

- **Critical (>=8)**
- **High (7.9-5)**
- **Medium (4.9-3)**
- **Low (2.9-1)**
- **Good (0.9-0)**.

After classification, certificates are grouped by severity for further aggregation.

Example Calculations

- Example 1: Weak Certificate

  Attributes:

  - Wildcard certificate (**Priority 0**)
  - Weak key size (**Priority 1**)
  - Weak hashing (**Priority 2**).

  Base Scores:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Wildcard: 5
- Weak key size: 3
- Weak hashing: 2

Priority Weights:

- Priority 0: 3
- Priority 1: 2
- Priority 2: 1

Calculation:

Individual Score = (3 × 5) + (2 × 3) + (1 × 2)

= 15 + 6 + 2

= 23

As the individual score is **23**, which is greater than **8**, the certificate falls into the **Critical** severity range and is categorized as **Critical**.

Example 2: Strong Certificate

Attributes:

- Valid
- Strong key size
- Strong hashing

Priority Weights:

- Priority 0: 0.1
- Priority 1: 0
- Priority 2: 0

Calculation:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Individual Score = (0.1 × 5) + (0 × 3) + (0 × 2)

= 0.5 + 0 + 0

= 0.5

Since the individual score is **0.5**, which is less than **0.9**, the certificate is categorized as **Good**.

Aggregate Overall Crypto Score

The overall Crypto Score is calculated by aggregating all certificates based on their severity levels using a logarithmic scale.

- The final Crypto Score ranges from **1 to 10**.

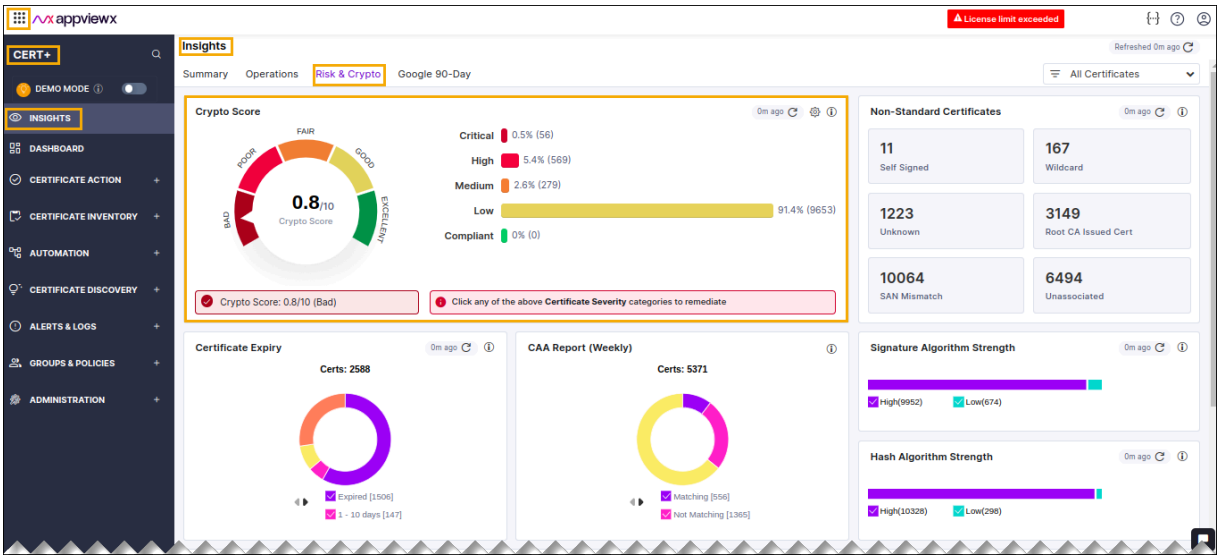
If the calculated score exceeds 10, it is capped at **10**.

Crypto Score Configuration

To configure the crypto score, do the following steps.

1. Go to (**Menu**) > **CERT+** > **INSIGHTS**.

   The Insights window is displayed.



2. Click **Risk & Crypto**.

   The **Rick & Crypto** score page is displayed.

3. In the **Crypto Score** section, click the (Settings Gear) icon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Crypto Score Configuration** page is displayed.

The field description for configuring the crypto score.

Field	Description
*Strongest Algorithm	Select the strongest algorithm to ensure that the data security and integrity in various cryptographic operations, such as encryption, digital signatures, and authentication. The available options are: • *RSA • *DSA • *EC.
*Strongest Hash	Select the strongest hash from the list.
*Prioritize score components	Select components based on priority level to calculate the crypto score. You can select maximum 3 components in a single priority list. • Priority 0 • Priority 1 • Priority 2 • Priority 3
**: Mandatory fields*	

4. Click **Save**.

Non-Standard Certificates

Displays a report detailing the count of non-standard certificates in the following categories:

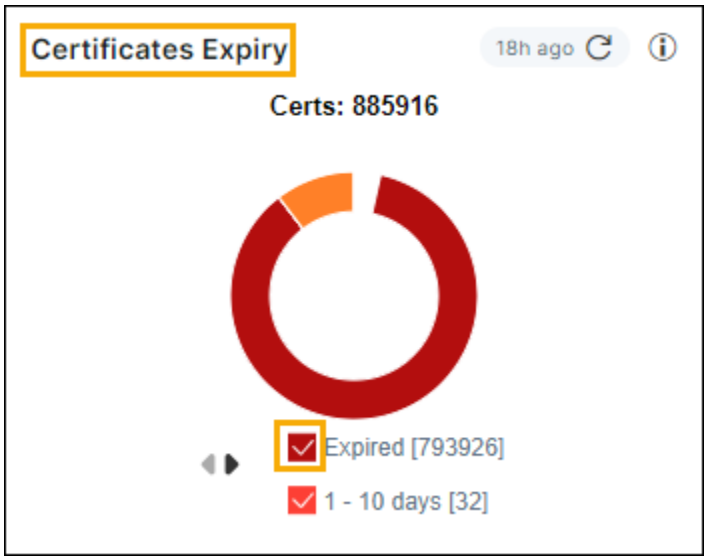
- Self-Signed
- Wildcard
- Unknown
- Root CA Issued Certificates
- SAN Mismatch
- Unassociated Certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificates Expiry

The Expiry Certificate widget shows the number of certificates set to expire within the next 1 to 10 days. Additionally, it indicates the count of certificates that have already expired. You have the following options:

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the **Certificates Expiry :: Expired** and ×**Certificates Expiry :: 1 - 10 days**, and to the remaining pages.
- Click the **View in inventory** tab that redirects to the **Certificates Expiry** page.

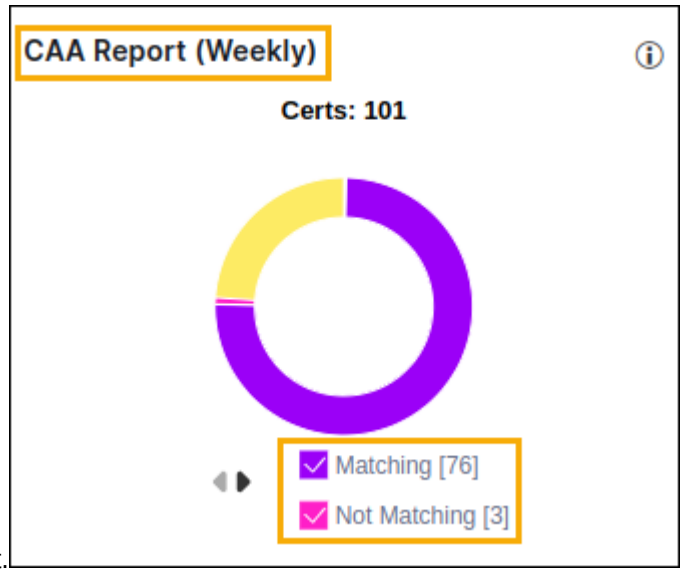


CAA Report

This report shows the count of certificates with and without CAA records in the inventory. You have the following options:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

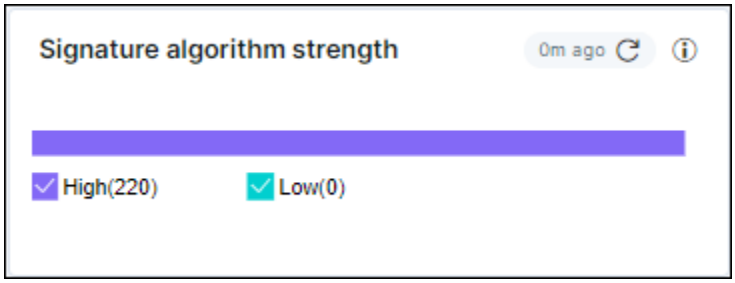
- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the respective inventory report.



Signature algorithm strength

Displays the count of certificates based on their signature algorithm strength, categorized as either high or low. A higher signature algorithm strength indicates stronger cryptographic algorithms, which are more resistant to attacks and tampering, thus enhancing the overall security posture of the system. You have the following options:

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the chart to redirect to the respective report.

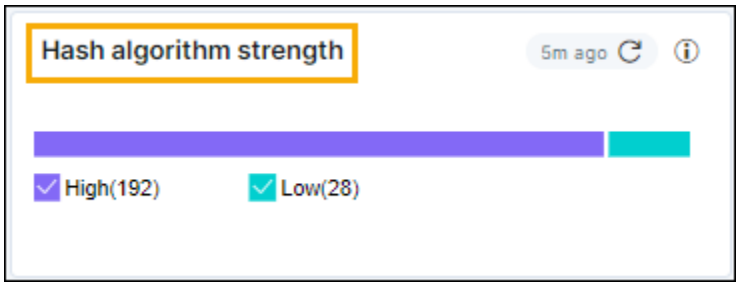


Hash algorithm strength

Displays the count of certificates based on their hash algorithm strength, categorized as either high or low. A higher signature hash strength indicates stronger cryptographic algorithms, which are more resistant to attacks and tampering, thus enhancing the overall security posture of the system. You have the following options:

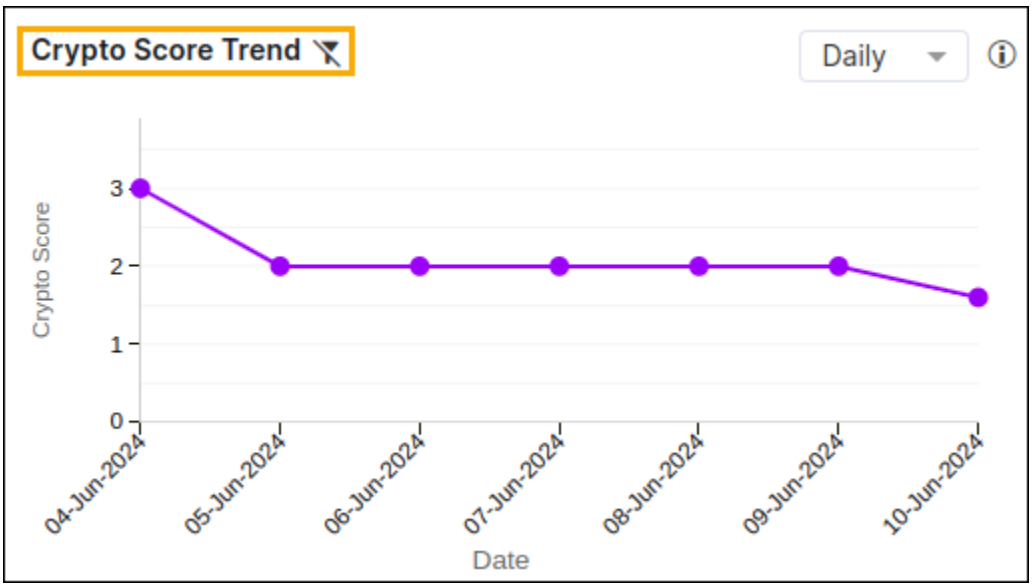
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the chart to redirect to the respective report.



Crypto Score Trend

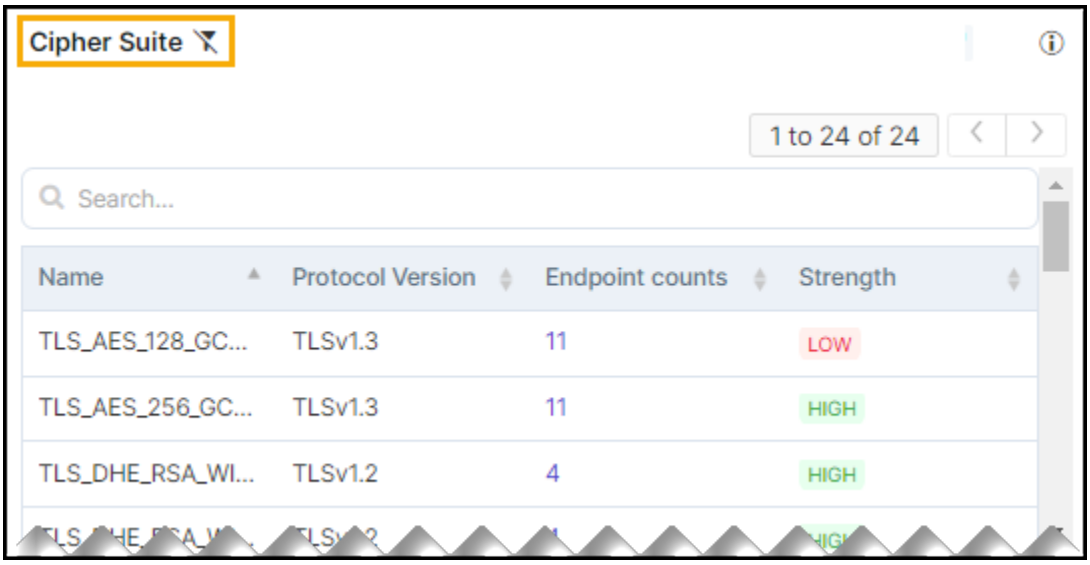
This score indicates the security and condition of cryptographic components within a system, including certificates, encryption protocols, or cryptographic algorithms.



Cipher Suite

The Cipher report in the Insights dashboard no longer uses a separate strength mapping configuration. Instead, it now references the strength mapping defined under Administration > General Settings > Cipher Settings.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Threshold Limits

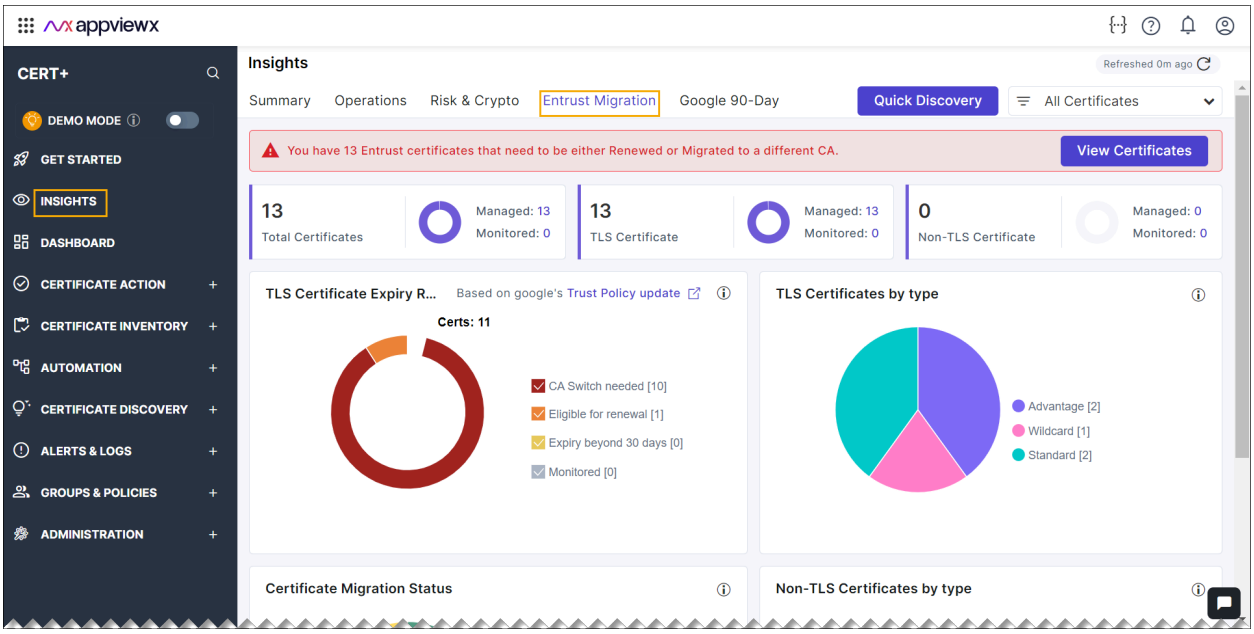
- For fewer than 100,000 certificates, live data will be displayed whenever the user navigates to the Insights page.
- For more than 100,000 certificates, a pre-calculated report will be shown with the last generated time indicated at the widget level.
- Users can click the widget level refresh to view the live data.

Insights Entrust Migration

The Entrust Migration Insights Dashboard is designed to provide a comprehensive view of all certificates issued by Entrust. It allows users to monitor, manage, and migrate their certificates effectively. The dashboard is segmented into various sections and widgets, each offering specific insights and actions related to Entrust-issued certificates. This dashboard aims to streamline the management of Entrust-issued certificates, ensuring timely renewals and efficient migration, while keeping users informed and in control of their certificate landscape.

- TLS Certificate Expiry Report
- TLS Certificates by Type
- Certificate Migration Status
- Non-TLS Certificates by Type.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Purpose of Entrust Migration Dashboard

Real-Time Data Display:

- Total number of Entrust-issued certificates.
- Certificates eligible for renewal or needing migration.
- Successfully migrated certificates and those still pending.
- Active certificates currently in use.

Direct Actions:

- Users can renew certificates or initiate their migration directly from the dashboard.

Real-Time Updates:

- The dashboard features real-time updates, with a refresh button at the top indicating the last refresh time.
- Auto-refresh occurs every 12 hours.

Detailed Auditing:

- Comprehensive logging and auditing for tracking all certificate-related activities.

Certificate Validity:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Only valid certificates are displayed, excluding expired or revoked Entrust certificates.

Alert Message

A red banner at the top alerts you that there are 13 Entrust certificates, which has to be either renewed or migrated to a different Certificate Authority (CA).

Title Bar

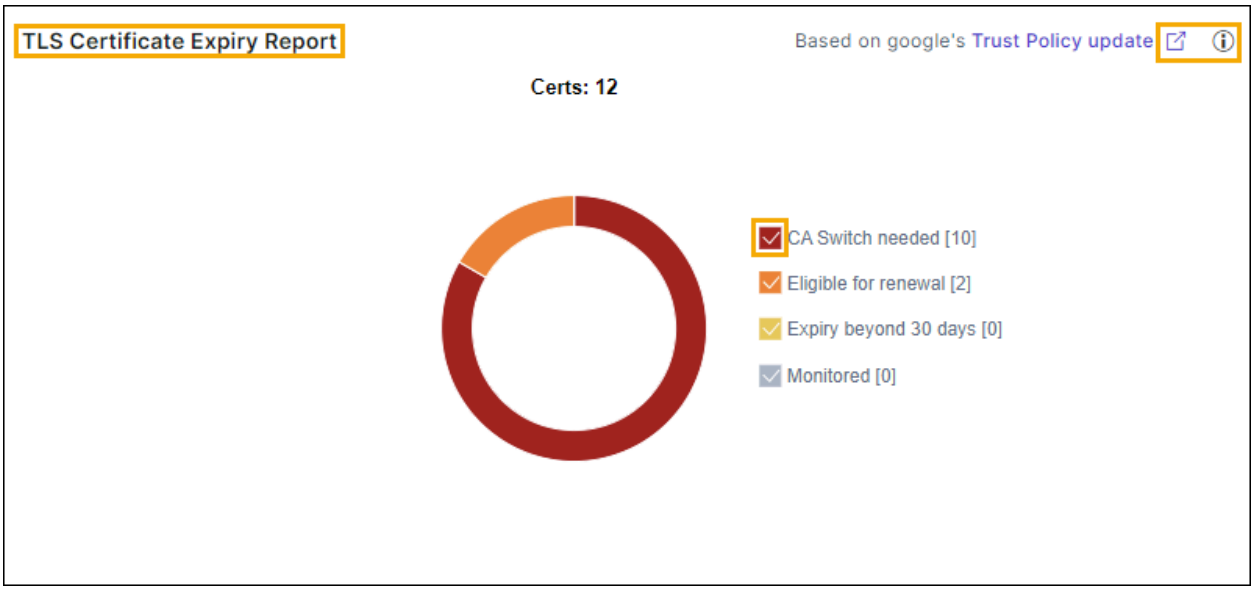
The title bar offers a concise summary of all certificates issued by Entrust. It displays three interactive widgets:

• Total Entrust Certificates
• TLS Certificates
• Non-TLS Certificates.

Each widget displays certificate data, covering both Managed and Monitored certificates.

TLS Certificate Expiry Report

This widget provides a detailed report on certificates that need to be migrated or renewed.



Categories include:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **CA Switch Needed**: This includes certificates that need to be switched to a different Certificate Authority from Entrust, as they expire after November 30th, 2024.
- **Eligible for Renewal**: This includes certificates that are set to expire within the next 30 days, up until November 30th, 2024.
- **Not Eligible for Renewal**: This includes certificates that expire more than 30 days from now, until November 30th, 2024.

> **Note:** Entrust permits certificate renewals only for those expiring within 30 days.

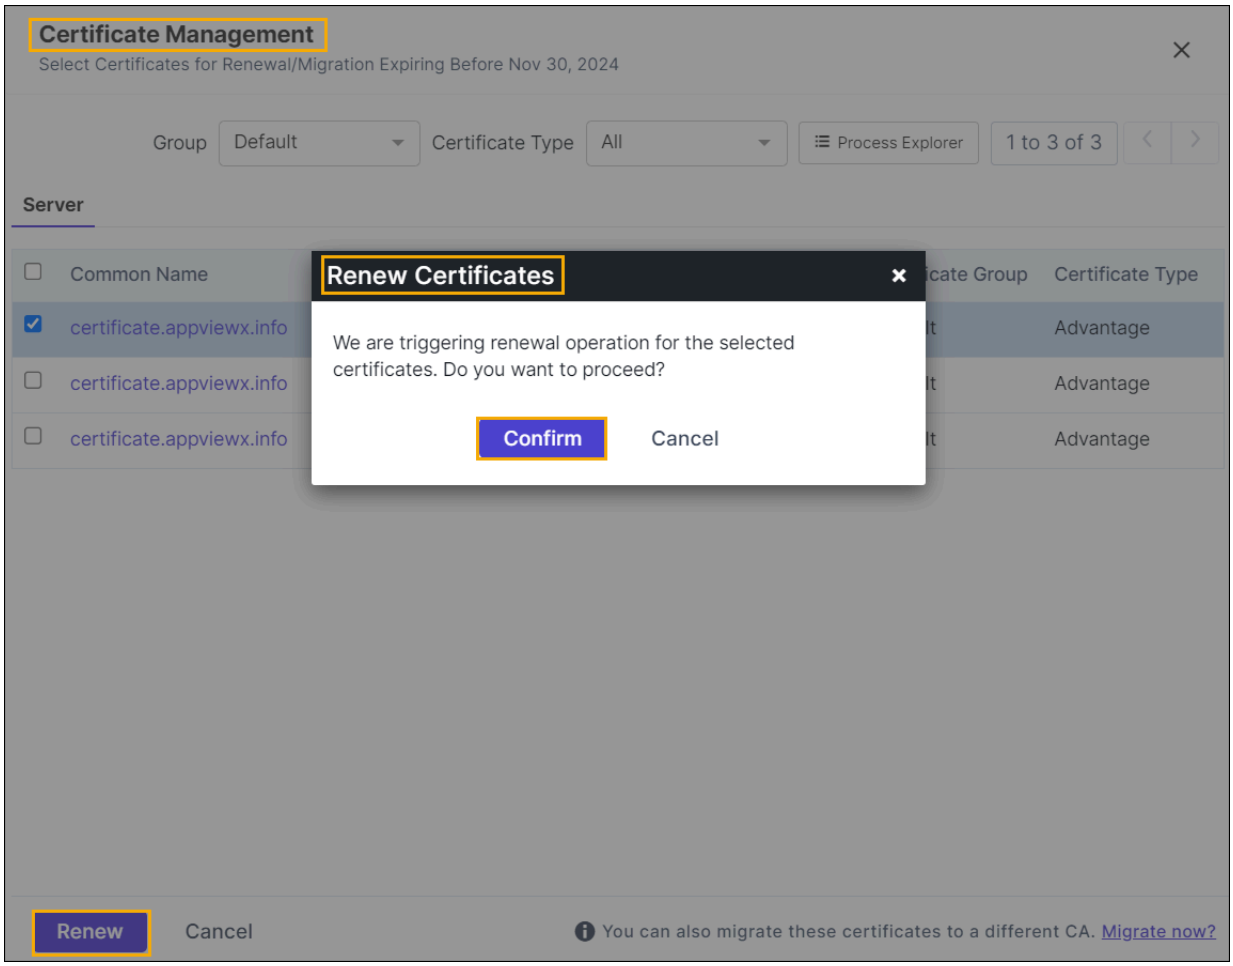
- **Monitored**: This includes certificates that are currently in Monitored status in the inventory. These certificates will need to be moved to Managed status in order to perform a CA switch or renewal.

> **Note:** Google's Entrust Distrust update, any certificate issued up until October 31st, 2024, is considered valid. Since Entrust only allows renewing certificates within 30 days of their expiry, certificates expiring by November 30th, 2024, can be renewed and remain valid. However, any certificate expiring after this date must be switched to a different Certificate Authority.

- **Link Icon:** Explains the impact of Google's distrust of Entrust-issued certificates and includes a link for more details.

- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to **Certificate Management** page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



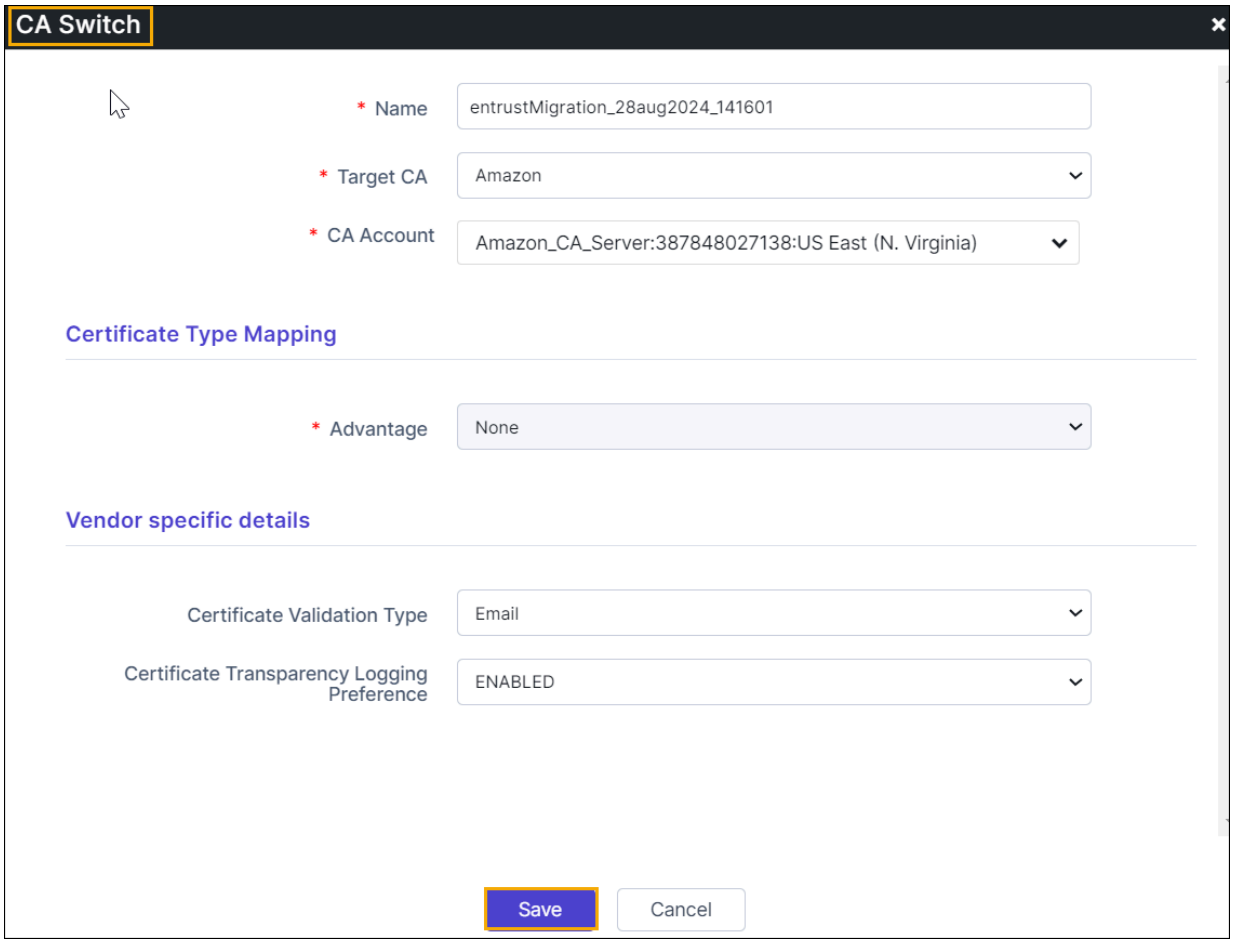
- **Group**: A dropdown labeled "Group" is set to "Default".
- **Certificate Type**: Another dropdown labeled "Certificate Type" is set to "All".
- **Process Explorer**: There is a button labeled "Process Explorer", likely used for detailed analysis or tracking of certificate processing.
- **Pagination**: The interface indicates that the user is viewing items 1 to 8 out of a total number, with navigation arrows for moving between pages.

- The main section of the interface displays a table listing certificates with the following columns:
- **Common Name**: The domain name associated with each certificate (for example, `poshacme.appviewwx.net`).
- **Expiry Date-Time**: The exact date and time when each certificate will expire (for example, 14/02/2025 17:21).
- **Discovery Source**: The source from which the certificate was discovered (for example, `MicrosoftServer`).
- **Applications Associated**: This column is likely meant to display the applications linked to each certificate, though in the image it appears empty.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

  - **Certificate Group**: Indicates the group to which each certificate belongs, set to "Default" in all cases.
  - **Certificate Type**: Also set to "Default" for each entry, this column categorizes certificates by their type.
- Each row has a check box to the left of the common name, allows you to select individual certificates for migration or further actions.
- At the bottom of the interface, there are options to **Renew** or **Cancel**. The **Renew** button is prominently displayed, indicating that the user can initiate the renewal process for the selected certificates if the **Eligible for renewal** certificate pie chart selected.
  - Click **Renew**, the **Renew Certificates** pop-up window appears with message as "We are triggering renewal operation for the selected certificates. Do you want to proceed?".
  - Click the **Confirm** button, the certificate gets renewed and the message is displayed as "We have successfully initiated the Renewal of 1 certificates" along with the **Click to View** link.
  - To see the renewed certificate in the **Renew Certificate** page, click the **Click to View** link that redirects to **Insights** > **Entrust Migration** > **Renew Certificate** view page.
- Click the **Cancel** button to discard the current changes and exit the form without saving.
- Click the certificate link to redirect to the Server certificate holistic view.
- A note at the bottom of the page indicates that user can also migrate the selected certificates to a different Certificate Authority (CA), with a link provided ("Migrate now?") for further action. Click the **Migrate now?** button that redirects to CA Switch page. For more details about CA Switch, refer the below steps.
- **CA Switch**: At the bottom of the interface, there are options to **Switch CA** or **Cancel**. The **Switch CA** button is prominently displayed, indicating that the user can initiate the CA Switch (migration) process for the selected certificates, if the **Eligible for CA Switch needed** certificate pie chart selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field descriptions for the CA Switch parameters

Fields	Description
***Name**	**Default**: Selected certificate name for the CA switch. The name of the migration task is specified as "entrustMigration_ 28aug2024_130633." This includes the date and time when the migration task was created.
***Target CA**	**Default**: Amazon. The dropdown menu shows that **Amazon** is selected as the target Certificate Authority to which the certificates will be migrated by default. The available options are: • **Amazon** • **Sectigo (Comodo Certificate Manager)**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• **Digicert** • **GlobalSign** • **Trustwave**
***CA Account**	This field is a dropdown menu, prompting the user to select an account associated with the chosen CA. **Note:** This field appears only if the **Amazon** selected in the target CA dropdown list.
***Settings**	This field is a dropdown menu, prompting the user to select an account associated with the chosen CA. **Note:** This field appears only if anyone of the **Sectigo (Comodo Certificate Manager)**, **Digicert**, **GlobalSign**, or **Trustwave**CA selected in the target CA dropdown list.
***Division**	**Default**: AppViewX Inc. Select the division from the dropdown list. The available options are: • **AppViewX Inc.** • **TestDivision** **Note:** This field appears only if the **Digicert** selected in the target CA dropdown list.
Certificate Type Mapping	
***Advantage**	Under the "Certificate Type Mapping" section, there is a dropdown menu labeled "Advantage," where "None" is selected. This allows users to map specific certificate types from the source CA to equivalent types in the target CA.
Vendor Specific Details	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: This field appears only if anyone of the **Amazon**, **Digicert**, or **GlobalSign** CA selected in the target CA dropdown list.
Certificate Validation Type	**Default**: Email. The dropdown menu under this section shows "Email" as the selected validation type. The available options are: • **Email**: This indicates that email validation will be used for the certificates during the migration process. • **DNS**: his indicates that DNS validation will be used for the certificates during the migration process. **Note:** This field appears only if the **Amazon**, , CA selected in the target CA dropdown list.
Certificate Transparency Logging Preference	**Default**: ENABLED. The preference for Certificate Transparency Logging is set to **ENABLED**, meaning that the certificates will be logged in publicly accessible Certificate Transparency logs. **Note:** This field appears only if the **Amazon** CA selected in the target CA dropdown list.
***Server Type**	**Default**: Apache. Select the type of server from the dropdown list. This field determines the type of server environment in which the certificate will be used. **Note:** This field appears only if the **Digicert** CA selected in the target CA dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Payment Method**	**Default**: Bill To Account Balance. Select the type of method from the dropdown list. This field specifies how the payment for the service will be handled. "Bill To Account Balance" suggests that the charges will be deducted from a pre-existing account balance, possibly linked to the user's account with the vendor. The available methods are: • Bill To Account Balance • Bill To Default Credit Card. **Note:** This field appears only if the **GlobalSign** CA selected in the target CA dropdown list.
***Domain Admin Email**	**Default**: hostmaster. Select the type of domain admin email from the dropdown list. **Note:** This field appears only if the **Digicert** CA selected in the target CA dropdown list.
*: Mandatory fields	

- Click **Save**.

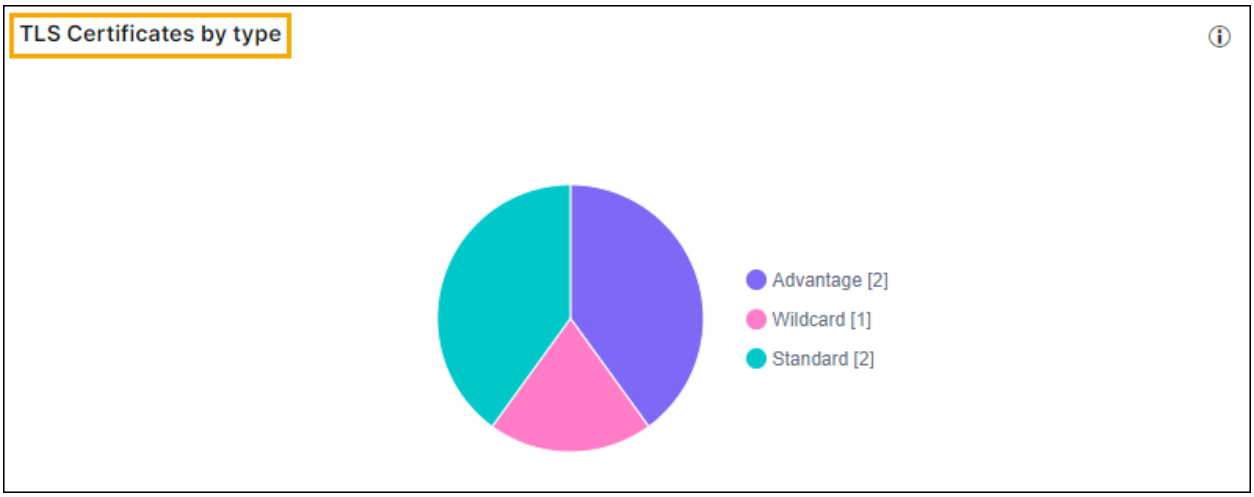
  The popup message appears as "<certificate name> saved" in the **CA Switch Summary** page.

- Click the **Cancel** button to discard the current changes and exit the form without saving.
- Select the checkbox for the certificate that you want to migrate CA, and then click **Submit**.

TLS Certificates by Type

This chart visually represents the distribution of TLS certificates based on their types. There are three distinct categories of certificates, each represented by a different color. The chart provides a quick visual summary of how many TLS certificates belong to each type such as **Standard**, **Advantage**, and **Wildcard**. Provides a drilldown option for more detailed insights, excluding certificates that have already been migrated or are in progress

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



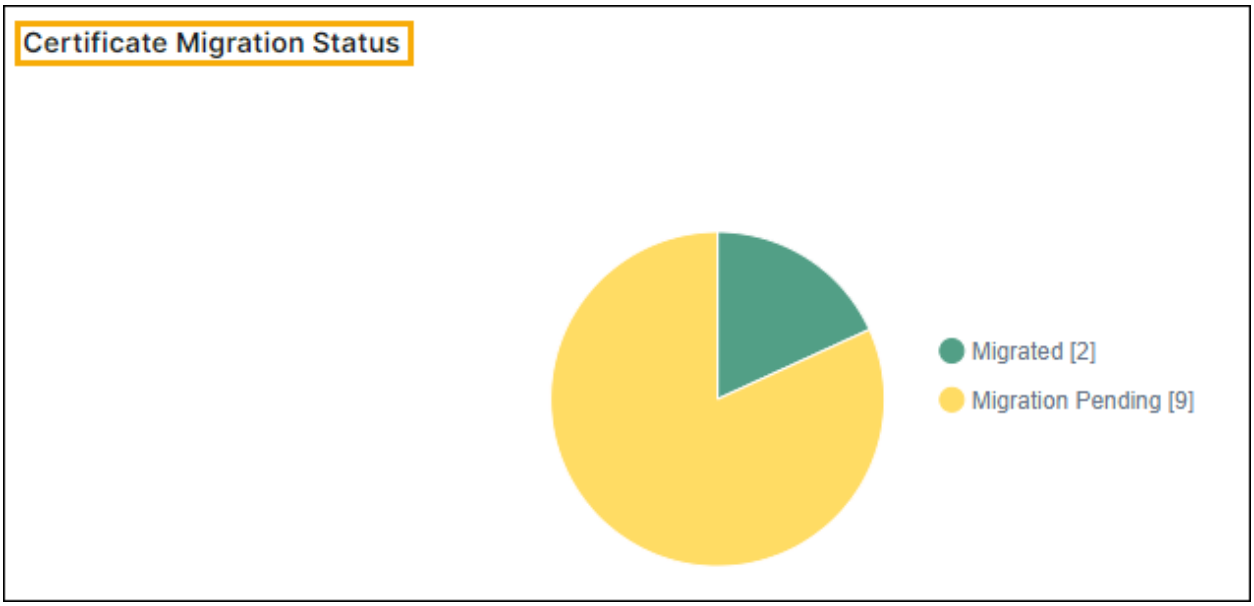
- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to **Certificate Management** page.

  - **Certificate Type**: Another dropdown labeled "Certificate Type" is set to "Advantage".
  - **Common Name**: The domain name associated with each certificate (for example, `poshacme.appviewwx.net`).
  - **Expiry Date-Time**: The exact date and time when each certificate will expire (for example, 14/02/2025 17:21).
  - **Discovery Source**: The source from which the certificate was discovered (for example, `MicrosoftServer`).
  - **Applications Associated**: This column is likely meant to display the applications linked to each certificate, though in the image it appears empty.
  - **Certificate Group**: Indicates the group to which each certificate belongs, set to "Default" in all cases.
  - **Certificate Type**: Also set to "Default" for each entry, this column categorizes certificates by their type.
- Click the certificate link to redirect to the Server certificate holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

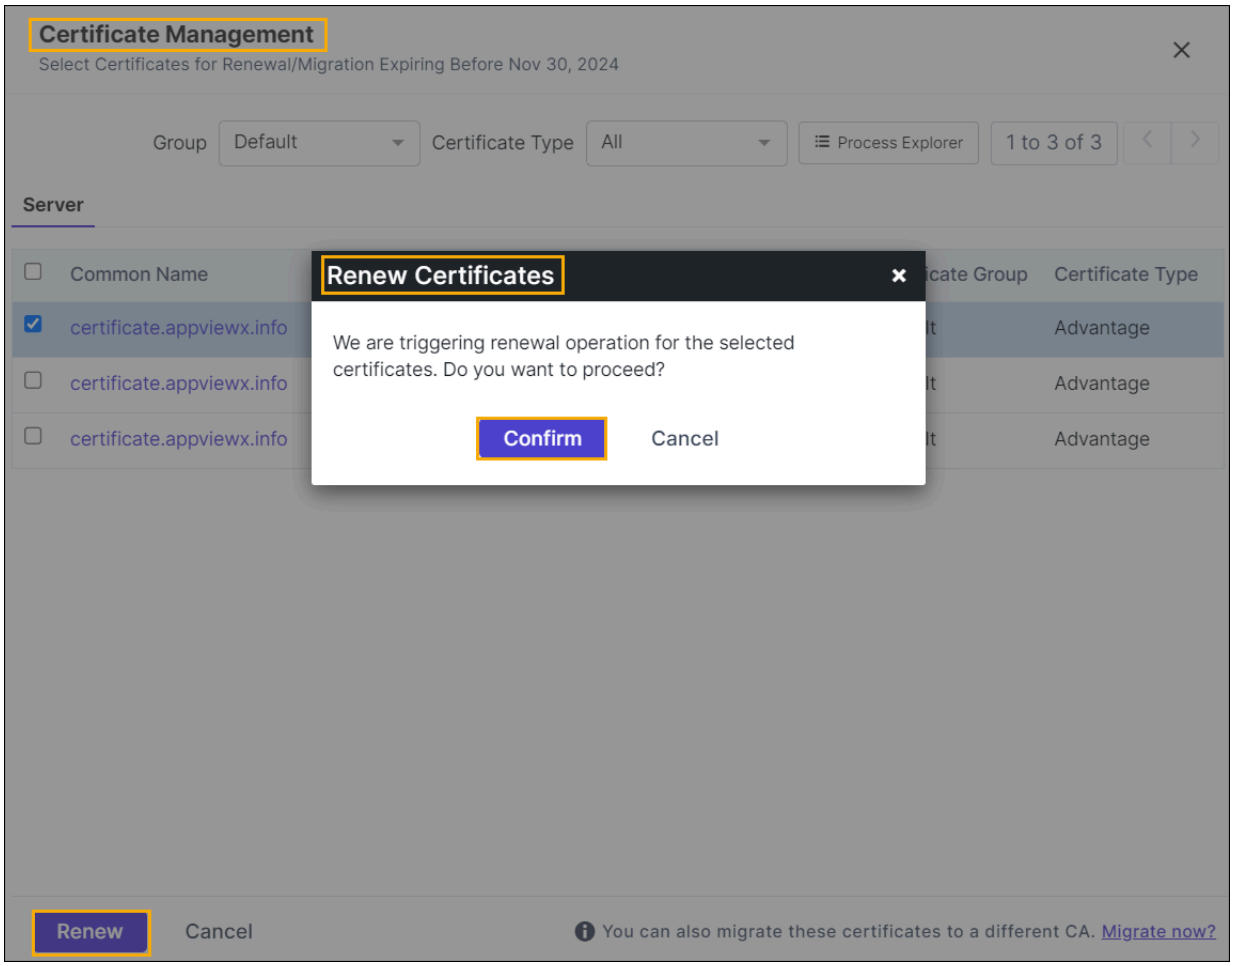
Certificate Migration Status:

Tracks the progress of Entrust certificate migration, showing how many have been migrated or are pending. Offers insights into the migration process and the status of certificates.



- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to **Certificate Management** page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



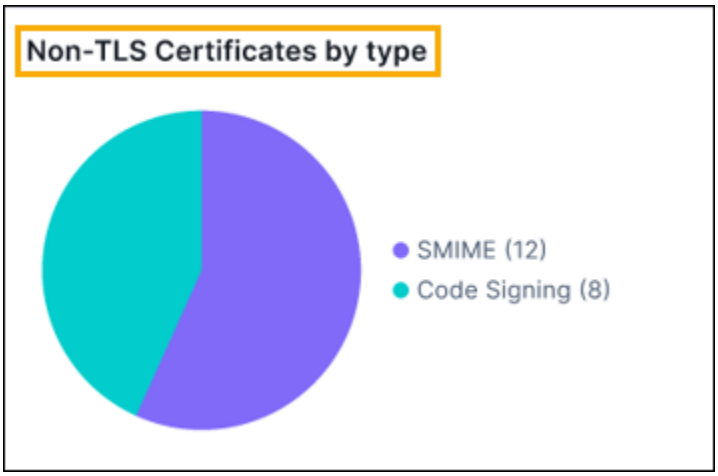
- **Certificate Type**: Another dropdown labeled "Certificate Type" is set to "All".
- **Common Name**: The domain name associated with each certificate (for example, `poshacme.appviewwx.net`).
- **Expiry Date-Time**: The exact date and time when each certificate will expire (for example, 14/02/2025 17:21).
- **Discovery Source**: The source from which the certificate was discovered (for example, `MicrosoftServer`).
- **Applications Associated**: This column is likely meant to display the applications linked to each certificate, though in the image it appears empty.
- **Certificate Group**: Indicates the group to which each certificate belongs, set to "Default" in all cases.
- **Certificate Type**: Also set to "Default" for each entry, this column categorizes certificates by their type.

• Click the certificate link to redirect to the Server certificate holistic view.

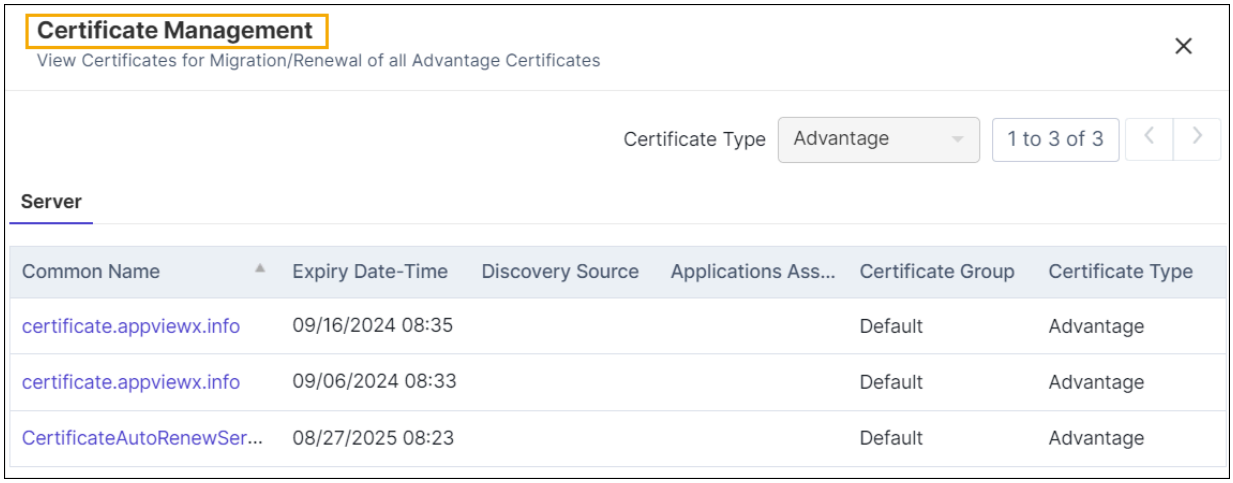
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Non-TLS Certificates by Type

Categorizes and displays Non-TLS Entrust certificates and excludes already migrated or in-progress certificates.



- Select the check-box to view the specific portion, excluding unselected items.
- Click the pie chart to redirect to **Certificate Management** page.



- **Certificate Type**: Another dropdown labeled "Certificate Type" is set to "Advantage".
- **Common Name**: The domain name associated with each certificate (for example, `poshacme.appviewwx.net`).
- **Expiry Date-Time**: The exact date and time when each certificate will expire (for example, 14/02/2025 17:21).
- **Discovery Source**: The source from which the certificate was discovered (for example, `MicrosoftServer`).
- **Applications Associated**: This column is likely meant to display the applications linked to each certificate, though in the image it appears empty.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Certificate Group**: Indicates the group to which each certificate belongs, set to "Default" in all cases.
- **Certificate Type**: Also set to "Default" for each entry, this column categorizes certificates by their type.

• Click the certificate link to redirect to the Server certificate holistic view.

Bulk Update CSR

1. Go to **Insights** > **Entrust Migration** > **CA Switch Summary**.
2. Select the checkbox for the certificates that you want to update the CSR parameters.
3. Click the **Bulk Update CSR** button.

   The **Update Connector Details** page is displayed to update the CSR parameters.

   Field descriptions for the CA Switch parameters.

Fields	Description
Attachments	
Name	Enter the alternate name for the field to be uploaded.
Comments	Enter the additional information if required.
Upload File	Click the **Upload** button to attach the file.
Certificate Attributes	
Expiry Alert	**Default**: True The Expiry Alert feature notifies users in advance of upcoming certificate expiration dates. This feature helps ensure that certificates are renewed or replaced before they expire, preventing potential service disruptions or security vulnerabilities.
AzureSSOAlertRecipients	The **AzureSSOAlertRecipients** feature refers to a setting or configuration within an Azure environment where specific individuals or groups are designated to receive alerts related to Azure Single Sign-On (SSO) activities.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Vendor specific details	
Certificate Validation Type	**Default**: Email. The dropdown menu under this section shows "Email" as the selected validation type. The available options are: • **Email**: This indicates that email validation will be used for the certificates during the migration process. • **DNS**: his indicates that DNS validation will be used for the certificates during the migration process. **Note:** This field appears only if the **Amazon**, , CA selected in the target CA dropdown list.
Certificate Transparency Logging Preference	**Default**: ENABLED. Select the preference from the dropdown list. The preference for Certificate Transparency Logging is set to **ENABLED**, meaning that the certificates will be logged in publicly accessible Certificate Transparency logs. Available options are: • **ENABLED** • **DISABLED.**

Google 90 Day Dashboard

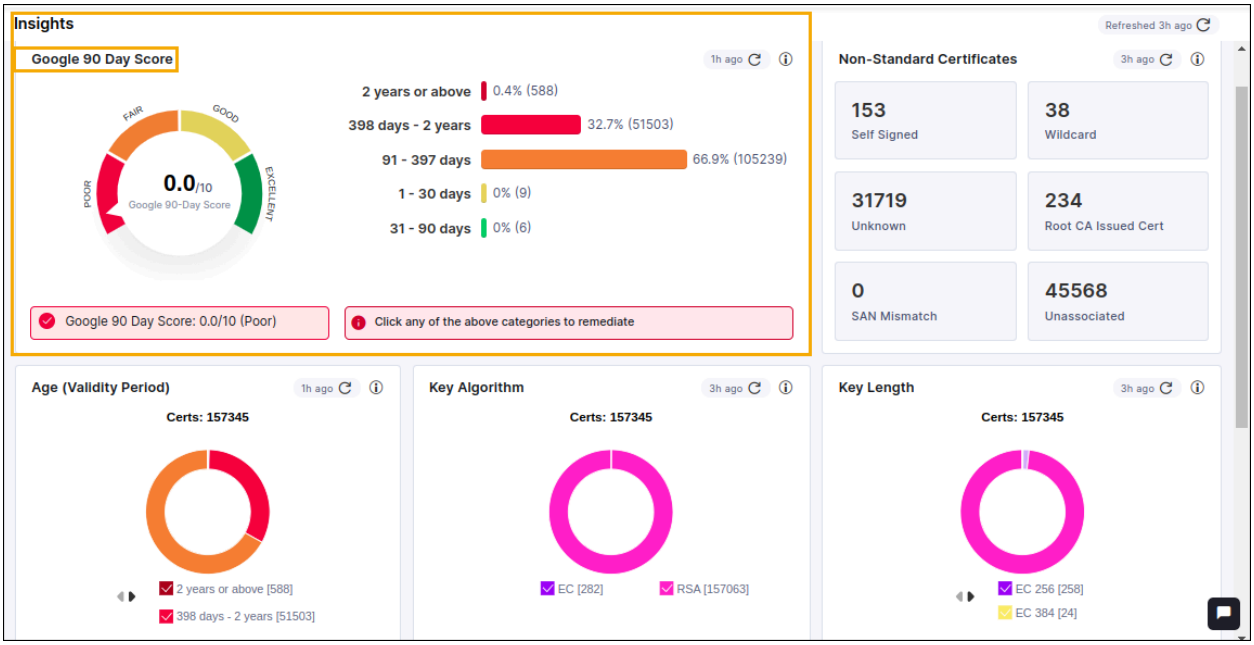
Overview

The Google 90-day certificate refers to Secure Sockets Layer (SSL) certificates issued by Certificate Authorities (CAs) in accordance with Google's guidelines on certificate validity periods. Certificates exceeding 398 days (approximately one year and one month) are considered insecure by Google. This

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

policy encourages the adoption of shorter-lived SSL certificates, typically lasting 90 days, to enhance security and promote timely certificate renewal.

This dashboard displays the reports related to certificate scores, server certificate age, issuers, key algorithms, and key lengths, adhering to the guidelines set by Google for 90-day SSL certificates.



Benefits of Google 90 Day

- **Achieve Visibility**: Clear insight into certificates is crucial for effectively managing renewals and removals. Regular scanning aids in identifying existing certificates and uncovering new ones.
- **Monitor Expiry Dates**: Automation streamlines tracking and upkeep of certificate renewals by issuing timely alerts to relevant personnel. It also ensures proper provisioning and configuration of certificates, along with accurate binding to endpoints.
- **Enforce Encryption Standards**: Encryption forms the cornerstone of certificates, making it imperative to determine the appropriate encryption level to uphold infrastructure security. Analyzing certificates for indicators like key size, strength, or signing algorithms helps identify those utilizing insecure or outdated cryptographic standards.
- **Establish Governance**: While automation aids certificate management, it necessitates a foundational policy for enforcing Public Key Infrastructure (PKI) governance. This governance framework oversees data protection, user identity provisioning, and the security of end-to-end communications.
- **Secure Key Management**: Private keys serve as the ultimate safeguard for sensitive data, yet storing them in unprotected text files exposes them to exploitation. Utilizing encrypted software vaults or certified Hardware Security Modules (HSMs) offers superior protection, particularly if automated key rotation is enabled to periodically replace them.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

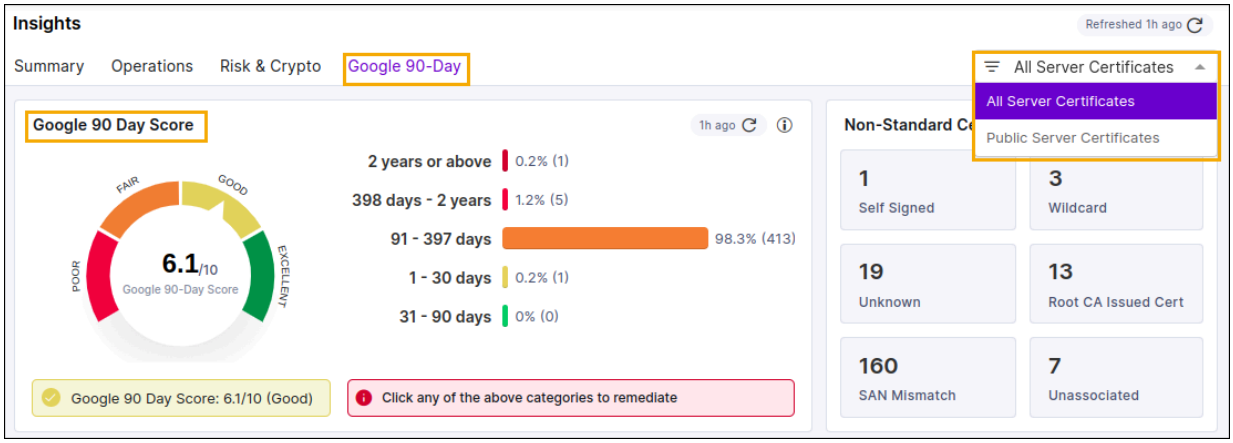
Showing Report For

The Google 90-day dashboard showcases two types of reports along with specific widgets:

- **All Server Certificates**: All Server Certificates refers to a category or group that includes all types of server certificates, regardless of their specific characteristics or attributes.

> **Note:** To access the report for the entire system, users must belong to the admin group with super access.

- **Public Server Certificates**: Certificates that have a trust chain consisting of a public root certificate and intermediate certificates are categorized as public certificates.



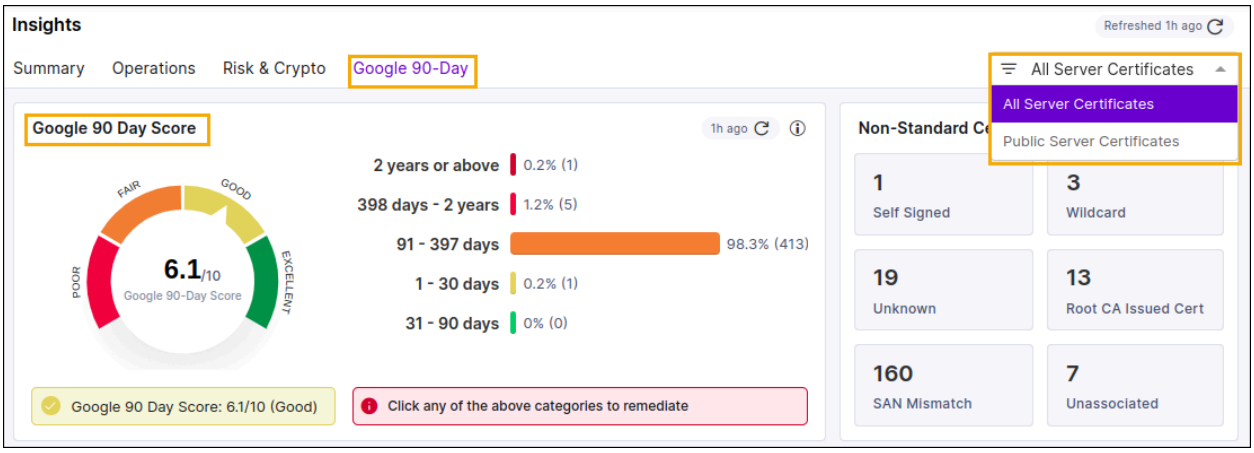
Google 90 Day Score

This report displays the score of certificate based on the certificate age and certificate count categorization on the single certificate validation time.

Certificate Age: This report presents the severity status of certificates. A certificate includes a created date and an expiry date, and the number of days between these dates is referred to as the certificate age. The terms Validity Period and Certificate Age share the same definition. Following are the status based on age limit:

- 2 years or above - CRITICAL
- 398 days - 2 years - HIGH
- 91 - 397 days - MEDIUM
- 1 - 30 days - LOW.
- 31 - 90 days - Good.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

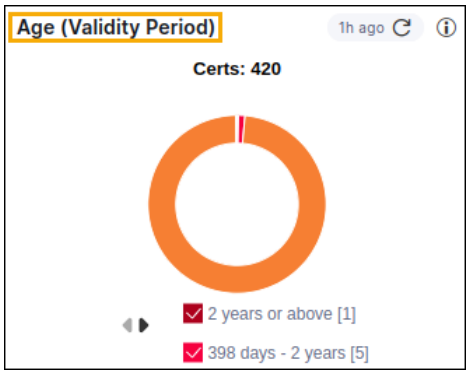


Certificates Count: The certificate count report displays the number of non-standard certificates. You can click on the count, which will redirect to the server certificate inventory.

Age (Validity Period)

The server certificates are grouped by validity in the Age (Validity Period) report, displays the different validity periods as shown on the image. The pie chart's colored sections represent the count and validity status of the certificates. You have the following options:

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the server certificate inventory.

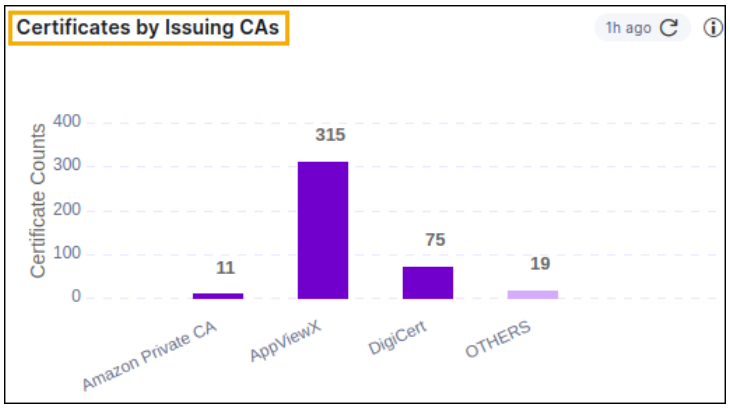


By Issuers

The server certificates are categorized by issuing vendors. The By Issuers report displays all the server certificates that are currently managed or monitored, excluding expired and revoked. You have the following options:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

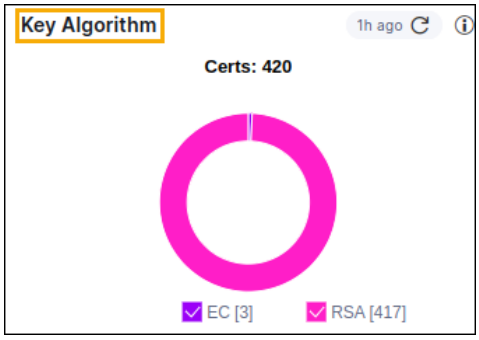
- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the server certificate inventory.



Key Algorithm

This report displays the count of server certificates by key algorithm. Different colored sections of the pie chart represent the count of server certificates based on the key algorithm. For instance, RSA (59), DSA (10), and so on. You have the following options:

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the server certificate inventory.

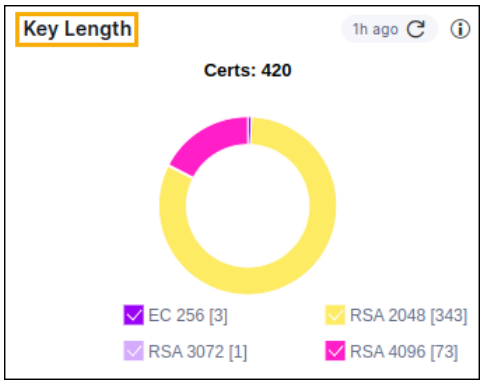


Key Length

This report displays the count of server certificates by key length. Different colored sections of the pie chart represent the count of server certificates based on the key length. For instance, RSA (59), DSA (10), and so on. You have the following options:

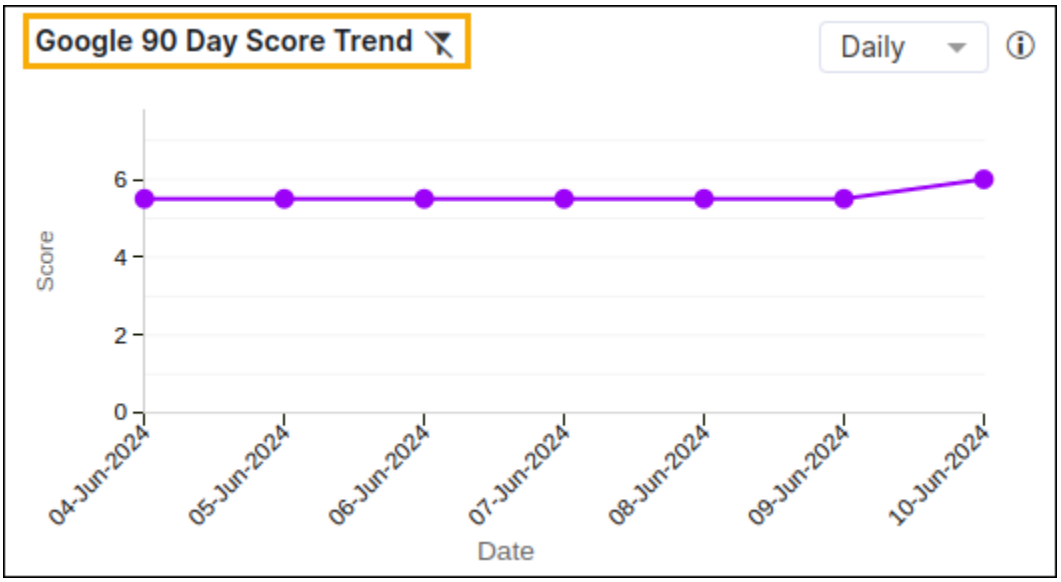
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Select the check-box to view the specific portion, excluding unselected items.
- Click on the pie chart to redirect to the server certificate inventory.



Google 90 Day Score Trend

Stated in the Google 90-day standard proposal, certificates are grouped based on their validity, and a score is calculated for each certificate. These scores are then aggregated to generate the Google 90-day score.



Non-Standard Certificates

Displays a report detailing the count of non-standard certificates in the following categories:

- Self-Signed
- Wildcard
- Unknown
- Root CA Issued Certificates

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

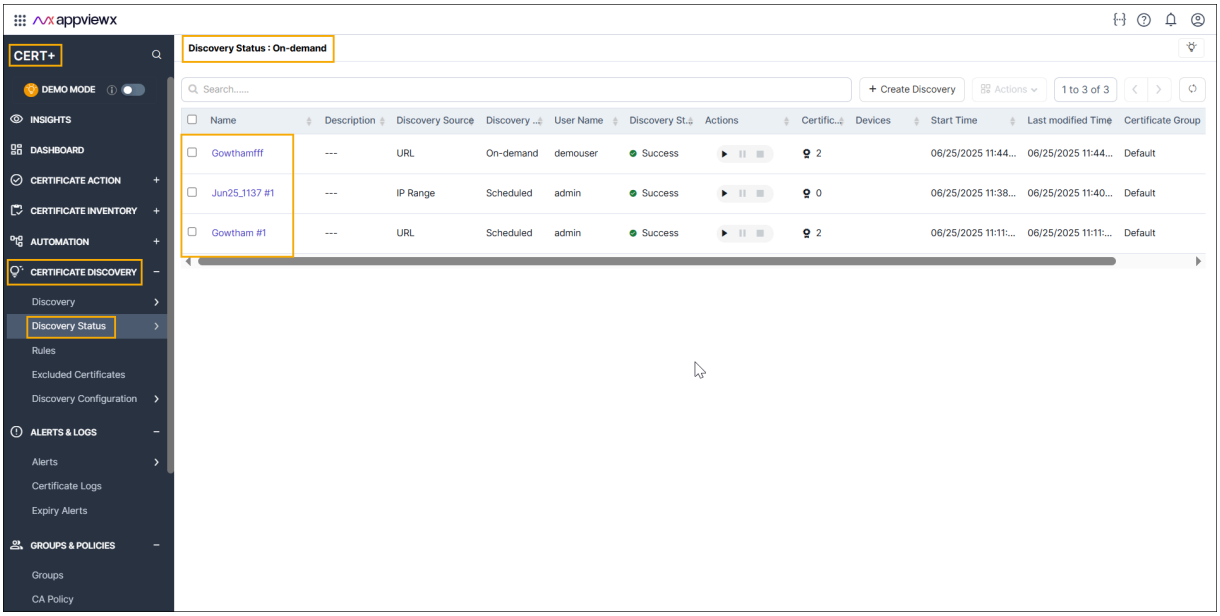
- SAN Mismatch
- Unassociated Certificates.

Threshold Limits

- For less than 100,000 certificates, live data will be displayed whenever the user navigates to the Insights page.
- For more than 100,000 certificates, a pre-calculated report will be shown with the last generated time indicated at the widget level.
- Users can click the widget level refresh to view the live data.

Accessing the Discovery Summary Dashboard

1. Go to (**Menu**) > **CERT+** > **Dashboard**.
   The dashboard home page is displayed.
2. To go to the Discovery Dashboard, from the top left corner of the screen, click Discovery URL.
   The **Dashboard** summary page is displayed.



- Understanding the Discovery Certificate Dashboard

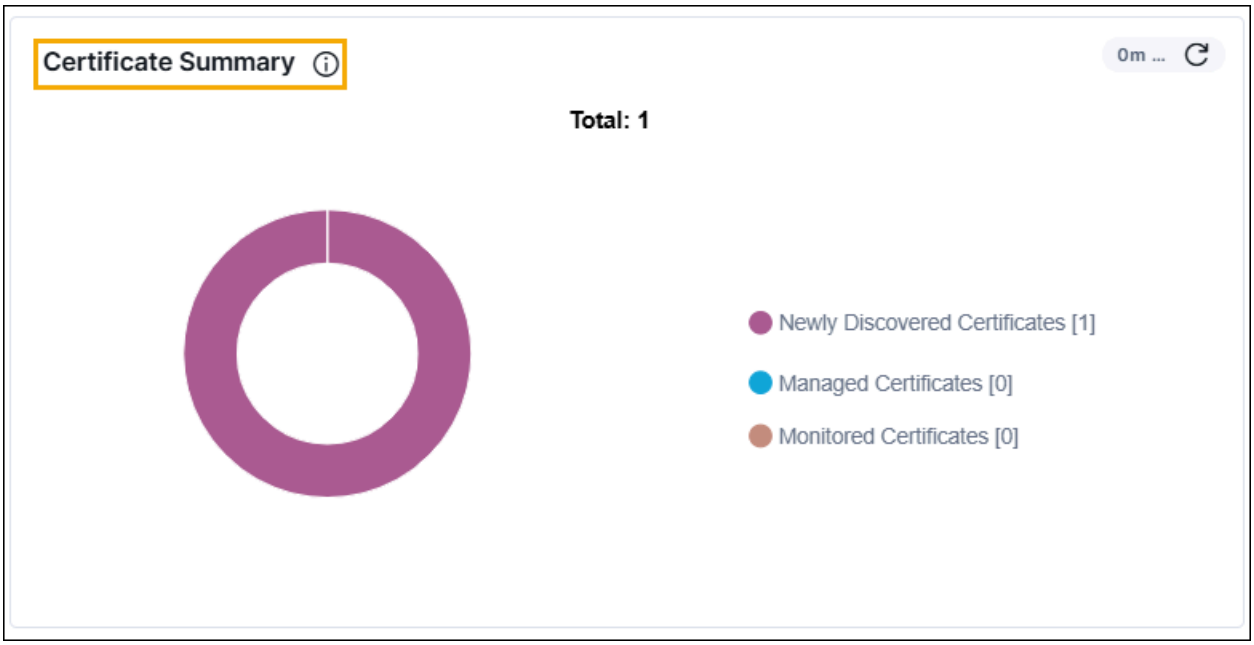
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Understanding the Discovery Certificate Dashboard

This dashboard displays reports related to the certificates from the certificate discovery. You can access this dashboard from the **Discovery Status** CERTIFICATE DISCOVERY page, by selecting **On Demand** option.

Certificate Summary

This widget provides a quick snapshot of the overall certificate landscape, highlighting the influx of new certificates and the proportion under active management or monitoring. A high number of newly discovered certificates may warrant further investigation.

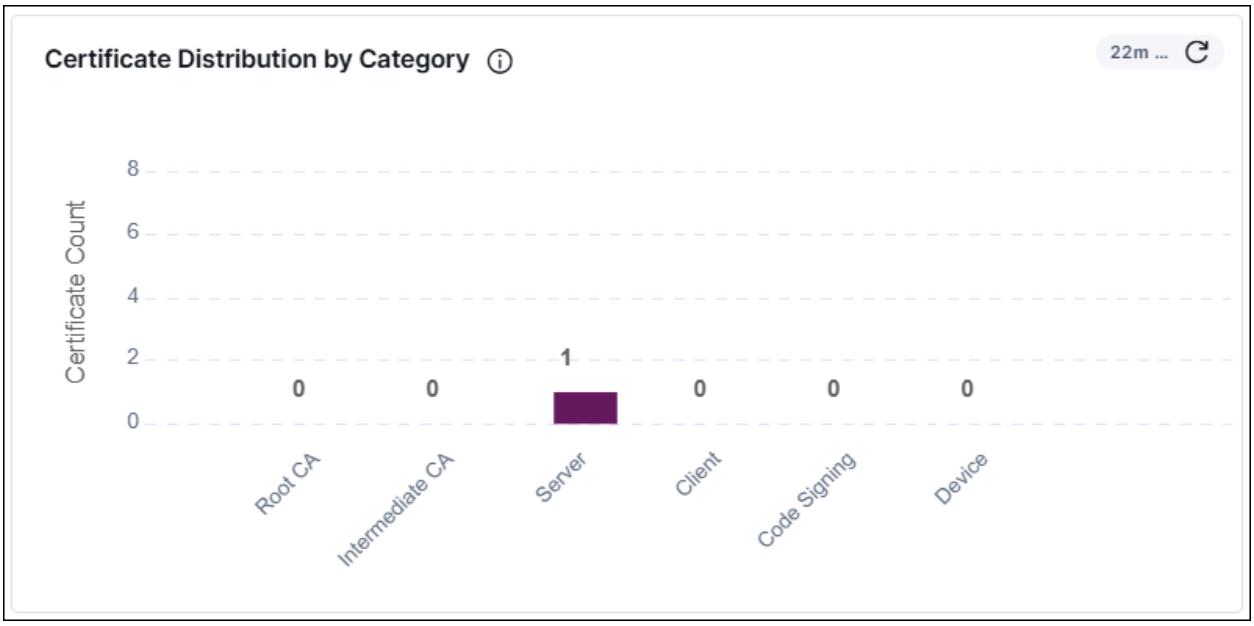


Certificate Distribution by Category

This widget helps you understand the distribution of certificate types, identifying their primary use within your environment and highlighting areas that may need focused management or stronger security policies. For example, a high number of server certificates may suggest a large web infrastructure.

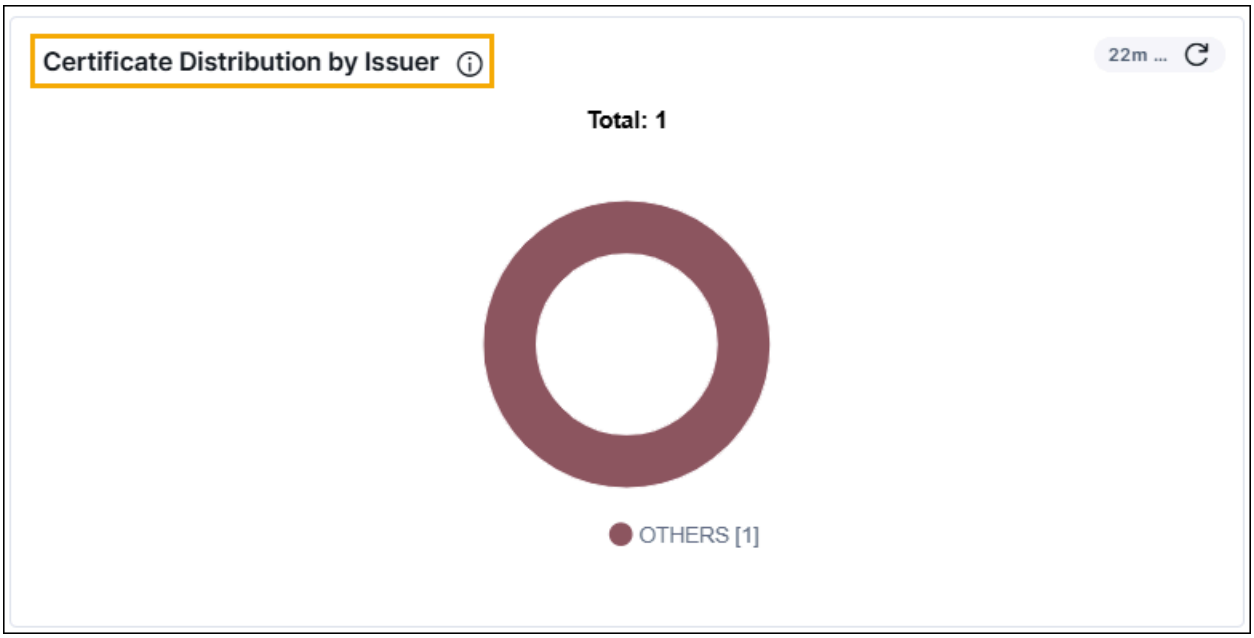
.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificate Distribution by Issuer

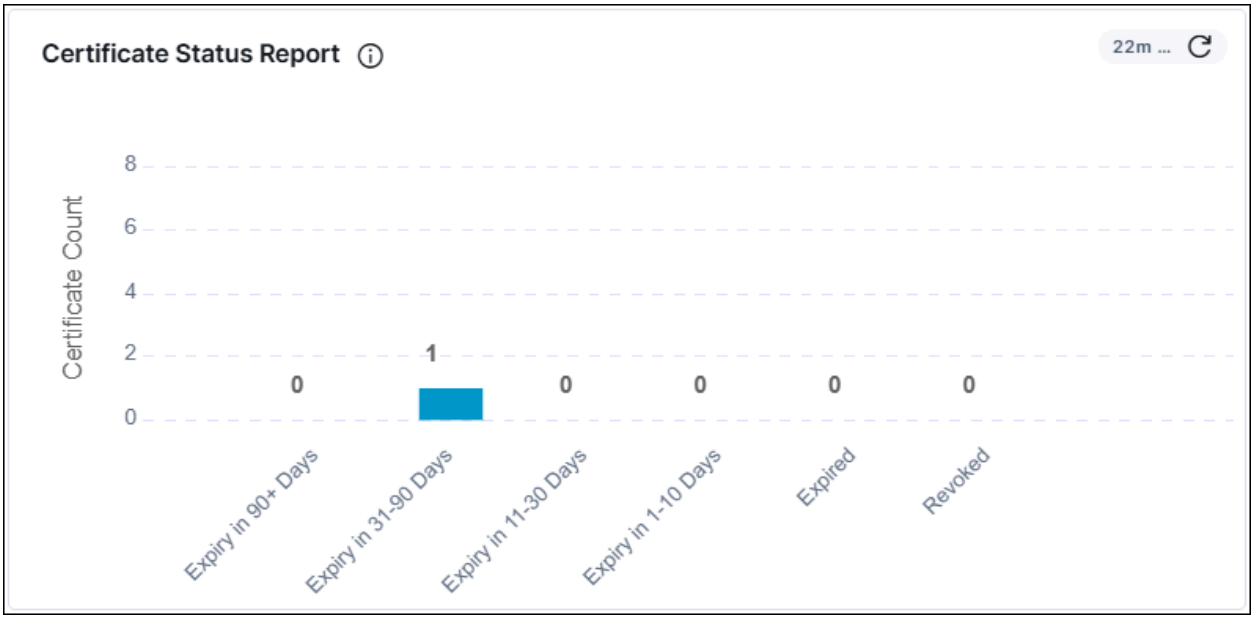
This widget provides insight into which entities issued your certificates—crucial for trust management and understanding dependencies on various certificate authorities. If specific issuers are identified, the chart visualizes the proportion of certificates issued by each. The current view indicates a need to investigate the issuers for improved visibility.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Status Report

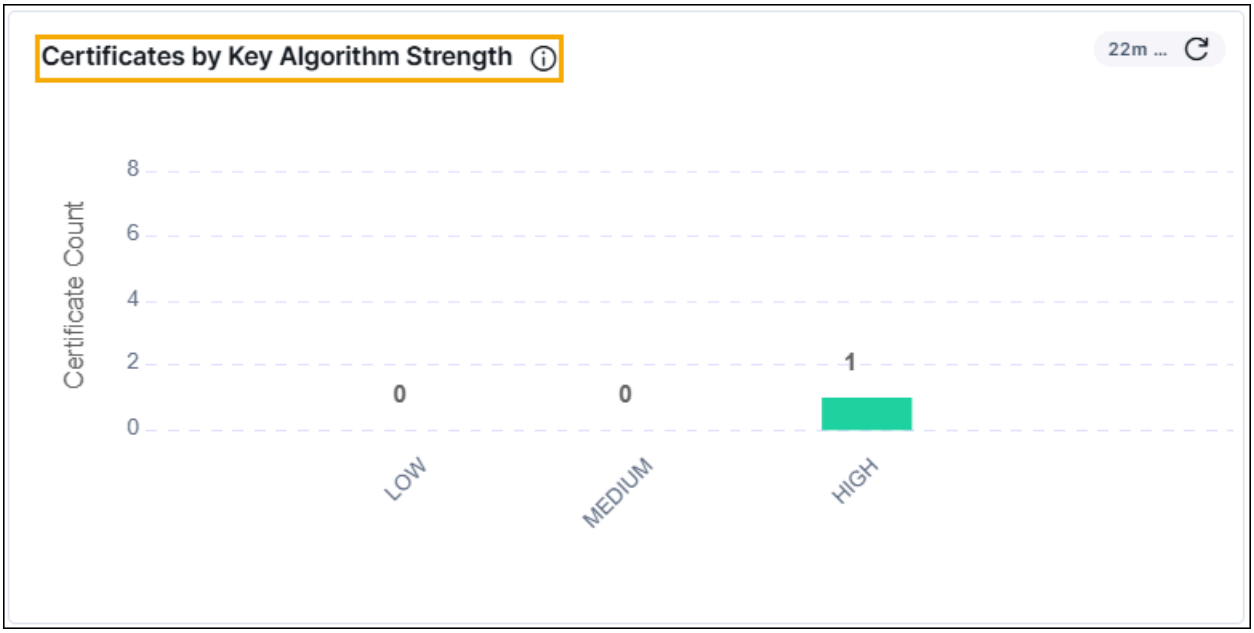
This widget is essential for proactive certificate management, helping you quickly identify certificates that are nearing expiry or already expired. It supports timely renewals to prevent service disruptions and security risks. Additionally, the count of revoked certificates may indicate potential security incidents or policy enforcement actions.



Certificates by Key Algorithm Strength

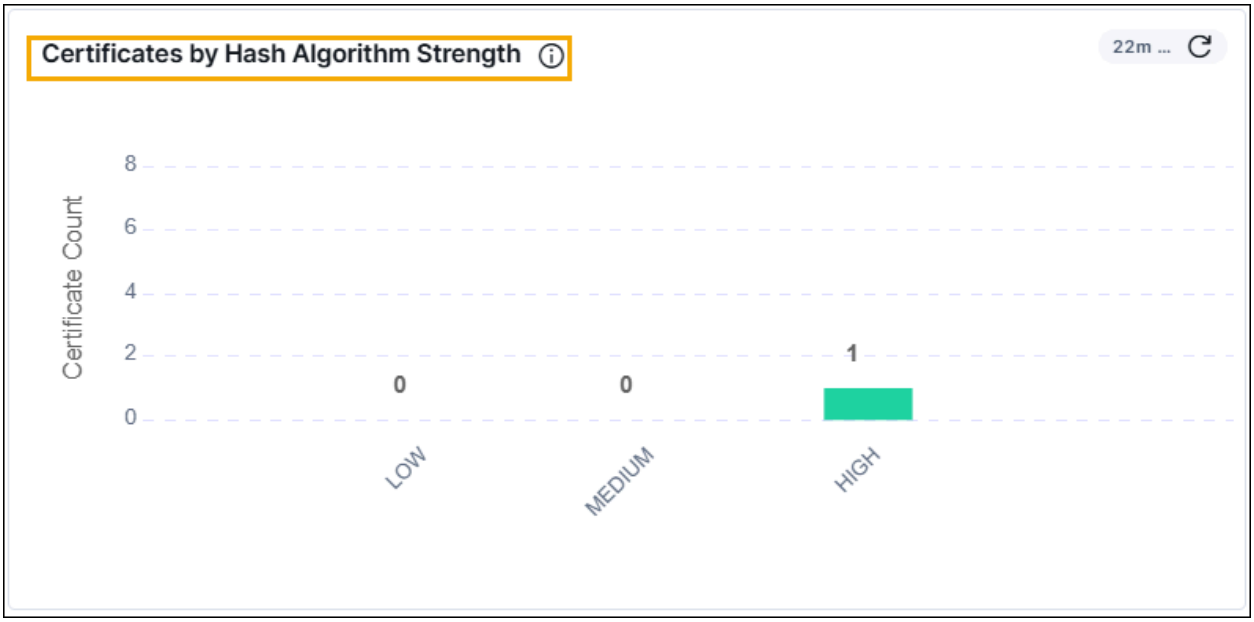
This widget helps assess the cryptographic strength of your certificates, offering insight into your overall security posture. A high number of certificates using low or medium strength algorithms may signal potential vulnerabilities and the need to upgrade to stronger algorithms. Ideally, most certificates should fall into the 'High' strength category.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Certificates by Hash Algorithm Strength

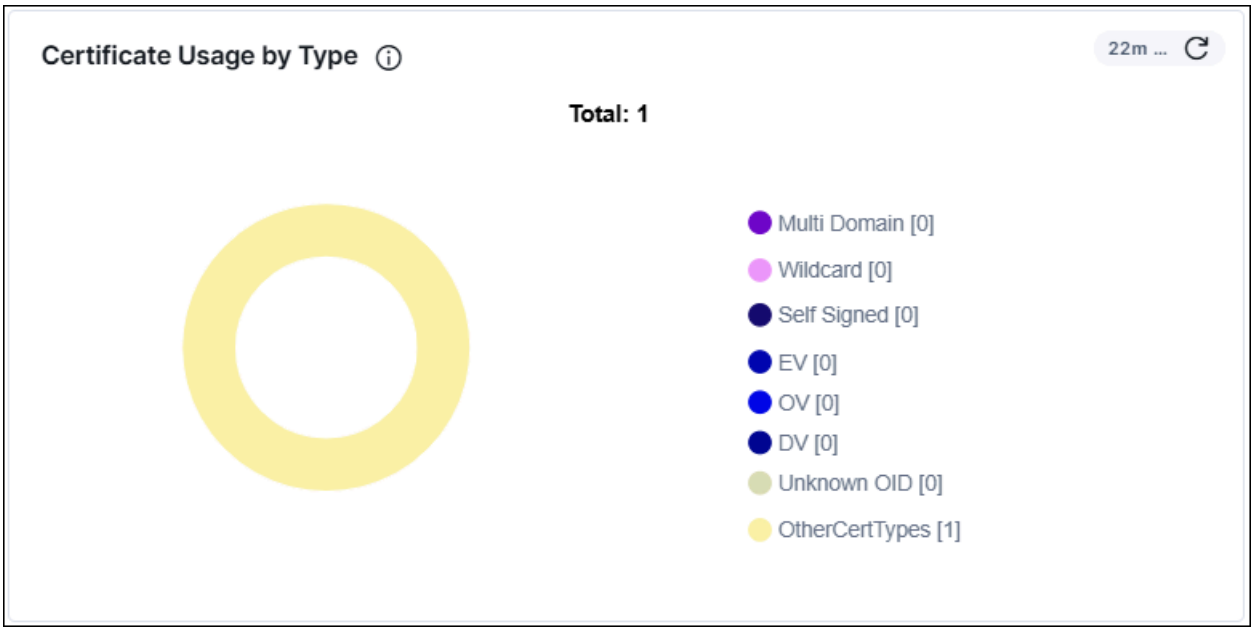
The hash algorithm ensures certificate integrity. Certificates using weak hash algorithms pose a security risk, as they can be more easily tampered with. This widget helps identify such certificates and prioritize their migration to stronger, more secure algorithms.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Type Distribution

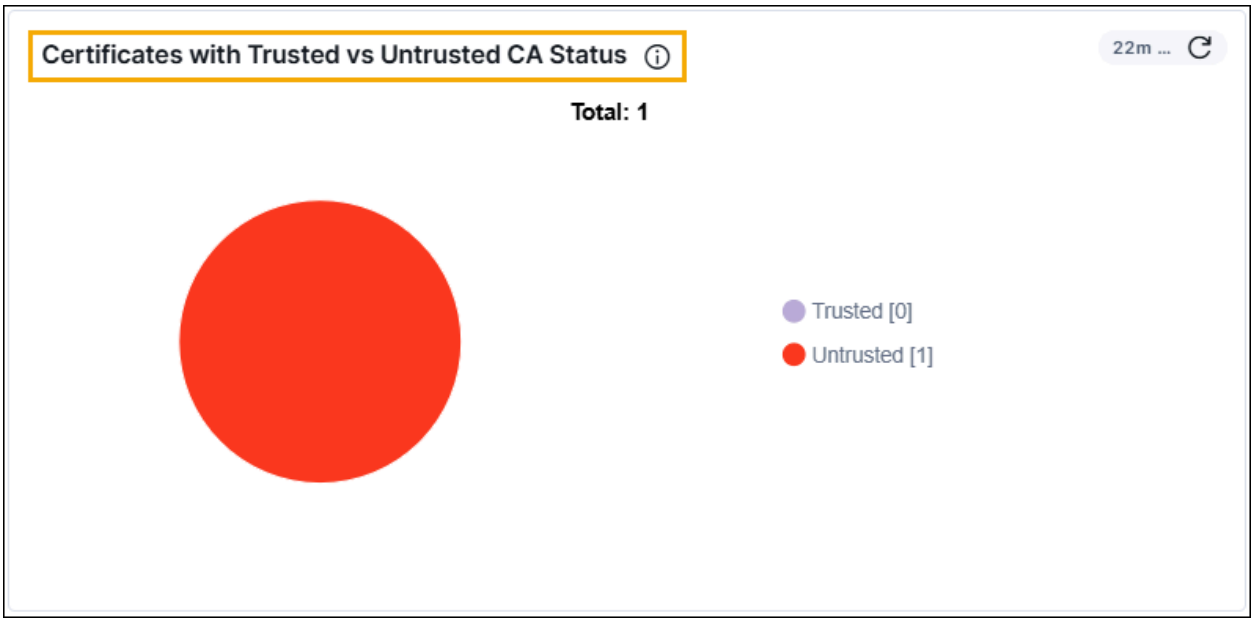
This widget helps understand dependency on various device or server vendors. This insight is valuable for vendor management, cost analysis, and aligning with organizational policies on infrastructure diversity or consolidation. It can also highlight potential single points of failure associated with specific vendors.



Certificates with Trusted vs Untrusted CA Status

This widget is crucial for assessing the trustworthiness and security of the certificate ecosystem. Ideally, the vast majority of certificates should be issued by trusted CAs. A high number of untrusted certificates may indicate security risks, misconfigurations, or the use of self-signed certificates where CA-signed ones are recommended. Investigating and addressing untrusted certificates is essential for maintaining a secure environment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



PQC Compliance Certificates

This widget highlights readiness for the post-quantum era, as current cryptographic algorithms may become vulnerable with advances in quantum computing. A high number of non-compliant certificates signals a potential future security risk, making long-term planning for migration to PQC-compliant algorithms essential. At present, with all certificates marked as non-compliant, this represents a key area to monitor and prepare for as PQC standards and implementations evolve.

Alerts and Logs

- Overview
- Certificate Alerts
- Configuring Expiry Alerts
- Configuring a Certificate Expiry Alert
- Configuring a Certificate Sync Alert
- Configuring a Certificate Validation Alert
- Configuring a Connection Failure Alert
- Configuring a CLM Action Failure Alert
- Certificate Logs
- Export Certificates Logs

Overview

CERT+ allows you to monitor the AppViewX component level and certificate-related alerts in a dashboard with predefined filters. Also, you can configure alerts based on your business needs. With these alerts, you can trigger an email with the necessary information. To run a custom logic based on the alert condition, you can configure it through a visual workflow in AppViewX. Alerts and logs help you to ensure the system performance is monitored.

You can view logs and receive certificate alerts through,

- Certificate Logs
- Certificate Alerts

Certificate Alerts

Certificate Alerts helps you with alerts that are related to certificates. You can configure these alerts based on certificate events such as sync, validation, or expiry. Any certificate-related actions performed in your application are captured as logs. Also, you can notify users of a specific certificate action through these alerts.

To verify certificate alerts,

1. Log in to AppViewX application with valid credentials.
2. Click the menu button located in the upper left corner of the screen.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

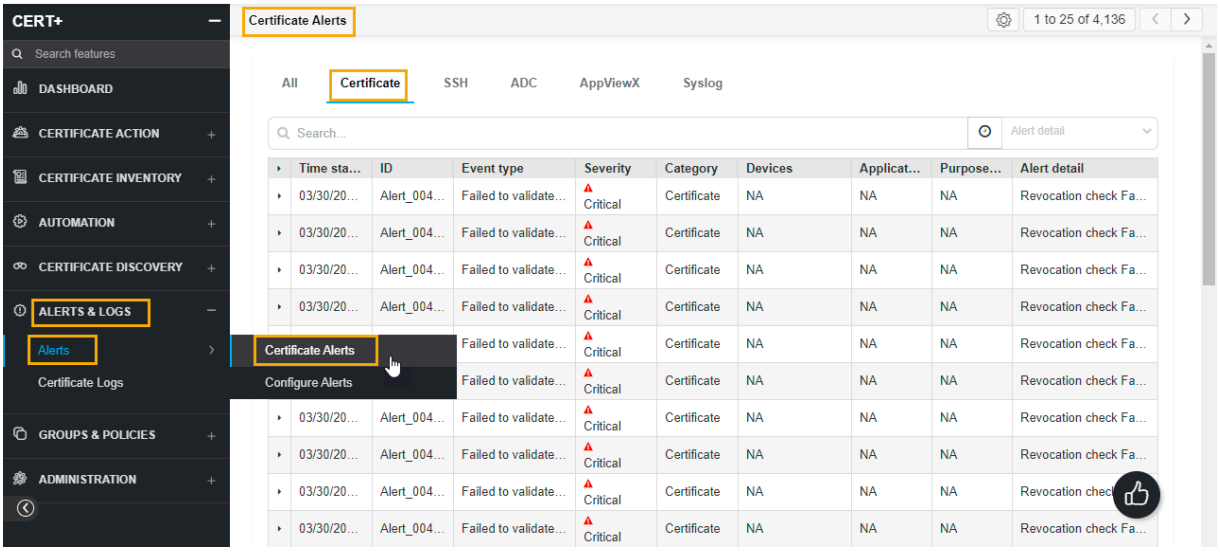
The left navigation pane appears.

3. Click **CERT+**.

   The **CERT+** left navigation pane appears.

4. Expand **ALERTS & LOGS**.
5. Click **Alerts**, and then select **Certificate Alerts**.

   The **Certificate Alerts** screen appears.



6. On the Certificate Alerts list view page, you can find the list of alerts related to the certificates. Any actions performed on the certificates are captured under this list view.
7. You can search for alerts based on the Alert ID, Alert Event type, Severity, Category, Devices, Applications, and Alert detail.
8. On the alert screen, view all details for a log by hovering your cursor over each column of data or click the (Expand) icon for the log you want to view. The table row expands to display all details for the log.

Configuring Expiry Alerts

Digital certificates are issued with a validity period predefined by the certificate authorities. When a certificate outgrows this validity period, it is no longer trusted and the services consuming the certificate are considered broken.

AppViewX lets you create certificate expiry alerts, which are proactive notifications to customers to renew the certificates that are due for expiry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The alerts are primarily created based on the period of certificate expiry (certificates expiring on a specific date, certificates expiring after x number of days, and so on). The emails also include a certificate renewal link, thus simplifying the CLM process.

The following sections list the prerequisites for configuring the expiry alerts and the configuration steps.

- Configuring Certificate Expiry Alerts over Email
- Configuring Certificate Expiry Alerts over ITSM
- Configuring Certificate Expiry Alerts using Custom Workflows
- Placeholders for Retrieving Certificate Details
- Disabling Expiry Alerts Manually

Configuring Certificate Expiry Alerts over Email

Before configuring certificate expiry alerts over emails, **ensure that permissions to create and modify the expiry alerts are assigned to the required role(s)**.

Note: Certificate renewal is allowed only for users having read and write permission to the certificate group. Ensure that you assign permissions accordingly.

1. To do this, follow the instructions given here and enable **Expiry Alerts** under **Authorized Functions** > **CERT+**.
2. Modify the resource mapped to this role to assign the following workflow requests (**Access Control** > **Workflow Requests**) to the resource:
   - **Cert_Expiry_Mail_Individual**
   - **Cert_Expiry_Mail_Bulk**

To configure certificate expiry alerts over email:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Expiry Alerts**.
   The expiry alerts inventory is displayed.
2. To create a new email expiry alert, click **+ Create**.
   The **Expiry Alert > Expiry Alert Add** page is displayed.

Tip: This page has a list of best practices you are advised to follow when creating a new expiry alert.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. For the new alert, enter a unique **Alert Name** (mandatory) and a description (optional) with additional details about the alert.
4. In the **Alert Configuration** section, click **+ Add**.
   The **Add Configuration** pane is displayed.
5. Select the **Certificate Type** for which you want to configure the expiry alert.
   - **End Certificate**
   - **CA Certificate**
6. Enter the **Filter Configuration** details.

Field descriptions for the Filter Configuration section

Field	Description
Certificate Expiry Period	To filter certificates based on their expiry: • **Range in days**: Sends an expiry alert email for certificates that will expire within the specified range of days from the current date For example, to set an alert for certificates that will expire between 10 and 40 days from the current calendar date, enter **10** and **40**. Alerts will be sent for all certificates expiring between 00:00:00 AM on the start day and 11:59:59 on the end day. • **On specified days**: Sends an expiry alert email for certificates that will expire on the nth day from the current date For example, to send an alert for certificates expiring on the 50th day from the current calendar date, enter **50**. Alerts will be sent for all certificates expiring between 00:00:00 AM and 11:59:59 PM of the specified day. • **Range in dates**: Sends an expiry alert email for all certificates expiring in a specific duration Use the calendar widget to select the **Start date** and **End date** for this duration. Alerts will be sent for all certificates expiring between 00:00:00 AM on the start date and 11:59:59 on the end date.
Additional Filters	To add a filter in addition to the certificate expiry period: a. Select the required filter from the **Select option** dropdown list. b. Enter the corresponding value in the **Type to enter value** field. c. Click **Add**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	The selected filter option and its value are displayed.
***Notification Method**	To send an expiry alert over email, select **Email**. **Note:** For instructions on sending an expiry alert over an ITSM tool (ServiceNow/JIRA), click here.
Individual Alerts : Allow certificate renewal	This field is displayed only when **Notification Method** = **Email**. To trigger individual emails for each certificate that matches the filter criteria along with a renewal and unsubscribe link for the certificate, enable this button.
Ignore renewed/ regenerate certificate	To stop alerts for certificates that have already been renewed or regenerated, enable this button.
Ignore Alerts if No Certificate Expirations	By default, this is enabled. Disabling this option will trigger alerts even if there are no certificate expirations to report.

7. Enter the **Email Configuration** details.

Field descriptions for the Email Configuration section

Field	Description
Template	From the dropdown list, according to the format and structure of the email content required, select an email template. This dropdown list is populated with predefined email templates that can be created and managed in the **Platform** module of the product. For instructions on creating a custom email template, click here.
To*	
Recipient(s)	Enter the recipient(s) email address. You can enter a maximum of 20 email addresses separated by a comma.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Certificate Parameter(s)	To add more recipients for the alert email, you can retrieve email addresses from the following certificate parameters: • Subject Email • SAN (rfc822) • Certificate Group From the dropdown list, select the required parameter(s).
Certificate Attribute(s)	To add more recipients for the alert email, you can retrieve email addresses from any certificate attribute that has the email ID as its value, for example, **Cert Owner**. From the dropdown list, select the certificate attribute.
CC	
Recipient(s)*	Enter the email address of stakeholders who are to receive a copy of the expiry alert email.
Certificate Parameter(s)	To add more recipients to the CC field in the alert email, you can retrieve email addresses from the following certificate parameters: • Subject Email • SAN (rfc822) • Certificate Group From the dropdown list, select the required parameter(s).
Certificate Attribute(s)	To add more recipients to the CC field in the alert email, you can retrieve email addresses from any certificate attribute that has the email ID as its value, for example, **Cert Owner**. From the dropdown list, select the certificate attribute.
Email Subject	
Subject*	Enter the subject line for the expiry alert email using the following (recommended) format: **Expiry Alert :: |Common Name| certificate| expiring on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Body*	Enter the body text for the email using the following (recommended) format:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Certificate with Common Name |Common Name| **Serial number |Serial Number|** **issued by |Issuer Common Name|** **is about to expire on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.

8. Click **Add**.

   The created alert is listed in the table below the **+ Create** button.

   Tip: To edit/delete an alert, use the **Edit**/**Delete** button, as required.

9. Under **Alert Execution Type**:

   Note: The settings configured here will be applicable to all expiry alerts listed in the above table.

   a. To configure a manual alert that will be triggered immediately, select **Run Now** and click **Save**.

      Note: Once an alert has been created, it's execution type cannot be modified.

   OR

   a. To trigger the alert at a scheduled time, select **Schedule** and enter the following details:
      - **Time Zone***
      - **Frequency** (daily/weekly/monthly/yearly)
      - **Starts On***
      - **Ends**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- For ends **ON**, use the calendar widget to select the date on which the last expiry alert email will be sent.
- For ends **After**, enter the number of **Occurrences** after which the expiry alert will be discontinued.

10. Click **Save**.

    Once the expiry alerts are configured with **Allow certificate renewal option**, the individual certificate renewal email will be sent to the stakeholders with two links:

    - Link for certificate renewal
    - Link for unsubscribing from the alerts for that specific certificate

> **Tip:** You can repeat steps **4** to **9** to add more than one **Alert Configuration** under a **Alert Name**.

11. To renew the certificate:

    a. Click the renewal link and login to AppViewX.

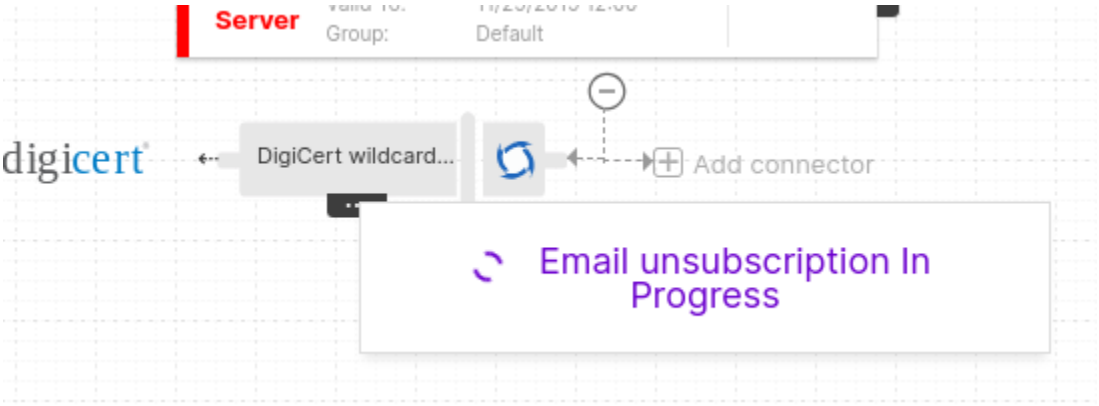
    You will be redirected to the holistic view for the certificate and the following renewal alert will be displayed:

    b. For instructions on how to renew a certificate, refer to the documentation for renewing a certificate.

To unsubscribe from the alerts for the certificate, click the unsubscribe link from the alert email.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

You will be redirected to the certificate inventory page and the following unsubscribe alert will be displayed:



• Use Cases for Configuring Expiry Alerts

Use Cases for Configuring Expiry Alerts

Use Case 1

Objective: Application owners want to configure alerts specific to their application.

Alert Criteria 1: Bulk notification

Alert Criteria 2: Individual certificate notification (recommended)

Configuring an Expiry Alert for Alert Criteria 1

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 1 configuration

Alert parameter	Value
Range in days	20 - 30
Filter	Certificate group < select the application group>
Notification Format	Attachment
To	< Recipient as application group email ID > Certificate group : <select the application group>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Alert parameter	Value
CC	<admin group email id>
Subject	Expiry Alert :: Certificates expiring in next 30 days
Body	Common Name, Serial Number, Valid From , Valid Until

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

Updated values for the alert criteria 1 configuration

Alert parameter	Value
Range in days	0 - 10
Subject	Expiry Alert :: Certificates Expiring in 10 days :: Critical
Alert execution type	Scheduled; everyday from the day of alert configuration

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Configuring an Expiry Alert for Alert Criteria 2

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 2 configuration

Alert parameter	Value
Range in days	20 - 30
Allow Users Renewal	Enabled
Filter	Certificate group < select the application group>
To	< Recipient as application group email ID > Certificate group : <select the application group>
CC	<admin group email id>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Alert parameter	Value
Subject	Expiry Alert :: |Common Name| certificate is expiring on |Valid Until|
Body	|Common Name| certificate is expiring on |Valid Until| issued by |Issuer Common Name|

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

   Updated values for the alert criteria 2 configuration

Alert parameter	Value
Range in days	0 - 10
Subject	Expiry Alert : Critical : |Common Name| certificate is expiring on | Valid Until|
Alert execution type	Scheduled; everyday from the day of alert configuration

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Use Case 2

Objective: The PKI team will receive the alerts and take remediation action, following up with the application owners. The PKI team will get a list of certificates expiring on the 30th day from the day of alert configuration and must then consult with the application owners. Reminders for certificates missing from remediation for 20 days should be part of a critical alert condition.

Alert Criteria 1: Bulk notification (recommended)

Alert Criteria 2: Individual certificate notification

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring an Expiry Alert for Alert Criteria 1

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 1 configuration

Alert parameter	Value
On specified days	30
Filter	Certificate group < select the application group>
Notification format	Attachment
To	< PKI Admin > Certificate group : <select the application group>
CC	<Certificate group>
Subject	Expiry Alert :: Certificates expiring in next 30 days
Body	Common Name, Serial Number, Valid from , Valid Until, Issuer Common Name

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

Updated values for the alert criteria 1 configuration

Alert parameter	Value
On specified days	10
Subject	Expiry Alert :: Certificates Expiring in 10 days :: Critical
Alert execution type	Scheduled; everyday from the day of alert configuration

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring an Expiry Alert for Alert Criteria 2

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 2 configuration

Alert parameter	Value
On specified days	30
Allow Users Renewal	Enabled
Filter	Certificate group < select the application group>
To	< Recipient PKI Admin > Certificate group : <select the application group>
CC	<Certificate group>
Subject	Expiry Alert :: |Common Name| certificate is expiring on |Valid Until| for the group |Certificate Group|
Body	|Common Name| certificate is expiring on |Valid Until| issued by |Issuer Common Name|

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

Updated values for the alert criteria 2 configuration

Alert parameter	Value
On specified days	10
Subject	Expiry Alert : Critical : |Common Name| certificate is expiring on |Valid Until| for the group | Certificate Group Name|
Alert execution type	Scheduled; everyday from the day of alert configuration

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Use Case 3

Objective: The administrator wants to send expiry alerts for certificates expiring in the next 30 days to all the application owners (who will take remedial action on their respective certificates). The administrator also wants to send a critical reminder to the application owners if an action has not been taken in the next 15 days.

Alert Criteria 1: Bulk notification

Alert Criteria 2: Individual certificate notification

Configuring an Expiry Alert for Alert Criteria 1

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 1 configuration

Alert parameter	Value
Range in days	0 - 30
Allow user Renewal	Enabled
To	Certificate group : <select the application group>
CC	<admin group email id>
Subject	Expiry Alert :: |Common Name| certificate is expiring on |Valid Until|
Body	|Common Name| certificate is expiring on |Valid Until| issued by |Issuer Common Name|
Alert execution type	Scheduled; everyday from the day of alert configuration

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Updated values for the alert criteria 1 configuration

Alert parameter	Value
Range in days	0 - 15
Subject	Expiry Alert :: Certificates not taken action for past 15 days :: Critical
Alert execution type	Scheduled; everyday from the day of alert configuration; ends after 15 days

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Configuring an Expiry Alert for Alert Criteria 2

1. Create an expiry alert using the alert configuration given in the table below.

Values for the alert criteria 2 configuration

Alert parameter	Value
Range in days	0 - 30
Notification Format	Attachment
To	Certificate group : <select the application group>
CC	<admin group email id>
Subject	Expiry Alert :: Certificates expiring in next 30 days
Body	Common Name, Serial Number, Valid From , Valid Until, Issuer Common Name
Alert execution type	Scheduled; everyday from the day of alert configuration; ends after 15 days

2. Click **Add**.
   The alert is added to the table in the **Alert Configuration** section.
3. Under **Alert Configuration**, click **Add**.
4. Use the alert parameters and values given in step 1 and only edit the parameters given in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Updated values for the alert critera 2 configuration

Alert parameter	Value
Range in days	0 - 15
Subject	Expiry Alert :: Certificates not taken action for past 15 days :: Critical
Alert execution type	Scheduled; everyday from the day of alert configuration; ends after 15 days

5. Click **Add**.
   The updated alert is also added to the table in the **Alert Configuration** section.

Configuring Certificate Expiry Alerts over ITSM

Prerequisites

Ensure that the ITSM tool you want to receive alerts on is integrated with AppViewX via tha Integration Hub. For instructions, you can refer to the documentation here.

Configuring Expiry Alerts over ITSM

Important: Expiry alerts over email can be configured for end certificates as well as CA certificates. Expiry alerts over ITSM channels can be configured only for end certificates.

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Expiry Alerts**.
   The expiry alerts inventory is displayed.
2. To create a new ITSM expiry alert, click **+ Create**.
   The **Expiry Alert > Expiry Alert Add** page is displayed.

   Tip: This page has a list of best practices you are advised to follow when creating a new expiry alert.

3. For the new alert, enter a unique **Alert Name** (mandatory) and a description (optional) with additional details about the alert.
4. In the **Alert Configuration** section, click **+ Add**.
   The **Add Configuration** pane is displayed.
5. From the **Certificate Type** field, select **End Certificate**.
6. Enter the **Filter Configuration** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field descriptions for the Filter Configuration section

Field	Description
Certificate Expiry Period	To filter certificates based on their expiry: • **Range in days**: Sends an expiry alert email for certificates that will expire within the specified range of days from the current date For example, to set an alert for certificates that will expire between 10 and 40 days from the current calendar date, enter **10** and **40**. Alerts will be sent for all certificates expiring between 00:00:00 AM on the start day and 11:59:59 on the end day. • **On specified days**: Sends an expiry alert email for certificates that will expire on the nth day from the current date For example, to send an alert for certificates expiring on the 50th day from the current calendar date, enter **50**. Alerts will be sent for all certificates expiring between 00:00:00 AM and 11:59:59 PM of the specified day. • **Range in dates**: Sends an expiry alert email for all certificates expiring in a specific duration Use the calendar widget to select the **Start date** and **End date** for this duration. Alerts will be sent for all certificates expiring between 00:00:00 AM on the start date and 11:59:59 on the end date.
Additional Filters	To add a filter in addition to the certificate expiry period: a. Select the required filter from the **Select option** dropdown list. b. Enter the corresponding value in the **Type to enter value** field. c. Click **Add**. The selected filter option and its value are displayed.
Notification Method	To send an expiry alert over ITSM, select **Others**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Ignore renewed/ regenerated certificate	When this field is enabled, results returned after the alert is triggered will not include certificates that have already been renewed or regenerated, even though they match the filter criteria.
***ITSM Tool**	This field is displayed only when **Notification Method** = **Others**.From the following options in the dropdown list, select an ITSM tool to raise a ticket for the alert: • **ServiceNow** • **JIRA**

7. To receive expiry alerts on **ServiceNow**:

   a. From the following options, select the **Configuration Type**:
   - **Basic**: Create a ticket by specifying the minimum details in the **Configuration** section.
   - **Advanced**: Based on the organization policy, fill the required values for a ticket using a JSON. In this case, a JSON editor will replace the **Configuration** section. The JSON is editable and can be customized as per requirement.

   b. From the following options, select the **Issue Type**:
   - **Incident** (Tickets will be listed on the **Incidents** page)
   - **Service Request** (Tickets will be listed on the **My requests** page)

   c. Enter the **Configuration** details.

Field description for Incident requests

Field	Description
Short Description*	Enter a title/short description for the ticket alert using the following (recommended) format: **Expiry Alert :: |Common Name| certificate| expiring on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Description*	Enter a detailed description of the incident event here (for example, certificate details and operation links) using the following (recommended) format:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Certificate with Common Name |Common Name| **Serial number |Serial Number|** **issued by |Issuer Common Name|** **is about to expire on |Valid Until|** The field will retain all line breaks as added. **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Urgency*	From the dropdown list, select the urgency level of the incident.
Impact*	From the dropdown list, select the impact level of the incident.
Assignment Group*	Enter the name of the group this incident will be assigned to.

Field description for Service Requests

Field	Description
Short Description*	Enter a title/short description for the ticket alert using the following (recommended) format: **Expiry Alert :: |Common Name| certificate| expiring on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Description*	Enter a detailed description of the incident event here (for example, certificate details and operation links) using the following (recommended) format: **Certificate with Common Name |Common Name|** **Serial number |Serial Number|**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	issued by |Issuer Common Name| **is about to expire on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Priority*	From the dropdown list, select the priority assigned to the incident.
Assigned to*	Enter the name of the user this incident will be assigned to.
Due Date*	Using the calendar widget, select a due date for the ticket.

d. Click **Validate**.

OR

To receive expiry alerts on **JIRA**:

a. From the following options, select the **Configuration Type**:
- **Basic**: Create a ticket by specifying the minimum details in the **Configuration** section.
- **Advanced**: Based on the organization policy, fill the required values for a ticket using a JSON. In this case, a JSON editor will replace the **Configuration** section. The JSON is editable and can be customized as per requirement.

b. Enter the **Configuration** details.

Field descriptions for the Configuration details

Field	Description
Project Id*	Enter the unique identifier of the project in JIRA under which the JIRA ticket will be created. **Note:** For instructions on how you can find the JIRA project ID, click here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Issue Type*	From the dropdown list, select the type of JIRA issue.
Summary*	Enter a title/short description for the JIRA ticket using the following (recommended) format: **Expiry Alert :: |Common Name| certificate| expiring on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Description	Enter additional details related to the ticket using the following (recommended) format: **Certificate with Common Name |Common Name|** **Serial number |Serial Number|** **issued by |Issuer Common Name|** **is about to expire on |Valid Until|** **Note:** • Specify the dates in the mm/dd/yyyy format. • The full list of placeholders and their corresponding values is given here.
Priority*	From the dropdown list, assign a priority to the ticket.
Reporter	Enter the name of the user who reported the issue. **Important:** For the JIRA server, only the AD user name (in the format **name.lastname**) is the accepted value for this field. Email ID or user name are **invalid** values.
Assignee*	Enter the name of the user to whom this JIRA ticket will be assigned.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Important: For the JIRA server, only the AD user name (in the format **name.lastname**) is the accepted value for this field. Email ID or user name are **invalid** values.

c. Click **Validate**.

8. Click **Add**.
   The created alert is listed in the table below the **+ Create** button.

> **Tip:** To edit/delete an alert, use the **Edit**/**Delete** button, as required.

9. Under **Alert Execution Type**:

> **Note:** The settings configured here will be applicable to all expiry alerts listed in the above table.

a. To configure a manual alert that will be triggered immediately, select **Run Now** and click **Save**.

OR

a. To trigger the alert at a scheduled time, select **Schedule** and enter the following details:
   - **Time Zone***
   - **Frequency** (daily/weekly/monthly/yearly)
   - **Starts On***
   - **Ends**
     - For ends **ON**, use the calendar widget to select the date on which the last expiry alert email will be sent.
     - For ends **After**, enter the number of **Occurrences** after which the expiry alert will be discontinued.

> **Note:** Once an alert has been created, it's execution type cannot be modified.

10. Click **Save**.
    Once the expiry alerts are configured with **Allow certificate renewal option**, the individual certificate renewal email will be sent to the stakeholders with two links:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Link for certificate renewal
- Link for unsubscribing from the alerts for that specific certificate

> **Tip:** You can repeat steps **4** to **9** to add more than one **Alert Configuration** under a **Alert Name**.

11. To renew the certificate:

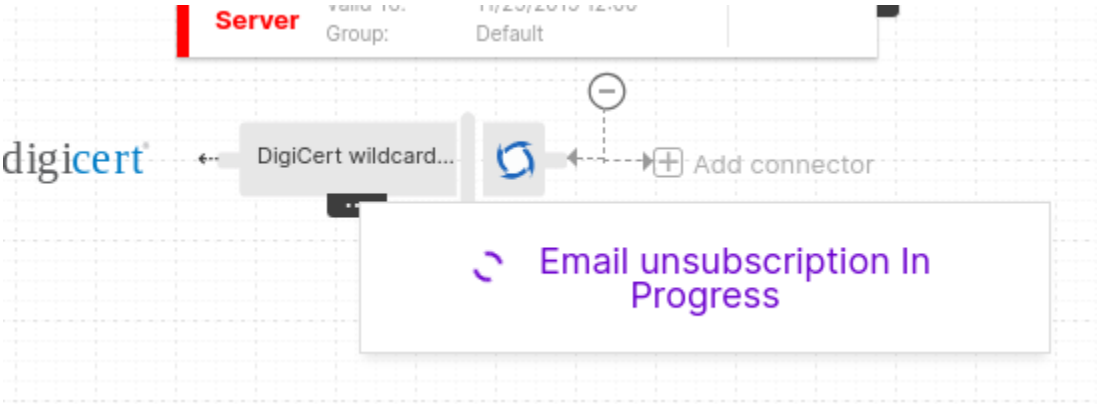
    a. Click on the renewal link and login to AppViewX.

    You will be redirected to the holistic view for the certificate and the following renewal alert will be displayed:

    b. For instructions on how to renew a certificate, refer to the documentation for renewing a certificate.

    To unsubscribe from the alerts for the certificate, click the unsubscribe link from the alert email.

    You will be redirected to the certificate inventory page and the following unsubscribe alert will be displayed:



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Certificate Expiry Alerts using Custom Workflows

You can create workflows with a customized configuration for the alert. Select the custom workflow at the time of creating the alert to bring it into effect.

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Expiry Alerts**.
   The **Expiry alert** inventory is displayed.
2. To create a new expiry alert using a custom workflow, click **+ Create**.
   The **Expiry Alert > Expiry Alert Add** page is displayed.

   Tip: This page has a list of best practices you are advised to follow when creating a new expiry alert.

3. For the new alert, enter a unique **Alert Name** (mandatory) and a description (optional) with additional details about the alert.
4. In the **Alert Configuration** section, click **+ Add**.
   The **Add Configuration** pane is displayed.
5. Select the **Certificate Type** for which you want to configure the expiry alert.
   - **End Certificate**
   - **CA Certificate**
6. Enter the **Filter Configuration** details.

Field descriptions for the Filter Configuration section

Field	Description
Certificate Expiry Period	To filter certificates based on their expiry: • **Range in days**: Sends an expiry alert email for certificates that will expire within the specified range of days from the current date For example, to set an alert for certificates that will expire between 10 and 40 days from the current calendar date, enter **10** and **40**. Alerts will be sent for all certificates expiring between 00:00:00 AM on the start day and 11:59:59 on the end day. • **On specified days**: Sends an expiry alert email for certificates that will expire on the nth day from the current date For example, to send an alert for certificates expiring on the 50th day from the current calendar date, enter **50**.

"applications" : "certAssociations.applications",
```

Disabling Expiry Alerts Manually

1. Go to the certificate inventory and click the common name of the certificate that you want to disable the alerts for.
2. Set the **Expiry Alert** field to **False**.

Configuring a Certificate Expiry Alert

Certificate expiry alerts are sent to designated recipients for all certificates that are set to expire on the date specified on the Settings: Certificate expiry alert screen.

To configure a certificate expiry alert:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Configure Alerts**.
   The **Configure Certificate Alerts** page is displayed.
2. Hover on **Alerts**, and then select **Configure Alerts**.
3. Enter a name for the certificate alert.
4. In the Event Type field, select Certificate Expiry Alert.
5. Select Critical as the severity of the alert.
6. Select the Certificate Category from the dropdown list.
7. In the Expires in (days) field, enter the number of days before a certificate expires. An alert will be sent out.
8. To use Email Configuration to send the alert, complete the following steps:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Select the Email Configuration checkbox.
- In the Email Address field, enter the email addresses you want to send the alert to. Use commas to separate the addresses.
- In the Subject field, leave the default text or enter the text that briefly describes the alert the user is receiving.

9. To use the Simple Network Management Protocol (SNMP) to send the alert, complete the following steps:
   - Enter the Destination IP for the alert.
   - Select the version of SNMP you want to use: V1 or V2.
   - Enter the port that should be used for the alert.
10. Enter the Community String for the alert. The string is similar to a user ID or password and allows users to access the requested information on the device.
11. Click Add to create the alert. It then appears at the bottom of the screen and on the Certificate tab within the Alert module.

Configuring a Certificate Sync Alert

AppViewX maintains a record of what certificate is mapped to which Server:Application service, which can be seen on the certificate's holistic view. This information is used by AppViewX to monitor continued existence of the certificate on Server:Application. AppViewX establishes connectivity to the Server and validates if the Application is still configured with the Certificate. Any change in the status is flagged out as a Certificate Sync Alert. This can also be visualized through the change of Application Connector status color. The Application Connectors on the Certificate's holistic view will turn Red in such circumstances.

To configure a certificate sync alert:

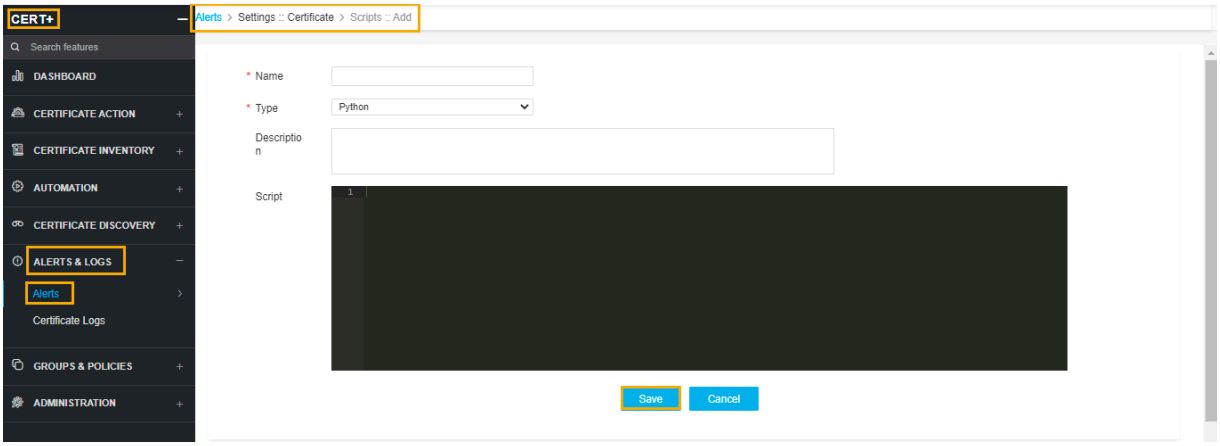
1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Configure Alerts**.
   The **Configure Certificate Alerts** page is displayed.
2. In the **Event Type** field, select Certificate Sync Alert.
3. Enter/Select the alert details.

Field	Description
***Alert name**	Enter a unique name for the alert.
***Event type**	From the dropdown list, select **Certificate Sync Alert**.
***Vendor**	From the dropdown list, select the vendor for the alert criteria.

4. Enter a name for the certificate alert.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Select the Alert severity of the alert: Critical, Major, and Notification.
6. In the Alert Message field, enter the text that users see when the alert appears on the screen.
7. Select the Vendor whose device or application you are creating an alert for.
8. Select the Certificate Category from the dropdown list.
9. In the Device Name field, select the device associated with the certificate you are creating an alert for.
10. In the Application field, select the application associated with the certificate you are creating an alert for.
11. Select the Execute Script checkbox.
12. In the Execute Script dropdown list, select the script to trigger the alert. To create a script, click the (Add new script) icon. The below page appears.



- Provide value in the Name field.
- Type by default is selected as Python.
- Provide description value in the Description field.
- Enter the script to be executed in the Script field and click **Save**.

13. To use the Email Configuration to send the alert, complete the following steps:
    - Select the Email Configuration checkbox.
    - In the Email Address field, enter email addresses to send the alert to. Use commas to separate the addresses.
    - In the Subject field, leave the default text or enter the text that briefly describes the alert the user is receiving.
14. To use the Simple Network Management Protocol (SNMP) to send the alert, complete the following steps:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Enter the Destination IP for the alert.
- Select the version of SNMP you want to use: V1 or V2.
- Enter the port that should be used for the alert.
- Enter the Community String for the alert. The string is similar to a user ID or password and allows users to access the requested information on the device.

15. Click Add to create the alert. It then appears at the bottom of the screen and on the Certificate tab within the Alert module.

Configuring a Certificate Validation Alert

AppViewX acts as a repository of all the known certificates in the organization. A certificate identifies a application via its Subject Common Name. In many a circumstance it observed that the organizations faces certificate related outages even if the certificate is valid. This is because of an error while setting up the application configuration or invalid certificate selected for the application. To identify such a misconfiguration AppViewX periodically validates the identity of application but trying and establishing connectivity to the Subject Common Name of server certificates in the Inventory. If the certificate is exchanged as part of SSL handshake is found to be invalid through expiry, revocation or through misconfiguration, AppViewX triggers a Certificate Validation Alert to notify administrators about a SSL handshake issue that users could be facing.

To configure a certificate validation alert:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Configure Alerts**.
   The **Configure Certificate Alerts** page is displayed.
2. In the **Event Type** field, select **Certificate Validation** Alert.
3. Enter a name for the certificate alert.
4. Select the severity of the alert: Critical, Major, or Notification.
5. In the Alert Message field, enter the text that users see when the alert appears on the screen.
6. Select the Vendor whose device or application you are creating an alert for.
7. Select the Certificate Category from the dropdown list.
8. In the Device Name field, select the device associated with the certificate you are creating an alert for.
9. In the Application field, select the application associated with the certificate you are creating an alert for.
10. To use the Email Configuration to send the alert, complete the following steps:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Select the Email Configuration checkbox.
- In the Email Address field, enter email addresses to send the alert to. Use commas to separate the addresses.
- In the Subject field, leave the default text or enter the text that briefly describes the alert the user is receiving.

11. To use the Simple Network Management Protocol (SNMP) to send the alert, complete the following steps:
    - Enter the Destination IP for the alert.
    - Select the **version** of SNMP you want to use: V1 or V2.
    - Enter the port that should be used for the alert.
    - Enter the Community String for the alert. The string is similar to a user ID or password and allows users to access the requested information on the device.
12. Click **Add** to create the alert. It then appears at the bottom of the screen and on the Certificate tab within the Alert module.

Configuring a Connection Failure Alert

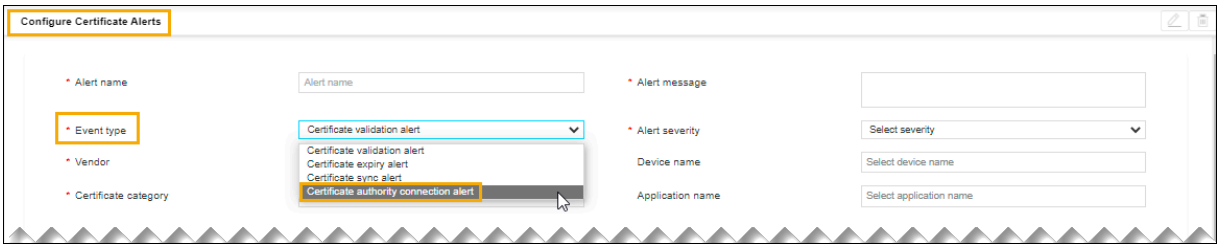
When a certificate is enrolled with AppViewX, a connection is established between the Certificate Authority (CA) signing the certificate. This connection is vital to perform CLM actions and certificate discovery tasks seamlessly.

When you can check manually if the connection is successfully established between AppViewX and certificate authority, and continues to stay so, starting version 2021.1.0, AppViewX allows you to configure automatic alerts when this connection fails. These alerts will be recorded in AppViewX logs as well as sent as email notifications.

To configure a connection failure alert:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Configure Alerts**.
   The **Configure Certificate Alerts** page is displayed.
2. Enter an **Alert name**.
3. From the **Event type** dropdown list, select **Certificate authority connection alert**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. From the **Certificate Authority Settings** dropdown list, select the CA Account
5. Set the **Alert severity** to critical.
6. To configure email alerts, in the **Email configuration** section, enter the **Email address** that will receive the email notifications in the event of a connection failure.
7. Enter the relevant subject in the **Subject** field.
8. To use the Simple Network Management Protocol (SNMP) for sending the alerts:
   a. Enter the **Destination IP** address for the alert.
   b. Select the SNMP **version** to be used.
   c. Enter the **Port** number to be used for the alert.
   d. Enter the **Community string** for the alert.

      The string is similar to a user ID or password and allows users to access the requested information on the device.
9. Click **Add** to create the alert.
   The new alert is now listed in the **Certificate Alerts** page.
10. Click **Reset** if you want to re-enter the details.

Configuring a CLM Action Failure Alert

A Certificate Lifecycle Management (CLM) action failure alert in certificate management is a notification generated when a CLM action fails. CLM involves managing digital certificates throughout their lifecycle, such as Enroll, Regenerate, Renewal, Revoke, Suspend, Reissue, and Reinstate.

When a CLM action fails, it means that a specific task related to certificate management did not complete successfully. These alerts inform administrators to investigate and resolve the problem, ensuring the

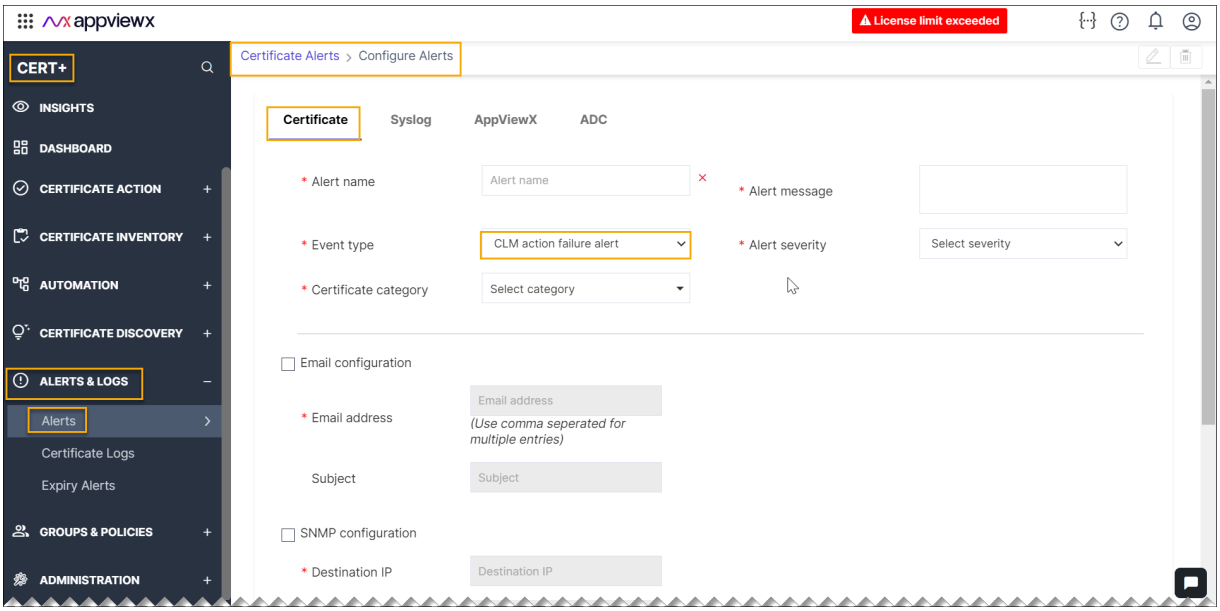
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

security and functionality of systems relying on digital certificates. This failure might happen due to various reasons, such as:

- **Network Issues**: Connectivity problems between the certificate authority (CA) and the requesting system.
- **Configuration Errors**: Incorrect settings or parameters within the certificate management system.
- **Authentication/Authorization Failures**: Issues with credentials or permissions required to perform the CLM action.
- **Expired Certificates**: Attempting to renew or use an expired certificate.
- **CA Service Problems**: Outages or issues with the CA providing the certificates.
- **Policy Violations**: Actions that do not comply with the defined security policies or certificate policies.

To configure a CLM action failure alert:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Alerts** > **Certificate Alerts**.
   The **Certificate Alerts** page is displayed.
2. Click the (⚙) **Settings** icon.
   The **Configure Alerts** page is displayed.
3. Enter an **Alert name**.
4. From the **Event type** dropdown list, select **CLM action failure alert**.



5. From the **Certificate category** dropdown list, select the type of certificate.
6. In the **Alert message** field, enter the additional information.
7. Set the **Alert severity** as required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. To configure email alerts, in the **Email configuration** section, enter the valid **Email address** that will receive the email notifications in the event of a connection failure.
9. Enter the relevant subject in the **Subject** field.
10. To use the Simple Network Management Protocol (SNMP) for sending the alerts:
    a. Enter the **Destination IP** address for the alert.
    b. Select the SNMP **Version** to be used.
    c. Enter the **Port** number to be used for the alert.
    d. Enter the **Community string** for the alert.

       The string is similar to a user ID or password and allows users to access the requested information on the device.
11. Click the **Add** button to create the alert.
    The new alert is now listed in the **Certificate Alerts** page, and below in the same **Configure Alerts** page.
12. Click **Reset**, if you want to re-enter the details.
13. Click **Cancel**, if you want to close **Configure Alerts** page and return to **Certificate Alerts** page.

Modifying the Configured CLM Action Failure Alerts

To ensure effective monitoring and timely resolution of issues in certificate management, you can modify the configured CLM (Certificate Lifecycle Management) action failure alerts.

To modify a CLM action failure alert:

1. In the **Configure Alerts** page > failure alerts list in bottom of page, click the check-box that the configured failure alert to be modified.
2. Once the check-box is selected, the **(** **) Modify** icon and **(** **) Delete** icon appears on the right-top of the page.
3. Click the **(** **) Modify** icon.
   The configure alerts page appears with existing information.
4. Enter the re-select/enter the required details in the fields.
5. Click **Update**.
   The pop-up appears as **Updated Successfully**.
6. Click **Cancel**, if you want to close **Configure Alerts** page and return to **Certificate Alerts** page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Deleting the Configured CLM Action Failure Alerts

You can delete the configured CLM action failure alerts from the certificate alerts list.

To delete a CLM action failure alert:

1. In the **Configure Alerts** page > failure alerts list in bottom of page, click the check-box that the configured failure alert to be modified.
2. Once the check-box is selected, the **(** **) Modify** icon and **(** **) Delete** icon appears on the rig- top of the page.
3. Click the **(** **) Delete** icon.
   The Confirmation window is displayed with message as **Do you want to delete certificate alert?**
4. Click **Yes**.
   The pop-up message appears as **Deleted Successfully**
5. Click **No**, if you want to return to **Configure Alerts** page.

Certificate Logs

Logs keep track of all activities that take place within AppViewX or any external entity that is connected to the AppViewX system. The Logging functionality in AppViewX tracks user activities and creates the device and object-level event logs. Certificate Logs helps you with logs that are related to certificates. Any system or certificate-related actions performed in the application are captured as logs. With these logs, you can check the system performance and it helps you with audit purposes to meet industry standards.

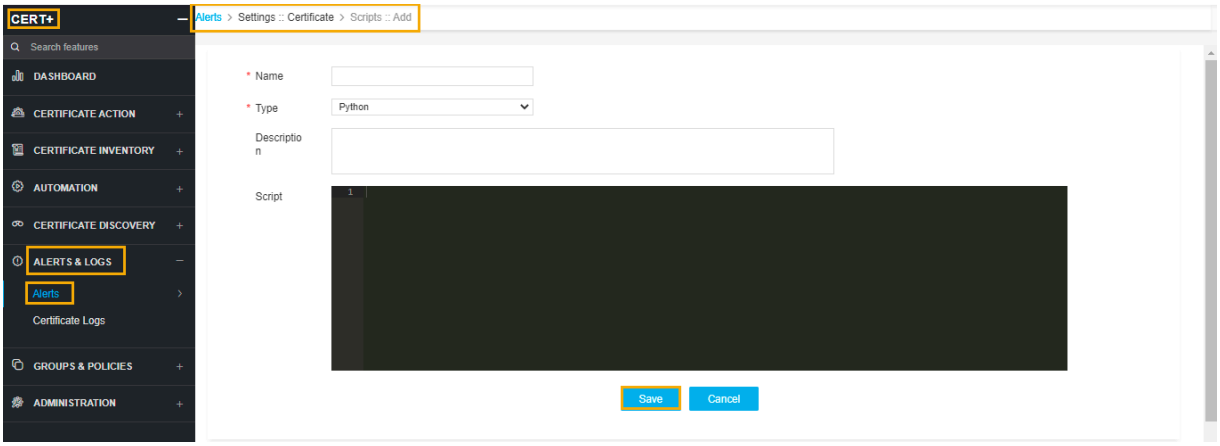
To check logs,

1. Log in to AppViewX application with valid credentials.
2. Click the menu button located in the upper left corner of the screen.

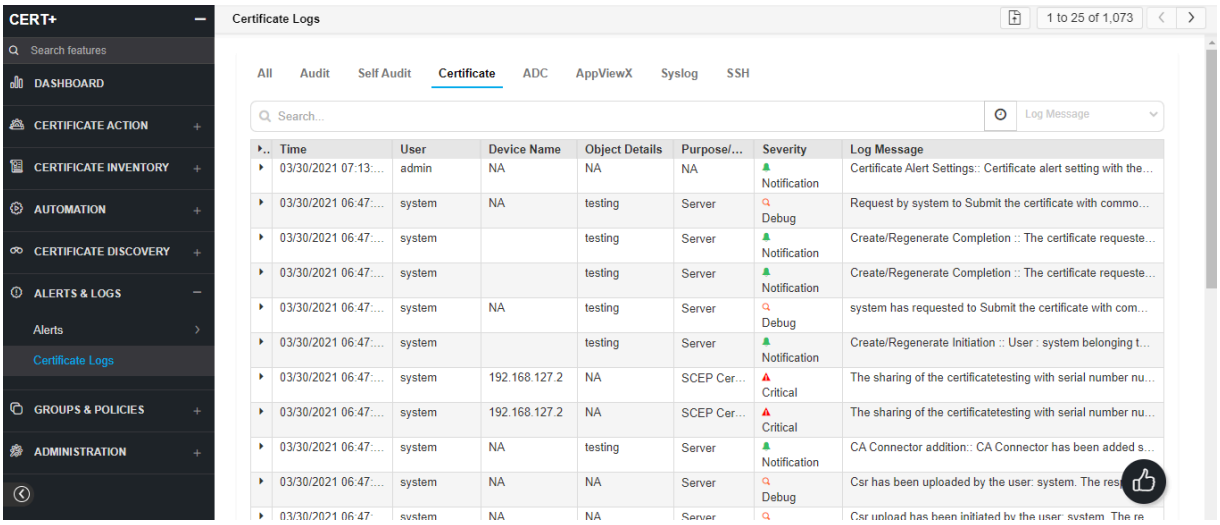
   The left navigation pane appears.
3. Click **CERT+**.

   The CERT+ left navigation pane appears.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Under the section Alerts & Logs, select Certificate Logs.



5. On the Certificate logs list view page, you can find the list of logs related to the certificates. Any actions performed on the certificates are captured under this list view.
6. You can search for logs based on the time, user, device name, object details, and severity.
7. You can also filter logs based on the date and time and through the Log Message filter.
8. On the log screen, view all details for a log by hovering your cursor over each column of data or click the (Expand) icon for the log you want to view. The table row expands to display all details for the log.

Export Certificates Logs

When exporting logs in AppViewX, you can export all of the logs of a given type-for example, all Configure files or all Audit files-or you can search for specific logs or filter the default log list using the Date Range and Log Detail fields and then export only the logs that remain.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To export a logging report:

1. Go to (**Menu**) > **CERT+** > **ALERTS & LOGS** > **Certificate Logs**.
   The **Certificate Logs** page is displayed.
2. At the top of the Logging screen, click the tab for the type of logs you want to export: Certificate (in this case).
3. (Optional) Run a search for specific logs or filter the default list using the Date Range and/or Log Detail fields in the Search bar.
4. Click the export button in the Command bar in the top-right corner of the page.
5. The log report is then downloaded as a tar.gz file.

Managing Certificates Using Automation Workflows

AppViewX's predefined Out of the Box (OOB) workflows for CERT+ will assist you in self-servicing workflows for the certificate expiry notification, certificate enrollment, and certificate renewal. These workflows automate tasks like the intimation of expiry of certificates, generating reports of expiry of orphan certificates, updating certificate attributes, enrolling new certificates based on different input methods (manual, policy based, CSR), renewing and regenerating certificates, pushing certificates to devices, and incident automation with ServiceNow and JIRA.

The OOB tasks, available in the Workflow Studio, can be used to design workflows for certificate expiry notification, enrolling certificates, and renewing certificates as per your requirements.

- Getting Started
- Certificate Expiry Workflows
- Certificate Enrollment Workflows
- Renew Certificate Workflows
- Automation Workflow Tasks
- Designing a Custom Workflow using OOB Tasks
- Scheduling an OOB workflow
- Customizing an OOB Workflow

Getting Started

- Prerequisites
- Role-Based Access Control

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

• Accessing CERT+ Automation Workflows
• Accessing CERT Automation Work flow Tasks

Prerequisites

The following table describes the web browser requirements to create and execute workflows as well as tasks.

Web Browser Requirement

Browsers	Version
Internet Explorer	v11.0.9600.18817 or later
Firefox	V74.0.1 (64-bit) or later
Google Chrome	V85.0.4183.83 (64-bit) or later

Role-Based Access Control

With role-based access control (RBAC), you can assign permissions to users for accessing the module and allow/restrict them to perform certain actions. You can refer to this link and find out more about RBAC.

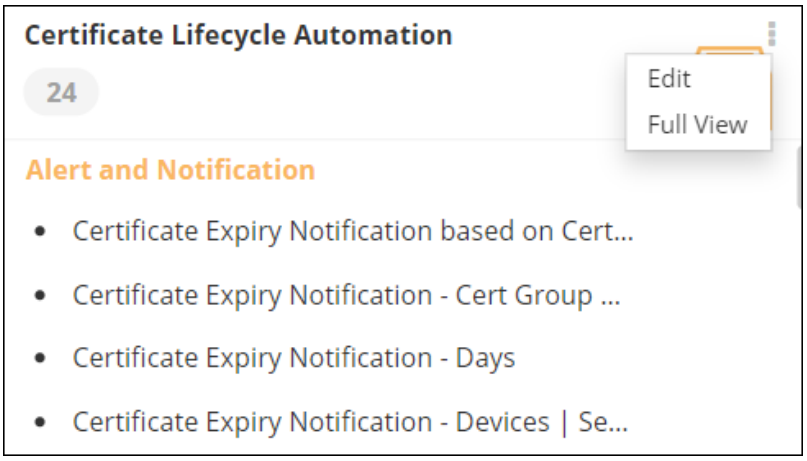
Accessing CERT+ Automation Workflows

You can access the CERT+ Automation workflows, available on the **Request :: View/Run** page, in the following ways:

- In the **CERT+** module, navigate to **AUTOMATION** > **My Workflows** > **View/Run**
- In the **Automation** module, navigate to **SERVICE REQUESTS** > **View/Run**

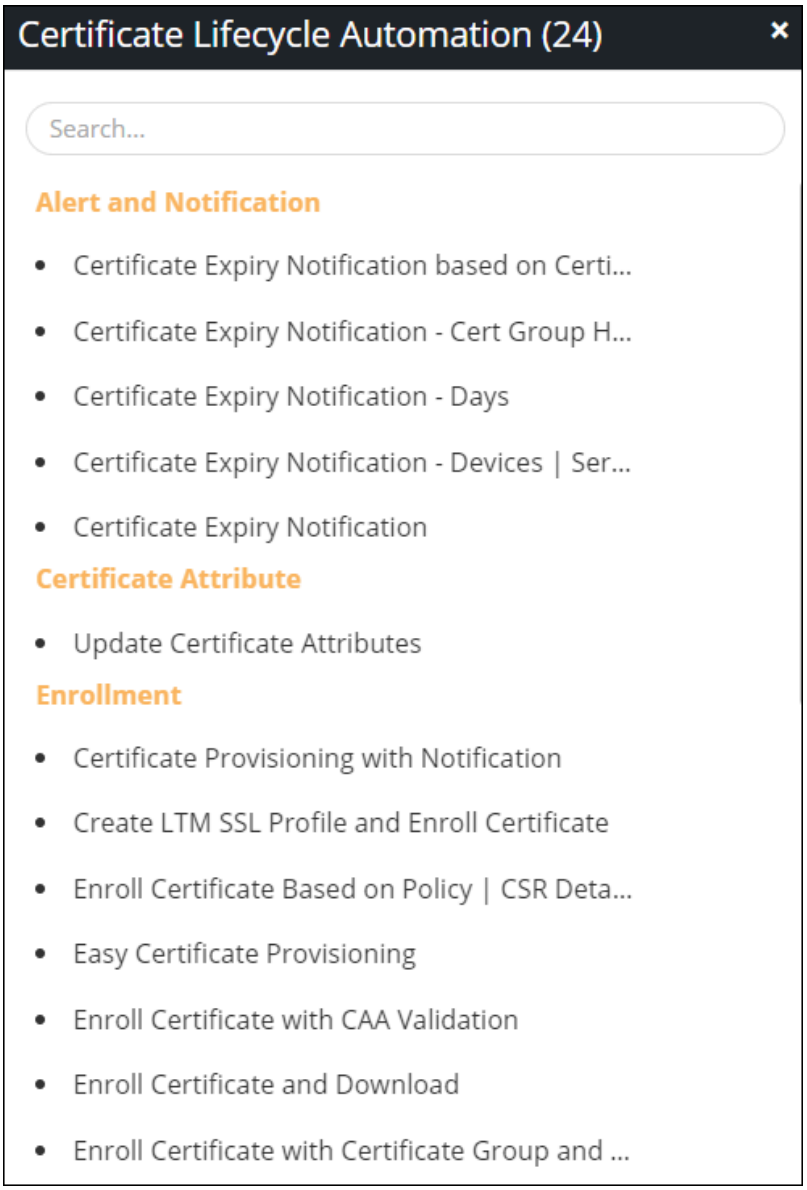
1. On the **Request :: View/Run** page, from the top right corner of the **Certificate Lifecycle Automation** catalog, click .
2. From the options displayed, select **Full View**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



The CERT+ Automation workflows are displayed in the **Certificate Lifecycle Automation** window.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Tip: You can also search for a workflow on the **Catalog** page by typing the keyword(s) in the search bar.

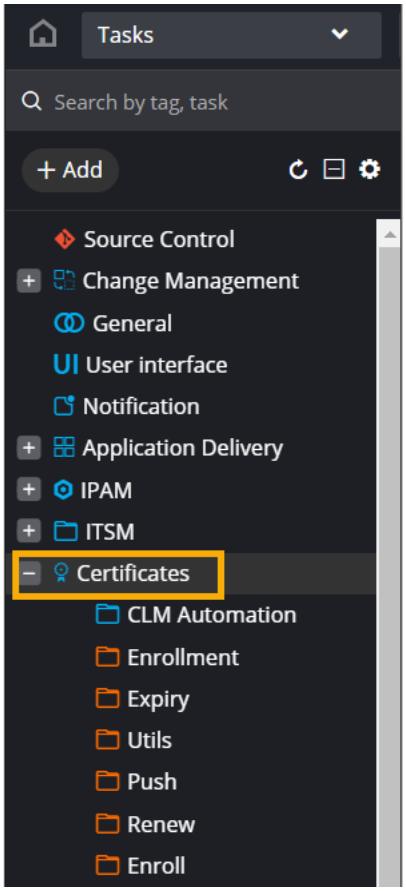
Accessing CERT Automation Work flow Tasks

The CERT+ Automation workflow tasks enable you to design your own custom workflows. These are available in the **Automation** module.

To view these tasks:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. In the **Automation** module, navigate to the **Workflow** page and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.
3. To access the OOB workflow tasks, from the left menu, expand **Certificates**.



The following categories of tasks are available in this folder:

- Enrollment - Lists all the OOB tasks for enrolling certificates from configured CAs.
- Expiry - Lists the Get Expiry Certificates task.
- Renew - Lists the Renew and Regenerate tasks.
- Push - Lists all the OOB tasks for pushing certificates to devices and servers.

Note: For more information on how to design a custom workflow using these OOB tasks, click here.

Certificate Expiry Workflows

- Overview
- Certificate Expiry Notification based on Certificate Attributes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

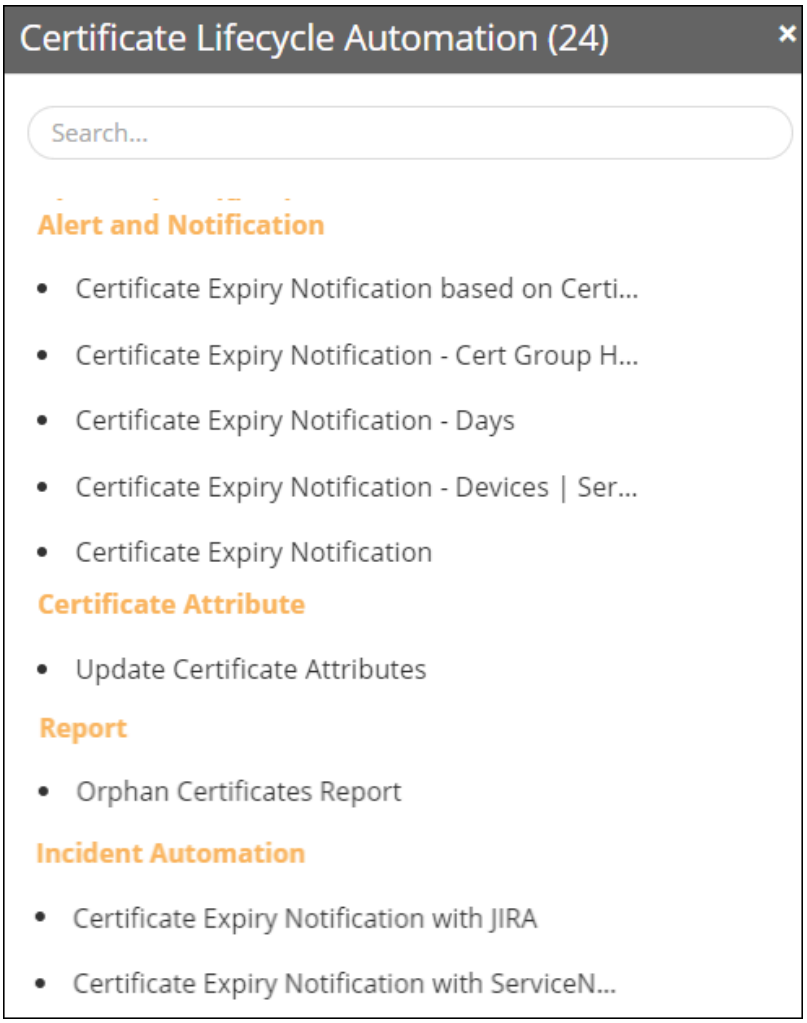
- Certificate Expiry Notification - Cert Group Hierarchy
- Certificate Expiry Notification - Days
- Certificate Expiry Notification - Devices | Servers
- Certificate Expiry Notification
- Update Certificate Attributes
- Certificate Expiry Notification with JIRA
- Certificate Expiry Notification with ServiceNow
- Orphan Certificates Report

Overview

This section lists and describes the workflows that can be used to notify the user(s) about the expiry of the certificates based on different criteria such as certificate attributes, expiry period, hierarchy, and so on. Some workflows also allow you to create tickets for expiring certificates on Jira/ServiceNow, update certificate attributes, and generate an orphan certificates report.

These workflows are available in the **Certificate Lifecycle Automation** catalog under four categories.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



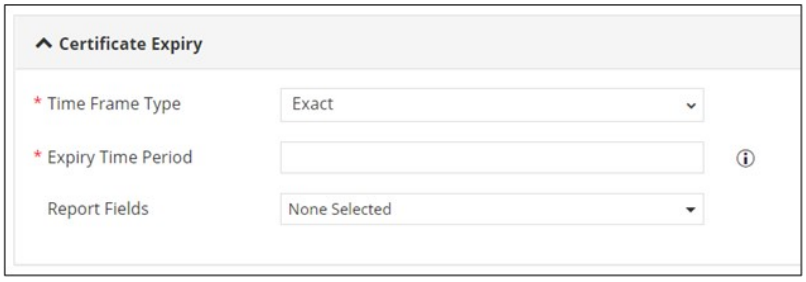
Certificate Expiry Notification based on Certificate Attributes

This workflow allows you to send an email notification listing certificates expiring in a specific number of days with selected certificate attribute details displayed in the email.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Certificate Expiry Notification based on Certificate Attributes** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Certificate Expiry** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

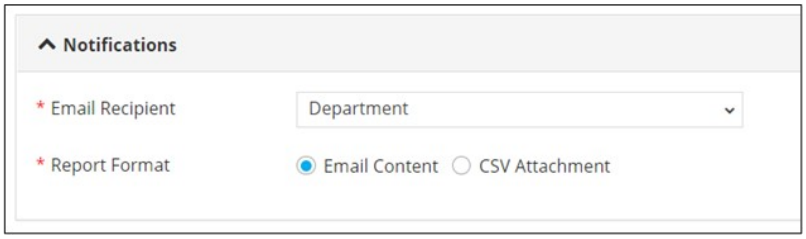


Field Description for Certificate Expiry section:

Field	Description
***Time Frame Type**	Enter the time frame type from the available options: • **Exact**: The system generates a report of certificates that expire on exactly the number of days as mentioned in the expiry time period starting from today. For example, if you mention 30 in the Expiry Time period on the 1st day of the month, the report will contain details of certificates expiring on the 30th day of the month. • **Range**: The system generates a report of certificates that expire within a range of days as mentioned in expiry time period. For example, if the range is mentioned as 30-60 on the 1st day of the month, the system generates a report of certificates expiring from 30th day to 60th day from that day.
***Expiry Time Period**	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
Report Fields	Select the fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.



Field Description in Notifications section:

Field	Description
***Email Recipient**	Select the email recipient from the dropdown list.
***Report Format**	Select the required checkbox to send the report as: • **Email content**: The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.
   The workflow is executed successfully and an email notification listing the certificates expiring in specific number of days with selected certificate attribute details is sent to the recipient email address(es) entered in the input form.

Certificate Expiry Notification - Cert Group Hierarchy

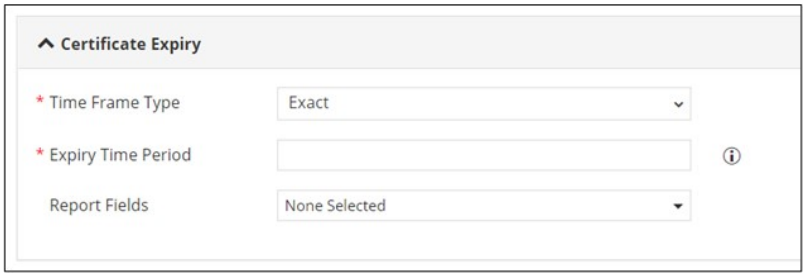
This workflow allows you to send a certificate expiry report notification to the certificate group and its associated hierarchical groups.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Certificate Expiry Notification - Cert Group Hierarchy** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Under the **Certificate Expiry** section, enter or select the requested field information as described in the table below.

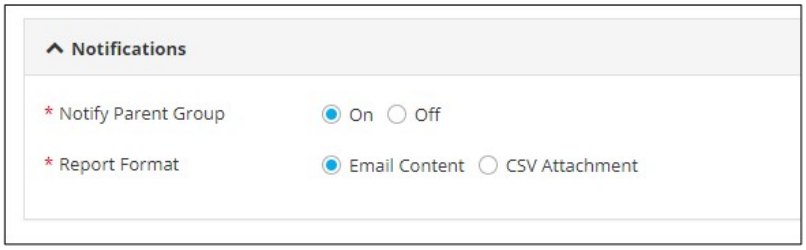


Field Description for Certificate Expiry section.

Field	Description
***Time Frame Type**	Enter the time frame type from the available options: • **Exact**: The system generates a report of certificates that expire on exactly the number of days as mentioned in the expiry time period starting from today. For example, if you mention 30 in the Expiry Time period on the 1st day of the month, the report will contain details of certificates expiring on the 30th day of the month. • **Range**: The system generates a report of certificates that expire within a range of days as mentioned in expiry time period. For example, if the range is mentioned as 30-60 on the 1st day of the month, the system generates a report of certificates expiring from 30th day to 60th day from that day.
***Expiry Time Period**	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
Report Fields	Select the fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field Description for Notifications section.

Field	Description
***Notify Parent Group**	Select: • **On** to send the notification to the certificate group's parent group. • **Off** if you don't want to send the notification to the certificate group's parent group. **Note: On** is the default selection.
***Report Format**	Select the required option to send the report as: • **Email content**: The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.
   Workflow is executed successfully and a certificate expiry report notification is sent to certificate group and associated parent group(s).

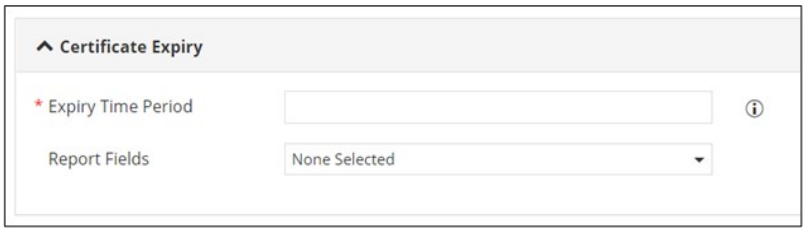
Certificate Expiry Notification - Days

This workflow enables you to generate a report listing certificates expiring in a specific number of days to the email addresses present in the certificate or certificate group.

To trigger this workflow:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

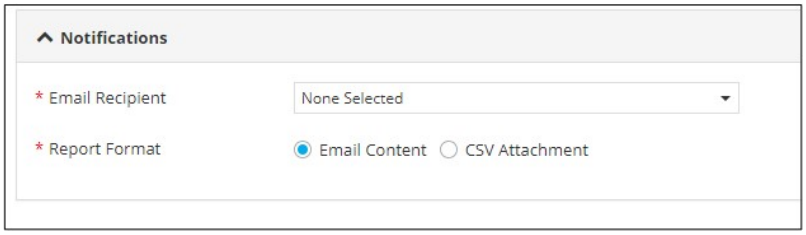
1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Certificate Expiry Notification - Days** workflow and click . The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Certificate Expiry** section, enter or select the requested field information as described in the table below.



Field Description for Certificate Expiry section.

Field	Description
***Expiry Time Period**	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
Report Fields	Select the fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Notifications section.

Field	Description
***Email Recipient**	Select the required recipient of the notification. You can select: • **Select all** • **Certificate Email**: The notification will be sent to the email addresses associated with the certificate. • **Certificate Group Email**: The notification will be sent to the entire certificate group to which the certificate belongs.
***Report Format**	Select the required checkbox to send the report as: • **Email Content**: The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.
   The workflow is executed successfully and an email notification with a report listing certificates expiring in time period as specified in the input form is sent to the recipient email address(es).

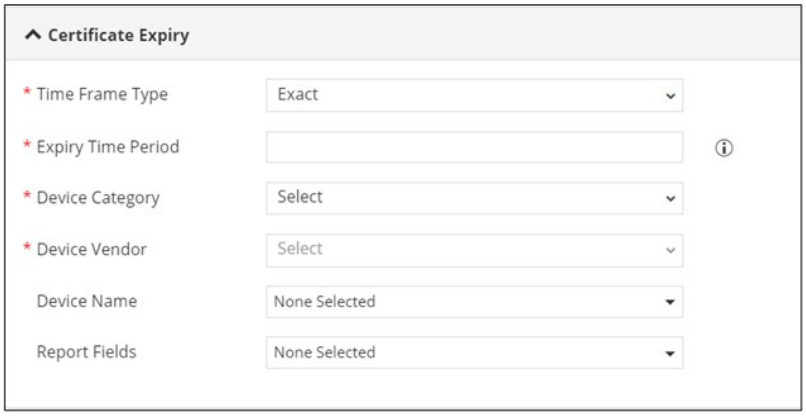
Certificate Expiry Notification - Devices | Servers

This workflow enables you to generate an expiry report of certificates present on a device and expiring in a specific number of days.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Certificate Expiry Notification - Devices | Servers** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Certificate Expiry** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



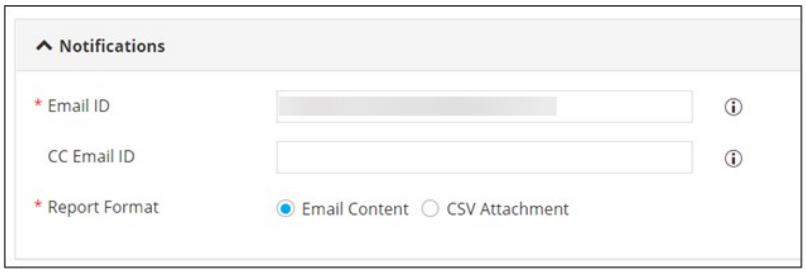
Field Description for Certificate Expiry section.

Field	Description
***Time Frame Type**	Enter the time frame type from the available options: • **Exact**: The system generates a report of certificates that expire on exactly the number of days as mentioned in the Expiry Time Period starting from today. For example, if you mention 30 in the Expiry Time period on the 1st day of the month, the report will contain details of certificates expiring on the 30th day of the month. • **Range**: The system generates a report of certificates that expire within a range of days as mentioned in Expiry Time Period. For example, if the range is mentioned as 30-60 on the 1st day of the month, the system generates a report of certificates expiring from 30th day to 60th day from that day. **Note: Exact** is the default selection.
***Expiry Time Period**	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
***Device Category**	Select the device category for the report from the dropdown list.
***Device Vendor**	Select the device vendor for the report from the dropdown list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Device Name	Select the specific device for the report.
Report Fields	Select the report fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.



Field Description for Notifications section.

Field	Description
***Email ID**	Enter the email address of the recipient in the 'To' field. Comma separated values can be entered for multiple email addresses. **Note:** The email id of the logged in user is populated automatically.
CC Email ID	Enter the email address of the recipient in the 'CC' field. Comma separated values can be entered for multiple email addresses.
***Report Format**	Select the required checkbox to send the report as: • **Email Content**: The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.

   The workflow is executed successfully and an email notification with the list of devices and certificates present on that device expiring in a specific number of days is sent.

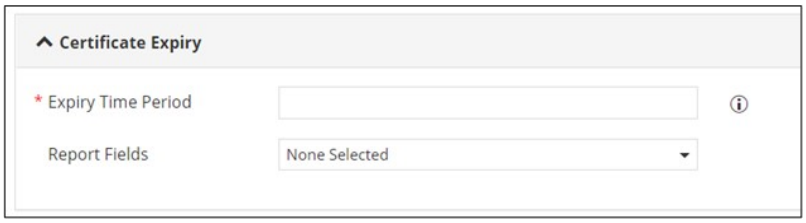
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Expiry Notification

This workflow enables you to generate a report listing certificates expiring in a specific number of days and notify the recipients via email. You can also mention email addresses of the recipients who need to be informed additionally in CC mails.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Certificate Expiry Notification** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Certificate Expiry** section, enter or select the requested field information as described in the table below.

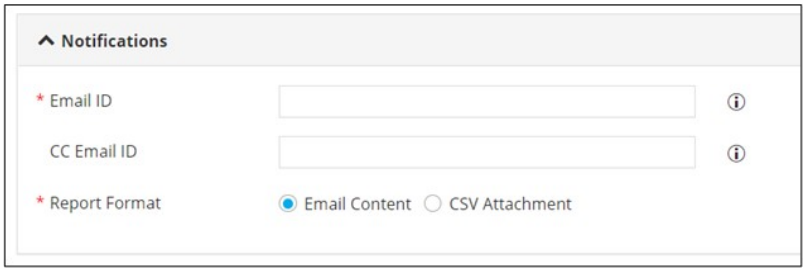


Field Description for Certificate Expiry section.

Field	Description
***Expiry Time Period**	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
Report Fields	Select the fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field Description for Notifications section.

Field	Description
***Email ID**	Enter the email address of the recipient in the 'To' field. Comma-separated values can be entered for multiple email addresses.
CC Email ID	Enter the email address of the additional recipients in the 'CC' field. Comma-separated values can be entered for multiple email addresses.
***Report Format**	Select the required checkbox to send the report as: • **Email Content**: The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.
   The workflow is executed successfully and email notification listing certificates expiring in a specific number of days is sent to the email address(s) configured in the workflow input form.

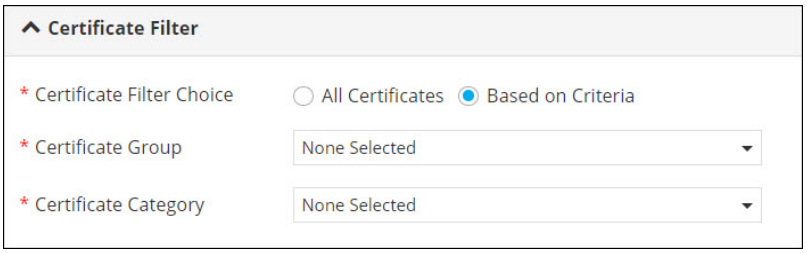
Update Certificate Attributes

This workflow allows you to update the certificate attributes in bulk.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Alert and Notification** category, hover your mouse over the **Update Certificate Attributes** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Certificate Filter** section, enter or select the requested field information as described in the table below.

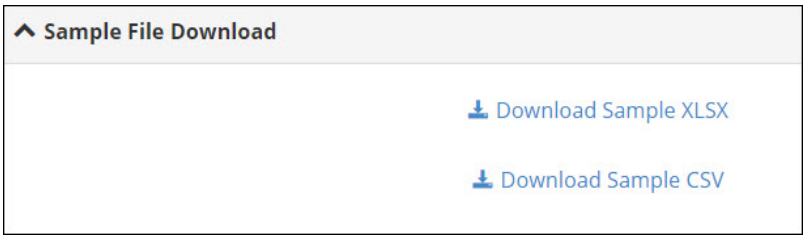
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field Description for Certificate Filter section.

Field	Description
***Certificate Filter Choice**	Select the required checkbox to fetch: • **All certificates**: This is the default selection and will fetch all the certificates. • **Based on Criteria**: Select this option to fetch certificates based on criteria such as certificate group and certificate category.
***Certificate Group**	Select the appropriate certificate group from the dropdown list. **Note:** This field is displayed only when you select the **Based on Criteria** option in **Certificate Filter Choice**.
***Certificate Category**	Select the appropriate certificate category from the dropdown list. **Note:** This field is displayed only when you select the **Based on Criteria** option in **Certificate Filter Choice**.
All asterisk (*) marked fields are mandatory.	

3. Click **Submit**.
   Certificates are fetched based on the selection criteria.
4. In the **Update Certificate Attribute Input** stage of workflow execution, select the option for downloading the file as a CSV or Excel file.



The file is downloaded to your device. You can now update the certificate attributes in this file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Once you have updated the certificate attributes, under **File Upload**, click to upload the modified file.

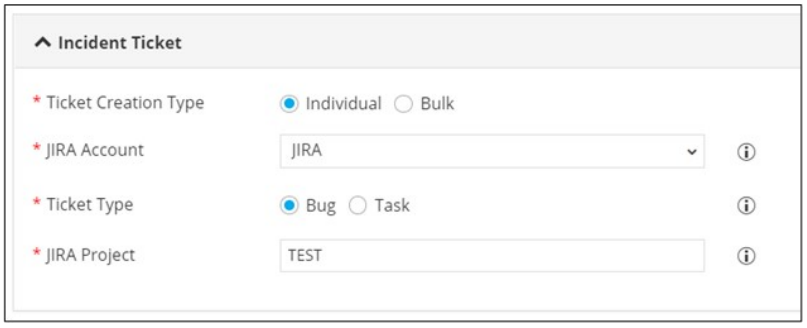
6. Click **Next** and in the **Confirmation** pop-up window, click **Ok**.
   The **Update Certificate Status** stage of the workflow displays the list of updated certificates. To download this list, from the top right corner of the screen, click . An email report is also sent to the requester.

Certificate Expiry Notification with JIRA

This workflow allows you to create a JIRA incident ticket for certificates expiring in a specific number of days.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Incident Automation** category, hover your mouse over the **Certificate Expiry Notification with JIRA** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Incident Ticket** section, select the requested field information as described in the table below.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Incident Ticket section.

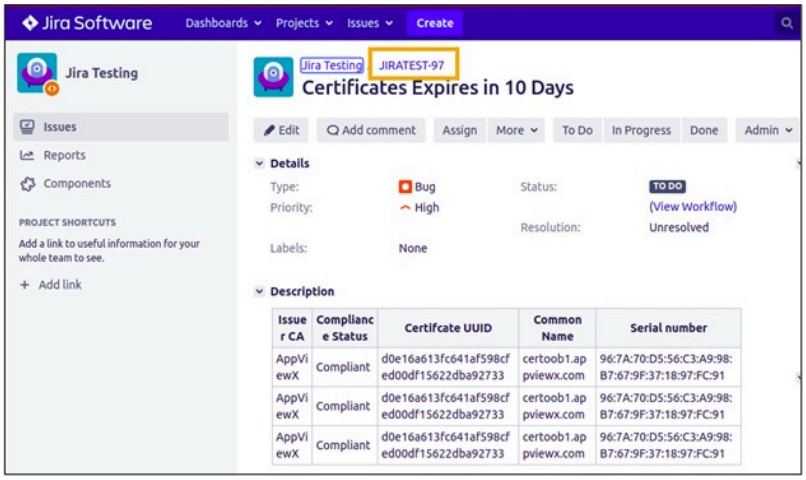
Field	Description
***Ticket Creation Type**	Select **Ticket Creation Type** as: • **Individual**: A separate ticket will be created for each certificate. • **Bulk**: A single ticket will be created for all the expiring certificates as per the category. The categories can be configured based on the ticket priority as Low, Medium and High. **Note: Individual** is the default selection.
***JIRA Account**	Select the **JIRA Account** as configured in the Integration Hub from the options available in the dropdown. **Note: JIRA** is the default selection.
***Ticket Type**	Select the type of ticket with reference to the project: • **Bug**: This will indicate that the ticket is for a bug in the project. • **Task**: This will indicate that the ticket is for a task in the project. **Note: Bug** is the default selection.
***JIRA Project**	Enter the name of the project for which ticket(s) have to be raised. **Note: Test** is the default selection.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Low - Set Incident ticket Priority** section, enter a value (number of days) for tickets with low priority. For example, for certificates expiring in 90 days, incident priority can be low.
4. Under the **Medium - Set Incident ticket Priority** section, enter a value (number of days) for tickets with medium priority. For example, for certificates expiring in 60 days, incident priority can be medium.
5. Under the **High - Set Incident ticket Priority** section, enter a value (number of days) for tickets with high priority. For example, for certificates expiring in 30 days, incident priority can be high.
6. Under the **Description Fields** section, select certificate attributes from the dropdown that will be displayed in the JIRA issue description.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: This is a mandatory field. Multiple certificate attributes can be displayed by selecting the checkbox of the attribute name.

7. Click **Submit**.
   The **Ticket Creation Summary** stage of workflow execution displays the JIRA ticket ID and the ticket for Certificate expiry notification is created on JIRA.

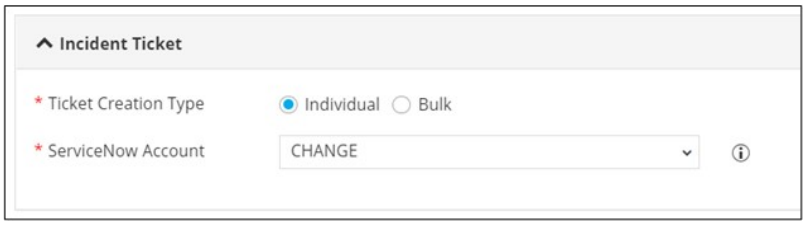


Certificate Expiry Notification with ServiceNow

This workflow allows you to create a ServiceNow incident ticket for certificates expiring in a specific number of days.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** window, under the **Incident Automation** category, hover your mouse over the **Certificate Expiry Notification with ServiceNow** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Incident Ticket** section, select the field requested information as described in the table below.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Incident Ticket section.

Field	Description
***Ticket Creation Type**	Select **Ticket Creation Type** as: • **Individual**: A separate ticket will be created for each certificate. • **Bulk**: A single ticket will be created for all the expiring certificates as per the category. The categories can be configured based on the ticket priority as Low, Medium and High. **Note: Individual** is the default selection.
***ServiceNow Account**	Select the **ServiceNow Account** as configured in the Integration Hub from the options available in the dropdown. **Note: Change** is the default selection.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Low - Set Incident ticket Priority** section, enter a value (number of days) for tickets with low priority. For example, for certificates expiring in 90 days, incident priority can be low.
4. Under the **Medium - Set Incident ticket Priority** section, enter a value (number of days) for tickets with medium priority. For example, for certificates expiring in 60 days, incident priority can be medium.
5. Under the **High - Set Incident ticket Priority** section, enter a value (number of days) for tickets with high priority. For example, for certificates expiring in 30 days, incident priority can be high.
6. Under the **Description Details** section, select multiple certificate attributes from the dropdown that will be displayed in the ServiceNow description.

   Note: This is a mandatory field.

7. Click **Submit**.

   The **Ticket Creation Summary** stage of workflow execution displays the ServiceNow ticket ID and the ticket for Certificate expiry notification is created on ServiceNow.

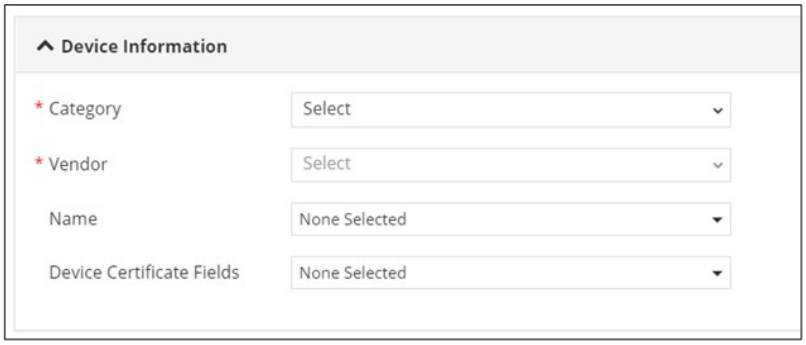
Orphan Certificates Report

This workflow enables you to generate a report on certificates that are present on a device but not associated with any application or profile.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Report** category, hover your mouse over the **Orphan Certificates Report** workflow and click .
   The workflow is executed with the workflow inputs requested at the first stage.
2. Under the **Device Information** section, enter or select the requested field information as described in the table below.



Field Description for Device Information section.

Field	Description
***Category**	Select the device category for the report from the options available in the dropdown.
***Vendor**	Select the device vendor for the report from the options available in the dropdown.
Name	Select the specific device for the report.
Device Certificate Fields	Select the report fields to be displayed in the report from the dropdown list.
All Asterisk (*) marked fields are mandatory.	

3. Under the **Notifications** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for Notifications section.

Field	Description
***Email ID**	Enter the email address of the recipient in the 'To' field. Comma separated values can be entered for multiple email addresses. **Note:** The email id of the logged in user is populated automatically.
CC Email ID	Enter the email address of the recipient in the 'CC' field. Comma separated values can be entered for multiple email addresses.
***Report Format**	Select the required checkbox to send the report as: • **Email Content**:The report will be sent as Email content. • **CSV Attachment**: The report will be sent as a separate attachment in CSV format. **Note: Email Content** is the default selection.
All Asterisk (*) marked fields are mandatory.	

4. Click **Submit**.
   The **Orphan Certificates List** is generated and an email notification is sent to the recipients specified in the input form.

Certificate Enrollment Workflows

- Overview
- Enroll Certificate and Download

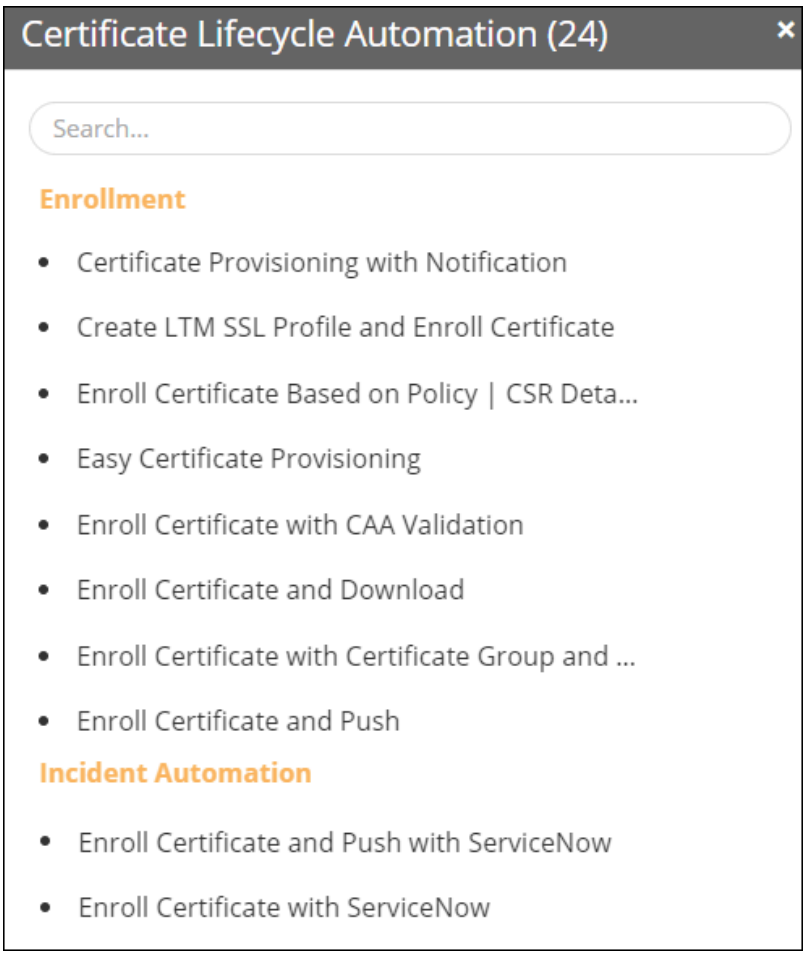
- Enroll Certificate and Push with ServiceNow
- Easy Certificate Provisioning
- Enroll Certificate with CAA Validation
- Enroll Certificate and Push

Overview

This section lists and describes the workflows that can be used to enroll certificates and push them to selected device(s) using the configured Certificate Authorities. Some workflows also describe Certificate Enrollment with Incident Automation. These workflows are available in the **Certificate Lifecycle Automation** catalog under the **Enrollment** and **Incident Automation** categories.



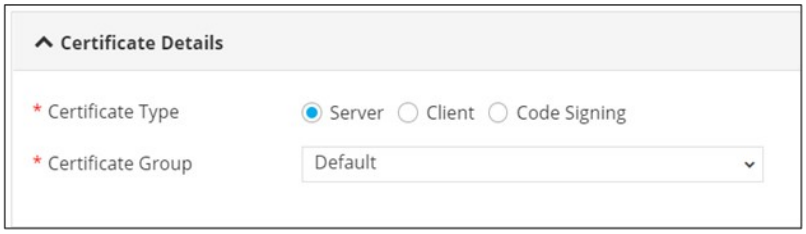
Enroll Certificate and Download

This workflow enables you to create and download certificates based on the certificate group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To trigger this workflow:

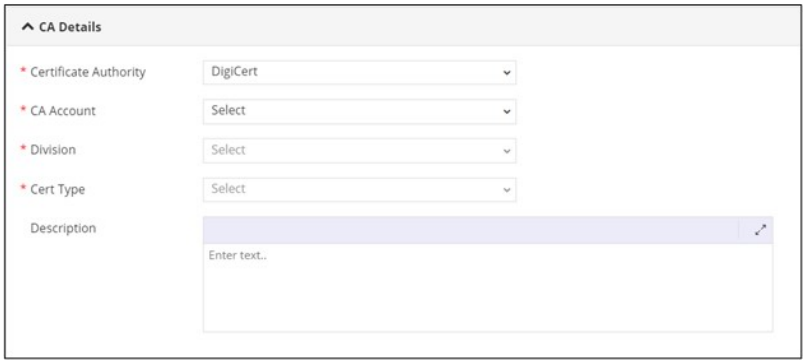
1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Enroll Certificate and Download** workflow and click .
   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **Certificate Details** section, select the requested field information as described in the table below.



Field description for Certificate Details section

Field	Description
***Certificate Type**	Select the required **Certificate Type** from the available options: • **Server** • **Client** • **Code Signing** **Note: Server** is the default selection.
***Certificate Group**	Select the required **Certificate Group** from the options available in the dropdown.
All asterisk (*) marked fields are mandatory.	

3. Under the **CA Details** section, enter or select the requested field information as described in the table below.



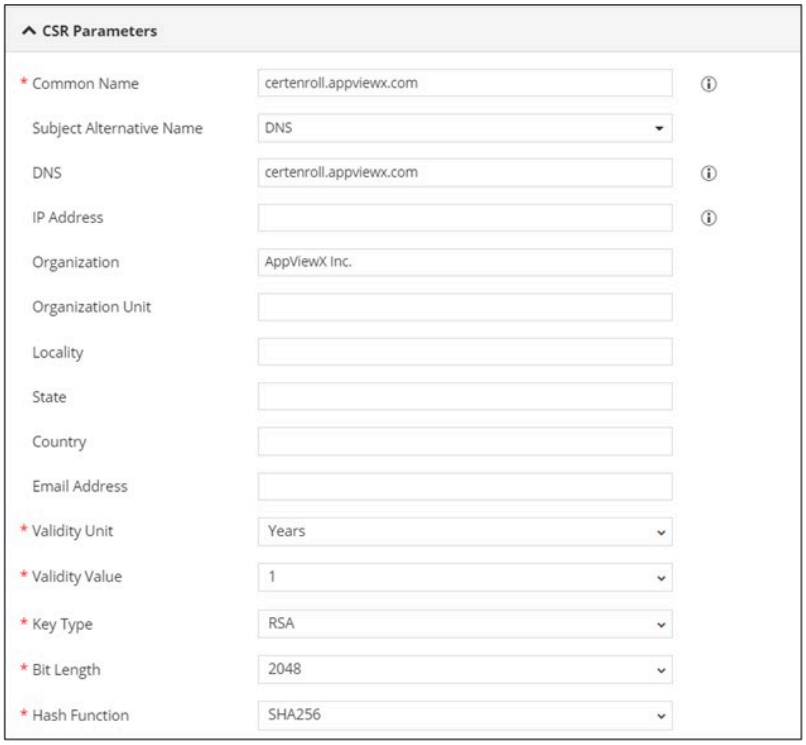
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for CA Details section

Field	Description
***Certificate Authority**	Select the **Certificate Authority** from the available options: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** This list will be populated based on the **Certificate Group** selected in the **Certificate Details** section.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note**: This field is populated based on the CA selected.
***Division**	Select the **Division** from the options available in the dropdown. **Note:** This field is displayed only when Digicert is selected as the CA.
***Cert Type**	Select the **Cert Type** from the options available in the dropdown. **Note:** This field is displayed only when DigiCert or Entrust are selected as the CA.
Description	Enter a **Description** of the workflow, if required.
All asterisk (*) marked fields are mandatory.	

4. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



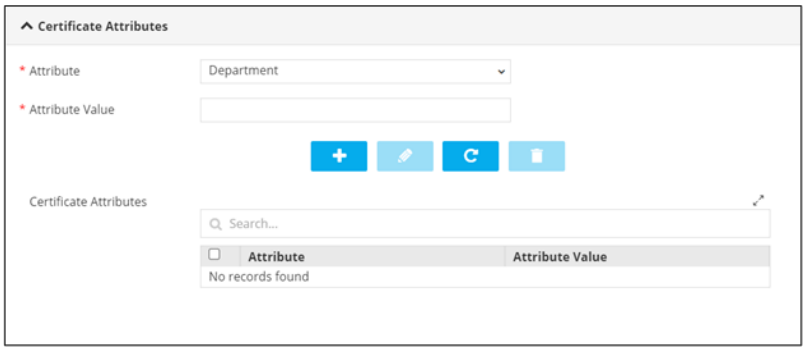
Field description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name (SAN)	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS, if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP address, if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Zip Code	Enter the zip code of the organization.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when DigiCert is selected as the Certificate Authority.
Email Address	Enter the email address.
***Validity Unit**	Select the validity unit as: • **Days** • **Months** or • **Years**
***Validity Value**	Select a valid validity value.
***Key Type**	Select a **Key Type** from the available options.
***Bit Length**	Select the **Bit Length** from the available options. The values displayed in the dropdown will differ depending on the **Key Type** selected.
***Hash Function**	Select the **Hash Function** from the available options.
All Asterisk (*) marked fields are mandatory.	

5. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
6. Enter a value for the selected attribute.



Actions available in the Certificate Attributes grid

Action	Description
+	Allows you to add the attribute to the **Certificate Attributes** grid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Action	Description
	Allows you to edit the value of a particular attribute. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a certificate attribute.
	Allows you to maximize the **Certificate Attributes** grid.
Search bar	Allows you to search for a particular attribute in the grid.

7. Under the **Vendor Specific Details** section, select the field information from the options available in the dropdown.

> **Note:** This section is displayed only when DigiCert or EJBCA is selected as the Certificate Authority under the CA Details section. The field(s) displayed in this section will vary based on the CA selected.

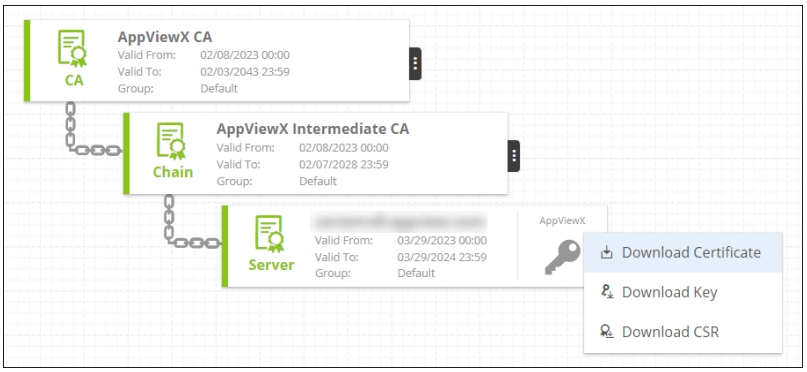
8. Under the **Notifications** section, enter the **Email ID** to which the certificate creation notification will be sent.

> **Note:** This field will auto-populate with the logged in user's email address by default if the email address has been configured in the SMTP settings. You can also enter a different email address in this field or enter multiple email addresses separated by commas.

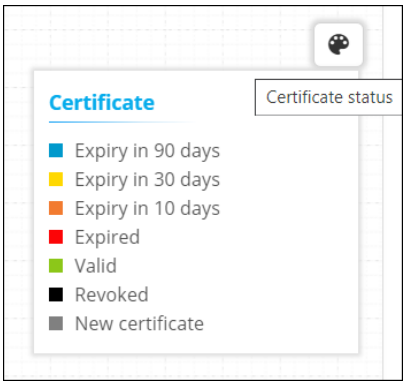
9. Click **Submit**.
   The certificate is created successfully and an email notification is sent to the recipient specified in the input form.

10. To download the certificate, at the **View | Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



11. Hover your mouse over to view the Certificate status.



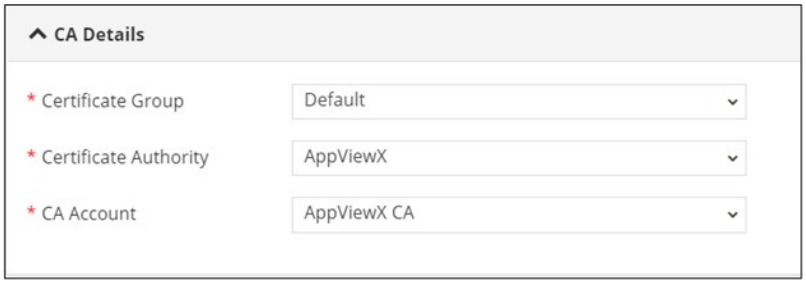
Certificate Provisioning with Notification

This workflow allows you to create a certificate based on the certificate group and the policy associated with it, and push to a device available in the instance. Email approval is required for certificate creation as well as pushing it to the device. Once approved, the logged in user will receive an email informing them about the Push to Device Status of the certificate.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Certificate Provisioning with Notification** workflow and click .
   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **CA Details** section, select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field description for CA Details section

Field	Description
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***Certificate Authority**	Select the **Certificate Authority** from the available options: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** This field is populated based on the selected **Certificate Group**.
CA Account	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the **CA**selected .
All asterisk (*) marked fields are mandatory.	

3. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

Field	Description
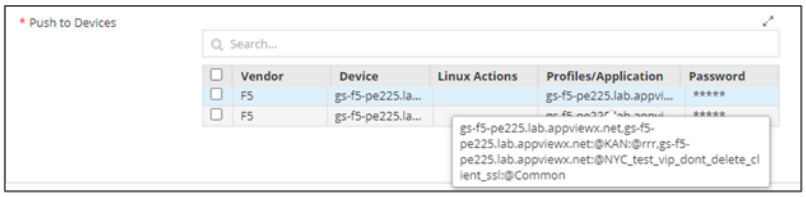
Linux Actions	Select the **Linux Action** from the options available in the dropdown. **Note:** This field is displayed only when you select **Linux Server** in the **Vendor** field.
***Profile/ Application**	Select the **Profile/Application** from the options available in the dropdown. **Note:** The **Profile/Application** list is populated based on the **Device** selected.
***KDB Password**	Configure a password to access the KDB file. **Note:** This field is displayed only when you select **Default** in the **Linux Actions** field.
***Push to Devices**	Add the selected profile/application to the grid as described below the table.
All asterisk (*) marked fields are mandatory.	

5. To add the selected profile/application to the grid, click .
   The **Profile/Application** is added to the **Push to Devices** grid.

Note: If you select multiple profiles/applications, they will be displayed in the **Push to Devices** grid, under the **Profiles/Applications** column as comma separated values.



Actions available in the Push to Devices grid

Action	Description
	Allows you to edit the device details. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Action	Description
	Allows you to delete a profile/application.
	Allows you to maximize the **Push to Devices** grid.
Search bar	Allows you to search for a profile/application in the grid.

6. Under the **Email** section, enter the field information as described in the table below.

Field description for Email section

Field	Description
***Certificate Approver Email ID**	Enter the email address or multiple addresses, separated by comma, of the user(s) approving the certificate creation request.
***Certificate Push Approver Email ID**	Enter the email address of the user who will approve the certificate push request.
All Asterisk (*) marked fields are mandatory.	

7. Click **Submit**.

   The workflow is executed successfully.

8. At the **View | Edit Certificate Details** stage, click **Submit**.

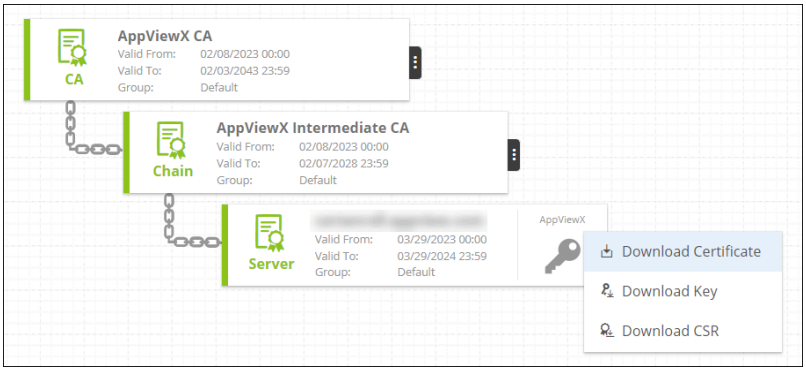
   Email notification for Create Certificate approval is received.

9. Click **Approve** or **Reject** in the **Approval for Creating Certificate** email.

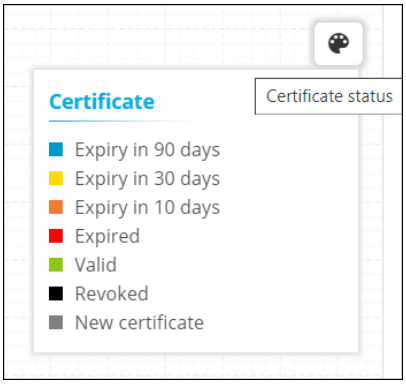
   Certificate is created after the approver clicks **Approve**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. To download the certificate, at the **View | Download Certificate** stage, hover your mouse over , and from the options displayed, click **Download Certificate**.



11. Hover your mouse over to view the Certificate status.



12. Click **Approve** or **Reject** in the **Approval for Pushing Certificate to Device** email.

Once the approver approves the request, the certificate is pushed to the selected device and an email notification is also sent to the requester.

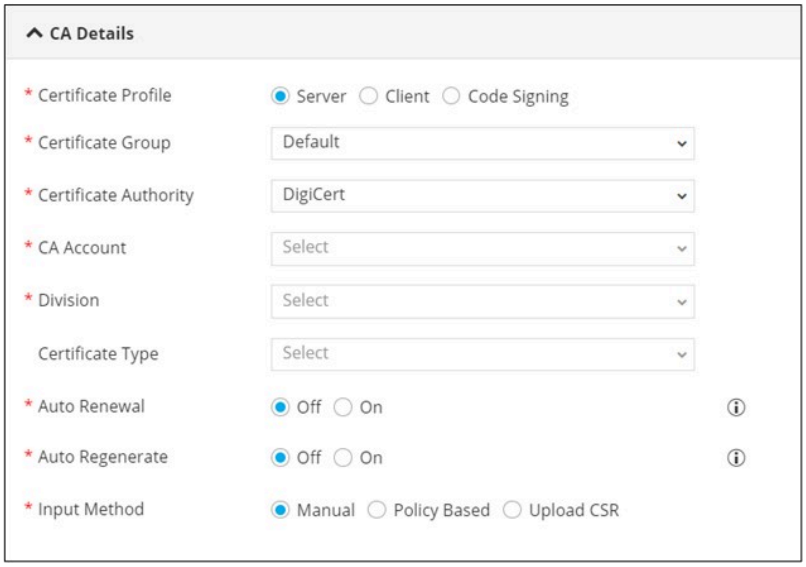
Enroll Certificate Based on Policy | CSR Details | CSR Upload

This workflow allows you to create a certificate using three input methods - Manual, Policy Based, and Upload CSR.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Enroll Certificate Based on Policy | CSR Details | CSR Upload** workflow and click .

   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **CA Details** section, select the requested field information as described in the table below.



Field description for CA Details section

Field	Description
***Certificate Profile**	Select the Certificate Profile from the following options: • **Server** • **Client** • **Code Signing** **Note: Server** is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. The following CAs are supported: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** This field is populated based on the **Certificate Group** selected.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the **Certificate Authority** selected.
***Division**	Select the **Division** from the options available in the dropdown. **Note:** This field is displayed only when DigiCert is selected as the CA.
Certificate Type	Select the **Certificate Type** from the options available in the dropdown.
***Auto Renewal**	Select the required radio button to enable/disable **Auto Renewal**. **Note:** Default selection is set to **Off**.
Renew Before (Days)	Enter the number of days in the **Renew Before (days)** field. For example, if you enter 5, then the renewal request will be triggered 5 days prior to the expiry date. **Note:** This field is displayed only when the **Auto Renewal** field is enabled.
***Auto Regenerate**	Select the required radio button to enable/disable **Auto Regenerate**. **Note:** Default selection is set to **Off**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Start Regenerating (Days)	Enter the number of days in the **Start Regenerating (days)** field. **Note:** This field is displayed only when the **Auto Regenerate** field is enabled.
***Input Method**	Select the required **Input Method**. The options available are: • **Manual**: (Default) If you select the **Input Method** as **Manual**, the CSR parameters will have to be entered/selected manually. For instructions, click here. • **Policy Based**: If you select the **Input Method** as **Policy Based**, the CSR parameter fields will be auto-populated based on the policy associated with the selected **Certificate Group**. For instructions, click here. • **Upload CSR**: If you select the **Input Method** as **Upload CSR**, you can upload the CSR file to fetch the CSR parameters. For instructions, click here.
All Asterisk (*) marked fields are mandatory.	

Enrolling Certificates Based on Input Method

Manual

After you select the **Input Method** as **Manual**, execute the following steps to enroll a certificate:

1. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

Field description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Subject Alternative Name	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select **IP Address** in the **SAN** field.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
Locality	Enter the name of the locality in which the organization is situated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Email Address	Enter the email address associated with the **Certificate Group**.
Zip Code	Enter the zip code.
***Validity Unit**	Select the **Validity Unit** as either: • **Days** • **Months** • **Years**
***Validity Value**	Enter a **Validity Value** based on the selected validity unit.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** This field will be populated based on the selected **Key Type**.
All asterisk (*) marked fields are mandatory.	

2. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
3. Enter a value for the selected attribute.

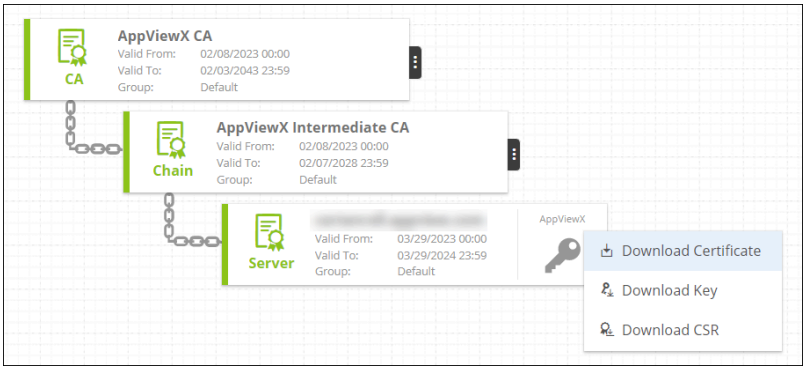
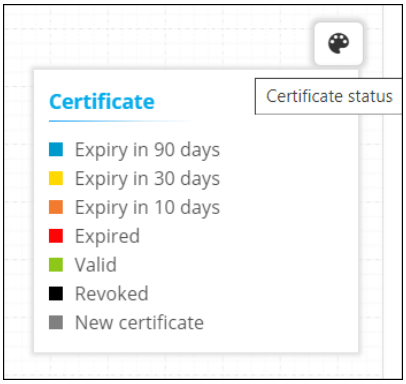
7. Click **Submit**.
   AppViewX certificate is created successfully and email notification is sent to the recipient specified in the input form.

8. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.



9. Hover your mouse over to view the **Certificate status**.



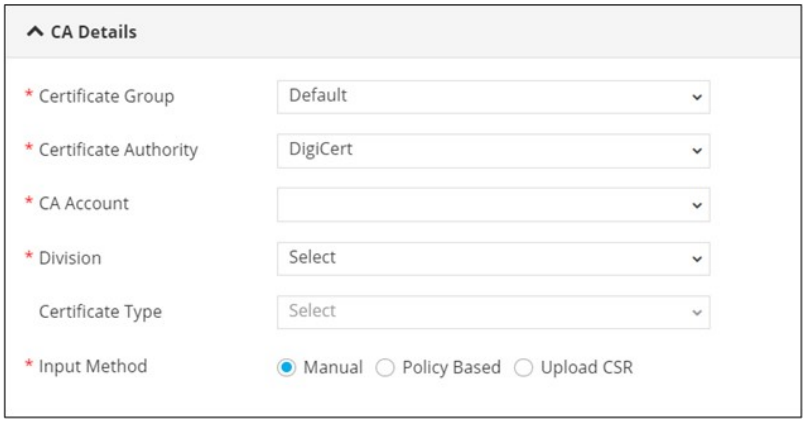
Create LTM SSL Profile and Enroll Certificate

This workflow allows you to create individual server certificates along with LTM SSL profile creation based on the selected certificate group.

To trigger this workflow:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Create LTM SSL Profile and Enroll Certificate**workflow and click .
   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **CA Details** section, select the requested field information as described in the table below.



Field descriptions in the CA Details section

Field	Description
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***Certificate Authority**	Select the **Certificate Authority** from the available options: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** The **Certificate Authority** field is populated based on the selected **Certificate Group**.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** The **CA Account** field is populated based on the selected **Certificate Authority**.
***Division**	Select the **Division** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when Digicert is selected as the CA.
***Cert Type**	Select the **Cert Type** from the options available in the dropdown. **Note:** This field is displayed only when Digicert or Entrust are selected as the CA.
***Input Method**	Select the required **Input Method**. The options available are: • **Manual**: (Default) If you select the **Input Method** as Manual, the CSR parameters will have to be entered/selected manually. For instructions, click here. • **Policy Based**: If you select the **Input Method** as Policy Based, the CSR parameters fields will be auto-populated based on the policy associated with the selected **Certificate Group**. For instructions, click here. • **Upload CSR**: If you select the **Input Method** as Upload CSR, you can upload the CSR file to fetch the CSR parameters. For instructions, click here.
All asterisk (*) marked fields are mandatory.	

Enrolling Certificates Based on Input Method

Manual

After you select the **Input Method** as **Manual**, execute the following steps to enroll a certificate:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

Field description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field. **Note:** This field is displayed if DNS is selected in the **The email id of the logged in user is populated automatically.** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field. **Note:** This field is displayed if IP Address is selected in the **Subject Alternative Name** field.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
Locality	Enter the name of the locality in which the organization is situated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Email Address	Enter the email address associated with the **Certificate Group**.
Zip Code	Enter the zip code.
***Validity Unit**	Select the **Validity Unit** as either: • **Days** • **Months** • **Years**
***Validity Value**	Enter a **Validity Value** based on the selected validity unit.

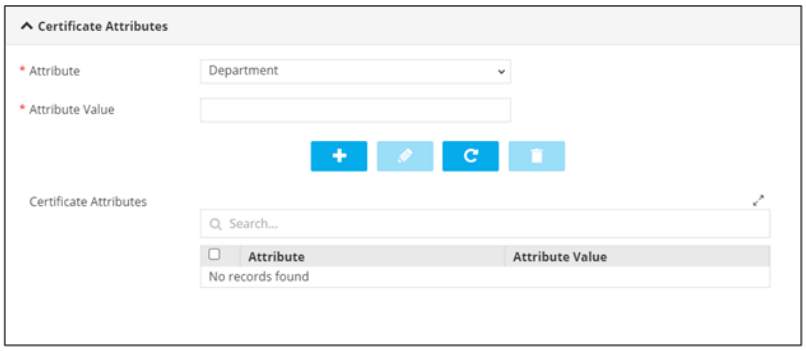
Field	Description
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** This field will be populated based on the selected **Key Type**.
All asterisk (*) marked fields are mandatory.	

2. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
3. Enter a value for the selected attribute.



Actions available in the Certificate Attributes grid

Action	Description
	Allows you to add the attribute to the **Certificate Attributes** grid.
	Allows you to edit the value of a particular attribute. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a certificate attribute.
	Allows you to maximize the **Certificate Attributes** grid.
Search bar	Allows you to search for a particular attribute in the grid.

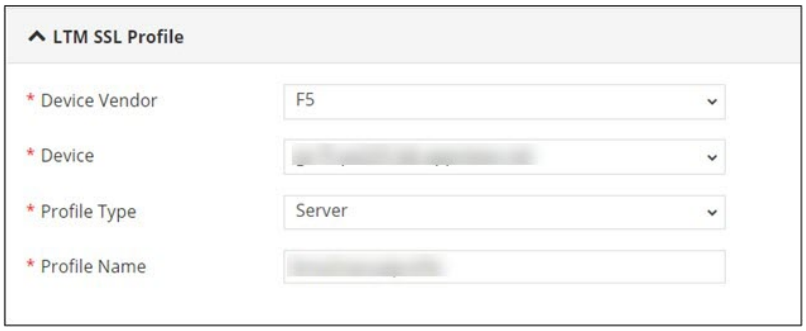
4. Under the **Vendor Specific Details** section, select the field information from the options available in the dropdown.

> **Note:** This section is displayed only when DigiCert or EJBCA is selected as the Certificate Authority under the CA Details section. The field(s) displayed will vary based on the CA selected.

5. Under the **LTM SSL Profile** section, enter or select the requested field information as described in the table below.



Field description for LTM SSL Profile section

Field	Description
***Device Vendor**	Select the device vendor from the options available in the dropdown.
***Device**	Select the device from the options available in the dropdown. **Note:** This field is populated on the basis of the selected device vendor.
***Profile Type**	Select the profile type from the options available in the dropdown.
***Profile Name**	Enter a meaningful profile name for the profile that is to be created.
All asterisk (*) marked fields are mandatory.	

6. Under the **Notifications** section, enter the email address(es).

> **Note:** The **User email** field will auto-populate with the logged in user's email address by default if the email address has been configured in the SMTP settings. You can also enter a different email address(es) in this field or enter multiple email addresses separated by commas.

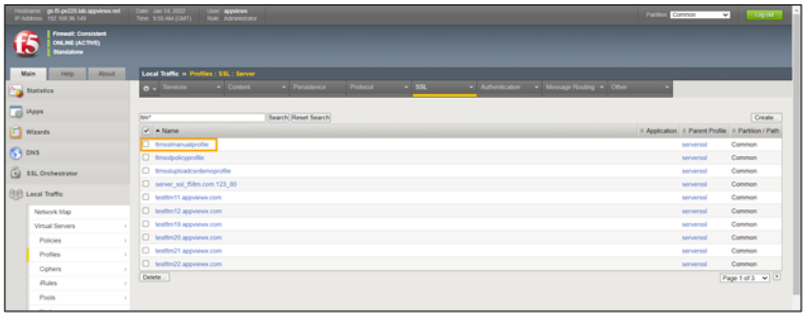
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Click **Submit**.

   AppViewX Certificate is generated and LTM Profile on Server SSL is created successfully.
8. At the **Review** stage of workflow execution, review the device and profile name and click **Submit**.

   Note: You can change the profile name at this stage.

   LTM Profile is created and pushed to the selected F5 device and an email notification is sent to the recipient specified in the input form.



9. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

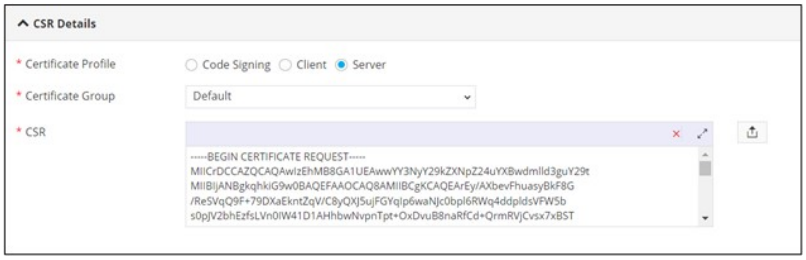
Enroll Certificate with Certificate Group and CSR Upload

This workflow allows you to create a certificate with minimal input. The Certificate Authority (CA) must be associated with the respective policy and Certificate group. In case there are multiple CAs associated with a policy, the first available CA will be considered for certificate creation.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Enroll Certificate with Certificate Group and CSR Upload** workflow and click . The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **CSR Details** section, select the requested field information as described in the table below.



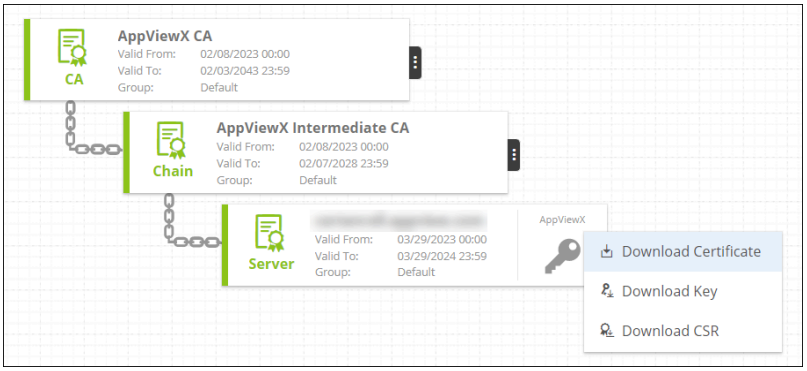
Field description for CSR Details section

Field	Description
***Certificate Profile**	Select the **Certificate Profile** from the following options: • **Code Signing** • **Server** • **Client** **Note: Server** is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***CSR**	Click to upload the **CSR** file.
All asterisk(*) marked fields are mandatory.	

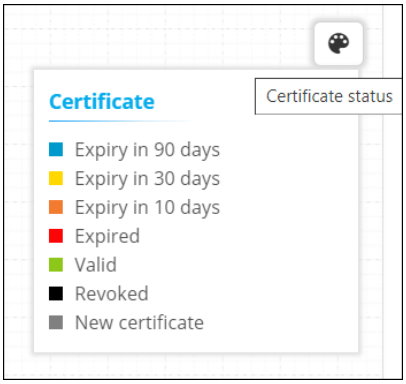
3. Click **Submit**.
   AppViewX Certificate is generated successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.



5. Hover your mouse over to view the **Certificate status**.



Enroll Certificate With ServiceNow

This workflow allows you to create a certificate corresponding to the ticket raised on ServiceNow (RITM).

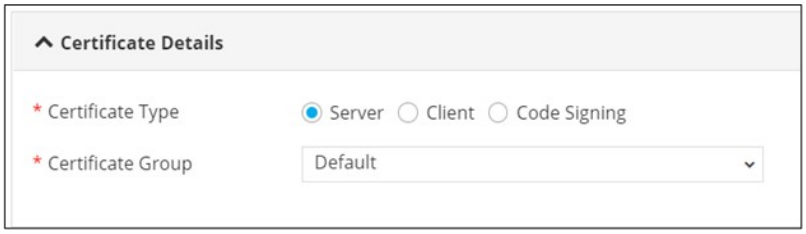
To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Enroll Certificate with ServiceNow** workflow and click .

> **Tip:** You can also search for the workflow by typing the workflow name in the search bar.

   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **Certificate Details** section, select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field description for Certificate Details section

Field	Description
***Certificate Profile**	Select the required **Certificate Profile** from the available options: • **Server** • **Client** • **Code Signing** **Note: Server** is the default selection.
***Certificate Group**	Select the required **Certificate Group** from the options available in the dropdown.
All asterisk (*****) marked fields are mandatory.	

3. Under the **CA Details** section, enter or select the requested field information described in the table below.

Field description for CA Details section

Field	Description
***Certificate Authority**	Select the **Certificate Authority** from the available options: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the CA selected.
***Division**	Select the **Division** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: This field is displayed only when DigiCert is selected as the CA.
***Cert Type**	Select the **Cert Type** from the options available in the dropdown. **Note:** This field is displayed only when DigiCert or Entrust are selected as the CA.
Description	Provide a Description for the workflow, if required.
All asterisk (*) marked fields are mandatory.	

4. Under the **CSR Parameters** section, enter or select the requested field information described in the table below.

Field description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully qualified domain name (FQDN) of the server for which the certificate is requested.
***Subject Alternative Name (SAN)**	Select the SAN as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
***Organization**	Enter the name of the organization .
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
Organization Address	Enter the address of the organization.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Zip Code	Enter the zip code of the organization. **Note:** This field is displayed only when **DigiCert** is selected as the **CA**.
Email Address	Enter the email address
Locality	Enter the name of the locality in which the organization is situated.
***Validity Unit**	Select the validity unit as: • **Days** • **Months** or • **Years**
***Validity Value**	Select a valid validity value.
***Key Type**	Select a **Key Type** from the available options - RSA, DSA, EC.
***Bit Length**	Select the **Bit Length** from the available options. The values displayed in the dropdown will differ depending on the **Key Type** selected.
***Hash Function**	Select the Hash Function from the available options.
***Download Format**	Select the format for downloading the certificate from the available options.
All Asterisk (*) marked fields are mandatory.	

5. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
6. Enter a value for the selected attribute.

Enroll Certificate and Push

This workflow allows you to create a certificate and push it to the selected device.

To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Enrollment** category, hover your mouse over the **Enroll Certificate and Push** workflow and click .
   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **CA Details** section, select the requested field information as described in the table below.

Field Description for CA Details section

Field	Description
***Certificate Profile**	Select the Certificate Profile from the following options: • **Server** • **Client** • **Code Signing** **Note: Server** is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. The following CAs are supported: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** This field is populated based on the **Certificate Group** selected.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the **Certificate Authority** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Division**	Select the **Division** from the options available in the dropdown. **Note:** This field is displayed only when Digicert is selected as the CA.
Certificate Type	Select the **Certificate Type** from the options available in the dropdown.
***Auto Renewal**	Select the required radio button to enable/disable **Auto Renewal**. **Note:** Default selection is set to **Off**.
Renew Before (Days)	Enter the number of days in the **Renew Before (days)** field. For example, if you enter 5, then the renewal request will be triggered 5 days prior to the expiry date. **Note:** This field is displayed only when the **Auto Renewal** field is enabled.
***Auto Regenerate**	Select the required radio button to enable/disable **Auto Regenerate**. **Note:** Default selection is set to **Off**.
Start Regenerating (Days)	Enter the number of days in the **Start Regenerating (days)** field. **Note:** This field is displayed only when the **Auto Regenerate** field is enabled.
***Input Method**	Select the required **Input Method**. The options available are: • **Manual**: (Default) If you select the **Input Method** as **Manual**, the CSR parameters will have to be entered/selected manually. For instructions, click here. • **Policy Based**: If you select the **Input Method** as **Policy Based**, the CSR parameter fields will be auto-populated based on the policy associated with the selected **Certificate Group**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	For instructions, click here. • **Upload CSR**: If you select the **Input Method** as **Upload CSR**, you can upload the CSR file to fetch the CSR parameters. For instructions, click here.
All Asterisk (*) marked fields are mandatory.	

Enrolling Certificates Based on Input Method

Manual

After you select the **Input Method** as **Manual**, execute the following steps to enroll a certificate:

1. Under **CSR Parameters**, enter the requested field information as described in the table below.

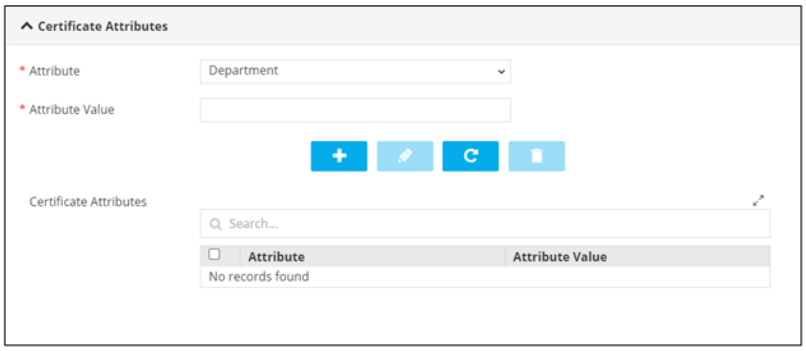
Field description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select **IP Address** in the **SAN** field.
Organization	Enter the name of the organization with which the certificate will be associated.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
Locality	Enter the name of the locality in which the organization is situated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Email Address	Enter the email address associated with the **Certificate Group**.
Zip Code	Enter the zip code.
***Validity Unit**	Select the **Validity Unit** as either: • **Days** • **Months** • **Years**
***Validity Value**	Enter a **Validity Value** based on the selected validity unit.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** This field will be populated based on the selected **Key Type**.
All asterisk (*) marked fields are mandatory.	

2. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
3. Enter a value for the selected attribute.



Actions available in the Certificate Attributes grid

Action	Description
+	Allows you to add the attribute to the **Certificate Attributes** grid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Action	Description
	Allows you to edit the value of a particular attribute. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a certificate attribute.
	Allows you to maximize the **Certificate Attributes** grid.
Search bar	Allows you to search for a particular attribute in the grid.

4. Under the **Device Details** section, enter or select the requested field information as described in the table below.

Field description for Device Details section

Field	Description
***Device Type**	Select the **Device Type** from the options available in the dropdown.
Vendor	Select the **Vendor** from the options available in the dropdown. **Note:** The vendor list is populated based on the **Device Type** selected.
Device	Select the **Device** from the options available in the dropdown. **Note:** The device list is populated based on the **Vendor** selected.
Linux Actions	Select the **Linux Action** from the options available in the dropdown. **Note:** This field is displayed only when you select **Linux Server** in the **Vendor** field.
***Profile/ Application**	Select the **Profile/Application** from the options available in the dropdown. **Note:** The **Profile/Application** list is populated based on the **Device** selected.

- Renew Certificate
- Regenerate Certificate with New CSR
- Renew Certificate and Push
- Renew Certificate with ServiceNow
- Renew Certificate and Push with ServiceNow

Renew Certificate

This workflow allows you to renew a certificate based on the certificate group and certificate authority.

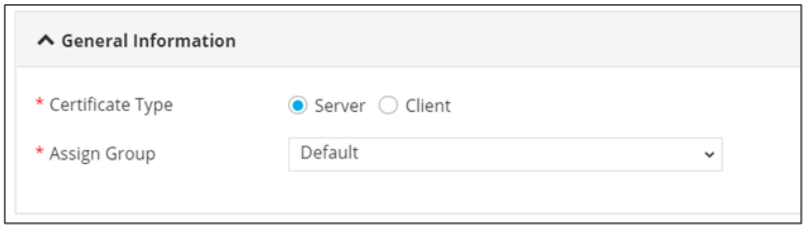
To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Renewal** category, hover your mouse over the **Renew Certificate** workflow and click .

   > **Tip:** You can also search for the workflow by typing the workflow name in the search bar.

   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **General Information** section, select the **Certificate Type** (mandatory).
3. Under the **General Information** section, select the **Assign Group** (mandatory).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Under the **CA Details** section, select the **Certificate Authority** (mandatory).
5. Under the **CA Details** section, add a description for the certificate being renewed (optional).

6. Under the **Certificate Information** section, select the **Certificate** from the dropdown list (mandatory). The **Serial Number** field is populated based on the Certificate selected.
7. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

Field Description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which the certificate is requested.
Subject Alternative Name (SAN)	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Zip Code	Enter the zip code of the organization.

Actions available in the Certificate Attributes grid

Action	Description
	Allows you to add the attribute to the **Certificate Attributes** grid.
	Allows you to edit the value of a particular attribute. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a certificate attribute.
	Allows you to maximize the **Certificate Attributes** grid.
Search bar	Allows you to search for a particular attribute in the grid.

9. Under the **Vendor Specific Details** section, select the field information from the options available in the dropdown.

> **Note:** This section is displayed only when DigiCert, EJBCA, or Entrust is selected as the Certificate Authority under the CA Details section. The field(s) displayed will vary based on the CA selected.

10. Under the **Device Information** section, select the field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

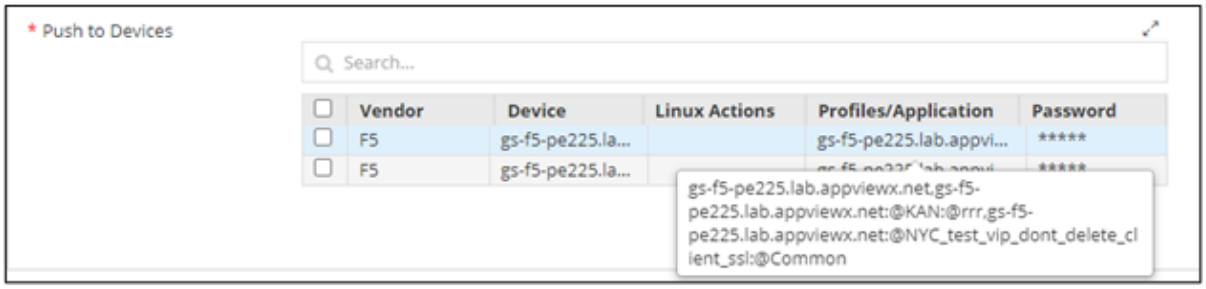
Field description for Device Details section

Field	Description
***Device Type**	Select the **Device Type** from the options available in the dropdown.
Vendor	Select the **Vendor** from the options available in the dropdown. **Note:** The vendor list is populated based on the **Device Type** selected.
Device	Select the **Device** from the options available in the dropdown. **Note:** The device list is populated based on the **Vendor** selected.
Linux Actions	Select the **Linux Action** from the options available in the dropdown. **Note:** This field is displayed only when you select **Linux Server** in the **Vendor** field.
***Profile/ Application**	Select the **Profile/Application** from the options available in the dropdown. **Note:** The **Profile/Application** list is populated based on the **Device** selected.
***KDB Password**	Configure a password to access the KDB file. **Note:** This field is displayed only when you select **Default** in the **Linux Actions** field.
***Push to Devices**	Add the selected profile/application to the grid as described below the table.
All asterisk (*) marked fields are mandatory.	

11. To add the selected profile/application to the grid, click .
    The **Profile/Application** is added to the **Push to Devices** grid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: If you select multiple profiles/applications, they will be displayed in the **Push to Devices** grid, under the **Profiles/Applications** column as comma separated values.



Actions available in the Push to Devices grid

Action	Description
	Allows you to edit the device details. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a profile/application.
	Allows you to maximize the **Push to Devices** grid.
Search bar	Allows you to search for a profile/application in the grid.

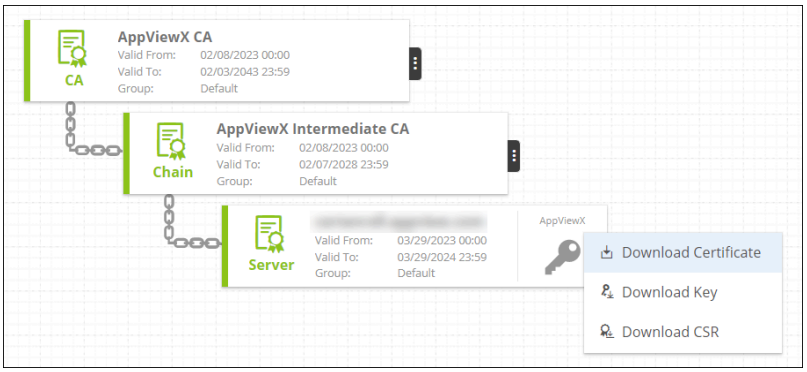
12. Under the **Notifications** section, enter the **Email ID** to which the certificate creation notification will be sent.

Note: The **Email ID** field will auto-populate with the logged in user's email address by default if the email address has been configured in the SMTP settings. You can also enter a different email address in this field or enter multiple email addresses separated by commas.

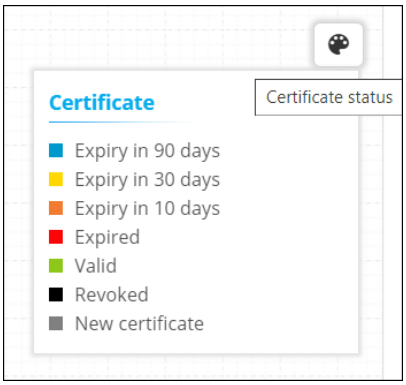
13. Click **Submit**.
    Certificate is renewed successfully.

14. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



15. Hover your mouse over to view the **Certificate status**.



Renew Certificate with ServiceNow

This workflow allows you to renew a certificate based on the certificate group and certificate authority and attach the renewed certificate to the ServiceNow ticket.

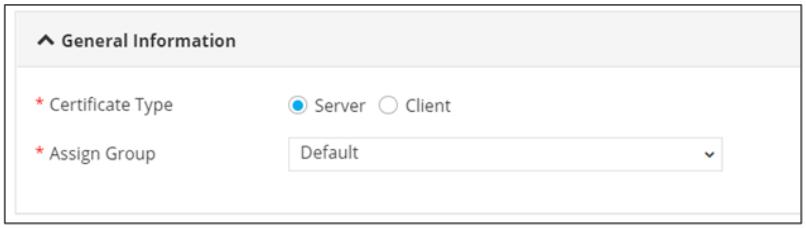
To trigger this workflow:

1. From the **Certificate Lifecycle Automation** catalog, under the **Renewal** category, hover your mouse over the **Renew Certificate with ServiceNow** workflow and click .

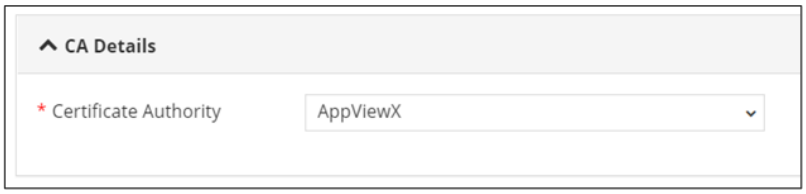
   Tip: You can also search for the workflow by typing the workflow name in the search bar.

   The workflow execution page is displayed with the workflow inputs requested at the first stage.
2. Under the **General Information** section, select the **Certificate Type** (mandatory).
3. Under the **General Information** section, select the **Assign Group** (mandatory).

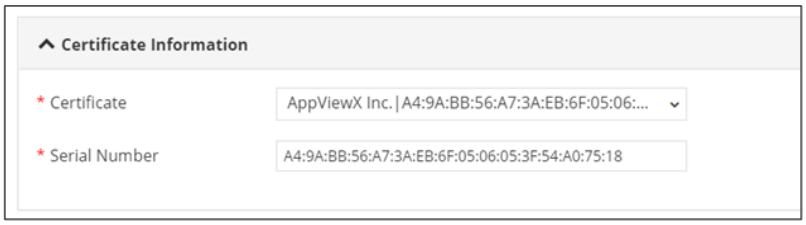
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



4. Under the **CA Details** section, select the **Certificate Authority** (mandatory).



5. Under the **Certificate Information** section, select the **Certificate** from the dropdown list (mandatory). The **Serial Number** field is populated based on the Certificate selected.



6. Under the **CSR Parameters** section, enter or select the requested field information as described in the table below.

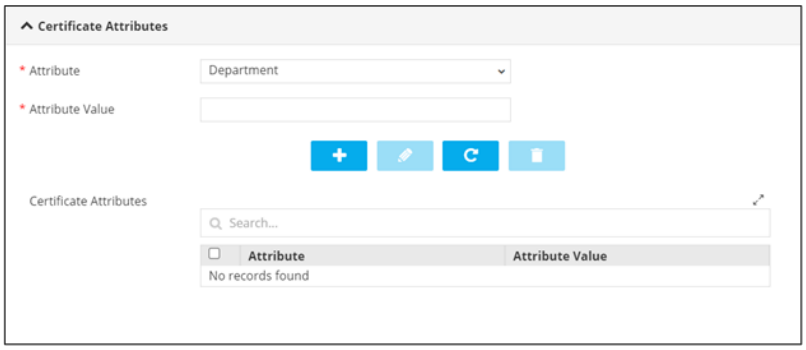
Field Description for CSR Parameters section

Field	Description
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested. **Note:** You have the option to change the common name of the regenerated certificate.
Subject Alternative Name	Select the **SAN** as either: • **DNS** • **Directory Name** • **Email** • **IP Address** • **Registered ID**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **URL** • **Other Name**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select **IP Address** in the **SAN** field.
Directory Name	Enter a valid Directory Name if you select the **Directory Name** option in the **SAN** field.
URL	Enter a valid URL if you select the **URL** option in the **SAN** field.
Other Name	Enter a valid Other Name if you select the **Other Name** option in the **SAN** field.
Registered ID	Enter a valid Registered ID if you select the **Registered ID** option in the **SAN** field.
Validity Unit	Select the **Validity Unit** as either: • **Days** • **Months** • **Years**
Validity Value	Enter a **Validity Value** based on the selected validity unit.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Download Format**	Select the format for downloading the certificate from the available options.
All asterisk (*) marked fields are mandatory.	

7. Under the **Certificate Attributes** section, select the **Attribute** from the available options.
8. Enter a value for the selected attribute.

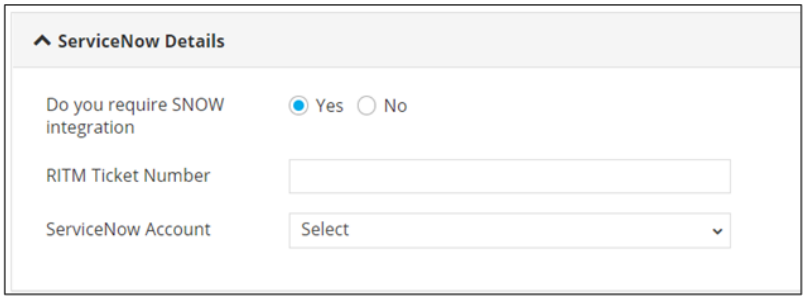


Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Actions available in the Certificate Attributes grid

Action	Description
	Allows you to add the attribute to the **Certificate Attributes** grid.
	Allows you to edit the value of a particular attribute. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a certificate attribute.
	Allows you to maximize the **Certificate Attributes** grid.
Search bar	Allows you to search for a particular attribute in the grid.

9. Under the **ServiceNow Details** section, enter or select the requested field information as described in the table below.



Field Description for ServiceNow Details section

Field	Description
Do you require SNOW Integration?	Select the required radio button for ServiceNow integration.
RITM Ticket Number	Enter the RITM Ticket Number to which the downloaded certificate will be attached. **Note:** This field is displayed only when you select Yes in the **Do you require SNOW Integration?** field.
ServiceNow Account	Select the ServiceNow Account from the options available in the dropdown.

Automation Workflow Tasks

- Overview
- Expiry Task
- Enrollment Tasks
- Renew Tasks
- Push Tasks

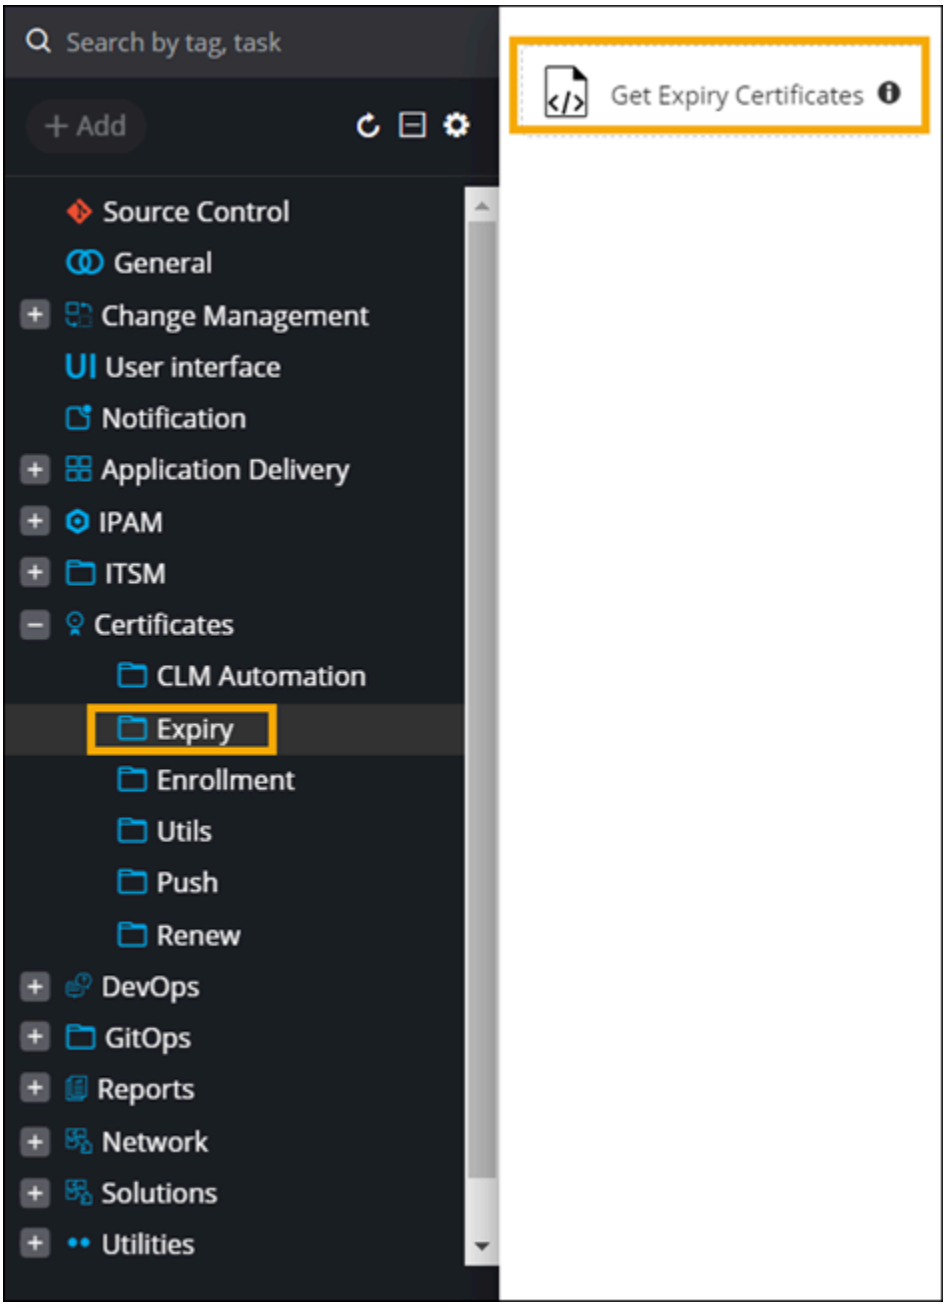
Overview

This section will describe the various OOB tasks available in the Workflow Studio.

Expiry Task

You can design a custom workflow for receiving certificate expiry notifications using the prebuilt task for getting expiry certificates available in the **Automation** module. The OOB script task for getting expiry certificates can be found under **Certificates** in the **Expiry** folder.

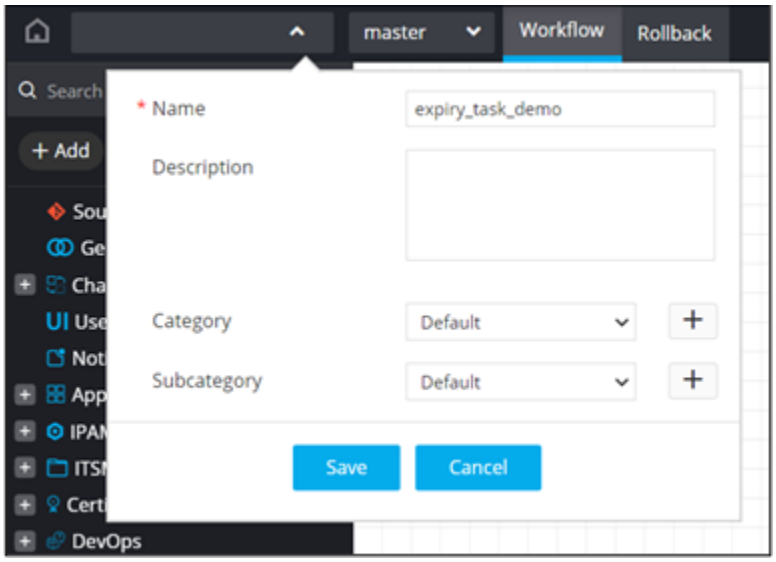
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



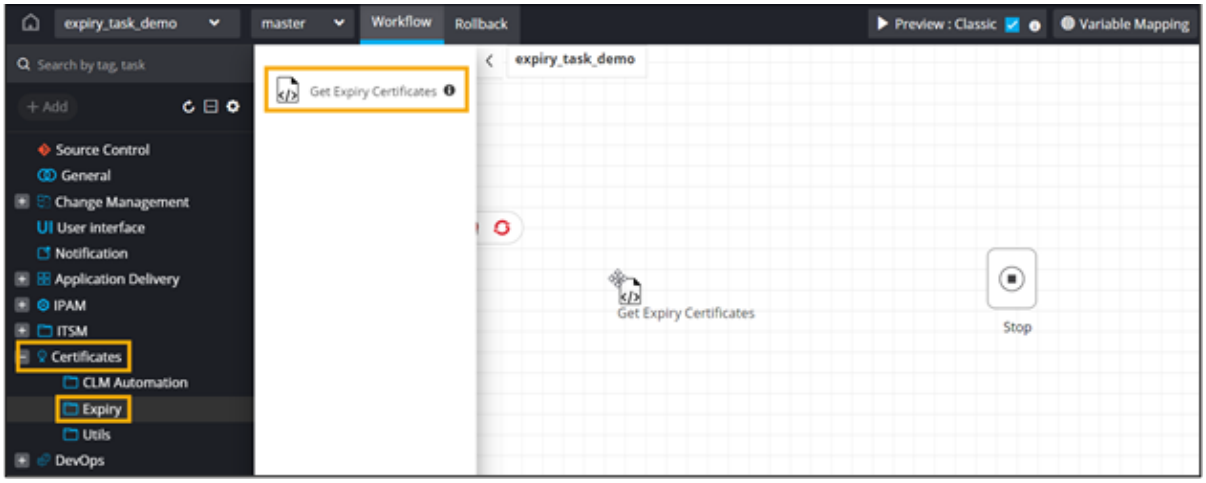
To design a custom workflow using the **Get Expiry Certificates** task

1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

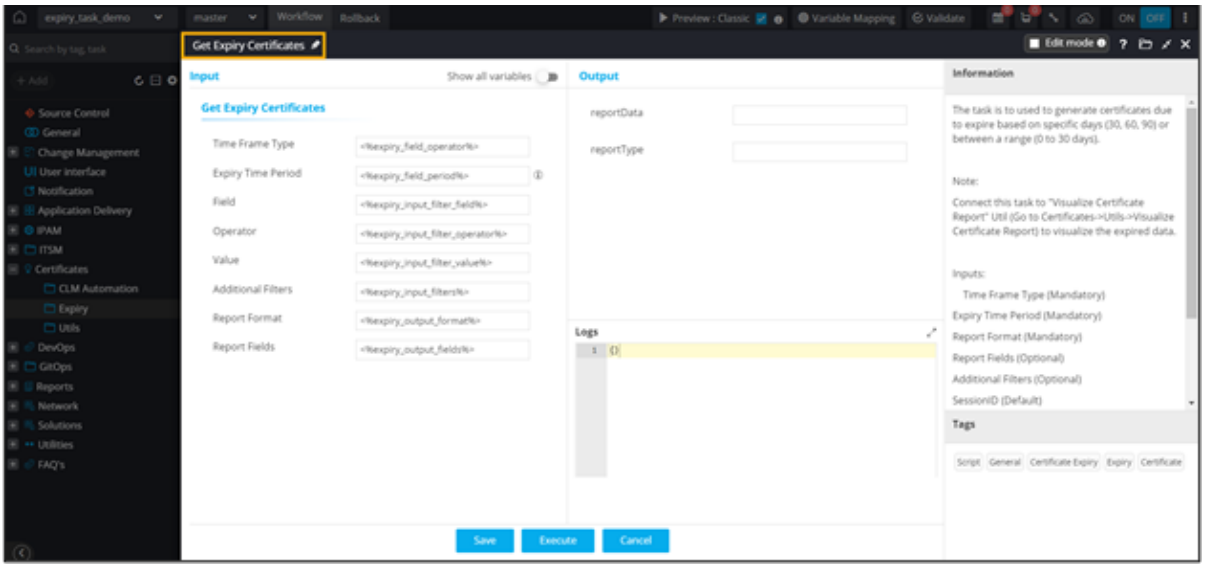


3. From the **Certificates**folder in the left menu, under **Expiry**, drag and drop the **Get Expiry Certificates** task.

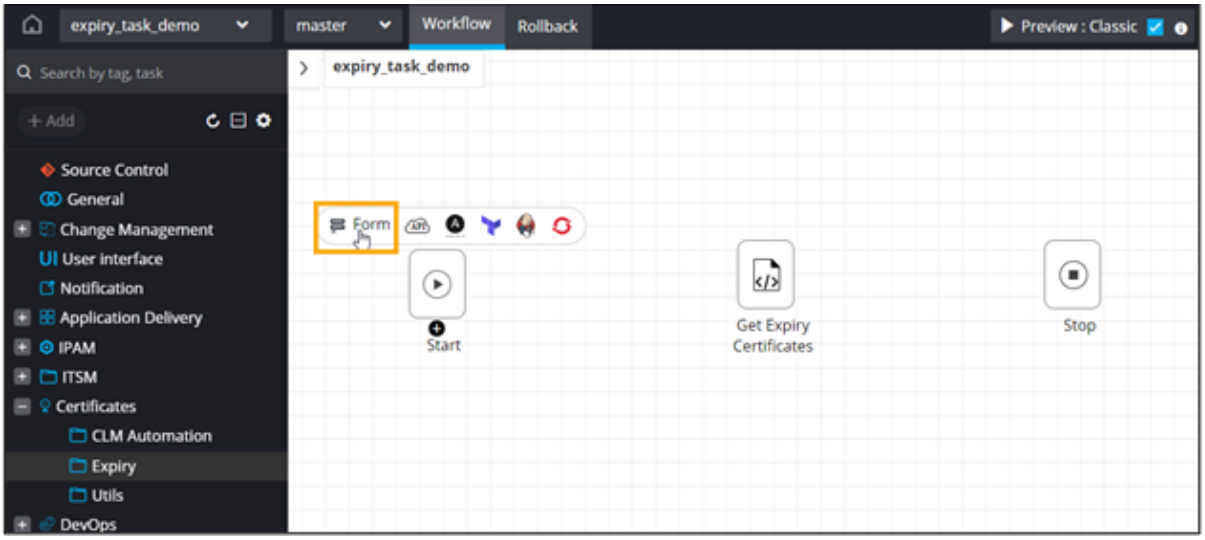


This task can be used to generate a report listing certificates due to expire in a specific number of days.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

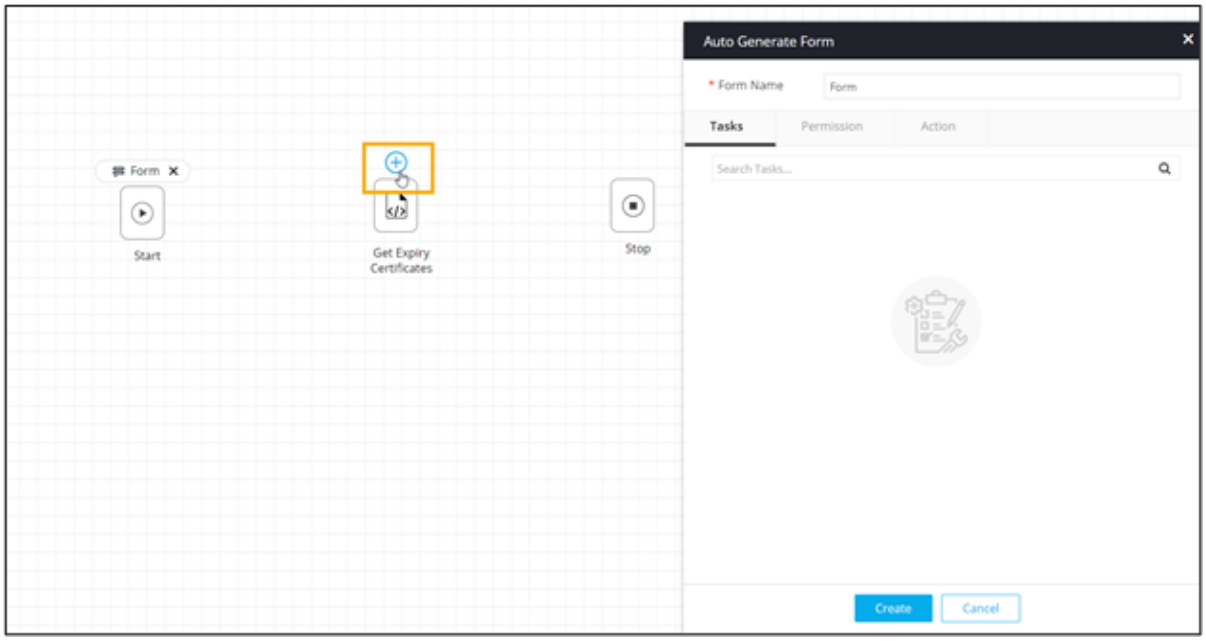


4. To auto-generate a form for this workflow, click **Form** above the **Start** task.



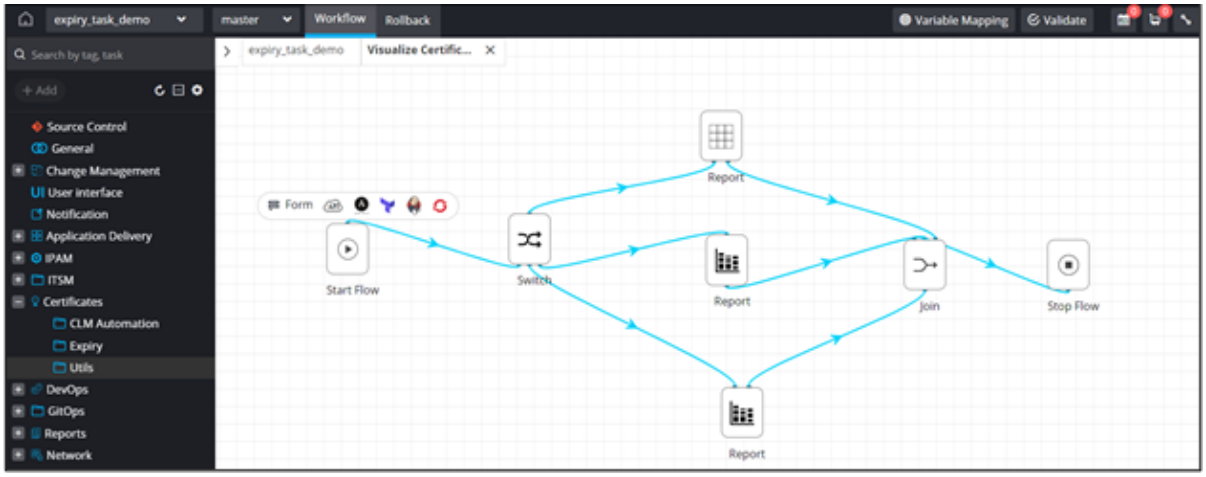
5. Click ⊕ above the **Get Expiry Certificates** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Select the fields required in the input form.
7. Enter a **Form Name** and click **Create**.
8. To display the certificate data in a report, from the **Utils** folder, drag and drop the **Visualize Certificate Expiry Report** prebuilt subflow.

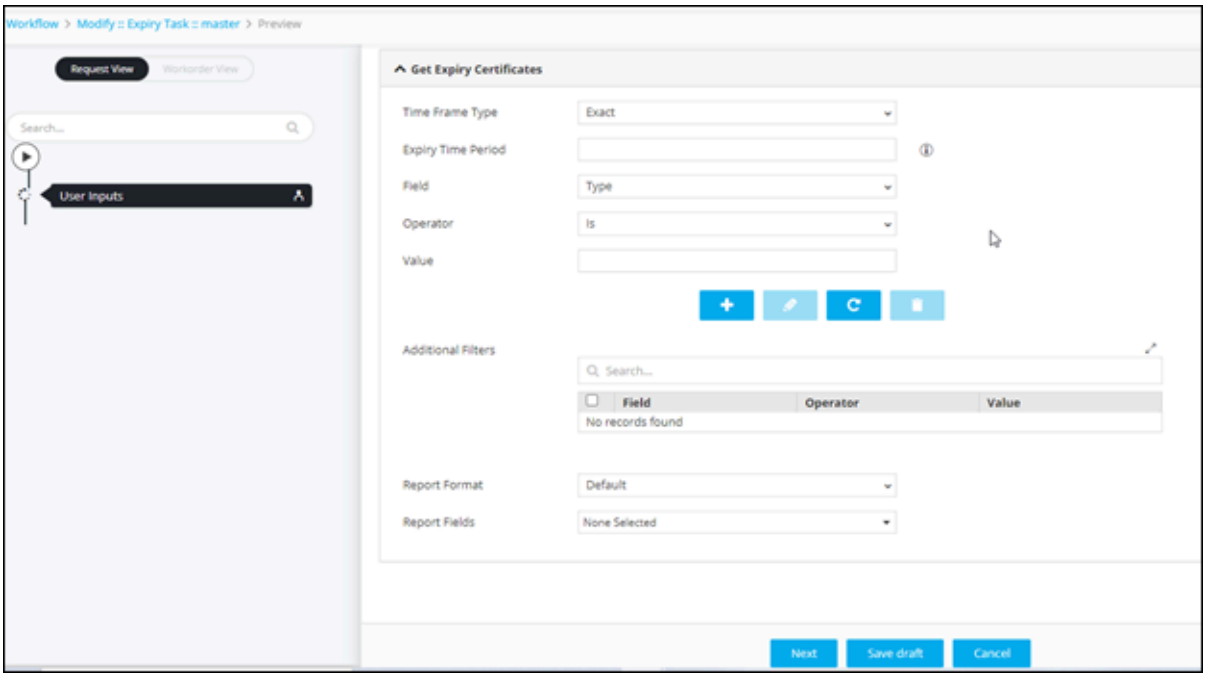
   This subflow includes **User Interface** tasks such as **Grid** and **Chart** (Pie chart and Stacked bar chart). The report generated will be displayed as a grid or a chart based on the inputs provided in the input form.



9. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.

   User Inputs form is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field Description for User Inputs form

Field	Description
Time Frame Type	Enter the time frame type from the available options: • **Exact** - Allows you to enter the exact value for the expiry time period (30 days). • **Range** - Allows you to give a range for the expiry time period (0 - 30). **Note: Exact** is the default selection.
Expiry Time Period	Enter the expiry time period for which notification has to be sent. Multiple values can be entered, separated by commas. You can either define it as an exact number or a range or a combination of both. For example, 30,60,90 or 0-30,30-60,0-60 or 30,30-60,90. • **Input type: Range** - The expiry report will be generated for the range specified. For example, 0 - 30 days, 0 - 60 days, 0 - 90 days. • **Input type: Exact** - The expiry report will be generated for certificates expiring on the exact specified date. For example, certificates expiring on the 30th, 60th, 90th day.
Field	Select the field from the options available in the dropdown.
Operator	Select the conditional operator: • **Is** • **Is Not**
Value	Enter a valid value for filtering the certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Additional Filters	This grid displays the values selected in these fields: • **Field** • **Operator** • **Value** **Note:** The steps to apply these additional filters are given below the table.
Report Format	Select the format in which the report is displayed from the available options: • **Default** • **Pie Bar Chart** • **Stacked/Bar Chart**
Report Fields	Select the fields to be displayed in the report from the options available in the dropdown.

10. To add filters to the **Additional Filters** grid, click
11. To edit the value of a particular filter, select the filter in the grid and click .
12. Enter the new value(s) for the filters (Field/Operator/Value) and click again to update the value(s).
13. To delete a filter, select the filter in the grid and click .
14. To maximize the **Additional Filters** grid, from the top right corner of the grid, click .
15. Click **Next**.

    Report is generated with expiry certificates data displayed in Grid format.

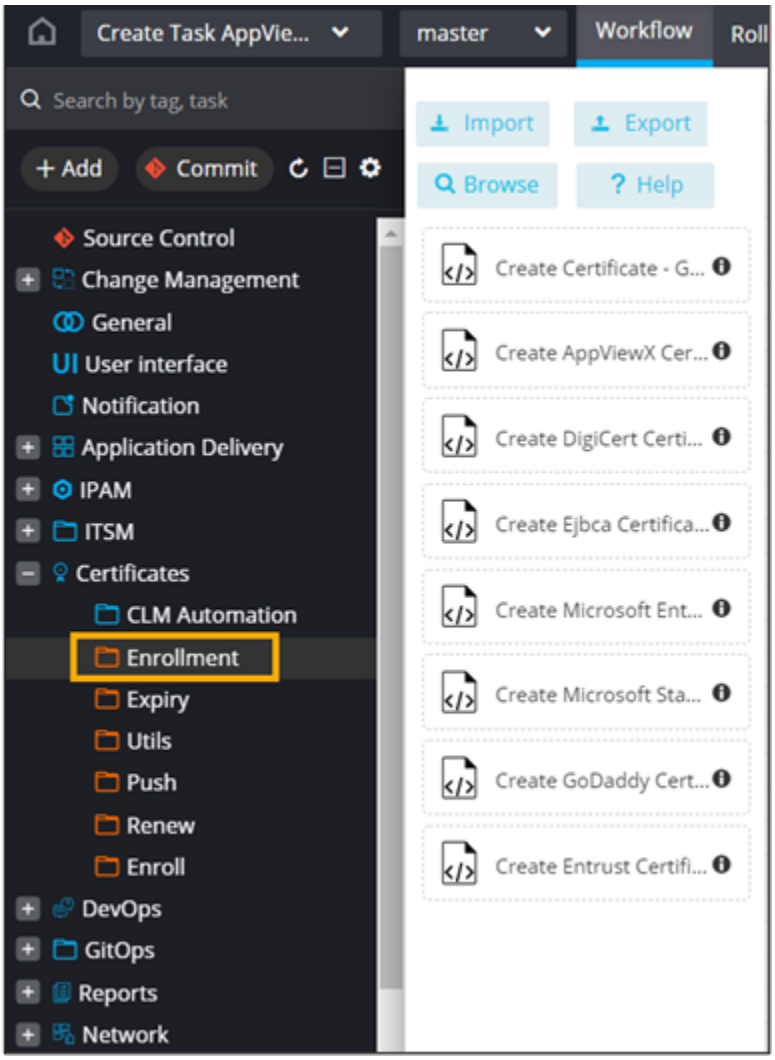
Note: For more information on how to design custom workflows, refer to the Automation User Guide.

Enrollment Tasks

You can design a custom workflow for enrolling a certificate using the prebuilt Create Certificate tasks available in the **Workflow Studio**. The OOB script task for enrolling certificates through different Certificate Authorities can be found under **Certificates**, in the **Enrollment** folder.

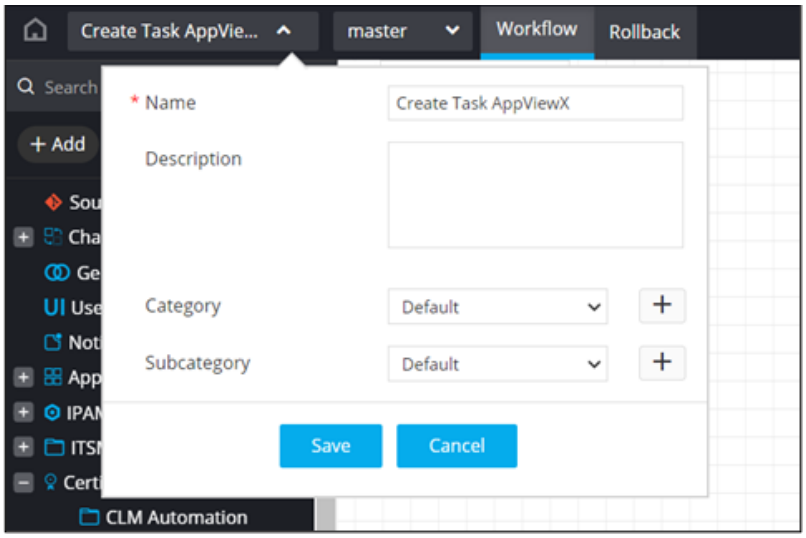
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



To design a custom workflow using **Enrollment** tasks:

1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

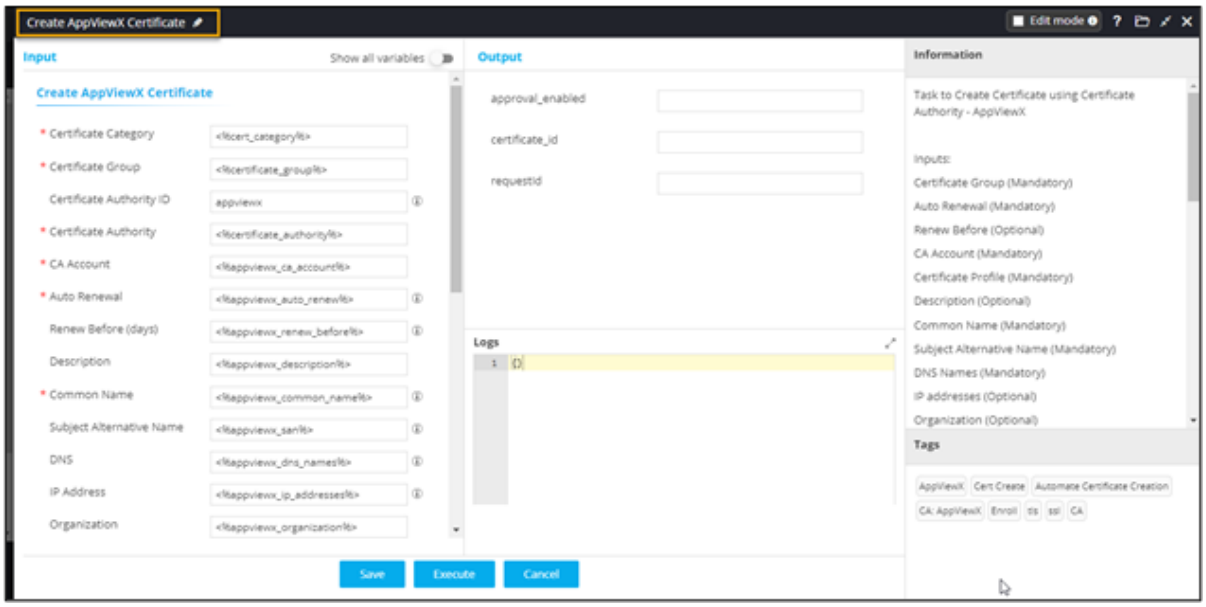


3. From the **Certificates** folder, click **Enrollment**.

   The tasks for the following CAs are available in the **Enrollment** folder:

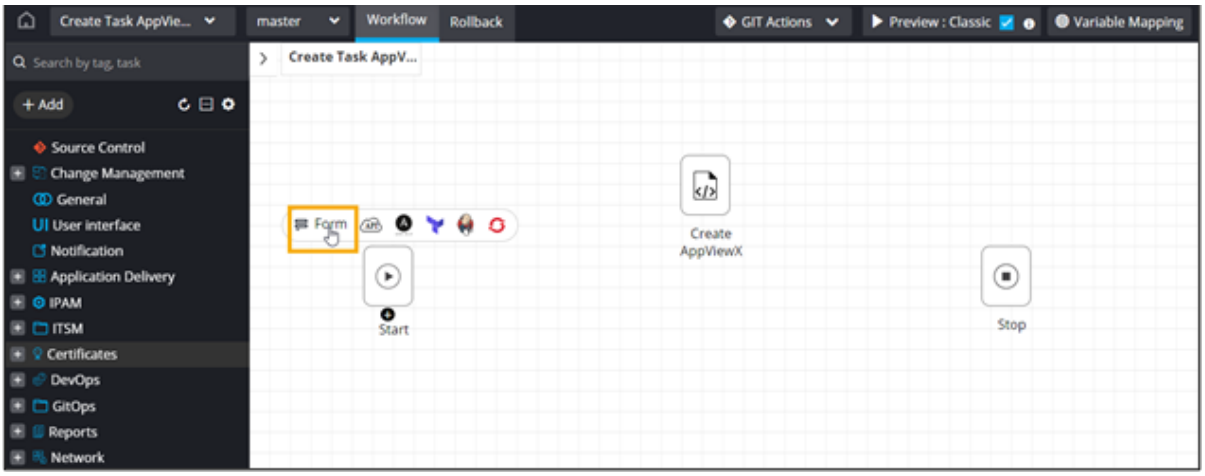
   - Appviewx
   - DigiCert
   - EJBCA
   - Entrust
   - Microsoft Enterprise
   - Microsoft Standalone
   - GoDaddy

4. From the **Enrollment** folder, drag and drop any of the Create Certificate tasks. For example, the **Create AppViewX Certificate** task.

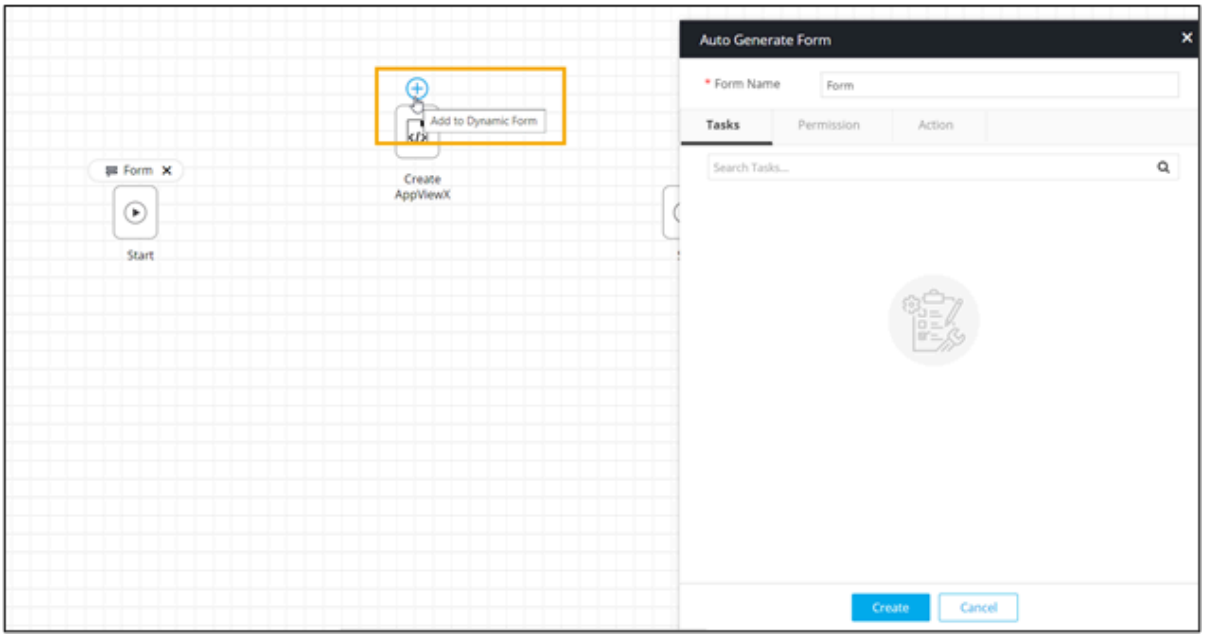


Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Click **Save**.
6. To auto-generate a form for this workflow, click **Form** above the **Start** task.

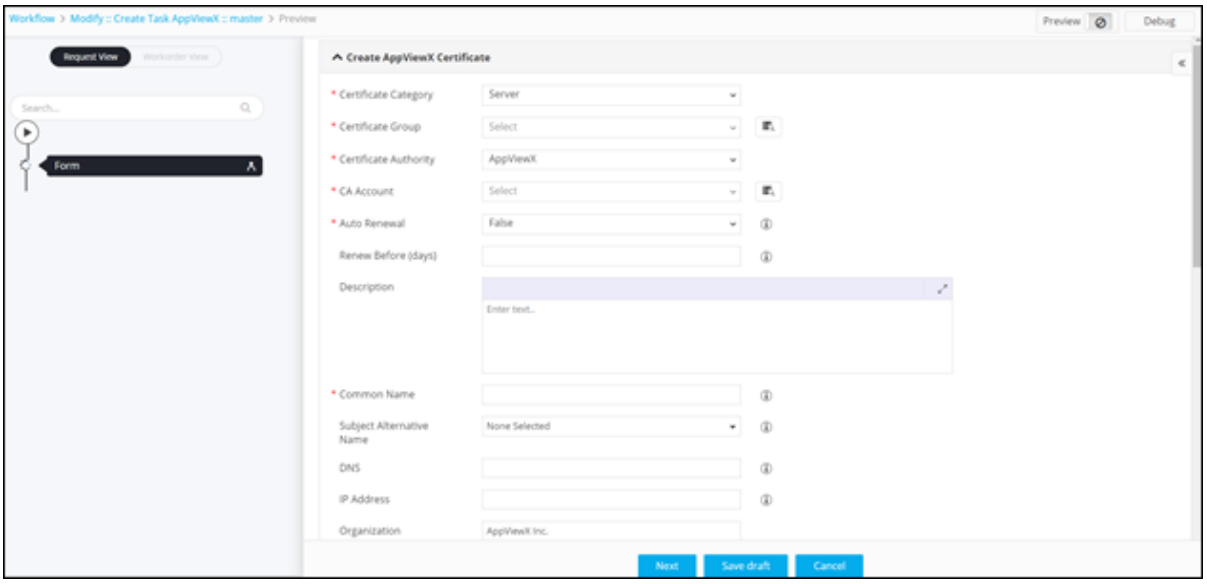


7. Click ⊕ above the **Create AppViewX** task to auto-populate the form fields.



8. Select the fields required in the input form.
9. Enter a **Form Name** and click **Create**.
10. To view and download the certificate in a holistic view, from the **Utils** folder, drag and drop the **View and Download Certificate** prebuilt task.
11. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.
    User Inputs form, when the **Create AppViewX Certificate** task is selected, is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field Description for the User Inputs form

Field	Description
Certificate Category	Select the **Certificate Category** from the options available in the dropdown. **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown. **Note:** To retrieve the values in the **Certificate Group** field, click .
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** To retrieve the values in the **CA Account** field, click .
***Auto Renewal**	Select the required option from the dropdown to enable/disable **Auto Renewal** for the regenerated certificate.
Renew Before (days)	Enter the number of days in the **Renew Before (days)** field. For example, if you enter 5, then the renewal request will be triggered 5 days prior to the expiry date.

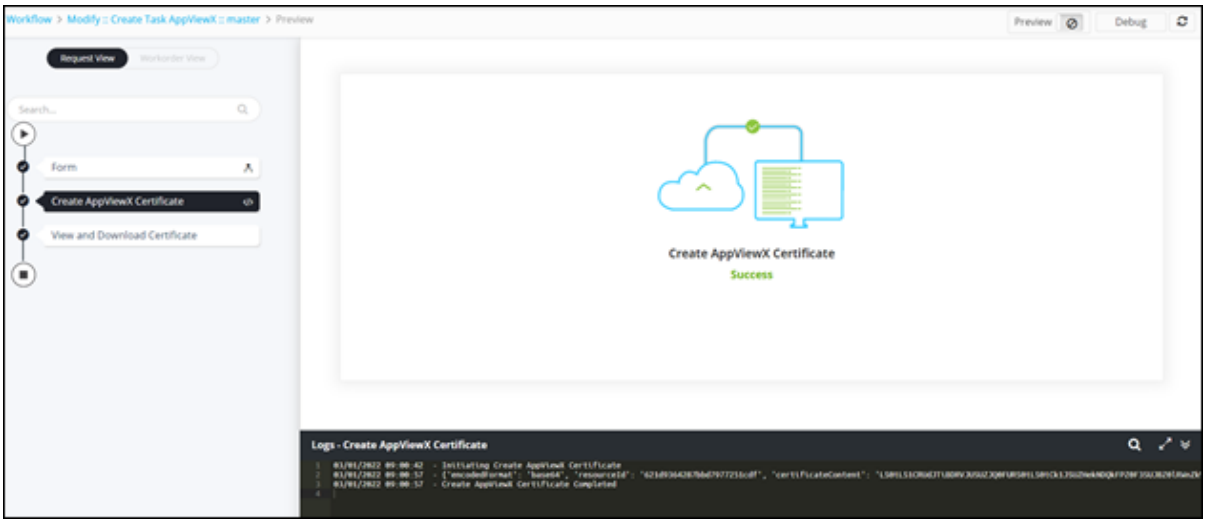
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Description	Add a description for the workflow, if required.
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown.
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit.
Locality	Enter the name of the locality in which the organization is situated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Zip Code	Enter the Zip code in which the organization is located.
Email Address	Enter the Email Address of the organization.
***Validity Unit**	Select the **Validity Unit** from the options available in the dropdown.
***Validity Value**	Enter the **Validity Value** based on the Validity Unit selected.
Challenge Password	Enter the challenge password.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

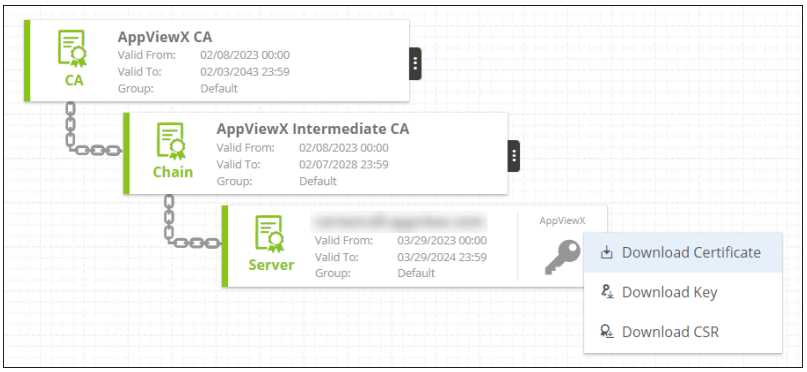
Field	Description
	Note: To retrieve the types of keys that can be availed, click .
***Bit Length**	Select the **Bit Length** from the options available in the dropdown.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.
All asterisk (*) marked fields are mandatory.	

12. To add the attribute to the **Certificate Attributes** grid, click .
13. To edit the value of a particular attribute, select the attribute in the grid and click .
14. Enter the new value for the attribute in the **Value** field and click again to update the value.
15. To delete a certificate attribute, select the attribute in the grid and click .
16. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
17. To search for a particular attribute in the grid, type the keyword(s) in the search field.
18. Click **Next**.
    AppViewX Certificate is created.

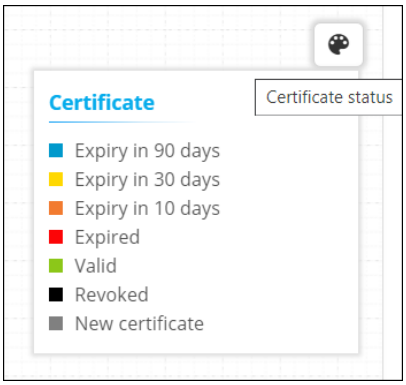


19. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



20. Hover your mouse over to view the **Certificate status**.



Note: For more information on how to design custom workflows, refer to the Automation User Guide.

Renew Tasks

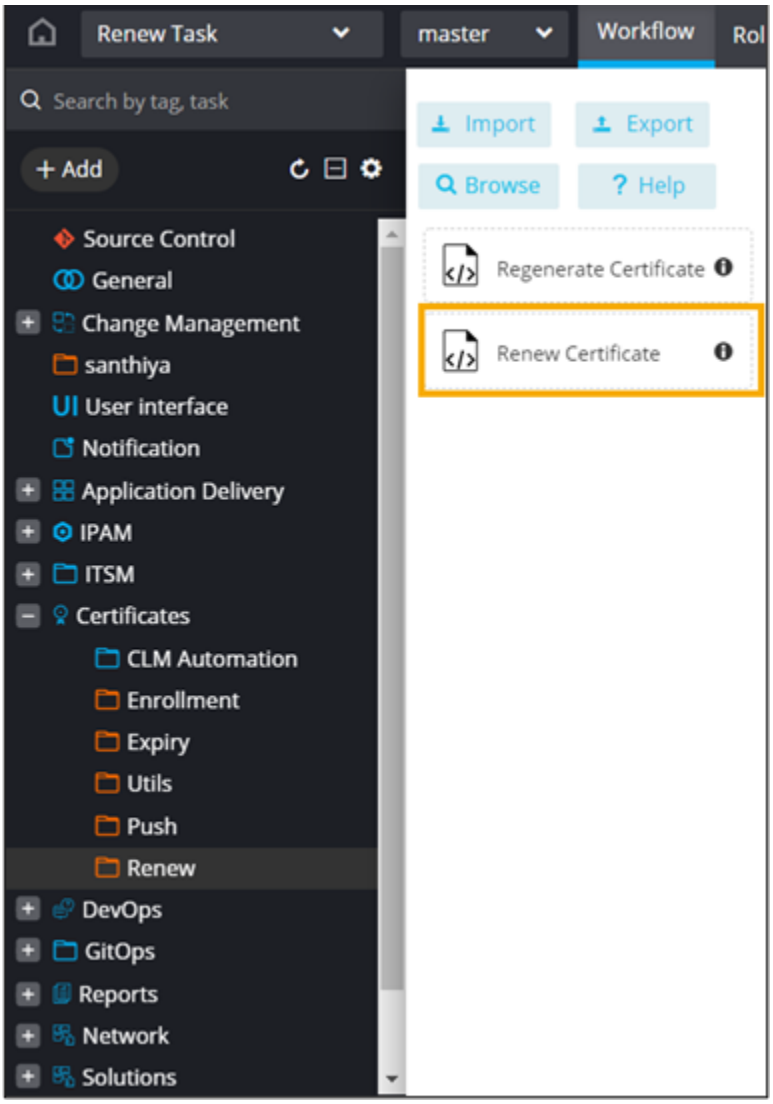
This section describes the **Renew** and **Regenerate** tasks that can be integrated with custom workflows to renew and regenerate certificates.

- Renew Task
- Regenerate Task

Renew Task

The OOB script task for renewing certificates can be found in the **Workflow Studio**, under **Certificates**, in the **Renew** folder.

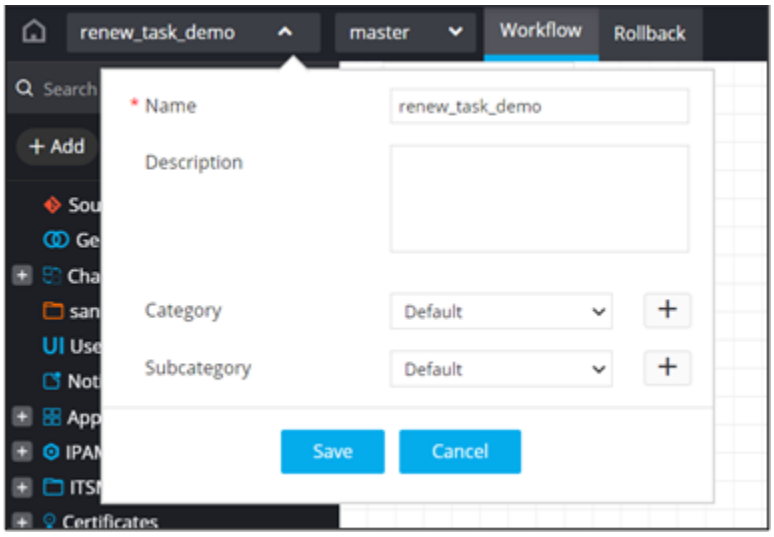
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



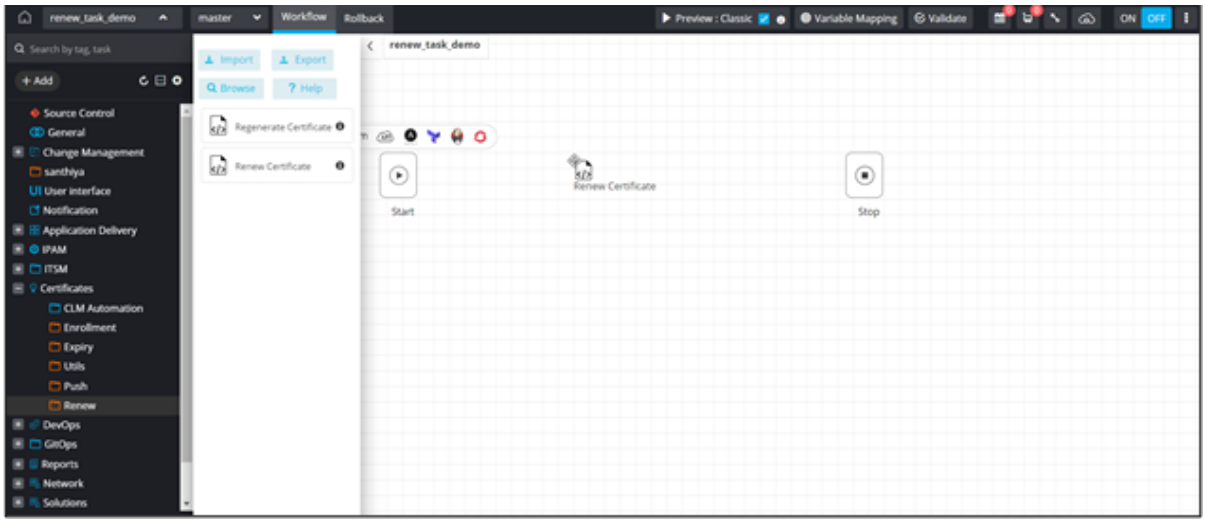
To design a custom workflow using the **Renew** task:

1. Navigate to the WorkflowWorkflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

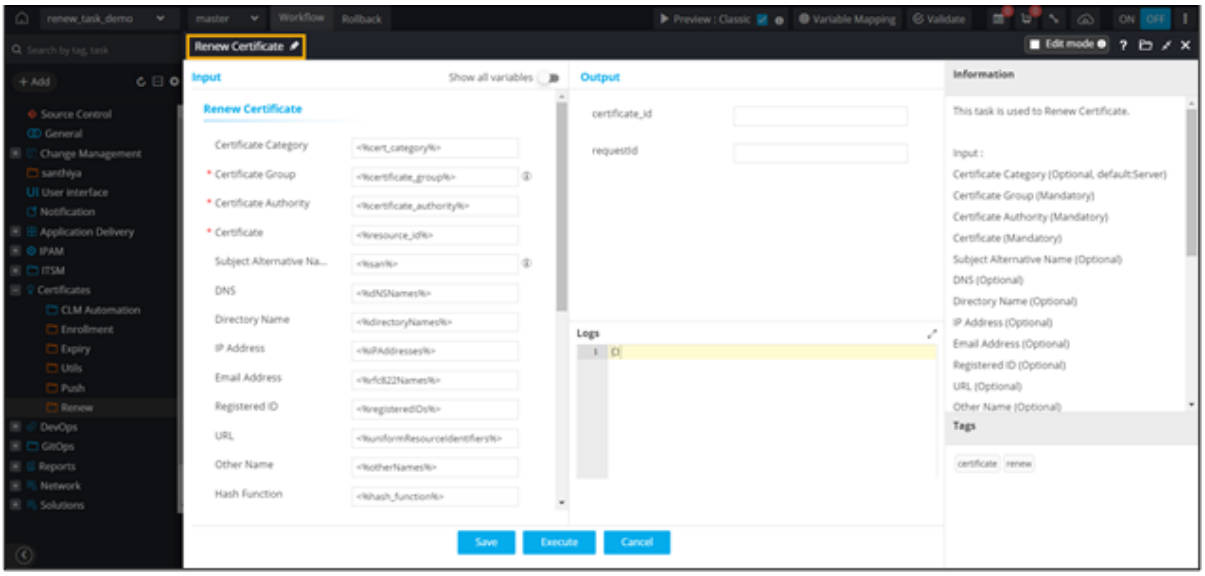


3. From the **Certificates** folder, under **Renew**, drag and drop the **Renew Certificate** task.

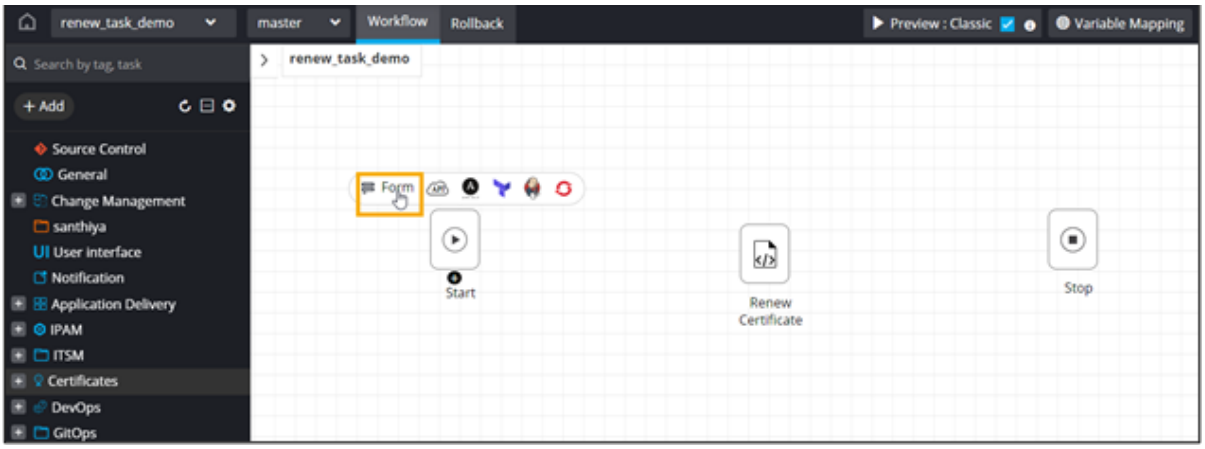


This task can be used to renew certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

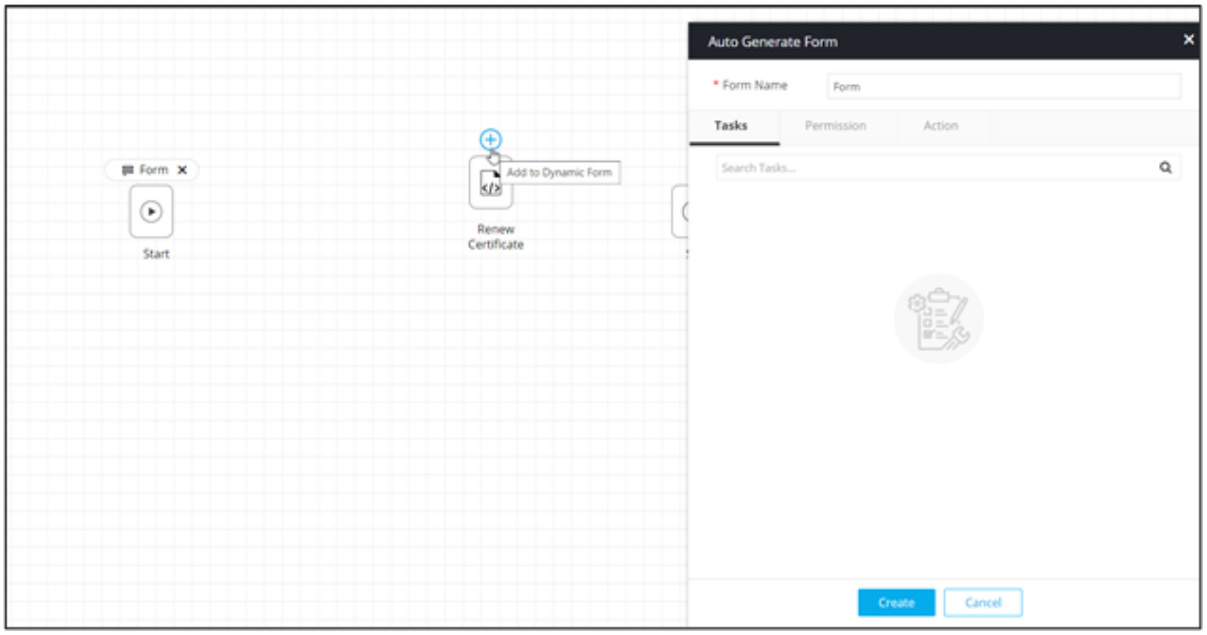


4. To auto-generate a form for this workflow, click **Form** above the **Start** task.



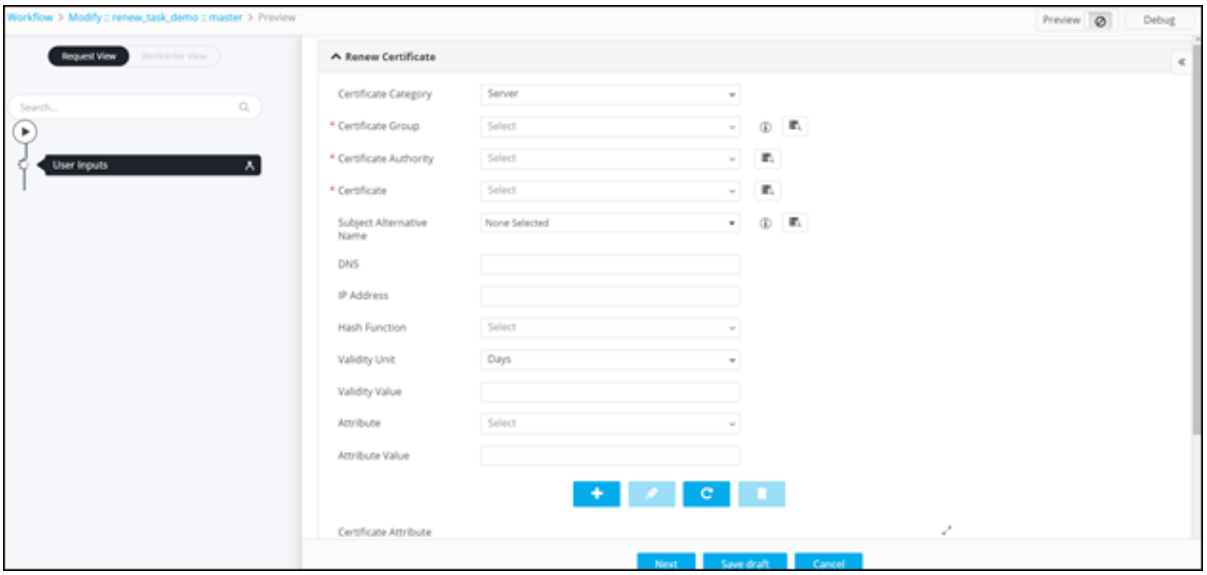
5. Click ⊕ above the **Renew Certificates** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Select the fields required in the input form.
7. Provide a **Form Name** and click **Create**.
8. From the **Utils** folder under the **Certificate** section, drag and drop the **View and Download Certificate** task.
9. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.

   The **User Inputs** form is displayed on the screen.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for the User Inputs form

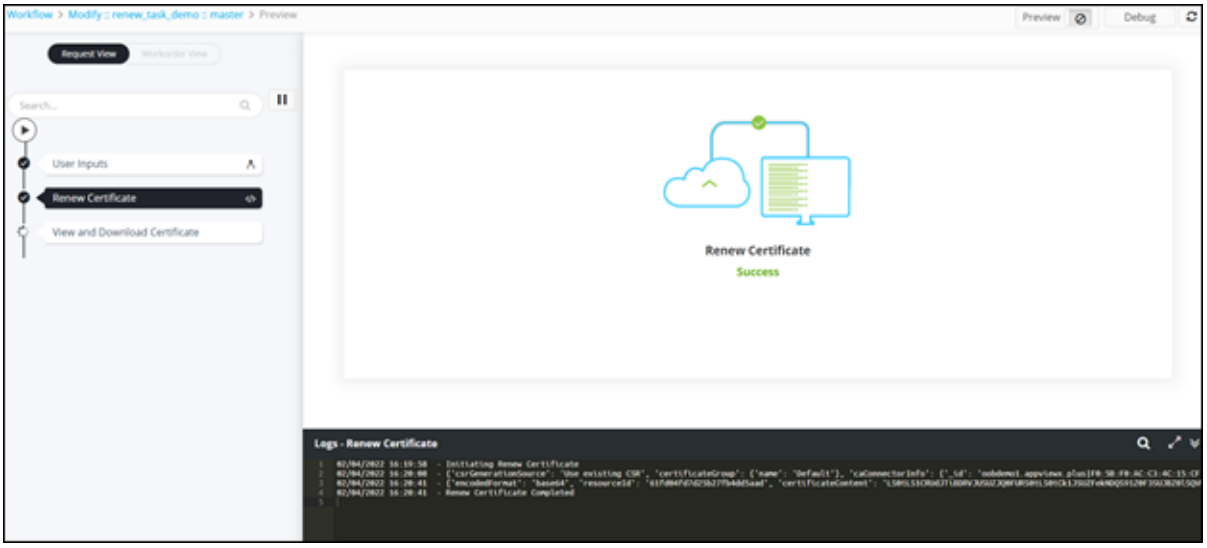
Field	Description
Certificate Category	Select the **Certificate Category** from the options available in the dropdown. **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Group field, click .
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Authority field, click .
***Certificate**	Select the **Certificate** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate field, click .
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown. **Note:** To retrieve the values in the Subject Alternative Name field, click .
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Hash Function	Select the **Hash Function** from the options available in the dropdown.
Validity Unit	Select the **Validity Unit** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Validity Value	Enter the **Validity Value** based on the **Validity Unit** selected.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.
All Asterisk (*) marked fields are mandatory.	

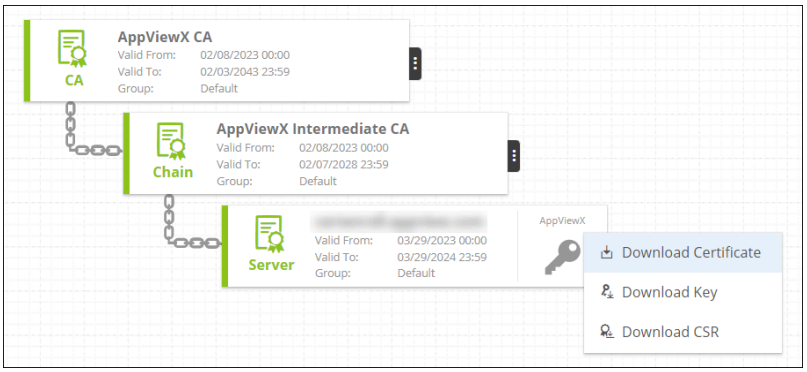
10. To add this attribute to the **Certificate Attributes** grid, click .
11. To edit the value of a particular attribute, select the attribute in the grid and click .
12. Enter the new value for the attribute in the **Value** field and click again to update the value.
13. To delete a certificate attribute, select the attribute in the grid and click .
14. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
15. To search for a particular attribute in the grid, type the keyword(s) in the search field.
16. Click **Next**.

    Certificate renewed successfully.

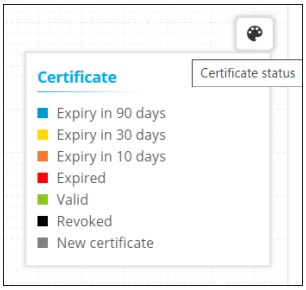


17. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



18. Hover your mouse over to view the **Certificate status**.



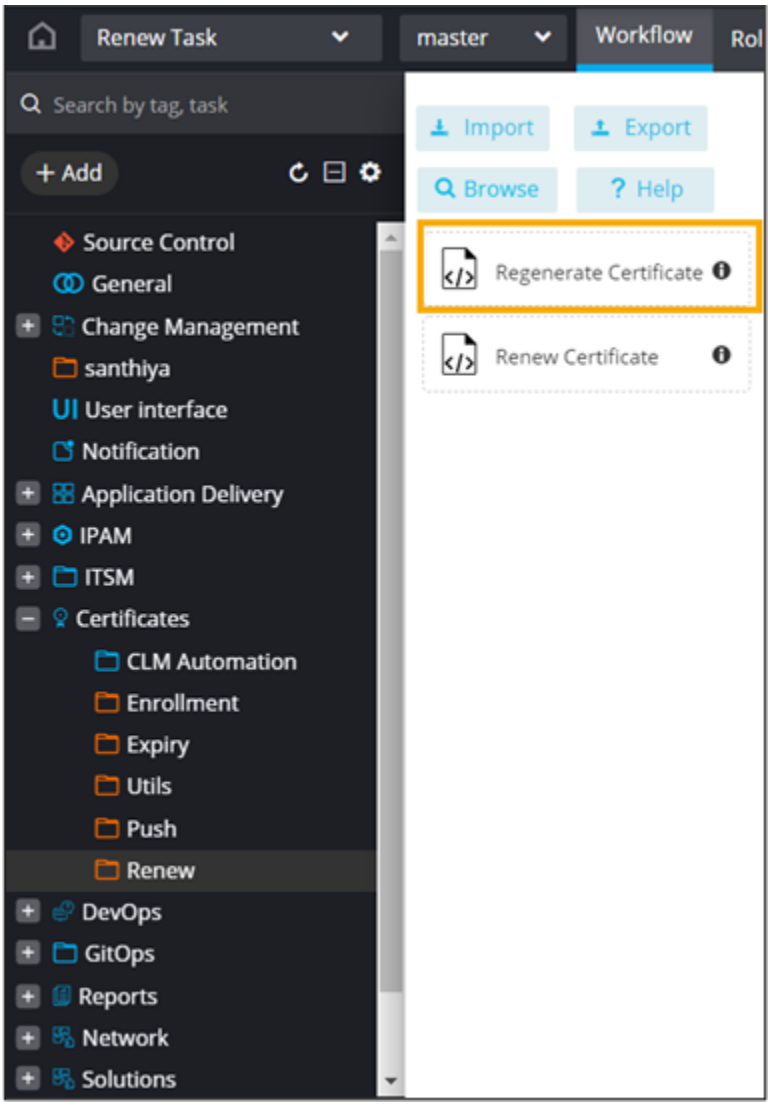
19. Click on the renewed certificate to view the **Certificate Details**.

> **Note:** For more information on how to design custom workflows, refer to the Automation User Guide.

Regenerate Task

The OOB script task for regenerating certificates can be found in the **Workflow Studio**, under **Certificates**, in the **Renew** folder.

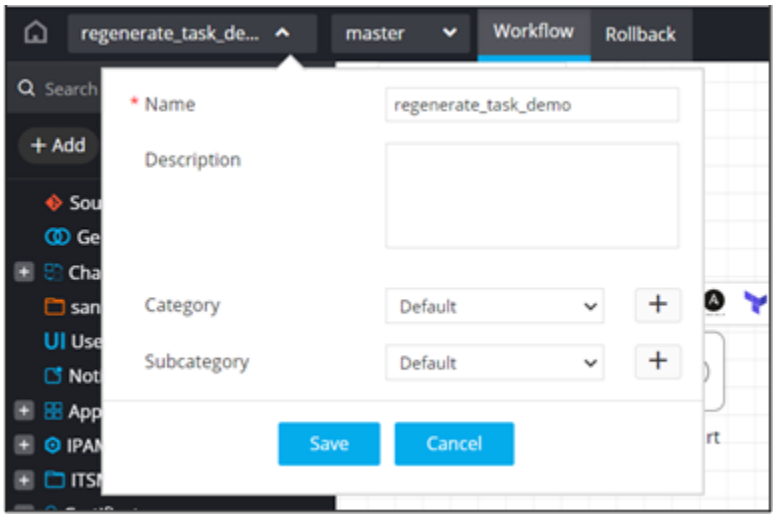
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



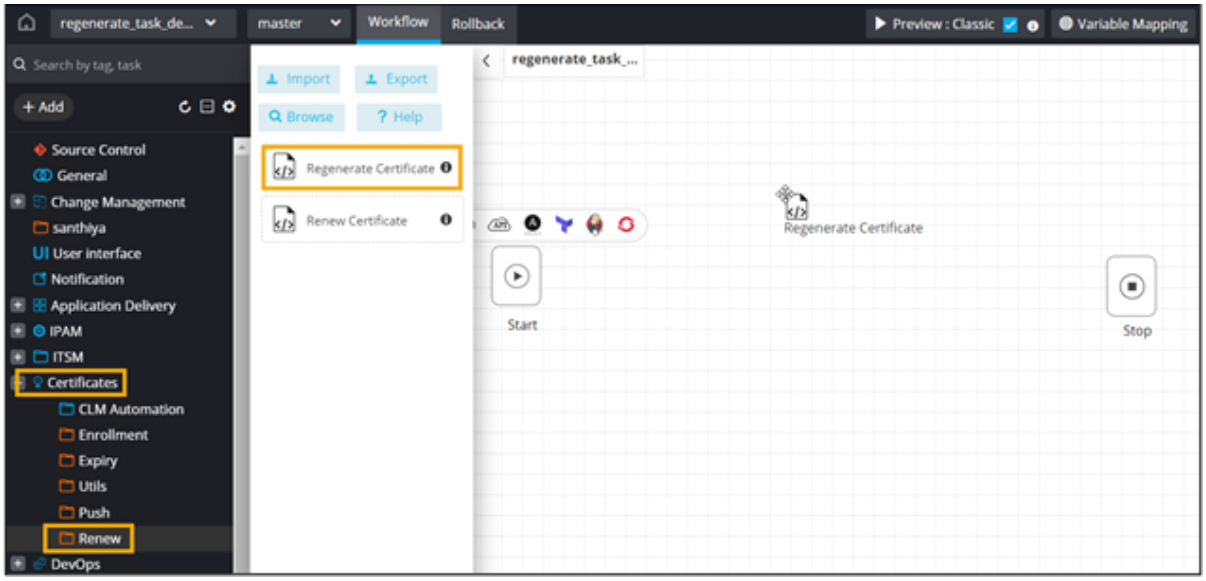
To design a custom workflow using the **Regenerate** task:

1. Navigate to the WorkflowWorkflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

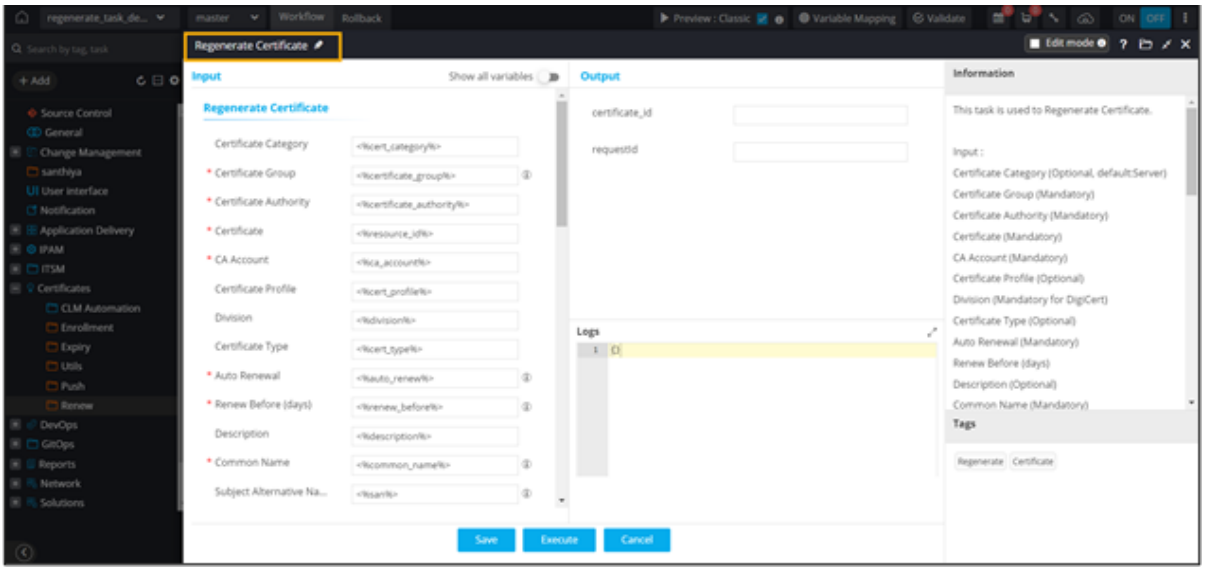


3. From the **Certificates** folder, under **Renew**, drag and drop the **Regenerate Certificate** task.

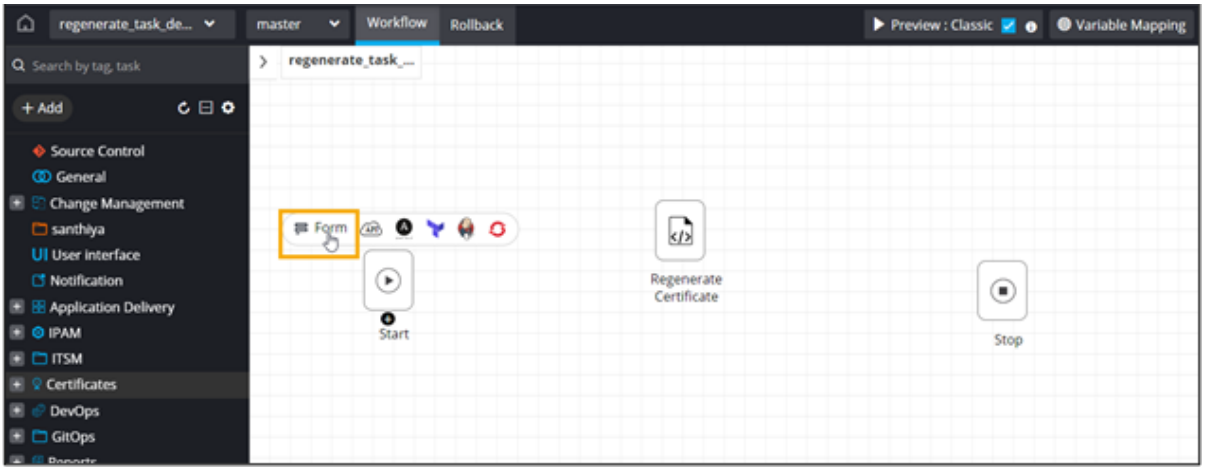


This task can be used to regenerate certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

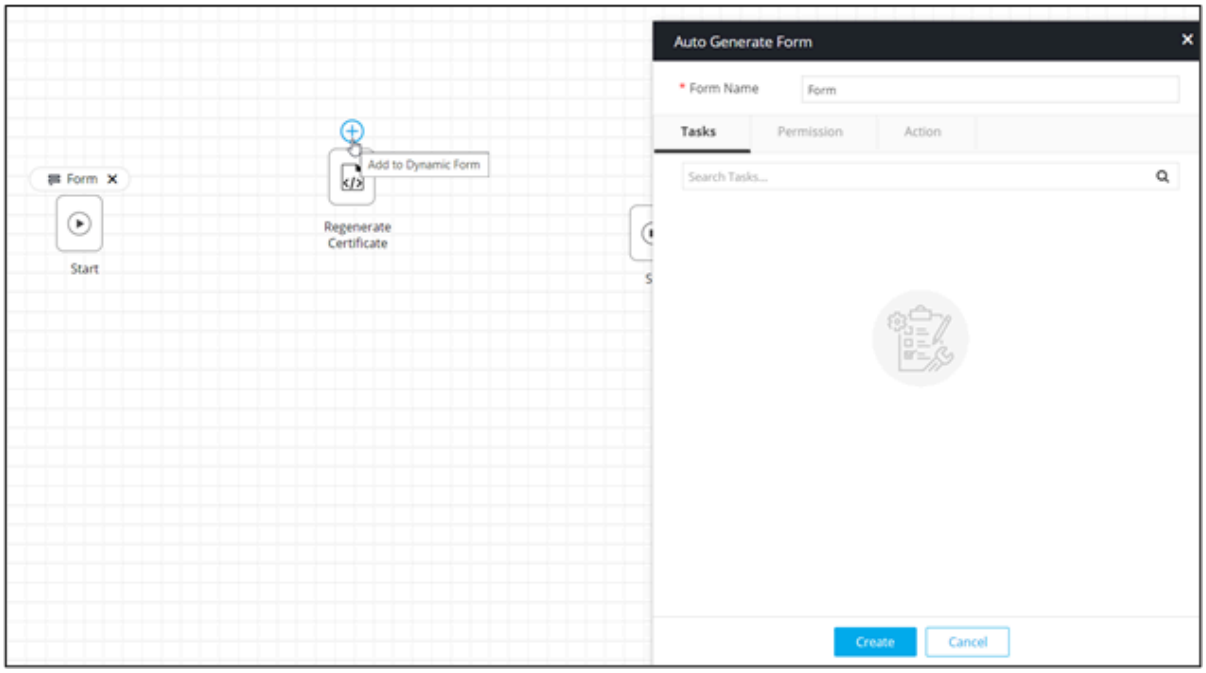


4. To auto-generate a form for this workflow, click **Form** above the **Start** task.

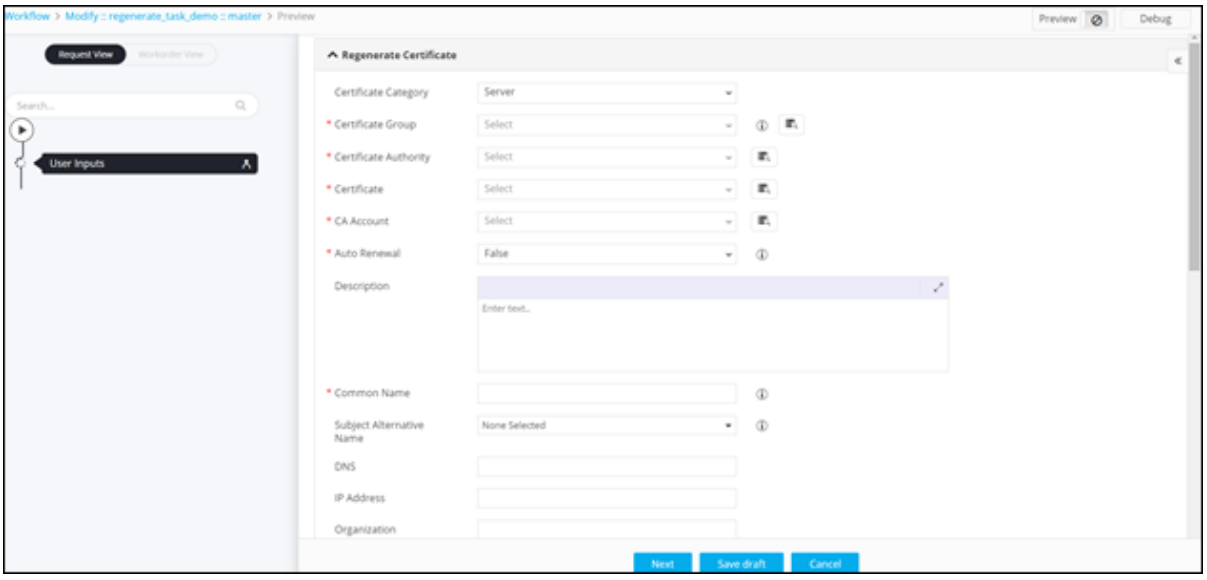


5. Click ⊕ above the **Regenerate Certificates** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Select the fields required in the input form.
7. Enter a **Form Name** and click **Create**.
8. From the **Utils** folder under the **Certificate** section, drag and drop the **View and Download Certificate** task.
9. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.
   The **User Inputs** form is displayed on the screen.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Description for the User Inputs form

Field	Description
Certificate Category	Select the **Certificate Category** from the options available in the dropdown. **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Group field, click .
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Authority field, click .
***Certificate**	Select the **Certificate** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate field, click .
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** To retrieve the values in the CA Account field, click .
***Auto Renewal**	Select the required option from the dropdown to enable/disable **Auto Renewal** for the regenerated certificate.
Description	Provide a description for the regenerated certificate.
***Common Name**	This field is populated on the basis of the certificate selected.
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown. **Note:** To retrieve the values in the Subject Alternative Name field, click .
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
City	Enter the name of the city in which the organization is located.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Email Address	Enter the email address associated with the organization.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type**from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** To retrieve the values in the Bit Length field, click .
***Validity Unit**	Select the **Validity Unit** from the options available in the dropdown.
***Validity Value**	Enter the **Validity Value** based on the **Validity Unit** selected.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.
All Asterisk (*) marked fields are mandatory.	

10. To add this attribute to the **Certificate Attributes** grid, click .
11. To edit the value of a particular attribute, select the attribute in the grid and click .
12. Enter the new value for the attribute in the **Value** field and click again to update the value.
13. To delete a certificate attribute, select the attribute in the grid and click .
14. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
15. To search for a particular attribute in the grid, type the keyword(s) in the search field.

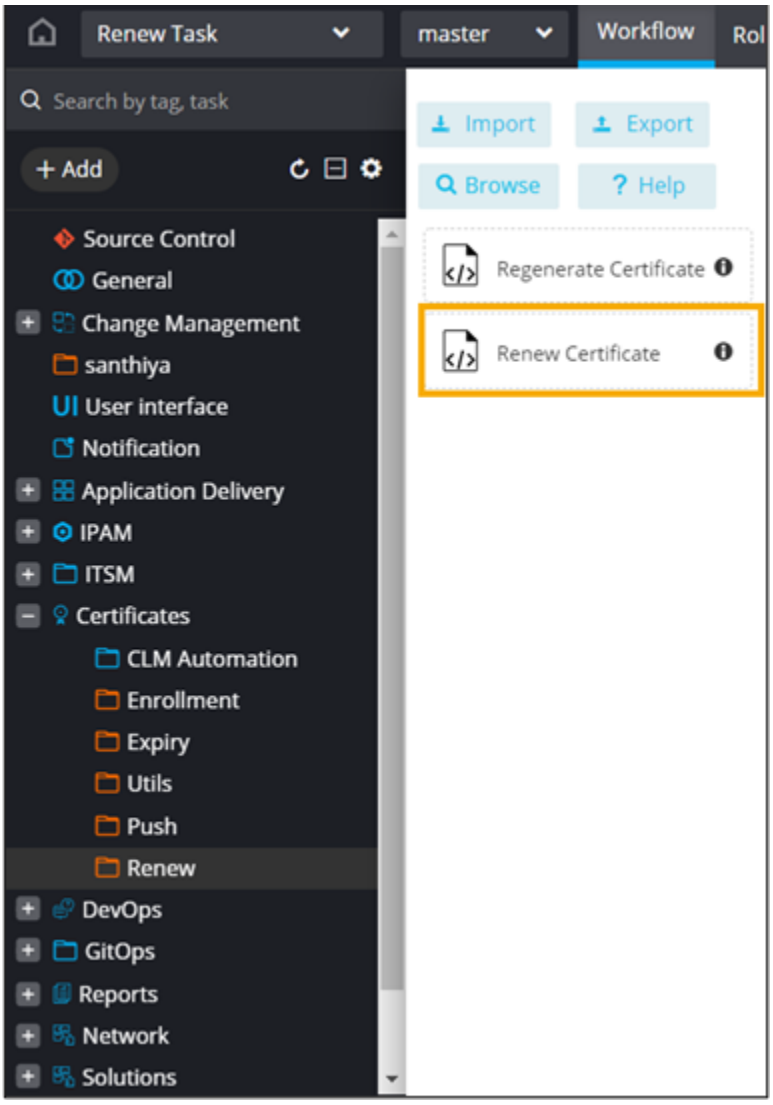
Renew Task

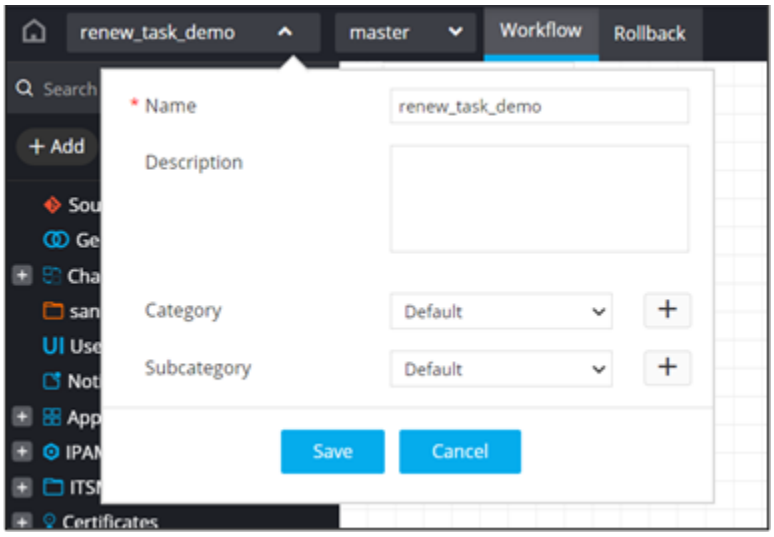
The OOB script task for renewing certificates can be found in the **Workflow Studio**, under **Certificates**, in the **Renew** folder.



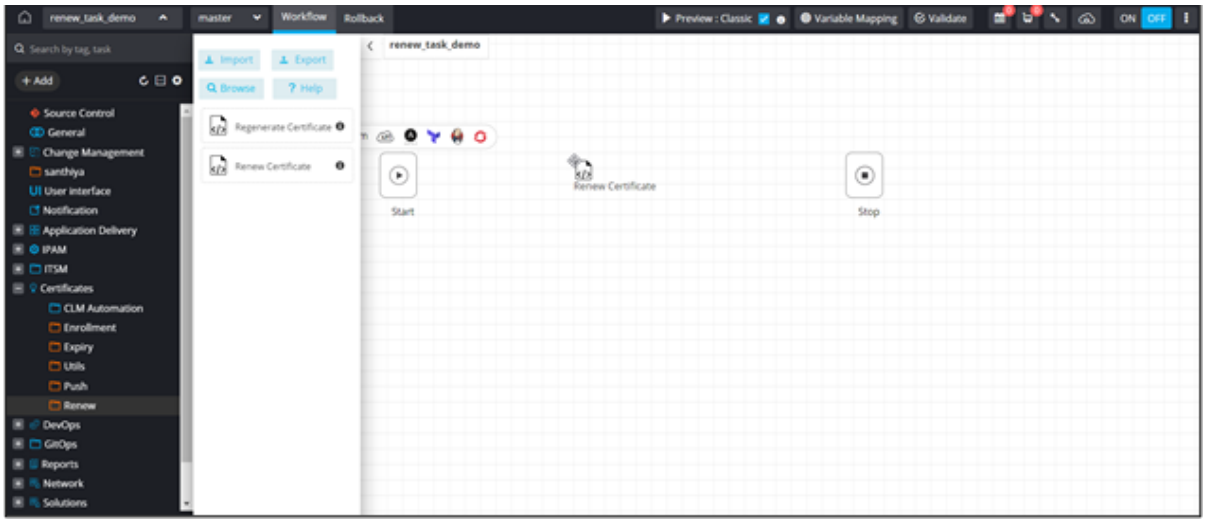
To design a custom workflow using the **Renew** task:

1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

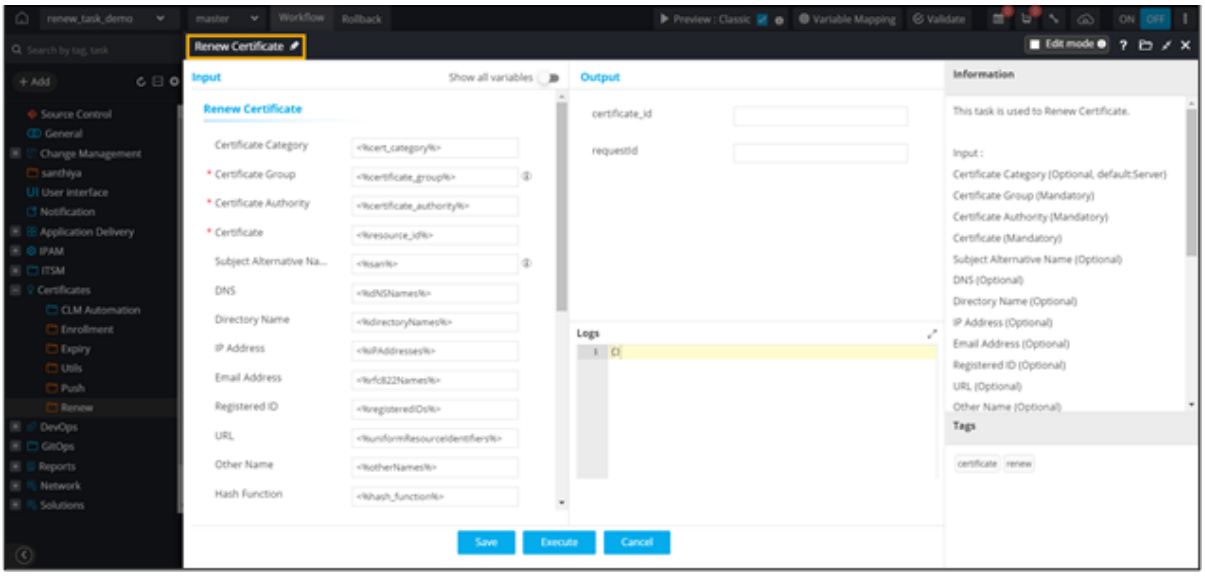


3. From the **Certificates** folder, under **Renew**, drag and drop the **Renew Certificate** task.

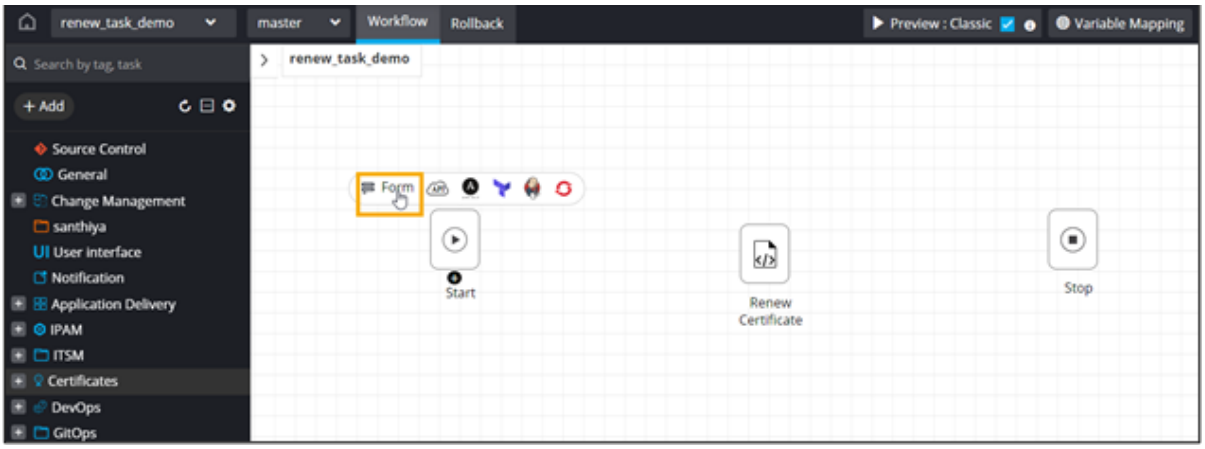


This task can be used to renew certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

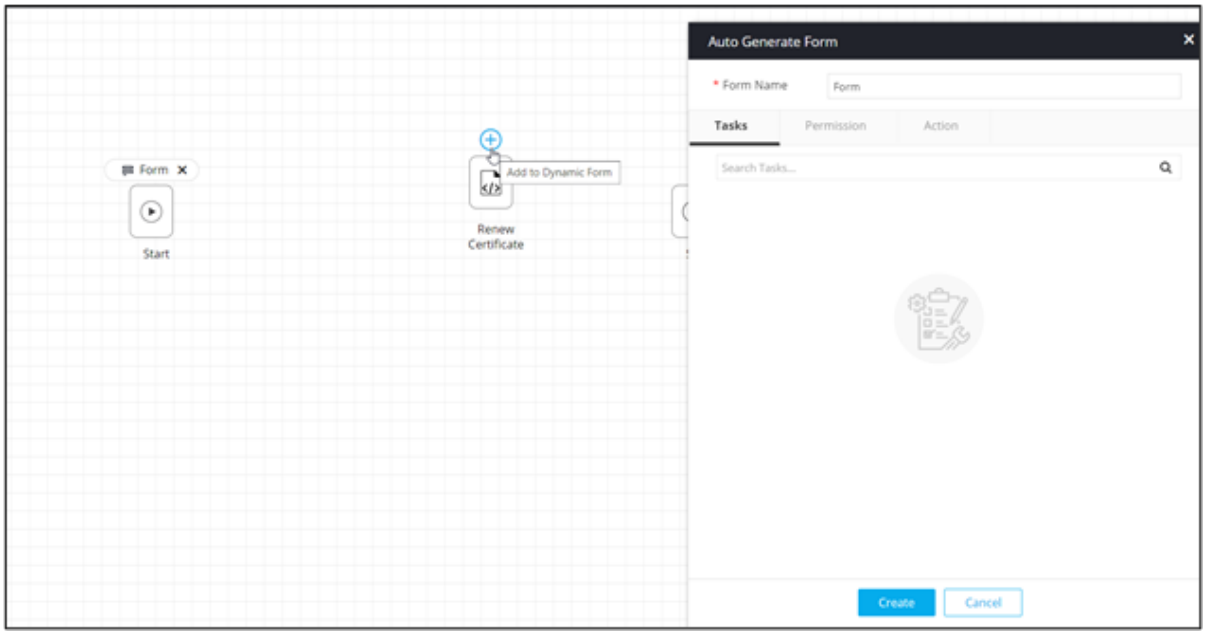


4. To auto-generate a form for this workflow, click **Form** above the **Start** task.



5. Click ⊕ above the **Renew Certificates** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Select the fields required in the input form.
7. Provide a **Form Name** and click **Create**.
8. From the **Utils** folder under the **Certificate** section, drag and drop the **View and Download Certificate** task.
9. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.

   The **User Inputs** form is displayed on the screen.

Field Description for the User Inputs form

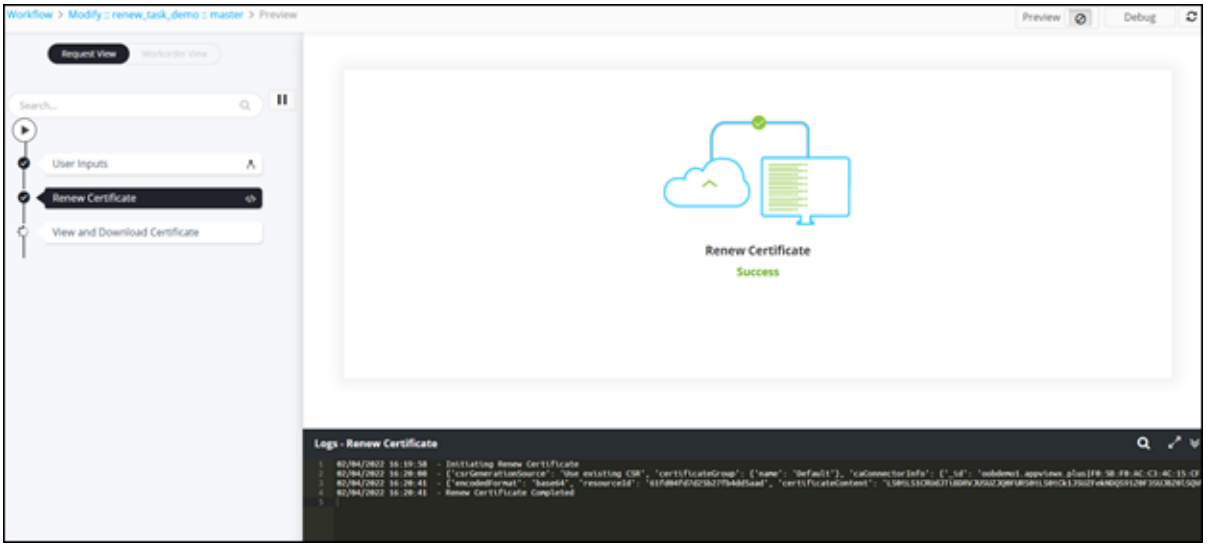
Field	Description
Certificate Category	Select the **Certificate Category** from the options available in the dropdown. **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Group field, click .
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Authority field, click .
***Certificate**	Select the **Certificate** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate field, click .
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown. **Note:** To retrieve the values in the Subject Alternative Name field, click .
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Hash Function	Select the **Hash Function** from the options available in the dropdown.
Validity Unit	Select the **Validity Unit** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Validity Value	Enter the **Validity Value** based on the **Validity Unit** selected.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.
All Asterisk (*) marked fields are mandatory.	

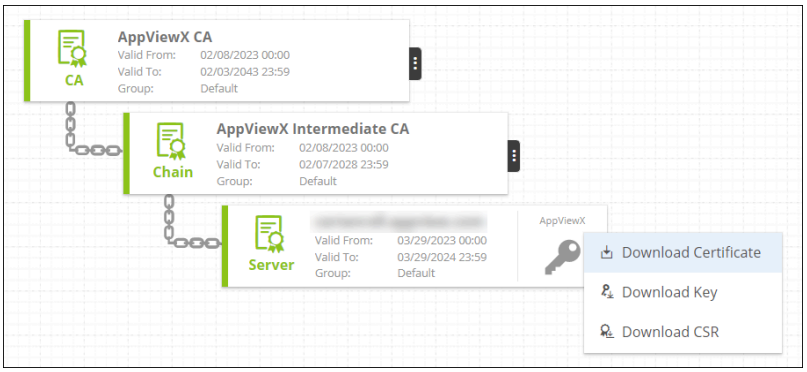
10. To add this attribute to the **Certificate Attributes** grid, click .
11. To edit the value of a particular attribute, select the attribute in the grid and click .
12. Enter the new value for the attribute in the **Value** field and click again to update the value.
13. To delete a certificate attribute, select the attribute in the grid and click .
14. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
15. To search for a particular attribute in the grid, type the keyword(s) in the search field.
16. Click **Next**.

    Certificate renewed successfully.

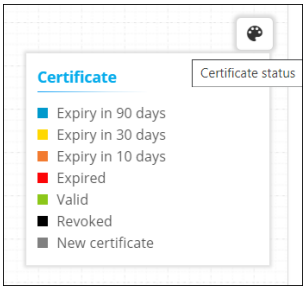


17. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



18. Hover your mouse over to view the **Certificate status**.



19. Click on the renewed certificate to view the **Certificate Details**.

Note: For more information on how to design custom workflows, refer to the Automation User Guide.

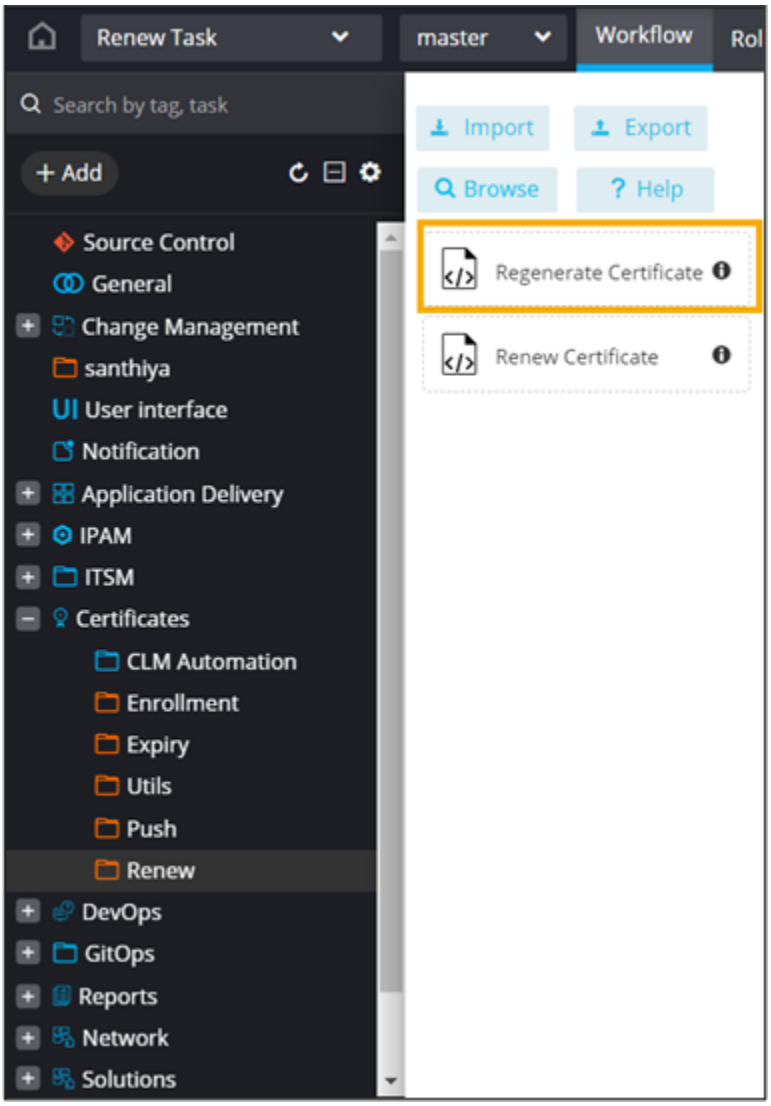
Regenerate Task

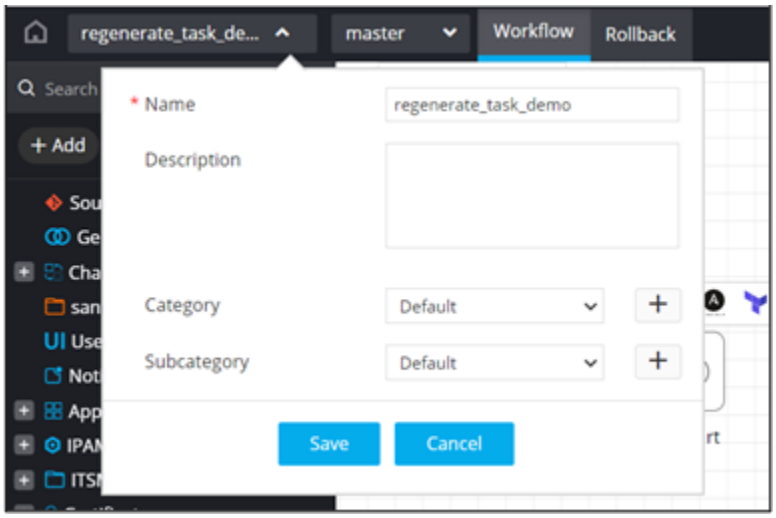
The OOB script task for regenerating certificates can be found in the **Workflow Studio**, under **Certificates**, in the **Renew** folder.



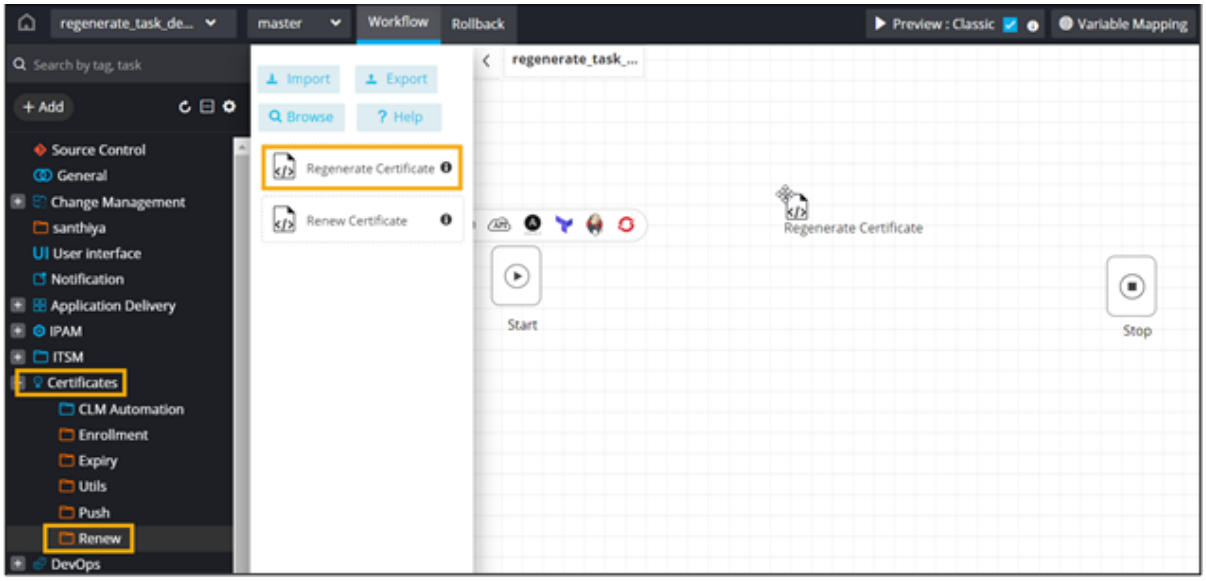
To design a custom workflow using the **Regenerate** task:

1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

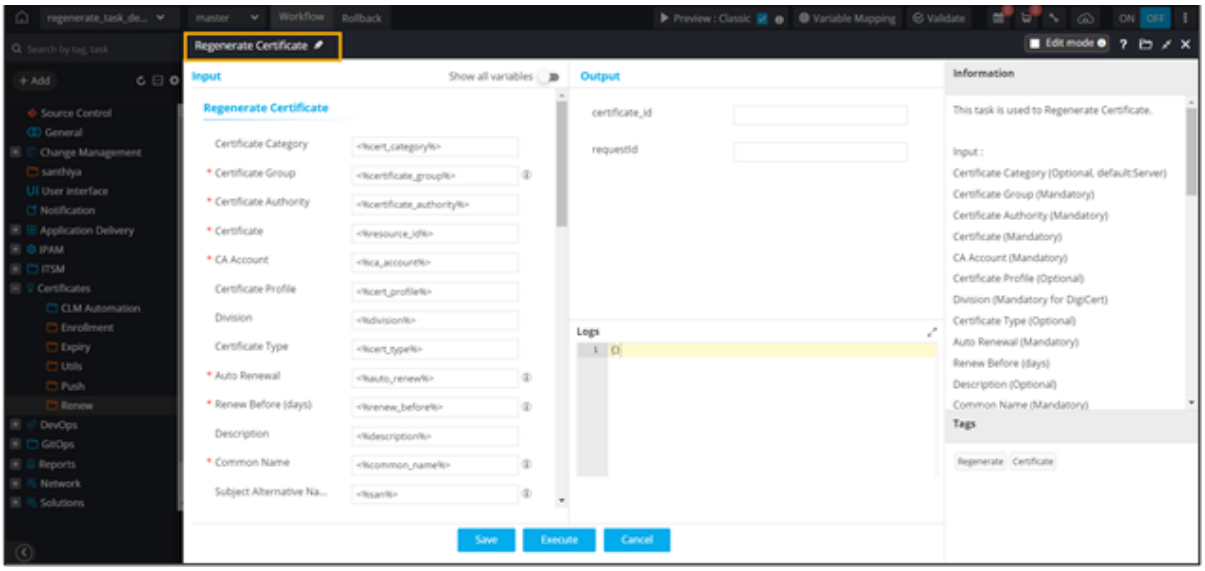


3. From the **Certificates** folder, under **Renew**, drag and drop the **Regenerate Certificate** task.

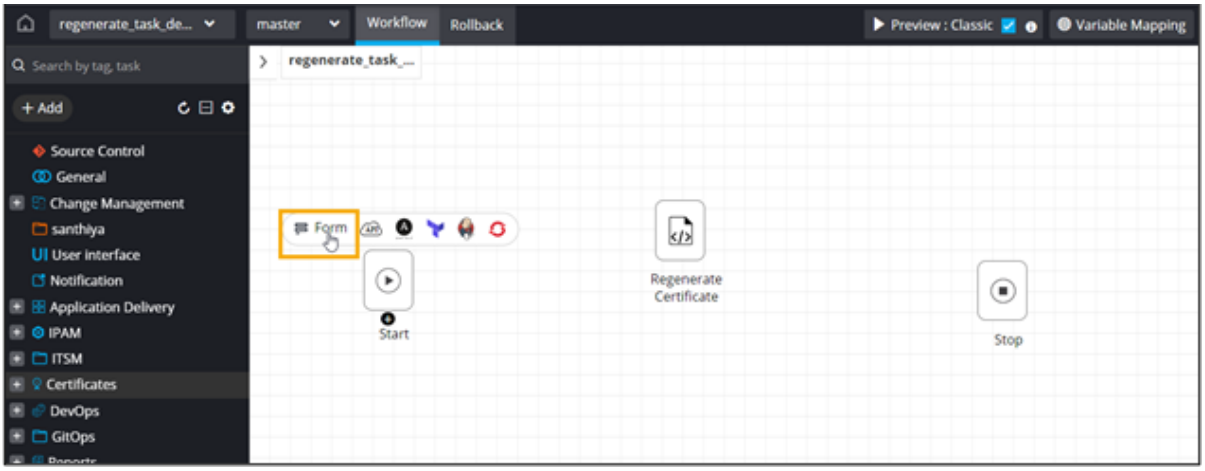


This task can be used to regenerate certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

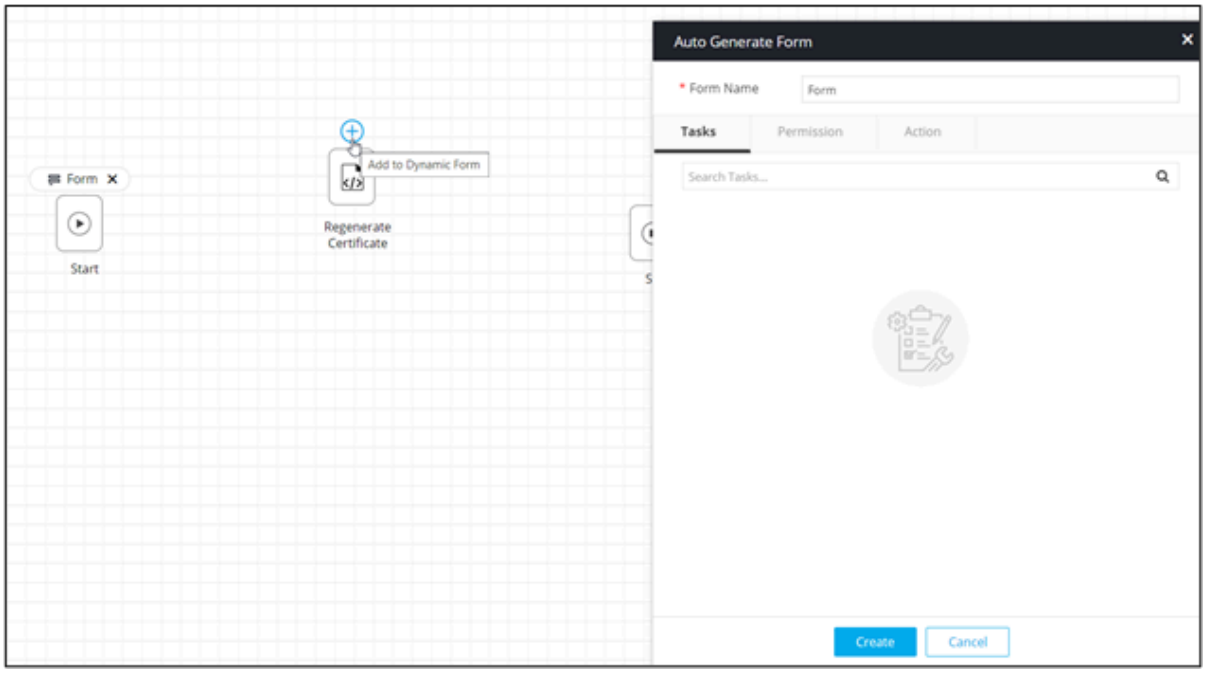


4. To auto-generate a form for this workflow, click **Form** above the **Start** task.



5. Click ⊕ above the **Regenerate Certificates** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



6. Select the fields required in the input form.
7. Enter a **Form Name** and click **Create**.
8. From the **Utils** folder under the **Certificate** section, drag and drop the **View and Download Certificate** task.
9. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.
   The **User Inputs** form is displayed on the screen.

Field Description for the User Inputs form

Field	Description
Certificate Category	Select the **Certificate Category** from the options available in the dropdown. **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Group field, click .
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate Authority field, click .
***Certificate**	Select the **Certificate** from the options available in the dropdown. **Note:** To retrieve the values in the Certificate field, click .
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** To retrieve the values in the CA Account field, click .
***Auto Renewal**	Select the required option from the dropdown to enable/disable **Auto Renewal** for the regenerated certificate.
Description	Provide a description for the regenerated certificate.
***Common Name**	This field is populated on the basis of the certificate selected.
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown.

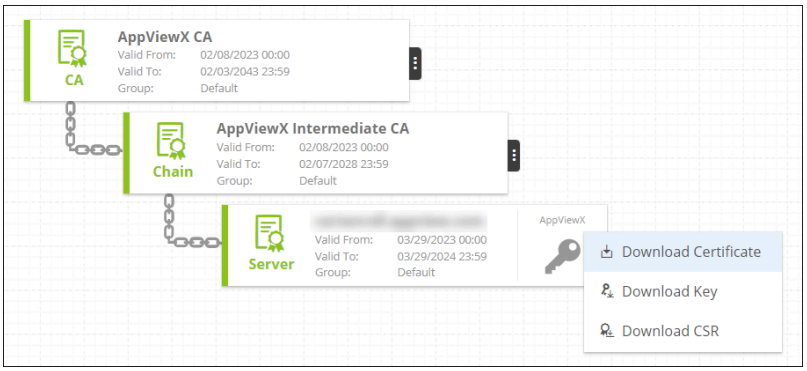
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Note: To retrieve the values in the Subject Alternative Name field, click .
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
City	Enter the name of the city in which the organization is located.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Email Address	Enter the email address associated with the organization.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type**from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** To retrieve the values in the Bit Length field, click .
***Validity Unit**	Select the **Validity Unit** from the options available in the dropdown.
***Validity Value**	Enter the **Validity Value** based on the **Validity Unit** selected.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.
All Asterisk (*) marked fields are mandatory.	

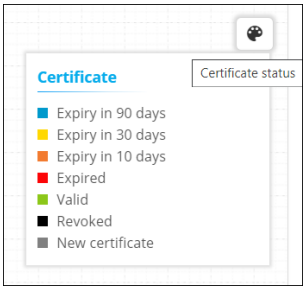
10. To add this attribute to the **Certificate Attributes** grid, click .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

11. To edit the value of a particular attribute, select the attribute in the grid and click .
12. Enter the new value for the attribute in the **Value** field and click again to update the value.
13. To delete a certificate attribute, select the attribute in the grid and click .
14. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
15. To search for a particular attribute in the grid, type the keyword(s) in the search field.
16. Click **Next**.
    Certificate is regenerated successfully.
17. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.



18. Hover your mouse over to view the **Certificate status**.



19. Click the regenerated certificate to view the **Certificate Details**.

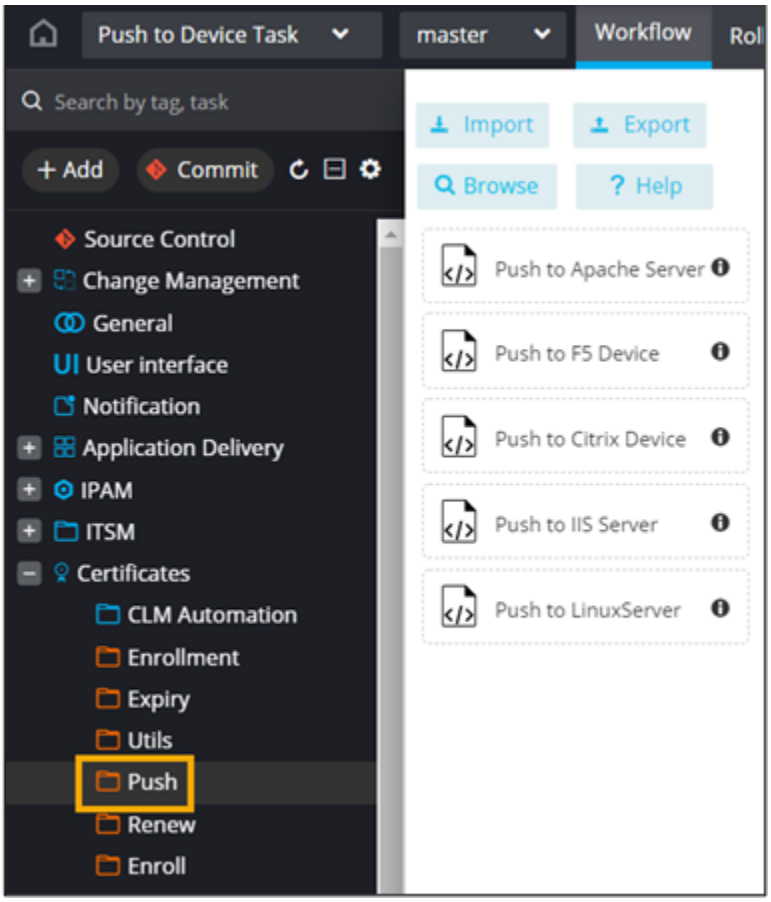
Note: For more information on how to design custom workflows, refer to the Automation User Guide.

Push Tasks

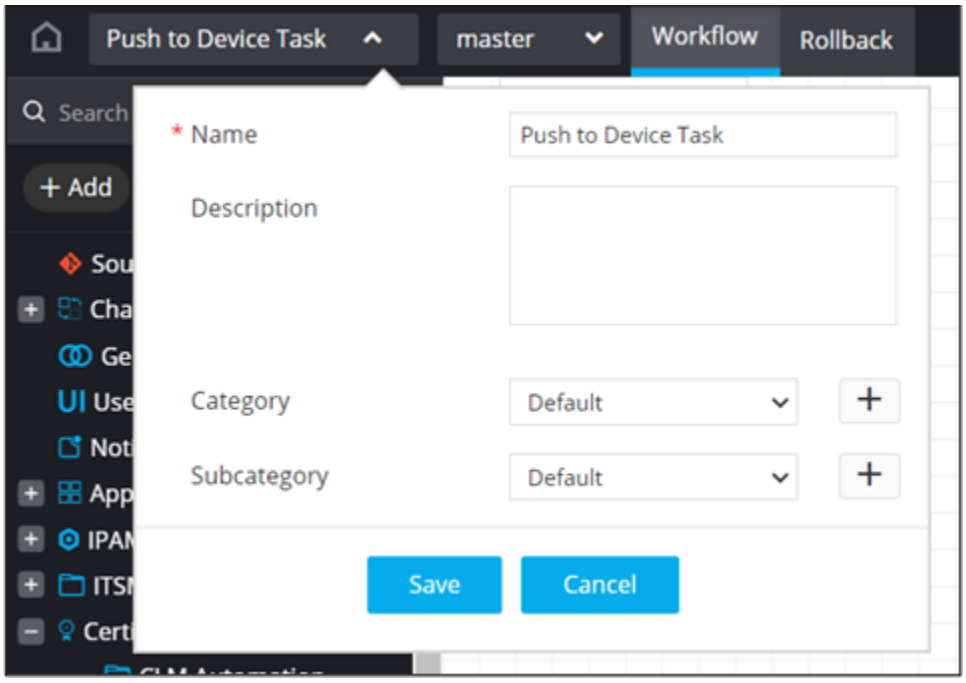
You can design a custom workflow for pushing a certificate to a device(s) or a server(s) using the prebuilt Push tasks available in the **Workflow Studio**. The OOB script task for pushing certificates to devices/ servers can be found under **Certificates**, in the **Push** folder.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



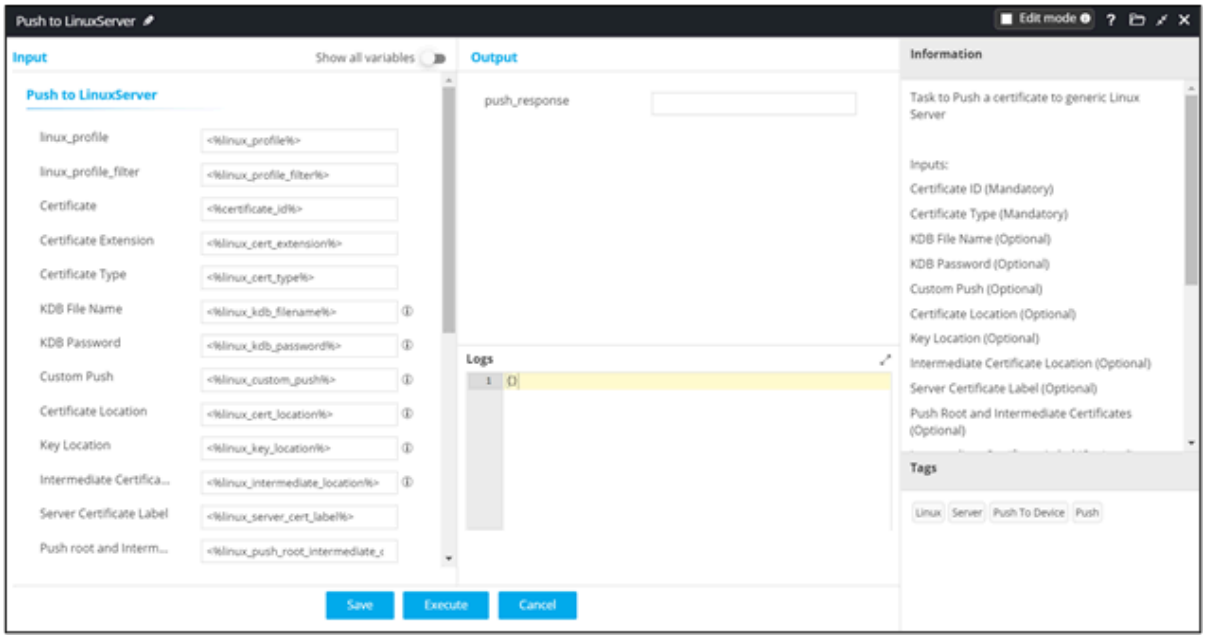
1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

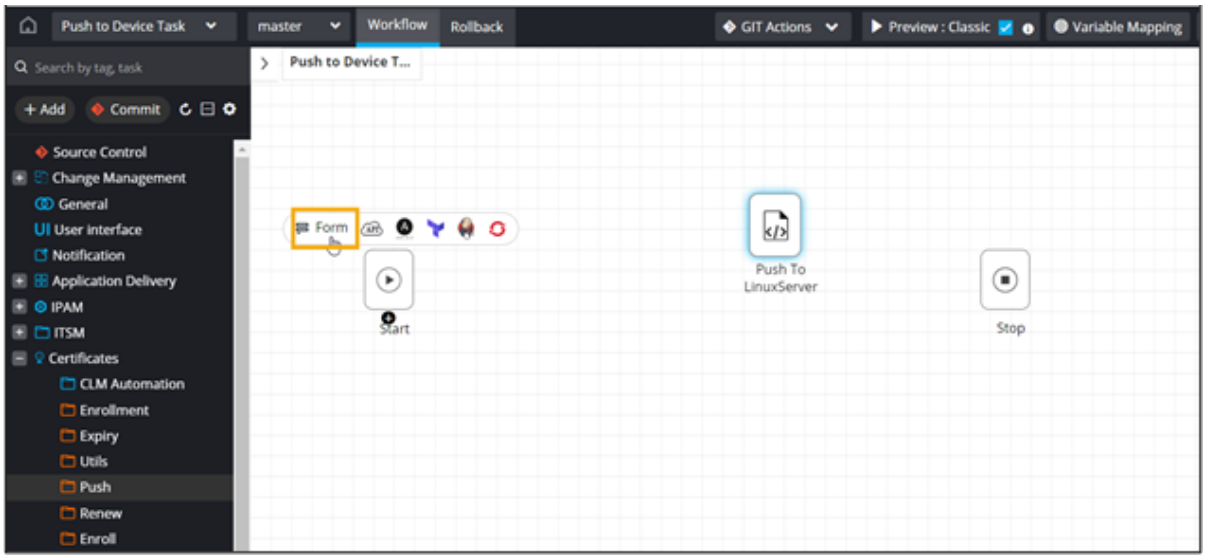


3. From the **Certificates** folder, click **Push**.
   The following tasks for pushing certificates are available in the **Push** folder:
   - Push to Apache Server
   - Push to F5 device
   - Push to Citrix Device
   - Push to IIS Server
   - Push to Linux Server
4. From the **Push** folder, drag and drop any of the Push tasks. For example, the **Push to Linux Server** task.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

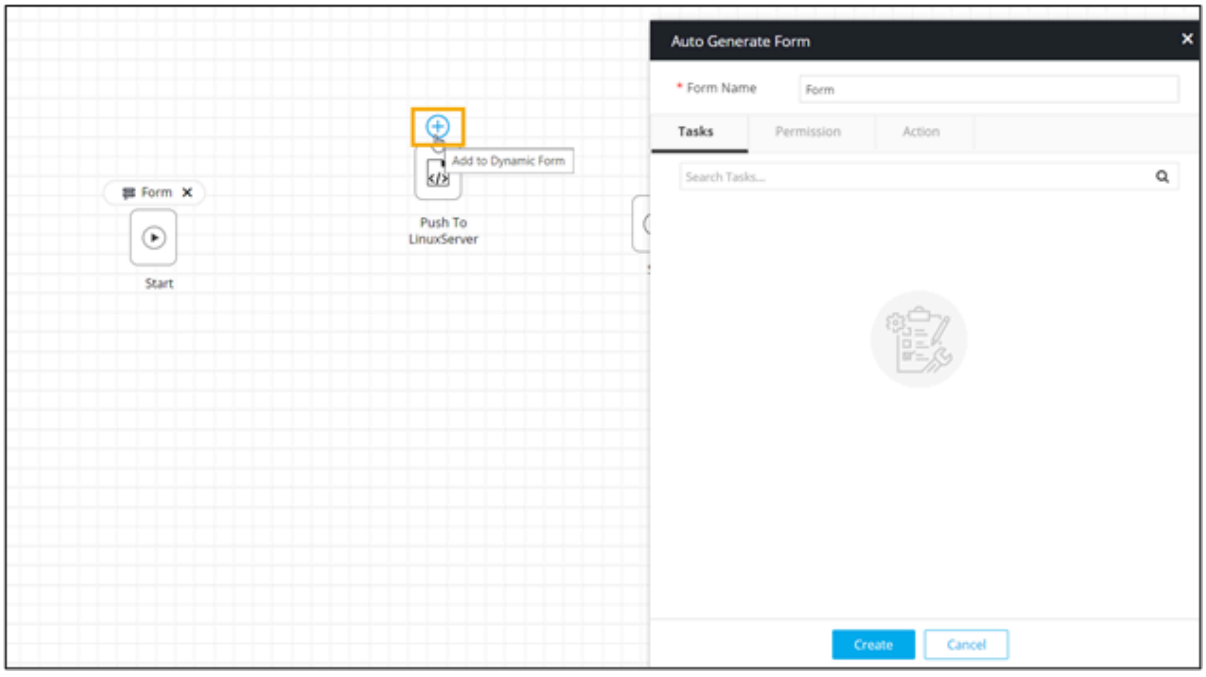


5. Click **Save**.
6. To auto-generate a form for this workflow, click **Form** above the **Start** task.



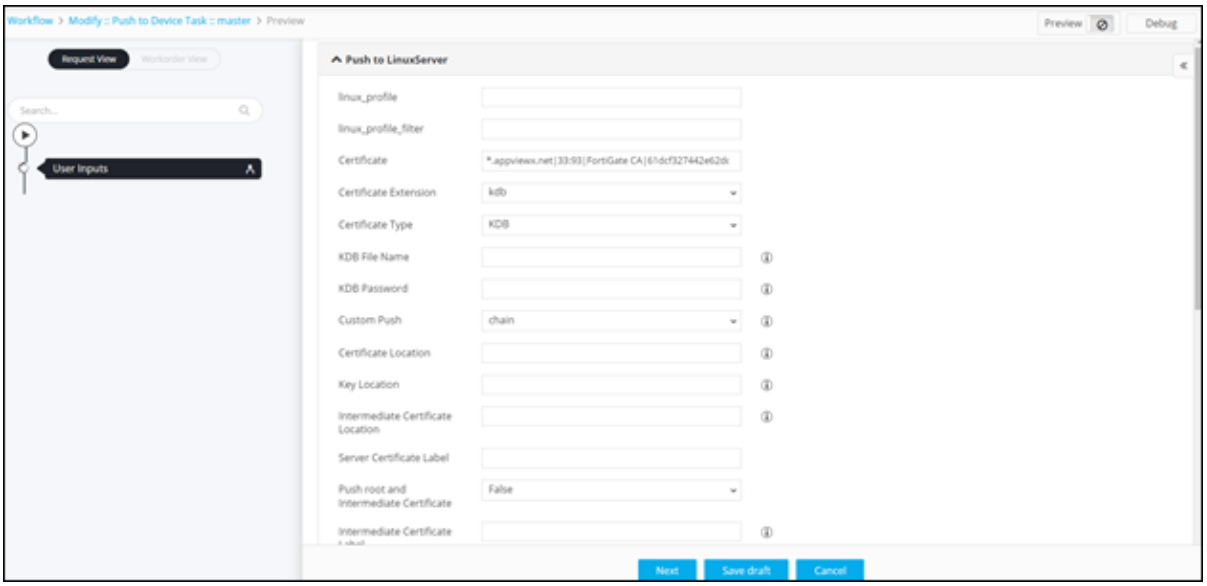
7. Click ⊕ above the **Push to LinuxServer** task to auto-populate the form fields.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



8. Select the fields required in the input form.
9. Provide a **Form Name** and click **Create**.
10. To view and download the certificate in a holistic view, from the **Utils** folder, drag and drop the **View and Download Certificate** prebuilt task.
11. To get a preview of the user input form, connect all the workflow tasks and click **Preview**.

    User Inputs form when the **Push to LinuxServer** task is selected is displayed.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The fields displayed in the User Inputs form will vary depending on the Push task selected from the Push folder while designing the workflow.

Field Description for the User Inputs form

Field	Description
***Certificate Category**	Select the **Certificate Profile** from the following options: • **Server** • **Client** • **Code Signing** **Note: Server** is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. The following CAs are supported: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note**: This field is populated based on the **Certificate Group** selected.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the **Certificate Authority** selected.
***Auto Renewal**	Select the required radio button to enable/disable **Auto Renewal**. **Note**: Default selection is set to **Off**.
Renew Before (Days)	Enter the number of days in the **Renew Before (days)** field. For example, if you enter 5, then the renewal request will be triggered 5 days prior to the expiry date. **Note**: This field is displayed only when the **Auto Renewal** field is enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
Description	Add a description for the workflow, if required.
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name	Select the **Subject Alternative Name** from the options available in the dropdown.
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select the **IP Address** option in the **SAN** field.
Organization	Enter the name of the organization.
Organization Unit	Enter the name of the organization unit.
Locality	Enter the name of the locality in which the organization is situated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Zip Code	Enter the Zip code in which the organization is located.
Email Address	Enter the Email Address of the organization.
***Validity Unit**	Select the **Validity Unit** from the options available in the dropdown.
***Validity Value**	Enter the **Validity Value** based on the Validity Unit selected.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown. **Note:** To retrieve the types of keys that can be availed, click .
***Bit Length**	Select the **Bit Length** from the options available in the dropdown.
Attribute	Select the **Attribute** from the options available in the dropdown.
Attribute Value	Enter the **Attribute Value** based on the Attribute selected.

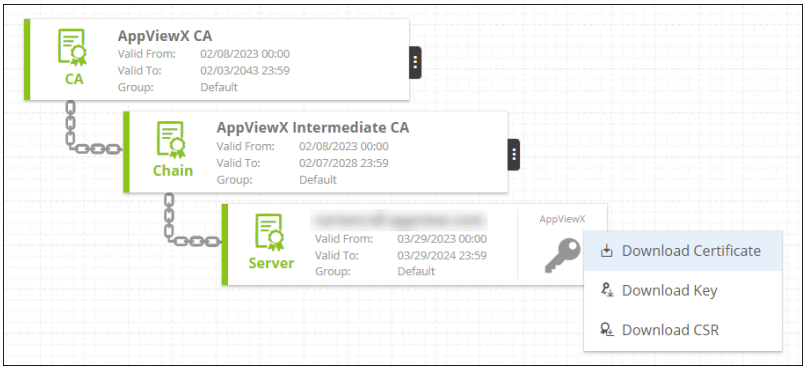
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
All Asterisk (*) marked fields are mandatory.	

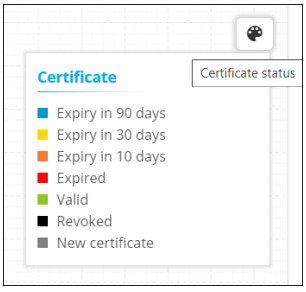
12. To add this attribute to the **Certificate Attributes** grid, click .
13. To edit the value of a particular attribute, select the attribute in the grid and click .
14. Enter the new value for the attribute in the **Value** field and click again to update the value.
15. To delete a certificate attribute, select the attribute in the grid and click .
16. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
17. To search for a particular attribute in the grid, type the keyword(s) in the search field.
18. Click **Next**.

    Certificate created successfully.

19. To download the certificate, at the **View and Download Certificate** stage, hover your mouse over and from the options displayed, click **Download Certificate**.



20. Hover your mouse over to view the **Certificate status**.



Note: For more information on how to design custom workflows, refer to the Automation User Guide.

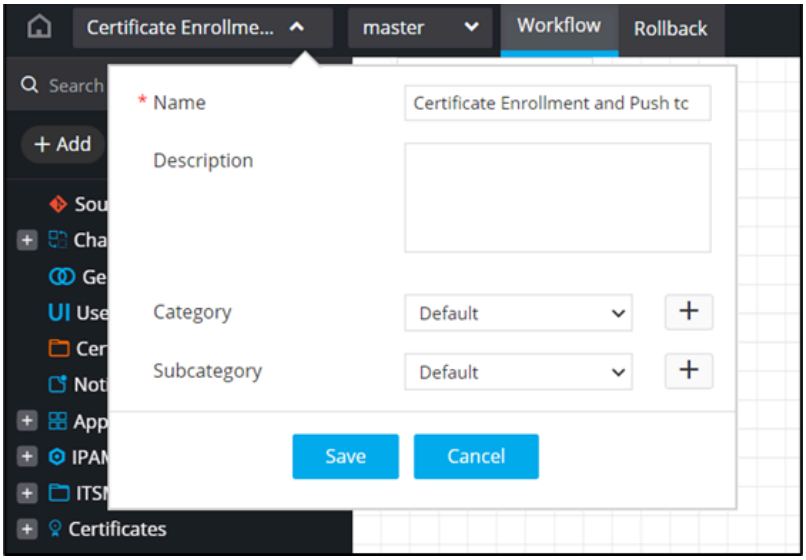
Designing a Custom Workflow using OOB Tasks

You can use the OOB tasks and subflows available in the Automation module to build custom workflows for enrolling and renewing certificates. You can also add the OOB Push to Device subflow to push the certificates to a selected device.

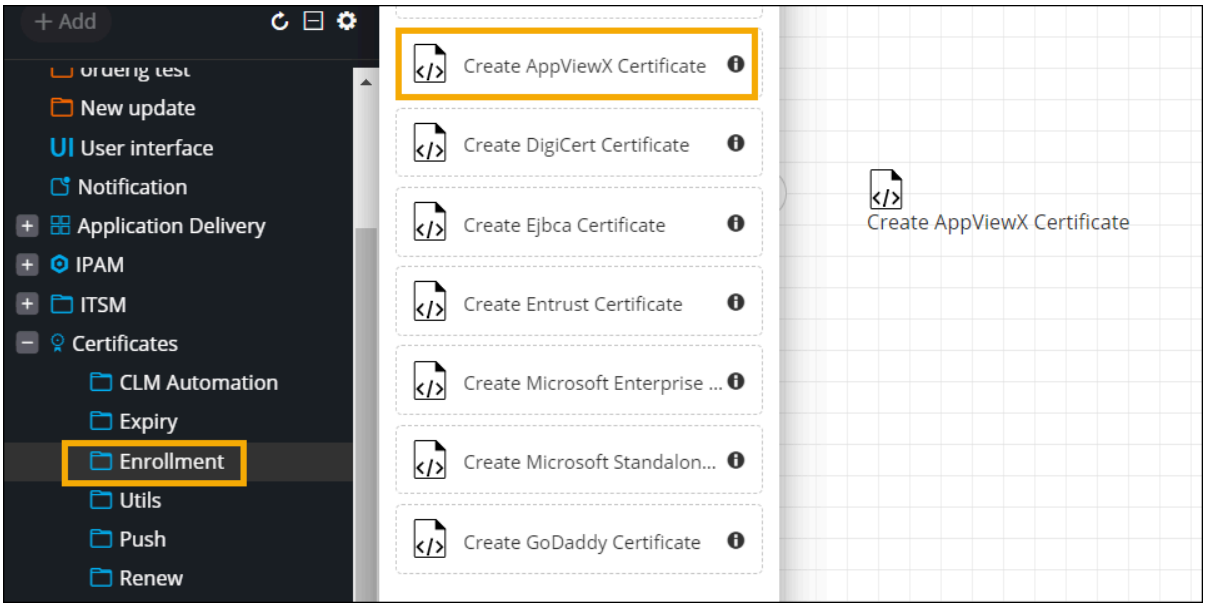
To design a custom workflow to enroll a certificate and push it to a device:

1. Navigate to the Workflow page in the **Automation** module and click **Create New**.
2. Enter a **Name** for the workflow and click **Save**.

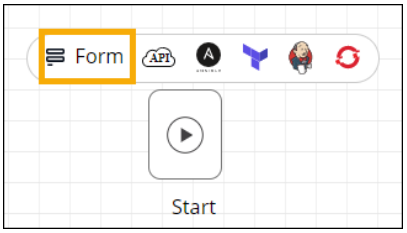


3. To access the OOB workflow tasks, from the left menu, click **Certificates**.
4. Under **Certificates**, from the **Enrollment** folder, drag and drop the required OOB task for enrolling a certificate, for example, the **Create AppViewX Certificate** task.

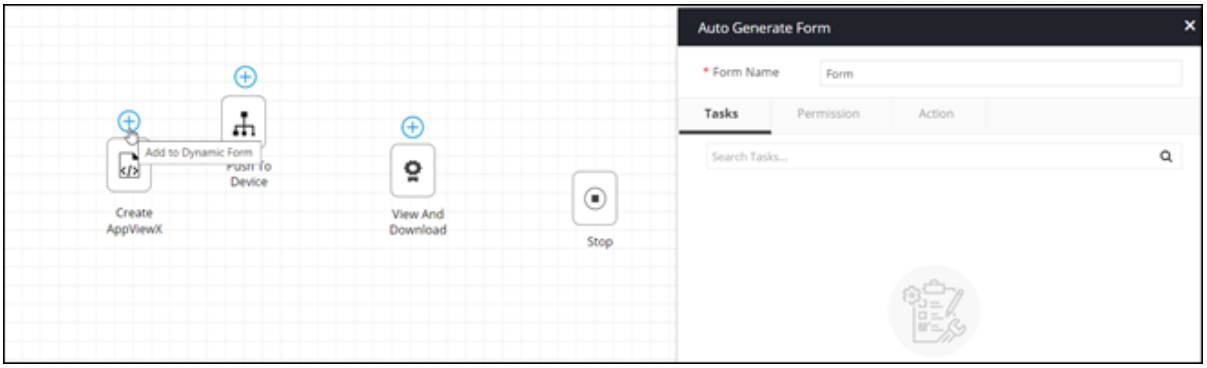
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



5. Click **Save**.
6. Under **Certificates**, from the **Utils** folder, drag and drop the OOB **Push to Device** subflow.
7. Under **Certificates**, from the **Utils** folder, drag and drop the OOB **View and Download Certificate** task.
8. To generate a form for this workflow, click **Form** above the **Start** task.



9. Click ⊕ above the **Create AppViewX Certificate** task to auto-populate the form fields.



10. Connect all workflow tasks and enable the workflow.
11. Trigger the workflow from the Request :: View/Run page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The workflow execution page is displayed with the workflow inputs requested at the first stage.

Field Description for the User Inputs form

Field	Description
***Certificate Category**	Select the **Certificate Profile** from the following options: • **Server** • **Client** • **Code Signing** **Note:** Server is the default selection.
***Certificate Group**	Select the **Certificate Group** from the options available in the dropdown.
***Certificate Authority**	Select the **Certificate Authority** from the options available in the dropdown. The following CAs are supported: • DigiCert • Entrust • EJBCA • Microsoft Enterprise • AppViewX **Note:** This field is populated based on the **Certificate Group** selected.
***CA Account**	Select the **CA Account** from the options available in the dropdown. **Note:** This field is populated based on the **Certificate Authority** selected.
***Division**	Select the **Division** from the options available in the dropdown. **Note:** This field is displayed only when **DigiCert** is selected as the **CA**.
Certificate Type	Select the **Certificate Type** from the options available in the dropdown.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

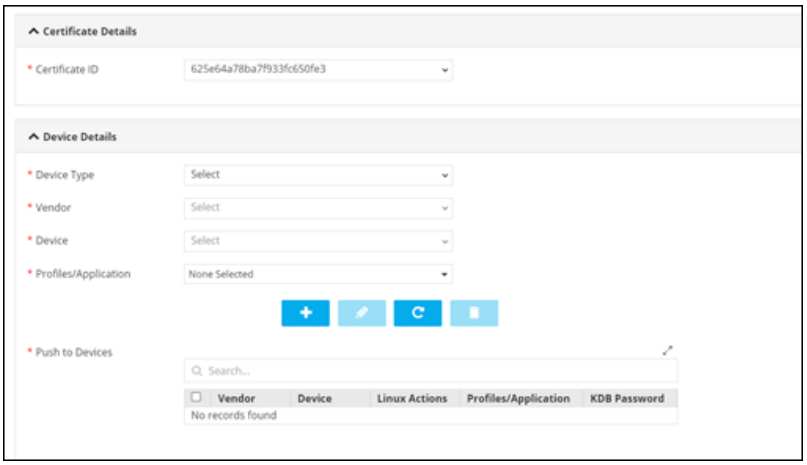
Field	Description
***Auto Renewal**	Select the required radio button to enable/disable **Auto Renewal**. **Note:** Default selection is set to **Off**.
Renew Before (Days)	Enter the number of days in the **Renew Before (days)** field. For example, if you enter 5, then the renewal request will be triggered 5 days prior to the expiry date. **Note:** This field is displayed only when the **Auto Renewal** field is enabled.
Description	Enter a description for the certificate to be created.
***Common Name**	Enter the Fully Qualified Domain Name (FQDN) of the server for which certificate is requested.
Subject Alternative Name	Select the **SAN** as either: • **DNS** • **IP Address**
DNS	Enter a valid DNS if you select the **DNS** option in the **SAN** field.
IP Address	Enter a valid IP Address if you select **IP Address** in the **SAN** field.
Organization	Enter the name of the organization with which the certificate will be associated.
Organization Unit	Enter the name of the organization unit with which the certificate will be associated.
State	Enter the name of the state in which the organization is located.
Country	Enter the name of the country in which the organization is located.
Zip Code	Enter the zip code.
Email Address	Enter the email address associated with the **Certificate Group**.
***Validity Unit**	Select the **Validity Unit** as either: • **Days** • **Months** • **Years**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Validity Value**	Enter a **Validity Value** based on the selected validity unit.
Challenge Password	Configure the **Challenge Password** to protect the certificate.
***Hash Function**	Select the **Hash Function** from the options available in the dropdown.
***Key Type**	Select the **Key Type** from the options available in the dropdown.
***Bit Length**	Select the **Bit Length** from the options available in the dropdown. **Note:** This field will be populated based on the selected **Key Type**.
Attribute	Select the **Attribute** from the available options.
Attribute Value	Enter a value for the selected attribute.
All Asterisk (*) marked fields are mandatory.	

12. To add this attribute to the **Certificate Attributes** grid, click .
13. To edit the value of a particular attribute, select the attribute in the grid and click .
14. Enter the new value for the attribute in the **Value** field and click again to update the value.
15. To delete a certificate attribute, select the attribute in the grid and click .
16. To maximize the **Certificate Attributes** grid, from the top right corner of the grid, click .
17. To search for a particular attribute in the grid, type the keyword(s) in the search field.
18. Click **Next**.
    AppViewX Certificate is created successfully.
19. At the **Device Inputs** stage of workflow execution, under **Device Details**, select the requested field information as described in the table below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



This table describes the field information in this section:

Field Description for Device Details section

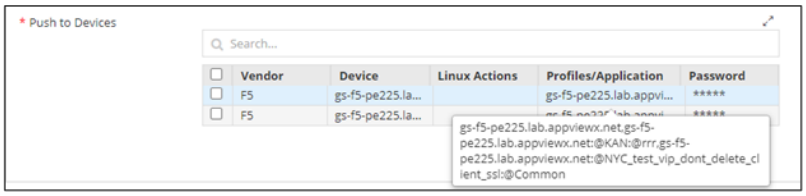
Field	Description
***Device Type**	Select the **Device Type** from the options available in the dropdown.
***Vendor**	Select the **Vendor** from the options available in the dropdown. **Note:** The vendor list is populated based on the **Device Type** selected.
***Device**	Select the **Device** from the options available in the dropdown. **Note:** The device list is populated based on the **Vendor** selected.
Linux Actions	Select the **Linux Action** from the options available in the dropdown. **Note:** This field is displayed only when you select **Linux Server** in the **Vendor** field.
***Profile/ Application**	Select the **Profile/Application** from the options available in the dropdown. **Note:** The **Profile/Application** list is populated based on the **Device** selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***KDB Password**	Configure a password to access the KDB file. **Note:** This field is displayed only when you select **Default** in the **Linux Actions** field.
***Push to Devices**	Add the selected profile/application to the grid as described below the table.
All asterisk (*) marked fields are mandatory.	

20. To add the selected profile/application to the grid, click .
    The **Profile/Application** is added to the **Push to Devices** grid.

Note: If you select multiple profiles/applications, they will be displayed in the **Push to Devices** grid, under the **Profiles/Applications** column as comma separated values.



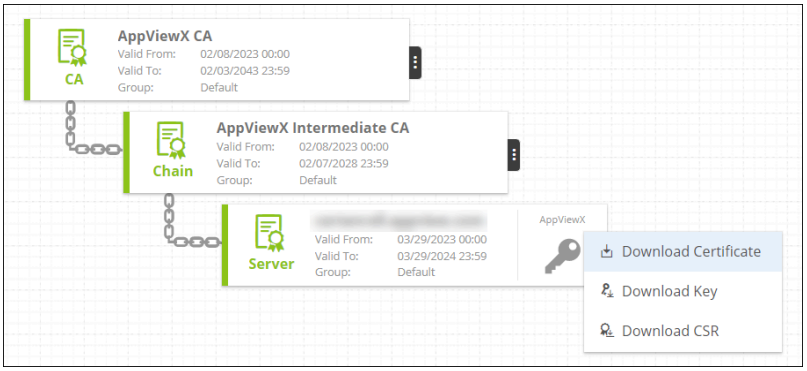
Actions available in the Push to Devices grid

Action	Description
	Allows you to edit the device details. You can do this by selecting the attribute in the grid, click , enter the new value for the attribute, and click again.
	Allows you to delete a profile/application.
	Allows you to maximize the **Push to Devices** grid.
Search bar	Allows you to search for a profile/application in the grid.

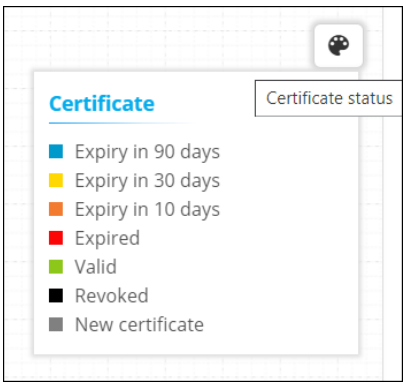
21. Click **Submit**.
    Certificate is pushed to the selected device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

22. To download the certificate, at the **View | Download Certificate** stage of the workflow, hover your mouse over , and from the options displayed, click **Download Certificate**.



23. Hover your mouse over to view the Certificate status.



Note: For more information on how to design workflows, refer to the Automation User Guide.

Scheduling an OOB workflow

You can also schedule these OOB workflows to be triggered at specific time intervals (once or repeat daily, weekly, monthly, yearly) as per your requirement.

Note: For more information on scheduling workflows, refer to the Automation User Guide.

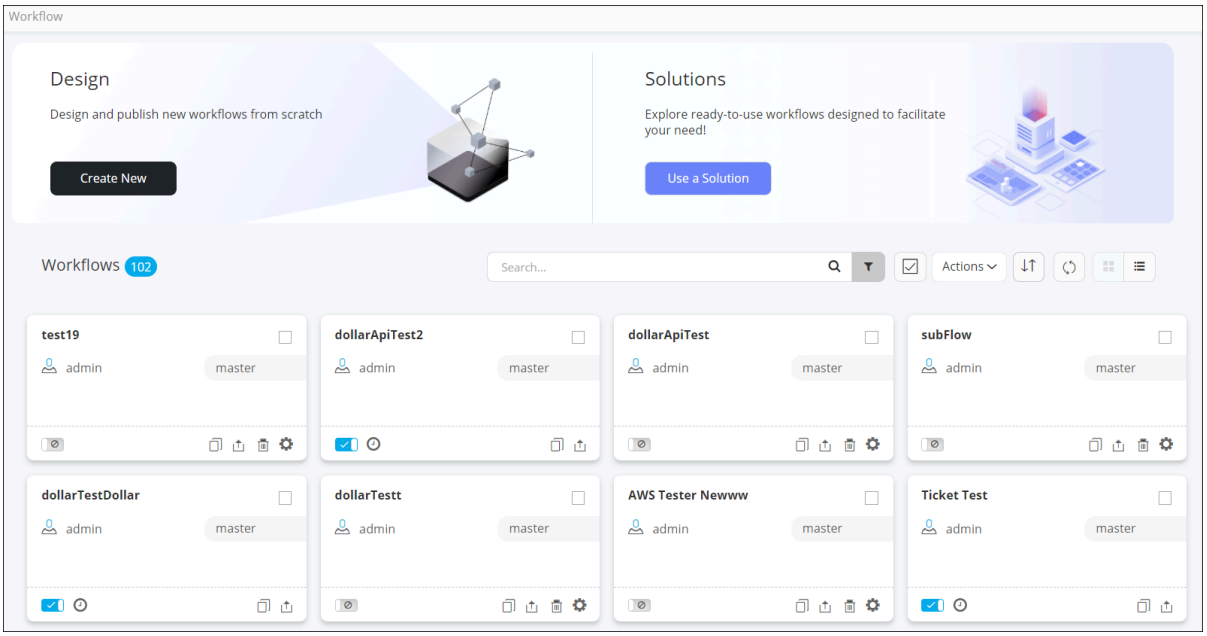
Customizing an OOB Workflow

You can customize any of these OOB workflows by modifying individual tasks within the workflow.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To customize a workflow:

1. Navigate to the **Workflow** page in the **Automation** module.



2. On the **Workflow** page, search for the workflow you want to customize by typing the keyword in the search bar.
3. Disable the workflow by turning off the toggle on the workflow card.
4. Click on the workflow to open it in the design space.
5. Modify the required tasks.
6. Once the tasks have been modified as required, validate and enable the workflow.
7. Trigger the workflow from the Request :: View/Run page.

Managing Certificates Using AppViewX Terraform Provider

What is Terraform?

Terraform is an infrastructure-as-code tool that lets you build, change, and version cloud and on-prem resources safely and efficiently.

HashiCorp Terraform is an infrastructure-as-code tool that allows you to define both cloud and on-prem resources using human-readable configuration files. These files can be versioned, reused, and shared. Terraform enables you to apply a consistent workflow to provision and manage your infrastructure throughout its entire lifecycle. It can handle low-level components such as compute, storage, and networking resources, as well as higher-level components like DNS entries and SaaS features.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

How does Terraform work?

Terraform creates and manages resources on cloud platforms and other services through their application programming interfaces (APIs). Providers enable Terraform to work with virtually any platform or service with an accessible API.

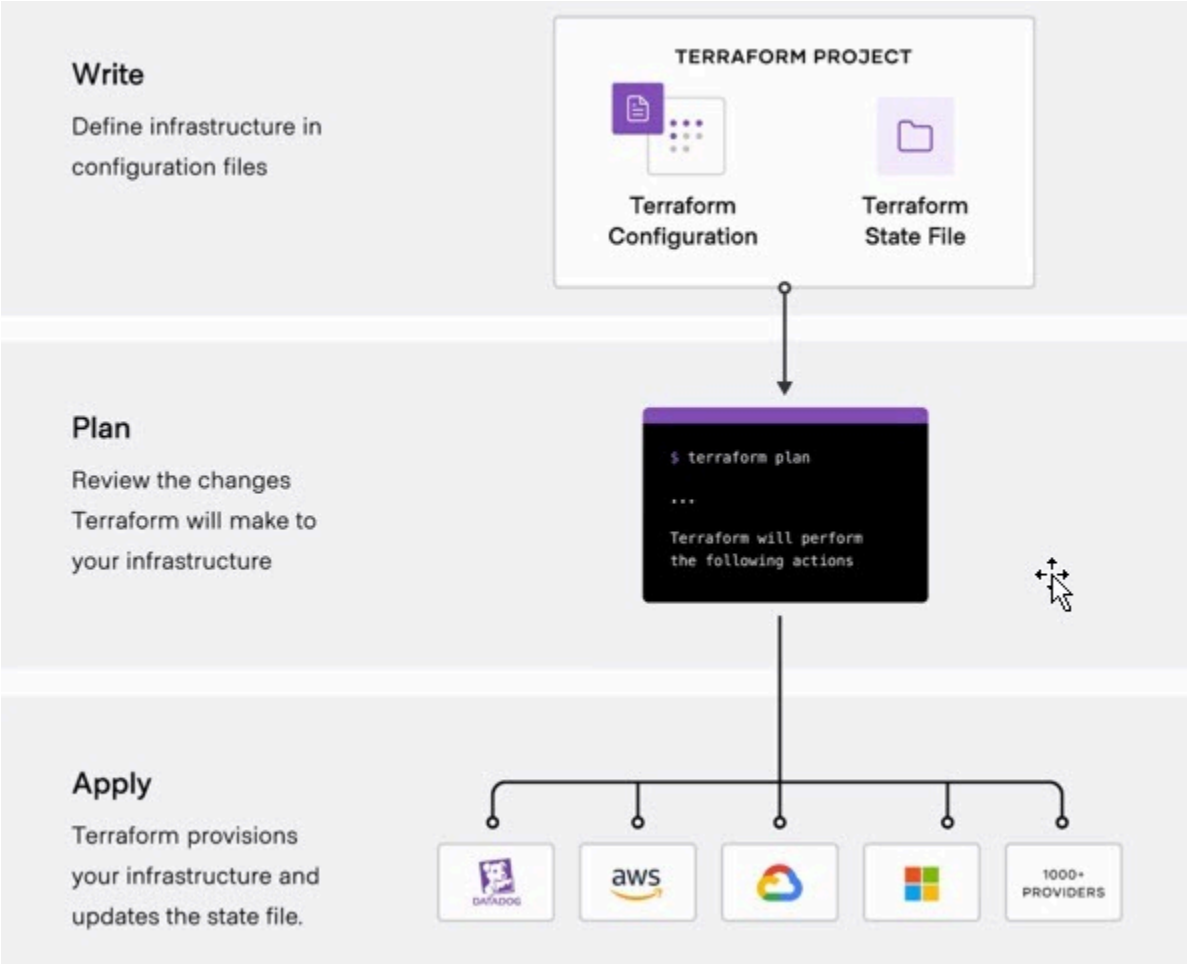
HashiCorp and the Terraform community have already written thousands of providers to manage many different types of resources and services. You can find all publicly available providers on the Terraform Registry, AppViewX Terraform is one of the providers.

The core Terraform workflow consists of three stages:

- **Write:** You define resources that span multiple cloud providers and services. For example, you can create a configuration to deploy an application on virtual machines within a Virtual Private Cloud (VPC) network, complete with security groups and a load balancer.
- **Plan:** Terraform creates an execution plan that outlines the infrastructure it will create, update, or destroy based on the existing infrastructure and your configuration.
- **Apply:** Once approved, Terraform executes the proposed operations in the correct sequence, aking resource dependencies into account. For example, if you update the properties of a VPC and change

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

the number of virtual machines within it, Terraform will re-create the VPC before scaling the virtual machines.



What AppViewX Terraform Provider does?

- Creates Certificate with the provided CSR Parameters.
- Downloads the certificate in different formats along with the trust store certificates, if needed
- Downloads the private key from AppViewX in password protected manner and in plain .pem format

Where is AppViewX Terraform Provider Hosted?

- The latest version of AppViewX Terraform Provider is 1.0.1 which is hosted in Hashicorp Terraform Registry.
- Opensource git hub repository which will be synced with this Terraform Registry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Supported Authentication Models

- AppViewX user name and password credentials
- AppViewX service account credentials

Supported APIs and Details

Following are the APIs used internally in AppViewX Terraform Provider to create certificates and download them:

- Log onto AppViewX using your user name and password
  - Using the session id for further API calls
- Log onto AppViewX using service account credentials
  - Using the access token for further API calls
- Create Certificate with the provided CSR parameters in the .tf file.
  - Create Certificate uses Visual Workflow process, so disabling the approval level in policy will be helpful.
- Download end certificate in formats such as .pem, .crt, .cer, .der, .p12, .pfx, .jks.
  - Download trusted certificates along with .p12, .pfx and .jks formats.
- Download the private key created in AppViewX in the password protected manner or in plain .pem format
- OpenSSL command to get the plain private key from the password protected key:

```
openssl pkey -in <Password protected private key file> -out <Plain Private key file path> -passin pass:<Password of the private key>
```

How to use AppViewX Terraform Provider?

- Install and configure Terraform on your local machine where you intend to use it.
- Copy the provider from the AppViewX Terraform provider link and add it to your local version.tf file
- Create a .tf configuration file to enroll the certificate.
- Remove the .tfstate configuration:

```
rm -rf ./terraform.tfstate
```

- Validate the terraform configuration:

```
terraform validate
```

- Review the execution plan:

```
terraform plan
```

- Apply the Terraform configurations:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
terraform apply
```

Post this step, the certificate creation process will be triggered.

.tf file Parameters explained

#	Field Name	Field Type	Mandatory	Description	Sample
1	appviewx_username	String	No	User name of the AppViewX user to login and perform API calls.	test_user
2	appviewx_password	String	No	Password of the AppViewX user to login and perform API calls.	password
3	appviewx_client_id	String	No	Client ID of the AppViewX service account to login and perform API calls.	test_user
4	appviewx_password	String	No	Client secret of the AppViewX service account to login and perform API calls.	password
Note: Mandatorily provide username and password, or client ID and client secret.					
5	appviewx_environment_is_https	Boolean	Mandatory	Used to frame the AppViewX API URL.	true
6	appviewx_environment_ip	String	Mandatory	FQDN/IP address of the AppViewX instance for making API calls.	pe-cert-iot-150-192.lab.appviewx.net
7	appviewx_environment_port	String	Mandatory	Used to frame the AppViewX API URL.	31443

appviewx_create_certificate resource .tf file parameters

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
1	common_name	String	No	CSR Parameter - Common Name	sample.test.com
2	dns_names	List of String	No	CSR Parameter - List of DNS names	[“sample.test.com”, "sample12.test.com”]
3	hash_function	String	No	CSR Parameter - Hash Function	Possible values: SHA256, SHA160, SHA224, SHA512, SHA384 **Note:** Values might vary based on the CA.
4	key_type	String	No	CSR Parameter - Key Type	Possible values: RSA, DSA, EC **Note:** Values might vary based on the CA.
5	bit_length	String	No	CSR Parameter - Bit Length	Possible values: 1024, 2048, 3072, 4096, 7680, 8192 **Note:** Values might vary based on the CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
6	certificate_authority	Boolean	No	Used to frame the AppViewX API URL.	true
7	ca_setting_name	String	No	FQDN/IP address of the AppViewX instance for making API calls.	pe-cert-iot-150-192.lab.appviewx.net
8	certificate_type	String	No	Used to frame the AppViewX API URL.	31443
9	custom_fields	Object	No	AppViewX configured certificate attributes, which will be seen under Certificate Attributes column in certificate inventory,	{"request_by": "terraform"}
10	vendor_specific _fields	Object	No	Based on the CA, these values will go under Vendor Specific fields during the certificate enrollment of that particular CA.	{"templateName": "WebServer"}
11	validity_days	Integer	No	Certificate validity in days.	Possible values: 1 to 365

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
12	validity_unit	String	No	Certificate validity type like days, months, or years	Possible values: days,months, years
13	validity_unit _value	Integer	No	Certificate validity based on the unit.	12
14	certificate_group _name	String	No	Certificate group name under which the certificates will be placed in AppViewX certificate inventory.	test_group1
15	is_sync	Boolean	No	• If sync is enabled, then the certificate is created and downloaded in the same API call. • If sync is disabled, then the certificate creation will be triggered. AppViewX Terraform will receive resourceId as response, which can	true

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
				be used to download the certificate later.	
16	certificate_download_path	String	No	Path where the certificate content is to be downloaded.	Possible scenarios: • /home/sample/testcert • home/sample/ • testcert

Note: Following are the possible download paths applicable to both certificate and private key downloads:

1. /home/sample/testcert
   - AppViewX Terraform will first check if testcert is a folder. If it is, the certificate will be downloaded with the CN as the filename under the sample directory.
   - If testcert is not a directory but sample is, then the certificate will be downloaded with testcert as the filename under the sample directory.
   - If neither testcert nor sample are directories, a new folder named sample will be created, and the certificate will be downloaded with testcert as the filename inside the sample directory.
2. /home/sample/
   - If sample is a folder, the certificate will be downloaded with testcert as the filename inside the sample directory.
   - If sample is not a folder, a new folder named sample will be created, and the certificate will be downloaded with testcert as the filename inside the sample directory.
3. testcert
   - The certificate is downloaded with the CN as file name in the same working directory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
17	certificate_download _format	String	No	Format in which the certificate will be downloaded.	Possible values: PEM, CRT, DER, CER, P12, PFX, JKS
18	certificate_download _password	String	Yes for P12, PFX and JKS formats.	Password used to download the certificates if they are in P12 or PFX or JKS formats.	password
19	certificate_chain _required	Boolean	No	If enabled, then the trust store certificates will be added to the end certificate during the download. **Note:** This is applicable only for P12, PFX and JKS certificate formats.	true
20	key_download _path	String	No	Path where the private key content is to be downloaded.	Possible scenarios: • /home/sample/testcert • home/sample/ • testcert

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Possible Values / Examples
21	key_download _password	String	No	Password to use to download the private key.	password
22	download_password _protected_key	Boolean	No	Private keys can be downloaded from AppViewX only in password protected manner. • If this flag is enabled, then the private key will be downloaded as an encrypted private key. • If disabled, then openSSL command is used to convert it into a plain private key and save it in the provided path.	false

appviewx_download_certificate resource .tf file parameters

#	Field Name	Field Type	Mandatory	Description	Sample
1	resource_id	String	No	Resource ID obtained in the previous appviewx_create_certificate resource response	6128381dq231sw1ww

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Sample
				log will be used to download the certificate post issuance.	

Note: If is_sync=false, then this resource can be used along with appviewx_create_certificate resource as shown:

```
....
....
}
resource "time_sleep" "wait" {
        depends_on = [appviewx_create_certificate.createcert]
        create_duration = "10s"
}
resource "appviewx_download_certificate" "downloadcert"{
 depends_on = [time_sleep.wait]
 resource_id=appviewx_create_certificate.createcert.resource_id
        .....
}
```

2	common_name	String	No	Common name of the certificate to download from AppViewX.	test.sample.com
3	serial_number	String	No	Serial number of the certificate to download from AppViewX.	12:QQ:23:12:34:45:45:23

Note: Mandatorily provide username and password, or client ID and client secret.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Sample
4	certificate_download_path	String	No	Path where the certificate content is downloaded.	Possible scenarios: • /home/sample/testcert • home/sample/ • testcert
5	certificate_download_format	String	No	Format in which the certificate will be downloaded Possible values: PEM, CRT, DER, CER, P12, PFX, JKS	PEM
6	certificate_download_password	String	Yes for P12, PFX and JKS formats	Password used to download the certificates if they are in P12 or PFX or JKS formats.	password
7	certificate_chain_required	Boolean	No	If enabled, then the trust store certificates will be added to the end certificate during the download. **Note:** This is applicable only for P12, PFX and JKS certificate formats.	true

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

#	Field Name	Field Type	Mandatory	Description	Sample
8	key_download _path	String	No	Path where the private key content will be downloaded.	Possible scenarios: • /home/sample/ testcert • home/sample/ • testcert
9	key_download _password	String	No	Password used to download the private key.	password
10	download_password _protected _key	Boolean	Optional	Private keys can be downloaded from AppViewX only in password protected manner. If this flag is enabled then the private key will be downloaded as an encrypted private key. If disabled then openssl command is used to convert it to a plain private key and save it in the provided path	false

Sample Provider and Resources .tf files

Sample version.tf file

```
terraform {
  required_providers {
    appviewx = {
      source = "AppViewX/appviewx"
      version = "1.0.1"
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  }
 }
}
```

1. Create the certificate in sync mode, which allows the certificate to be created and downloaded in a single `appviewx_create_certificate` resource.

```
resource "appviewx_create_certificate" "createcert"{
 common_name="sample.test.com"
 hash_function="SHA256"
      key_type="RSA"
      bit_length="2048"
      certificate_authority="Microsoft Enterprise"
      ca_setting_name="msca"
      #certificate_type="SSL Certificate"
      #dns_names=["test.com","test12.com"]
      custom_fields={"request_by":"terraform"}
      vendor_specific_fields={"templateName":"WebServer"}
      validity_unit=365
 validity_unit_value="years"
      certificate_group_name="cert_group"

      is_sync=true
      certificate_download_path="/home/sample/test/"
      certificate_download_format="P12"
      certificate_download_password="test"
      certificate_chain_required=true

      key_download_path="/test/testcert123"
      key_download_password="password"
      download_password_protected_key=false
}
```

2. Create a certificate in ASYNC mode, where certificate creation is triggered first, followed by a delayed certificate download using the `appviewx_download_certificate` resource.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
resource "appviewx_create_certificate" "createcert"{
 common_name="test.sample.com"
 hash_function="SHA256"
       key_type="RSA"
       bit_length="2048"
       certificate_authority="Microsoft Enterprise"
       ca_setting_name="msca"
       #certificate_type="SSL Certificate"
       #dns_names=["test.com","test123.com"]
       custom_fields={"request_by":"terraform"}
       vendor_specific_fields={"templateName":"WebServer"}
       validity_unit=365
 validity_unit_value="years"
       certificate_group_name="cert_group"
       is_sync=false
}

resource "time_sleep" "wait" {
  depends_on = [appviewx_create_certificate.createcert]
  create_duration = "10s"
}

resource "appviewx_download_certificate" "downloadcert"{
 depends_on = [time_sleep.wait]
 resource_id=appviewx_create_certificate.createcert.resource_id
       certificate_download_path="/Downloads/testcert123"
       certificate_download_format="P12"
       certificate_download_password="test"
       certificate_chain_required=true
       key_download_path="/test/testcert123"
       key_download_password="password"
       download_password_protected_key=false

}
```

3. Create a certificate in ASYNC mode, where certificate creation is triggered, and the user can later attempt to download the certificate at any time using the `appviewx_download_certificate` resource, either by common name and serial number or by resource ID.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
resource "appviewx_create_certificate" "createcert"{
 common_name="test.domain.com"
 hash_function="SHA256"
       key_type="RSA"
       bit_length="2048"
       certificate_authority="Microsoft Enterprise"
       ca_setting_name="msca"
       #certificate_type="SSL Certificate"
       #dns_names=["test.com","test123.com"]
       custom_fields={"request_by":"terraform"}
       vendor_specific_fields={"templateName":"WebServer"}
       validity_unit="years"
       validity_unit_value=2
       certificate_group_name="cert_group"
       is_sync=false

}

resource "appviewx_download_certificate" "downloadcert"{
 resource_id="564647657564gfdfx3w"
 common_name="test.domain.com"
 serial_number="21:23:123…"
       certificate_download_path="testcert"
       certificate_download_format="P12"
       certificate_download_password="password"
       certificate_chain_required=true
       key_download_path="/test/testcert123"
       key_download_password="password"
       download_password_protected_key=false
}
```

Troubleshooting

1. Ensure that the provider version is correct.
2. Verify that the fields in the `.tf` files have the exact field names and types.
3. Review the console logs after running the `terraform apply` command.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Change the logging level using the command: `export TF_LOG=DEBUG` or `export TF_LOG=TRACE`.
5. **For authentication-related errors:** Check the AppViewX user account's role and permissions in the AppViewX GUI to ensure the user has access to create and download certificates.
6. **For internal server errors:** Verify the provided input parameters and check the AppViewX server logs for any failures or issues on the AppViewX side.

Enhancements Implemented

1. The group name must be provided in the payload when creating the certificate.
2. Ability to enroll certificates from Sectigo CA.
3. Option to download the certificate and private key separately.
4. Support for using service account credentials alongside username and password.
5. Capability to pull updates directly from the AppViewX Terraform registry.
6. Enhanced logging in Terraform to display error messages from AppViewX for improved clarity.
7. Support for specifying certificate validity in days, months, and years.

Use Cases supported in AppViewX Terraform Registry v1.0.1

1. Custom attributes are functional, allowing users to view Terraform-issued certificates with the field `custom_fields={"fieldname":"value"}`.
2. After creating certificates with Terraform, the CA connector displays all relevant information, such as certificate type, CSR parameters, and template names.
3. Ability to issue certificates for MSCA, AppViewX CA, and CCM CA, all of which were tested in an internal lab.
4. Ability to create and download certificates in both async and sync modes.
5. AbleAbility to download the private key in both plain and password-protected formats.
6. When `validity_unit="days"` and `validity_unit_value=1`, the validity period is automatically calculated in days, months, and years are all supported for validity calculations.

Future Roadmap Items

• Support renewal before provided number of days.
• Improve logging for better handling of 407 Proxy Authentication Required errors.
• Ability to support multiple versions of AppViewX providers.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Points to Remember

- Users can authenticate using either username/password or client ID/client secret.
- Downloading the private key is optional but access to private key download in AppViewX is required to retrieve the key.
- Fields related to certificate download are mandatory when is_syncis true and within the appviewx_download_certificateresource.
- The `Certificate Password` field is only required for formats such as PFX, P12, and JKS.
- The `isChainRequired` field is applicable only for formats such as CRT, CER, CERT, PEM, and DER.
- Users on older versions of the provider should update their resource names to appviewx_create_certificate and appviewx_download_certificate. All other fields remain unchanged, allowing seamless usage.

Standard Practices

- PKI Standard Practices
- CLM - Best Practices
- Standard Practices followed in the Certificate Inventory Management
- Securing CERT+

PKI Standard Practices

Offline Root CA

- The root CA should never be connected to the network or to the domain and no fingerprint of the server should ever be recorded since the root key compromise will impact the entire PKI hierarchy.
- Root CAs should always stay offline and shut down except when signing the Issuing CA certificates and during root CRL publish.
- Access to the Root CA to sign the Issuing CA request should be initiated in an agreed and controlled workflow so as to not compromise the Root CA in any means.
- Once the Issuing CA certificate has been issued and Root CRL published the Root CA should be turned off.
- Ensure to publish a reasonably short-lived Root CA CRL, the recommendations from NIST is to have the Root CA CRL published for 1 year and ensure to renew the CRL before expiry.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- We strongly recommend that all your CA keys be stored securely in a FIPS 140-2 Hardware Security Module (HSM).
- Protect the server during boot using Bitlocker or any other encryption system of choice and ensure to backup CA private key, CA registry Key, the CA database, and the CA certificate.
- Ensure to enable an audit event to track all actions performed on the Root CA.

Inline with Compliance

- Ensure to have a CP and CPS created to suit the organization's needs and ensure the PKI infrastructure meets all standards and requirements with respect to the CP and CPS.
- Any changes or addition of features ensure to capture in the CP and CPS documents.
- Ensure to renew the CA certificates(Root and Subordinate) within half its lifecycle.
- Enterprise key and certificate security policies should align with the latest regulatory, industry-standard recommendations, and guidelines such as key storage, secure communication protocols (TLSv1.2), cryptographic algorithms (RSA-2048), and hashing algorithms (SHA-2).
- Enterprise security architects should constantly monitor security standard recommendations and periodically update the enterprise's security policy.
- Ensure all security events are audited and a periodic security audit is performed to validate the security adherences and metrics.
- Encourage short-lived certificates for all key usages.

CSR Generation Standardization

- A process must be defined across the enterprise to generate CSR that aligns with the security standards and to store keys securely.
- Harden parameters such as Country and Organisation in accordance with organizational requirements.
- Access to keys should be restricted to authorized personnel.
- Key Generation, Certificate Request, and Approval processes should be well defined.

Archival

Signing keys do not require archival. We can always generate new keys for signing since the signed data is not encrypted. But encryption keys have to be archived so that the encrypted files during the certificate validity can be decrypted even after the certificate expiry. Also, this is recommended for security audits.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Secure Storage of Keys

- It is recommended to store private keys in HSM.
- Ensure respective certificate owners or certificate authorized administrators are granted access to private keys using the RBAC solution.
- Best practices training can be provided to certificate users and administrators to keep private keys secure.

Compromised CA/CA keys

- Ensure to discover a compromise as quickly as possible by implementing tracking and detection mechanisms and performing regular manual operational sanity checks.
- Establish well-defined communications plans for informing subjects, relying parties, and other stakeholders with sufficient details about the type of compromise so these parties can implement the appropriate remedial actions.
- If a CA system or signing key compromise occurs, the organization should perform the following steps:
  - Ensure that certificates issued to the organization’s systems or users from the compromised CA are revoked.
  - Notify all owners of the affected certificates about the CA compromise and establish a point of contact for responding to questions and providing guidance and instructions.
  - Replace all certificates from the compromised CA with new certificates from a different CA effective immediately.
  - Ensure that all relying parties have the certificate trust chains required to validate certificates from the new CA.
  - Ensure that revocation checking is enabled on all relying party systems.
- If the compromised CA is a root CA, the root certificate must be removed from all trust stores and relying on party systems.

Compromised Certificate Handling

- Ensured to be prepared to respond in a timely manner in case of a CA or end-entity certificate compromise and have a plan or workflow to replace all affected certificates or the trust chain.
- In the event of a key or certificate compromise, a fresh key pair should be generated on a secured system. The compromised item should be revoked and taken out of the service as soon as the systems are secured.
- If you are not sure of your private key possession, report it to your CA and suspend the key immediately. Once you find the key is secure, reinstate the certificate.

CA Compromise and Remediation Matrix

S/No.	Issue Type	Revoke compromised/ counterfeit certificates	Revoke CA certificate	Replace all certs issued	Remove/Revoke Root certificate
1	Impersonation	Yes	NA	NA	NA
2	RA compromise	Yes	NA	NA	NA
3	CA system compromise	NA	Yes	Yes	Yes
4	CA key compromise	NA	Yes	Yes	NA
5	Root CA compromise	NA	NA	Yes	Yes

CLM - Best Practices

Risks Involved in an Enterprise without CLM and their Solutions

S/No	Risks Involved in an Enterprise without CLM	Solutions
1	No centralized management for all certificates in an enterprise and to know the certificate's location.	Different modes to discover existing certificates along with the discovery source.
2	Enforcing teams to follow the enterprise security standards.	• Get information about all certificates within an enterprise. • Run a validation for the existing certificate against the organization's security standard.
3	Poor monitoring of certificate validity causes outages due to expired certificates.	• Continuous monitoring of the certificate status and notifications. • Automated renewals and provisioning should be available.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

S/No	Risks Involved in an Enterprise without CLM	Solutions
4	Control over the generation of keys.	Provide a mode of access to teams to access and generate certificates for their requirements.

- Create a certificate lifecycle management action plan
- Start automating the certificate management process wherever feasible.
- Identify and expose all the neglected certificates, these are the certificates that will cause more damage during expiry.
- Ensure proper RBAC controls and avoid using direct user accounts and instead use identified admin accounts for access and control.
- Enable notifications and alerts to ensure timely renewal.
- Schedule scans to run overnight or after business hours.

Standard Practices followed in the Certificate Inventory Management

- Certificate Group
- Access Control
- Recommended Columns to View in the Default Inventory

Certificate Group

- Group similar certificates into logical groups
- Groups can be based on business units or teams using certificates
- Provide group owner details during configuration for easy tracking
- Create hierarchy-based grouping to leverage alert escalation on OOB workflow.
- Try and maintain the same policy across a hierarchy of groups. It is also allowed to set a different policy for each hierarchy.

The best way to manage certificates is to group certificates based on the following:

- AD Security Group vs Department
- Test vs Production
- Internal vs External Hierarchy
- Auto-renew vs Approved CSRs
- Auto Push Updated Certificate vs Controlled Push Updated Certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Access Control

Based on certificate groups, you can create resources and map devices/applications.

Identify various authorization roles that have to be created. Find the list of roles below:

- Certificate Administrator Team
- CERT Owner/Requester
- Approver
- Certificate Manager
- Inventory View

The certificate admin team should be granted access to view the entire certificate inventory and end-users should be able to view their respective certificates.

All managed/monitored certificates should be available on a single window for tracking and visibility. The product provides various columns that have rich information that might not be needed in all scenarios.

Recommended Columns to View in the Default Inventory

- Subject Distinguished Name (DN)
- Subject Alternative Names (SANs)
- Issue Date (not Before date)
- Expiry Date (not After date)
- Issuing Certificate Authority
- Key Length
- Key Algorithm (RSA, ECDSA)
- Signing Algorithm
- Validity Period (From the not Before date/time to the not After date/time)
- Installed location(s) of a certificate (IP or DNS address and file path)
- Certificate Owner (The group responsible for the certificate)
- Contacts (The group of individuals is notified of issues)
- Approver(s) (parties responsible for reviewing issuance and renewal requests)

As the inventory is a RegEx-based search engine, users can search for a certificate based on any parameter with various filters.

Securing CERT+

CERT+ Certificate Lifecycle Management (CLM) offers capabilities to discover and manage certificates on devices and self-service certificate enrollment for users. CERT+ also acts as a Key Escrow for keys discovered and enrolled.

Typically, the private keys are stored by the devices handling SSL termination, and an SSL management tool retrieves them during certificate renewal. The tools and devices store them in their storage in the original format, which can be reused. If there is an attack on the device or tool storage, the private keys will be given away, which can be used to host an array of attacks.

AppViewX stores the private keys discovered in a secure part of the database, which is encrypted using the AES-256 algorithm. It encrypts each private key with independent keys and stores the encrypted independent keys in the database with a randomly generated key.

Thus, even if the hackers get the database, they will not be able to get the private keys. Only a maze of jumbled up characters will be visible to them, which does not make any sense and hence, rendering the attack useless.

Chapter 3: CERT+ Admin Guide

AppViewX CERT+ Admin Guide provides comprehensive instructions for administrators to efficiently manage and configure the CERT+ certificate lifecycle management solution. It covers key administrative tasks, including setup, and configuration, to ensure optimal performance and security of digital certificates.

As an admin user, you can perform the following tasks:

- Deploy and manage CERT+ hosts and licenses.
- Configure user accounts, authorization, and authentication.
- Monitor the system health of managed hosts and the application.
- Auto enroll certificates by automating all the steps involved, including CSR generation, domain ownership verification, certificate download, and provisioning, making the process efficient, scalable, and secure. (See Auto Enrollment Protocols)
- Onboard Certificate Authorities (CAs). (See Configuring CA Settings)
- Enforce organization standards by configuring certificate policies in **CERT+**. Thus the attributes of discovered certificates are compared against the certificate policy to ensure they are complaint. (See CA Policy)
- Configure certificate groups. (See Configuring Certificate Groups)
- Manage server devices. (See Configuring and Managing Servers)
- Manage firewall devices. (See Configuring and Managing Firewalls)
- Manage cloud devices. (See Configuring and Managing Cloud Devices)
- View certificate reports. (See Certificate Reports)

Amazon and Amazon Private CA

Prerequisites

The prerequisites for configuring Amazon CA or Amazon Private CA account in AppViewX are as follows:

- An Amazon account for a user having necessary access for enrolling the certificates and other CLM operations.

  For links to detailed instructions for retrieving the above information, see the **References** section.

- AppViewX server should either have internet access or have a proxy configured in AppViewX general settings. Refer to the section Managing Proxy Settings in the Platform guides.
- Policy JSON for AWS EC2 Instance Certificate Management.
- Prerequisite permissions for Amazon CA:

Prerequisites for Using a CyberArk Credential List for Onboarding

If credentials for onboarding have to be fetched from a credential list in CyberArk:

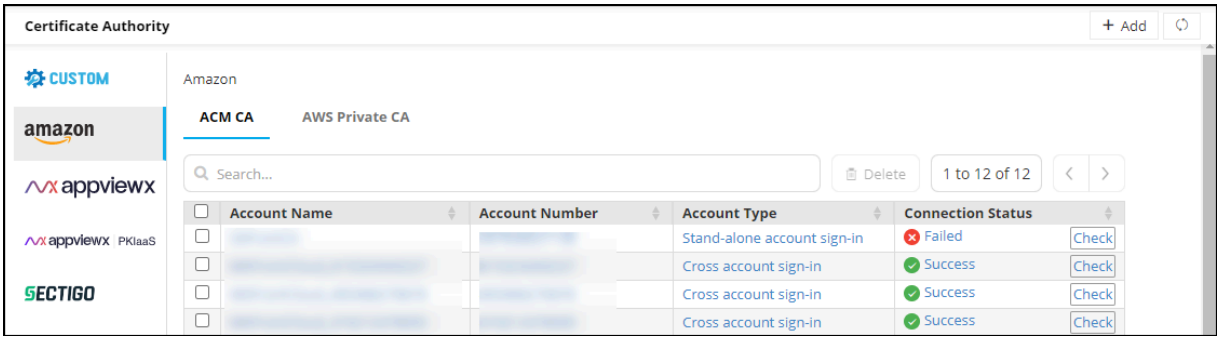
- Ensure that your AWS access credentials are saved in your CyberArk account. For instructions on creating AWS access details in the CyberArk account , refer to the documentation here.

> **Important:** For this use case, in the Account Parameters, the **Password** field must be considered a mandatory parameter. This field is used to specify the AWS access secret key information.

- Ensure that CyberArk is integrated with AppViewX and a credential list is created. For instructions, refer to the documentation here.

Configuring Amazon CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Amazon**.
   The **Amazon** home page is displayed.



3. To configure Amazon CA, click **ACM CA** from the home page.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.

> **Note:** The **Configure Now** option is displayed if you are configuring a CA for the first time.

   The **Amazon** configuration page is displayed.
5. Enter/Select the following details in the **General Information** section:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Information - Field Description Table

Field	Description
***Account Type**	From the dropdown list, select one of the following account types: • **Standalone** (Traditional access key- and secret key-based communication) • **Cross or Federated** (Authentication using assume role)
***Account Name**	Enter your AWS account name.
***Account Number**	Enter your AWS account number.
Account Description	Enter any additional information related to your AWS account.
***Purpose/Usage**	From the dropdown list, select the certificate type(s) for which CLM actions will be enabled. **Possible values**: Server, Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
***Default Region**	Default region for API communication
***Data Center (AppViewX's CA agent)**	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

6. Enter/Select the following **Credentials**-related information.

Credentials - Field Description Table

Field	Description
Credential type*	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	• **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the CA setting. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
*: *Mandatory fields*	

7. Enter/Select the following details in the **Discover resources** section:

Discover Resources - Field Description Table

Field	Description
***Role ARN for Resource Discovery**	This field is displayed only when **Account Type** is **Cross or Federated**. To let the master account assume role for the child account (get temporary privileges to discover resources from the child account), configure the role ARN for resource discovery: a. Click (Settings). b. Enter the following details:

Field	Description
Role Session name	**Role Session name** is an identifier for the assumed role session. Use the **Role Session name** to uniquely identify a session when the same rule is assumed by different principals or for different reasons.
Duration Seconds	Enter the duration, in seconds, for which the credentials should remain valid. Acceptable durations for IAM user sessions: • **Minimum**: 900 seconds (15 minutes) • **Maximum**: 129,600 seconds (36 hours) **Default**: 3600 seconds (1 hour)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>External Id</td><td>External Id is a unique identifier that might be required when you assume a role in another account.</td></tr>
<tr><td>Source Identity</td><td>The source identity is specified by the principal that is calling the AssumeRole operation.</td></tr>
<tr><td>Session Tags</td><td>Session Tags are key-value pairs that you pass when you assume an IAM role or federate a user in AWS STS.

To create a session tag:
i. In the Enter Key field, enter a key for the key-value pair.
ii. In the Enter Value field, enter a value for the key-value pair.
iii. Click Add.

The added key-value pair is shown in the table below the fields.</td></tr>
</table>
</td></tr>
<tr><td>*Service Region</td><td>To select a service region:
a. To fetch the service regions for the account information provided, click Fetch Region.

The retrieved service regions are populated in the Select the Region(s) dropdown list.
b. From the Select the Region(s) dropdown list, select the required service region.</td></tr>
<tr><td>Discover Certificate</td><td>To enable instant certificate discovery at the time of device addition, select this checkbox.</td></tr>
</table>

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Cert Sync**	Select from one of the following options: • **Managed**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory. Users with the relevant permissions can then perform the required certificate-related actions. • **Monitored**: AppViewX will connect with the customer's AWS account and discover certificates. These certificates will be added to the inventory where the users will be allowed to only view the certificates. • **Ignored**: AppViewX will connect with the customer's AWS account but certificate discovery will be disabled.
Auto Sync	To enable/disable automatic schedule-based synchronization: a. For **Auto Sync**, select the **Yes** checkbox. b. For **Schedule based discovery**, use the two dropdown lists to select a duration. For example, to schedule the auto sync after every 2 days, from the first dropdown list, select **2** and from the second dropdown list, select **Days**. By default, the auto sync is set to **1 Hours**. **Note:** The **Schedule based discovery** dropdown lists are displayed only when **Auto Sync** is enabled.
Route53 Zone Auto Approval	To support DNS validation as an automatic process, enable this toggle. **Important:** If Route53 has been configured for any of the older Amazon Public CAs, ensure that, after migration, the zones are manually updated.
*: *Mandatory fields*	

8. Click **Save**.

   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully

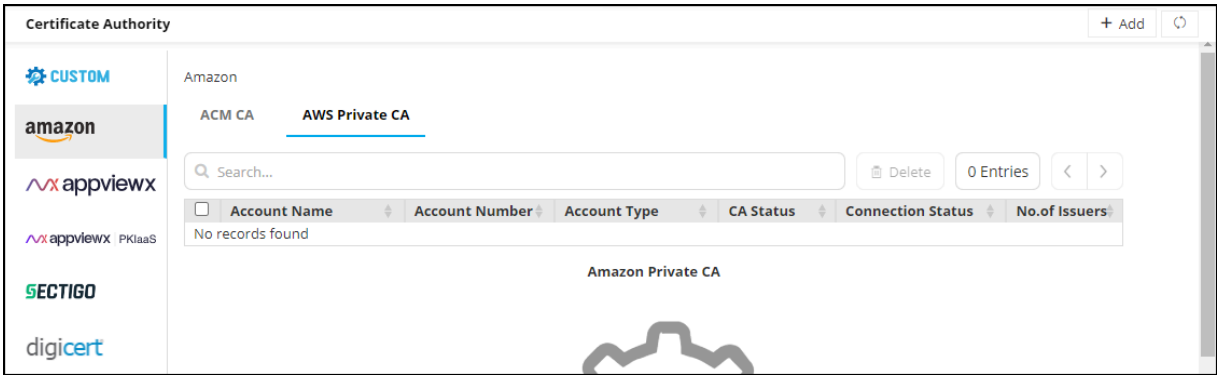
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Configuring Amazon Private CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Amazon**.
   The **Amazon** home page is displayed.
3. To configure the Amazon Private CA, click **AWS Private CA**.



The **Amazon** home page is updated to display the inventory grid as shown in the image. In the inventory grid for the Amazon Private CA, master and child account details are logged as separate entries, instead of having just one master entry.

Fields in the inventory grid are explained in the table below:

AWS Private CA - Screen Description Table

Field	Description
Search	Use the **Search** field to search for accounts, by entering the value of one of the details listed in the inventory grid.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	To delete one or more accounts: a. From the inventory grid, select the checkbox corresponding to the account(s) you want to delete. b. Click  (Delete) . **Tip:** To delete all accounts listed in the inventory grid, select the checkbox in the grid header.
	To set the number of records that should be displayed on one page: a. Click . b. From the **Show** menu displayed, select the required value. 	If the inventory grid spans more than one page, use this control to navigate the pages, one page at a time.
Account Name	This is the unique name for the Certificate Authority (CA) account entered at the time of account creation.
Account Number	AWS account number
Account Type	**Multi account**: Indicates that the account is a cross account **Single account**: Indicates that the account is a standalone account
CA Status	For an account, after all configuration details for Amazon Private CA are entered, you will be required to click the **Fetch issuer and save** button to sync and discover the issuers and the respective certificates for that account. The **CA Status** field shows the current status of this sync and discovery process.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Possible values for this field are: • Completed • In progress **Note:** An account entry in the grid will be disabled till the **CA Status** is **In progress**.
Connection Status	To validate if connection has been established with the CA, click **Check**. If a connection has been established, this field is updated to display **Success** or **Failure**.
No. of Issuers	This field displays the number of issuers associated with the account. **Note:** For a master account, this field will show the number of issuers associated with only the master account. The value does not include the number of issuers associated with the child account.
*: *Mandatory fields*	

4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively. The **Amazon** page is updated to display fields for entering the CA configuration-related information.
5. On this screen, enter the following **Basic Information**:

Basic Information - Field Description Table

Field	Description
***Account type**	From the dropdown list, from the following options, select the customer's AWS account type: • **Standalone**: The user account and the resources are available in the same account. • **Cross or Federated**: Resources are available across multiple accounts and users are given role-based access.
***Account name**	Enter a unique name for the Certificate Authority (CA) account that will be used during certificate enrollment and policy creation.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
***Account number**	Enter the customer's AWS account number.
Account Description	Enter any additional details related to the account, if required.
***Purpose/Usage**	From the dropdown list, select the purpose of the certificate that can be requested using this account.
Proxy Required	To allow all communication to the Certificate Authority (CA) to use the proxy details (provided in general settings; refer the CLMaaS Platform User Guide for more details), select this checkbox.
***Default Region**	From the dropdown list, select the default region for API communication.
Data Center (AppViewX's CA Agent)	From the dropdown list, select the data center that will be used to establish communication with the Certificate Authority (CA)
*: *Mandatory fields*	

6. Enter the **Credentials**-related information for the CA integration.

Credentials - Field Description Table

Field	Description
Credential type*	From the dropdown list, from the following options, select the authentication method that will be used for integrating AWS with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution. • **IAM ROLE ACCESS** Tech Preview: An IAM role-based approach is used for authentication instead of direct access keys. **Important:** This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production.
***Access key**	This field is displayed when **Credential type** = **Manual Entry**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Enter the access key generated for your AWS account.
***Secret key**	This field is displayed when **Credential type** = **Manual Entry**. Enter the secret key generated for your AWS account.
***Credential List**	This field is displayed when **Credential type** = **Credential List - CyberArk**. From the dropdown list, select the CyberArk account with the AWS credentials that will be used for onboarding the CA setting. The options listed in this dropdown list are the existing CyberArk accounts integrated with AppViewX. For instructions on integrating CyberArk with AppViewX, click here.
Download Cloud Formation Template (CFT)	This clickable link is displayed when **Credential type** = **IAM ROLE ACCESS**. To download the CloudFormation template, click this link. The downloaded CFT is pre-configured with all account details and permissions that have to be assigned to the IAM role and can be directly deployed in your AWS environment. To read more on CloudFormation templates, read the documentation here.
***Master Account Role**	Enter the Amazon Resource Name (ARN) of the AWS IAM role.
***External Id**	Enter the unique identifier generated to establish a secure trust relationship between AWS and AppViewX.
*: *Mandatory fields*	

7. In the **Discover resources** section, enter the following details:

Discover Resources - Field Description Table

Field	Description
Role ARN for Resource Discovery*	This field is displayed only when **Account Type** is **Cross or Federated**. To let the master account assume role for the child account (get

Field	Description
	If **Auto Sync** is enabled, to set the frequency of the schedule-based sync: a. From the first dropdown list, select the interval between two schedule-based syncs. b. From the second dropdown list, select a unit for the interval (**Hours**/**Days**). For example, to set the frequency of the schedule-based sync to every 2 hours, from the first dropdown list, select **2** and from the second dropdown list, select **Hours**.
*: *Mandatory fields*	

8. Click **Fetch issuer and save**.
   - AppViewX will now discover all the Private CA Certificate Authorities across the selected region(s).
   - The inventory grid on the Amazon CA home page will be populated with the properties and details retrieved from this discovery.
   - The connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

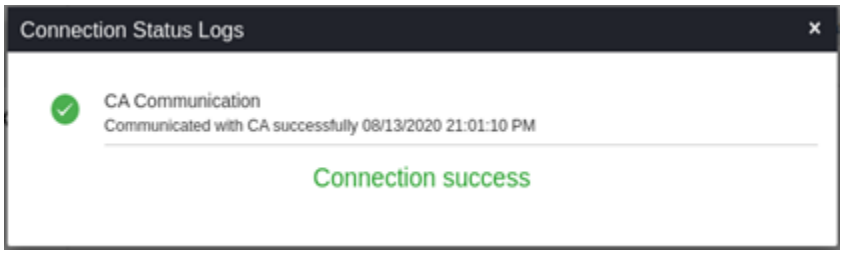
> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Amazon CA and Amazon Private CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Amazon**.
   The **Amazon** home page is displayed.
3. On the **Amazon** home page, select **Amazon** or **Amazon Private CA**.
4. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The CA communication will be validated and the **connection status** will be displayed as either **Connection success** or **Failure**.



References

Vendor documentation for retrieving the Amazon CA and Amazon Private CA configuration prerequisites:

- Creating an AWS account
- Creating an IAM user in your AWS account
- Managing access keys for IAM users

CSC Global CA

Prerequisites

The following values are required to configure the CSC Global CA:

- CA Base URL (the value is available in the UI field of the CA setting page)
- API Key
- Token

  Please contact the CSC Global team for retrieving the above listed prerequisite values.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

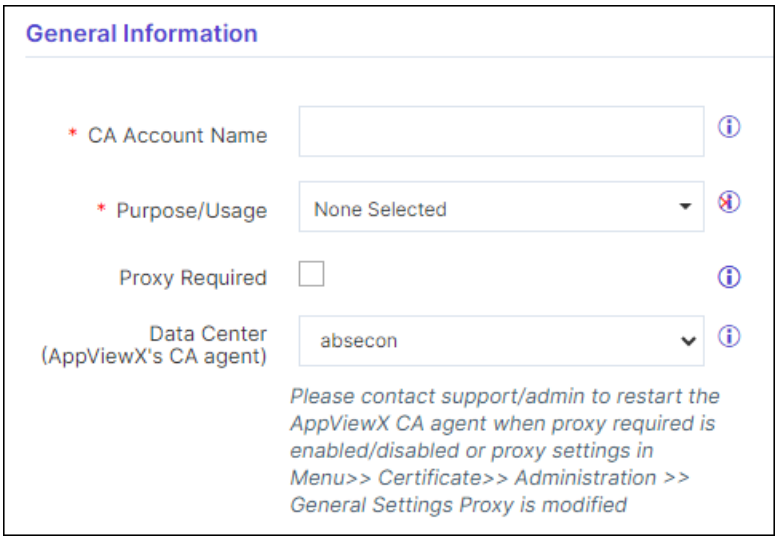
Configuring CSC Global CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **CSC**.

   The **CSC** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.

   The **CSC Global CA** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

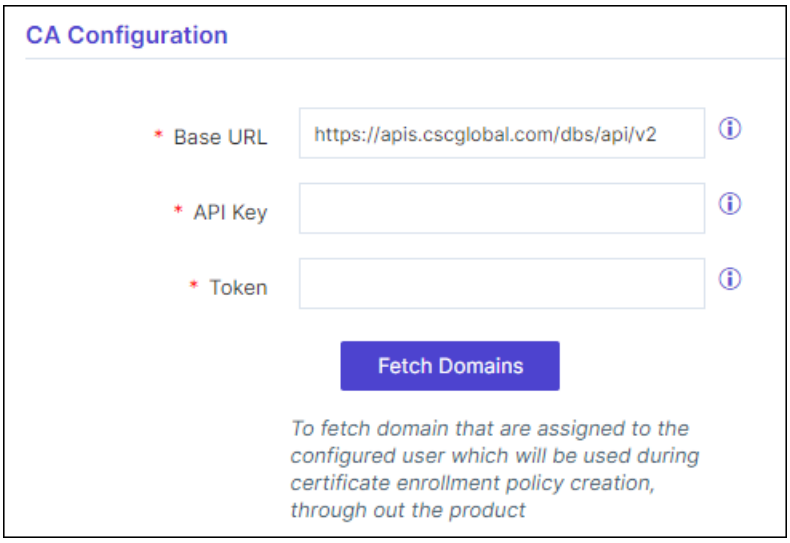


General Information - Field Description Table

Fields	Description
***CA Account name**	Enter a unique name in the text field to identify the CA account and be represented during certificate enrollment and policy creation. No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Select the purpose of the certificate from the dropdown list for which CLM actions will be enabled. Example: Server, Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the CSC Global CA APIs for Certificate Management:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

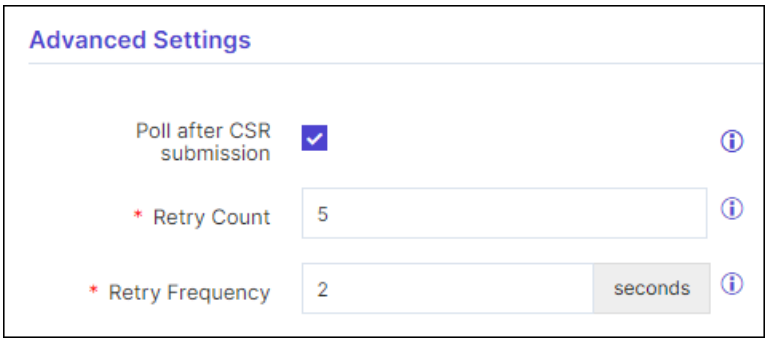


CA Configuration - Field Description Table

Fields	Description
***CA Base URL**	Enter the base URL that will be used to construct the API request. The value is *https://apis.cscglobal.com/dbs/api/v2*
***API Key**	Enter the API key which is a unique identifier used to authenticate the user. The value entered will be masked and encrypted.
Token	Enter the API token which is used to authenticate users or applications and provide access to protected resources. The value entered will be masked and encrypted.
*: *Mandatory fields*	

6. Click **Fetch Domain.**
   If the data provided is accurate the success message “Domains fetched successfully“ will be displayed and a table is displayed with two columns - *Account Number* and *Domain Name*. A list of active domains in AppViewX are listed in the table. Each account can hold multiple domains.
7. Update the following details in the **Advanced Settings** section as described in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Advanced Settings - Field Description Table

Fields	Description
***Poll after CSR submission**	Selecting the checkbox enables polling after CSR submission. It fetches the certificates immediately after CSR submission on enrollment, renew, and reissue with the retry count and retry frequency specified in the fields below.
***Retry Count**	Enter a value between 1 - 10.
***Retry Frequency**	Enter a value between 1 - 30 seconds.
*: *Mandatory fields*	

8. Click **Save**.
   - The CA details are saved in the CA instance inventory and the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

     Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

   - The **Fetch Custom Fields button** is enabled.

     Note: In case **Fetch Domains** and **Fetch Custom Fields** are not triggered before saving CA settings, this action can explicitly perform both these actions and update the CA.

9. To get the list of custom fields configured (if any), click **Fetch Custom Fields**.
   If the custom fields are configured they will be displayed in a table with two columns - *Name* and *Mandatory/Optional*.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

a. Enter the values for the custom fields.
b. Click **Save**.

The details are saved.

Note: These custom fields attributes are displayed in the certificate enrollment form at the time of enrollment.

Validating CSC Global

Once the CSC Global CA settings are added, validation needs to be done to check whether the connection between AppViewX and CSC is properly configured.

1. On the CSC CA page, the above configured CA will be displayed with a **Check** button in the last column of the table.
2. Click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

Custom CA

Prerequisites

The prerequisites for configuring Custom CA account in AppViewX are as follows:

- A logo to use it for the custom CA.
- An optional CA certificate and key to be used as a root certificate.

Configuring Custom CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Custom**.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **Custom** home page is displayed.
4. Update the following details in the **General Information** section as described in the table:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Information - Field Description Table

Fields	Description
***Custom CA Name**	A unique name to identify the CA name. No special characters allowed.
***Upload Custom CA Logo**	Upload a logo for the custom CA. This logo will appear in the product representing the custom CA.
Custom CA Certificate	Upload a certificate for the custom CA. This certificate will become the root certificate. The <.*pfx*> and <.*p12*> are certificate types are supported.
*: *Mandatory fields*	

5. Once the logo and certificate are uploaded, the entered CA will appear in the CA list with the logo presented.
6. Once the logo is added, users can click **Configure Now** to input the CA details.
7. Update the following details in the **General Information** section as described in the table:

Fields	Description
***Name**	Client authentication certificate for API communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

8. Update the following details in the **ROOT CSR parameters** section as described in the table:

Root CSR - Field Description Table

Fields	Description
Common Name	The common name of the root certificate. • Use Asterisk (*) for the host part of the FQDN to enforce the domain. For example, *.domain.com will only allow users to request certificates with domain domain.com. • Allowed Special Characters: Asterisk (*), Hyphen (-), Period (.)
Algorithm	Type of the root certificate.
Hash Function	The hash function for the root certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Organization Unit	Name of the Organisation unit.
Key Length	Key length for the root certificate.
Organization	Organization attribute for the root certificate.
Locality	Locality attribute for the root certificate.
State or Province	State attribute for the root certificate.
Country	Country attribute for the root certificate.
Email Address	Email address for the root certificate.
*: *Mandatory fields*	

9. Update the following details in the **Root Validity** section as described in the table.

Fields	Description
***Start Date**	Start date of the certificate issuance.
***End Date**	End date of the certificate issuance.
*: *Mandatory fields*	

10. Click **Save**.

    Once the setting is saved, the user will be directed to the root certificate submission holistic view as below.

11. Users can submit and fetch the root certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. On the CA setting page user can see the status of the created setting as shown below.

DigiCert CA

Important: Effective October 1st, 2025, DigiCert CA server certificates will include only server authentication in the Extended Key Usage (EKU). Dual authentication will no longer be supported.

As a temporary provision till May 01st, 2026, DigiCert CA will allow dual authentication in the EKU. Customers who need to continue enrolling server certificates with dual authentication enabled can contact AppViewX's Site Reliability Engineering (SRE) team for assistance at:

- saashelp@appviewx.com (for SaaS-based deployments)
- help@appviewx.com (for on-prem deployments)

However, it is strongly recommended to transition away from the use of server certificates for dual authentication to align with industry best practices.

Prerequisites

To configure a DigiCert CA account in AppViewX, you will need:

- A DigiCert CertCentral Account with one of the following roles:
  - **Administrator** (Full admin access including access to create divisions and users and to manage user access)
  - **Standard User** (Access to place and manage orders with changes being approved by a manager or administrator)
  - **Manager** (Access to mange finances, create and approve requests, manage orders and domains, and to view and edit users)
  - **Finance Manager** (Access to manage finances and to place and manage orders)
- API key

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Important: The API key is displayed only one time when it is generated. Ensure that it is copied and saved in a secure location.

- Account ID

For links to detailed instructions to get the above information from DigiCert, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring DigiCert

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the list of CAs displayed on the left, select **DigiCert**.
   The **DigiCert** CA account inventory is displayed. By default, the **DigiCert** CA tab is open.
3. If it is your first DigiCert CA integration in AppViewX, click **Configure Now**.
   The **Configure Now** button is displayed only if this is the first integration instance.

   For the subsequent integrations, from the top-right corner of the page, click **Add**.

   The **DigiCert** configuration page is displayed.
4. Enter/Select the **General Information** details for the DigiCert CA configuration.

General Information - Field Description Table

Fields	Description
***CA Account name**	Enter a unique name for the Certificate Account (CA) account, which will be displayed during certificate enrollment and policy creation. **Constraints**: • Valid special characters: **.**, **-**, and _ • CA account name should not begin with a special character and/or a space.
***Purpose/Usage**	From the dropdown list, select the certificate type(s) for which CLM actions will be enabled. **Possible values**: Server, Client, Code Signing
Proxy Required	For CA communication to happen via a proxy, select this checkbox.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
Data Center (AppViewX's CA agent)	From the dropdown list, select the data center through which the CA communication must happen.
*: *Mandatory fields*	

5. To invoke the DigiCert CA APIs for certificate management, enter/select the **CA Configuration** details.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	Enter the base URL for constructing API requests. **Default value**: https://www.digicert.com/services/v2
***Credential Type**	From the following options in the dropdown list, select the method for providing authentication credentials for integrating DigiCert CA with AppViewX: • **Manual Entry**: The required credentials will be entered manually. • **Credential List - CyberArk**: The required credentials will be retrieved from CyberArk, a Privileged Access Management (PAM) solution.
Account ID	Enter the account number provided for your DigiCert account.
***API Key**	The API key is a unique identifier that is used for authentication. In this field, enter the API key that has been generated for your DigiCert account.
***Credential List**	This field is displayed only when **Credential Type** = **Credential List - CyberArk**. The dropdown list is populated with credential entries stored in CyberArk. From the dropdown list, select the credential entry that will be used for authenticating the CA integration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Fetch Divisions and Certificate Types	To fetch the divisions and certificate types available in your DigiCert account, click **Fetch Divisions and Certificate Types**. AppViewX connects to DigiCert using the credentials provided to fetch the divisions (organizational units in DigiCert to manage certificates) and certificate types (available certificate types based on the **Purpose/Usage** selected).
Auto Approve	**Note:** This field has role-based access. It is disabled for the **Standard User** and **Financial Manager** roles. If all CLM requests from AppViewX do not need to be approved from the Digicert CA account, select the **Auto Approve** checkbox . Auto approval is optional and works only for **one-step certificate requests** configured in the Digicert Cert Central Account.
Discover additional fields	To fetch the custom attributes/additional certificate metadata configured for the DigiCert CA certificates, select this checkbox. These additional details are configured as vendor-specific details and custom certificate attributes at the time of certificate enrollment. **Important:** Enabling this field will have significant performance impact since an additional set of APIs must be executed to fetch the details.
*: *Mandatory fields*	

6. To fetch the custom attributes/additional certificate metadata details for this DigiCert CA integration, click **Fetch Custom Attributes**.

   Note: This field is displayed only when the **Discover additional fields** checkbox is selected.

7. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the DigiCert CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Digicert**.
   The **Certificate Authority** page is updated to display an inventory of all DigiCert CA settings onboarded in AppViewX.
3. In the **Connection Status** column of the inventory grid, click **Check** to validate the CA setting.
   The CA communication will be validated and the **Connection Status** will be updated to**Success**/**Failure**.

Vendor documentation for retrieving DigiCert prerequisites:

- CertCentral (Centralized Certificate Management)
- Manage CertCentral Account
- Generate an API Key
- Set up your CertCentral Account

DigiCert MPKI

Prerequisites

The prerequisites for configuring a Digicert MPKI CA account in AppViewX are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- A Digicert MPKI Account with **Administrator** role Access.
- An **API Key** configured in Digicert MPKI with required permissions to make API Requests from AppViewX.
- AppViewX server should either have internet access or have a proxy configured in AppViewX general settings. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring DigiCert MPKI

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **DigiCert**.
   The **DigiCert** home page is displayed.
3. Click the **DigiCert MPKI** tab.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **DigiCert MPKI** configuration page is displayed.
5. Update the following details in the **General Information** section as described in the table.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. Example: Server, Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

6. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the Digicert CA APIs for Certificate Management.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	This URL will contain just the hostname of the Digicert CA instance. For example, <https://www.digicert.com>
***Seat ID**	Enter the unique seat id for discovering certificates.
***API Key**	Enter the API key, which is generic across all CAs

*: *Mandatory fields*

Note: Auto approval checkbox is optional and features work only for **one-step certificate requests** configured in the DigiCert Central Account.

7. Select **Fetch Divisions and Certificate Types.**

   The Division and Certificate types available in the Digicert CA account will be fetched and listed for the specific API key user in the table as shown below.

	End Entity Profile Names	Custom Attributes	Required	Default Value	Modifiable	Regex Pattern
☐	Ecosystem_Code_Signing	country	☑		☐	
		locality	☐		☐	
		common_name	☑		☐	
		state	☐		☐	
		postal_code	☑		☐	
☐	Ecosystem_Client	common_name	☑		☐	
		otherNameUPN	☑		☐	
		san_ipAddress	☑		☐	
		mail_email	☑		☐	
		directory_name	☑		☐	
☐	Ecosystem_Server	common_name	☐		☐	
		cert_org_unit	☐		☐	
		custom_encode_dnsName	☑		☐	
		custom_encode_dnsName_multi	☐		☐	
		san_ipAddress	☑		☐	

8. Click **Save**.

   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully

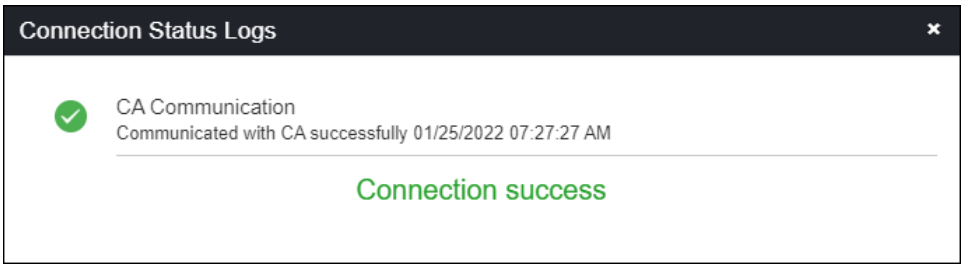
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the DigiCert MPKI Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **DigiCert**.
   The **DigiCert** home page is displayed.
3. Click **DigiCert MPKI** from the left pane of the page.
   The **DigiCert MPKI** home page is displayed.
4. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



DigiCert One

Prerequisites

In order to configure a DigiCert One CA account you will need the following:

- DigiCert One account base URL
- API Key or Client Authentication certificate (depending on the authentication mode)

For links to detailed instructions to get the above information from DigiCert One, see the **References** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring a DigiCert One CA Account

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
   The **Certificate Authority** page is displayed.
2. On the **Certificate Authority** page, from the CA list displayed in the left, select **DigiCert**.
   The **Certificate Authority** page for **DigiCert** is displayed.
3. Click the **DigiCert One** tab.
4. To onboard your first DigiCert One CA account setting in AppViewX, click **Configure Now**.
   OR

   Click **+Add**.

   The **Certificate Authority** page is updated to display the form fields for onboarding a DigiCert One CA account.
5. Enter/Select the **General Information** for the CA account.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	From the dropdown list, select the certificate type for which the CLM actions have to be enabled.
Proxy Required	Enable this field if the CA communication needs to happen via a proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

6. Enter/Select the **CA Configuration** details.

General Information - Field Description Table

Fields	Description
***Base URL**	Hostname of DigiCert One instance. For example http://one.digicert.com

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Authentication method**	From the following options, select an authentication method for authenticating the API requests: • **API Token**: To authenticate the API requests with an API token, select this option. • **Client Certificate**: To authenticate the API requests using a client certificate file, select this option. **Important:** Currently, only the **API Token** authentication method is supported.
***API Key**	Enter the API key that will be used for authentication. **Note:** You will be assigned an API key when you login to your DigiCert One instance and create a user.
Allow Seat ID during enrollment	Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. For the certificates enrolled for this CA account, you can either assign a unique seat ID for each certificate or a common one for all the certificates. To assign a unique Seat ID for the certificates enrolled for this CA account, select this checkbox. If you select this option, a field to specify the seat ID is hidden from the CA settings form and is included in the certificate enrollment form.
***Seat ID**	Seat ID is a unique user-defined value assigned to identify an entity in the DigiCert One account. The seat ID for a certificate is used for certificate enrollment, renewal, and regeneration. To have a common Seat ID for all certificates enrolled for this CA account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Use DigiCert One to switch certificates from DigiCert MPKI	To automatically switch your DigiCert MPKI certificates to DigiCert One at the time of auto regeneration, select this checkbox. **Important:** For multiple CA accounts with automatic CA switch enabled, CA switch will use CA settings configured for the first CA account for which the automatic CA switch is enabled. **Note:** To manually switch CAs, refer to the instructions here.
*: *Mandatory fields*	

7. To fetch profiles that are assigned to the configured user which will be used during certificate enrollment, policy creation, through out the product, click **Fetch Certificate Profiles**.
   All certificate profile configured with “enrollment_method”: **rest_api** and “authentication_method”: **third_party_app** are displayed.
8. Click **Save.**
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

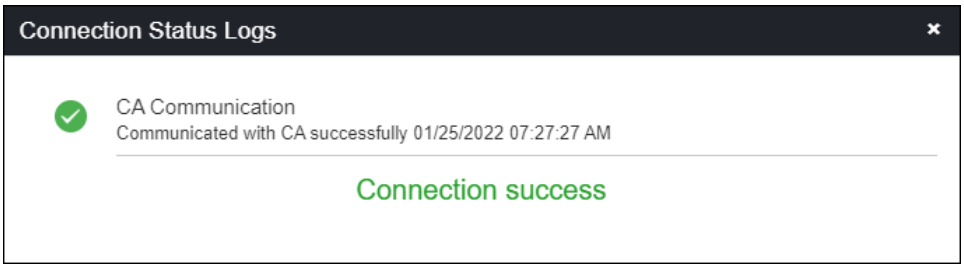
Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the DigiCert One CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
   The **Certificate Authority** page is displayed.
2. On the **Certificate Authority** page, from the CA list displayed in the left, select **DigiCert**.
   The **Certificate Authority** page for **DigiCert** is displayed.
3. Click the **DigiCert One** tab.
   All existing DigiCert CA accounts are listed in the inventory on this page.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the **Connection Status** column, click **Check**.
   The CA communication is validated and a success/failure message is displayed.



References

Vendor documentation for retrieving DigiCert One prerequisites:

- Retrieving the base URL
- Creating your API token
- Creating your API token authentication certificate

EJBCA

Prerequisites

A client certificate and URL are needed to configure the EJBCA account in AppViewX.

- The URL must be entered in the format **https://<node_hostname>:<port>/ejbca/ejbcaws/ejbcaws?wsdl**. The **node hostname** is available on the UI of the EJBCA adminweb portal's welcome screen.
- An EJBCA client certificate for a user having the necessary access for enrolling the certificates and other CLM operations. To issue a client authentication certificate in EJBCA, do the following:
  1. In EJBCA, click RA Web to access the EJBCA RA user interface.
  2. To enroll, select **Enroll** > **Use Username** and specify the following:
     - **Username:** Enter the username as specified earlier in the step Add end entity
     - **Enrollment code:** Enter the password specified earlier in the step Add end entity.
     - Click **Check**.
     - For Key algorithm, you can limit the type of keys to be used, such as only RSA 2048 bits.
     - Click **Download PKCS#12** to download and save the keystore.
- AppViewX server (worker node) / CC should either have internet access/EJBCA endpoint URL access, have a proxy configured in general settings (if required). Refer to the section Managing Proxy Settings in the Platform guides.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **For SaaS**: 443 communication from the preferred CC (Cloud Connector) to EJBCA API / endpoint URL.
- **For On-Prem**: Workers nodes should have internet access or the proxy should be configured in General Settings for connectivity to EJBCA API / endpoint URL.

Configuring EJBCA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **EJBCA**.
   The **EJBCA** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **EJBCA** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/ Usage**	Certificate Type for which CLM actions will be enabled. E.g. Server, Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the APIs for Certificate Management.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Configuration - Field Description Table

Fields	Description
***Client Authentication**	Client authentication certificate for API communication. a. Enter the valid password once the **Authentication Details** window is displayed. b. Click **OK**. The value must be a valid <.*p12*> or <.*pfx*> file.
***URL**	EJBCA URL in the format *https://<node_hostname>:<port>/ejbca/adminweb/*
Click **Validate and Fetch**. The **End entity profiles** available for the CA account will be fetched along with the certificate profile from the **Certificate Authority**.	
***Communication mode**	Choose any of the following modes; it is required for CA Discovery. • **SOAP** • **REST**
***Discover by expiry days**	Set the number of days to expiry, which is calculated from the current day. The value must be number.
*: *Mandatory fields*	

6. Update the following details in the **Certificate Attributes** section as described in the table:

Fields	Description
***End Entry Profile Names**	Select the profile that is used in the certificate enrollment from the dropdown list. This is the required end entity profiles for CA setting.
Custom Attributes	Select the list attributes configured in CA to enroll certificates. These are the required custom attributes for the specific end entity profile. Custom attributes should be configured as exactly as it is available in the EJBCA portal. (Validation can be added by the user in the regex box, check if mandatory and modifiable).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

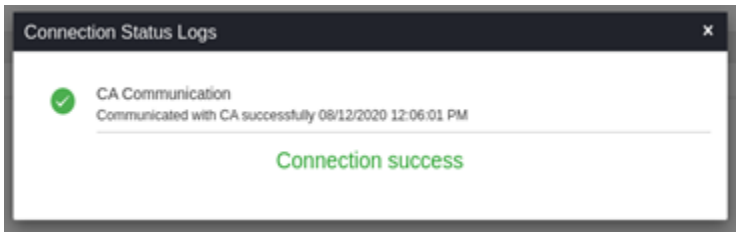
Fields	Description
*: *Mandatory fields*	

7. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the EJBCA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **EJBCA**.
   The **EJBCA** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



Entrust CA

Prerequisites

To configure a Entrust CA account in AppViewX, you will need:

- An Entrust client authentication certificate
- Credentials (API username and API key) for an account with the requisite access for executing CLM actions

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For links to detailed instructions to get the above information from Entrust, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Entrust

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Entrust**.
   The **Entrust** home page is displayed. The Entrust tab is selected by default.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **Entrust** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example: Server and Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the Entrust CA APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Client Authentication**	The client authentication certificate from Entrust for API communication.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: Must be a valid <.*p12*> file. To generate an CSR within AppViewX refer to Generating a CSR and download the CSR. Further, upload the CSR to the Entrust homepage.
***Base URL**	This URL will contain just the hostname of the Entrust CA instance. The default value is *https://api.entrust.net/enterprise/v2*.
***API Username**	Enter the API Username to communicate with the CA.
***API Key**	Enter the API Password to communicate with the CA.
Auto Approve	Select the checkbox to avoid queuing of new certificates in the CA portal.
**: Mandatory fields*	

6. Update the following details in the **Advanced Settings** section as described in the table.

Advanced Settings - Field Description Table

Fields	Description
Poll after CSR Submission	A check box field when selected will fetch the certificated immediately after CSR Submission on enrollment, renew, and reissue of certificate with the retry count and retry frequency as described below.
***Retry Count**	The number of times the polling will take place after CSR submission. Enter a value between 1 and 10.
***Retry Frequency**	The duration of the polling. enter the value between 1 and 30seconds
**: Mandatory fields*	

7. Click **Fetch Custom Attributes**.
   The attributes available for the CA account will be fetched from the Certificate Authority along with the CA and profile names. A pop-up message is displayed as **CA and profiles fetched**.
8. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully

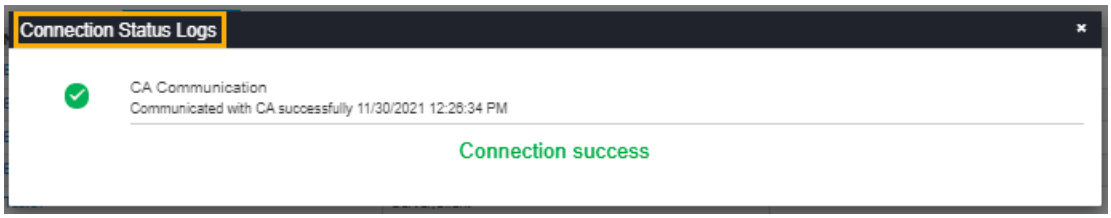
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Entrust CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Entrust**.
   The **Entrust** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



References

Vendor documentation for retrieving Entrust prerequisites:

- Entrust REST PKI Guide

  Downlad the Entrust REST PKI Guide and refer to the section **Authentication** > **TLS with client certificate authentication**.

Entrust MPKI

Prerequisites

To configure a Entrust MPKI account in AppViewX, you will need:

- Base URL
- Client authentication certificate

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For links to detailed instructions to get the above information from Entrust MPKI, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Entrust MPKI

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Entrust**.
   The **Entrust** home page is displayed.
3. Click the **Entrust MPKI** tab.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **Entrust MPKI** configuration page is displayed.
5. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example: Server and Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

6. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the Entrust MPKI CA APIs for Certificate Management.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Configuration - Field Description Table

Fields	Description
***Client Certificate**	Client authentication certificate for API communication. Click the **Upload** button to select and upload the client certificate. **Note:** Must be a valid <*.p12*> file. You will be prompted to enter a **Password** for the certificate.
***Base URL**	This URL will contain just the hostname of the Entrust CA instance. Eg - https://api.entrust.net/enterprise/v2
**: Mandatory fields*	

7. Click **Fetch CA and Profile Names.**
   The attributes available for the CA account will be fetched from the Certificate Authority along with the CA and profile names. A pop-up message is displayed as **CA and profiles fetched**.
8. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Entrust MPKI Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Entrust**.
   The **Entrust** home page is displayed.
3. Click **Entrust MPKI** from the left pane of the page.
   The **Entrust MPKI** home page is displayed.
4. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

Futurex

Important: For the AppViewX-Futurex integration, the current implementation supports only the certificate enrollment, regeneration, and auto-regeneration CLM actions. Support for the certificate renewal, auto-renewal, and revocation CLM actions will be included in the subsequent releases.

Prerequisites

To onboard a Futurex CA setting in AppViewX, you will need:

- KMES Host API URL and port number
- Login credentials

  For links to detailed instructions on getting the above information from Futurex, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring a Futurex CA Account in AppViewX

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
   The **Certificate Authority** page is displayed.
2. On the **Certificate Authority** page, from the CA list displayed in the left, select **Futurex**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If this is the first Futurex CA setting to be onboarded in AppViewX, the **Certificate Authority** page is updated to display the **Configure Now** button for Futurex.

If this is a subsequent CA setting, the **Certificate Authority** is updated to display an inventory of the existing Futurex CA settings.

3. To onboard your first Futurex account setting in AppViewX, click **Configure Now**.
   OR

   Click **+Add**.

   The **Certificate Authority** page is updated to display the form fields for onboarding a Futurex account.
4. Enter/Select the **General Information** for the CA account.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. Names should not start with special characters. **Constraints**: • Only the following special characters are considered valid: **.**, **-**, and _. • The CA account name cannot start with a special character (including the valid ones).
***Purpose/Usage**	From the dropdown list, select the certificate type (server, client, and code signing) for which the CLM actions have to be enabled.
Proxy Required	If the CA communication has to happen via a proxy, select this checkbox. Proxy settings configured in the **Platform** module of the product will be used for the communication. To read more on how the proxy is set up, click here.
Data Center (AppViewX's CA agent)	From the dropdown list, select the data center through which the CA communication will be routed.
*: *Mandatory fields*	

5. Enter/Select the **CA Configuration** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Information - Field Description Table

Fields	Description
***API Endpoint**	Enter the endpoint URL of the KMES remote host, without the port number. **Constraints**: • **Valid input values** • Letters (a–z, A–Z) • Numbers (0–9) • Hyphen (-) • Period (.) • Forward slash (/) • Colon (:) • Protocol prefix (`http://` or `https://`) • **Invalid input values** • Port numbers (for example, 443) • Backslash (\) • Single and double quotation marks (', '') • Angle brackets (<, >) • Braces ({, }) • Caret (^) • Pipe (|) • Backtick (`)
***Port**	Enter the KMES host API port number. **Constraints**: • Only numeric values are allowed. • Input value must be in the range **1** - **65535**.
***Authentication method**	From the dropdown list, select the authentication method that will be used for connecting to the KMES host API. Currently, for onboarding a Futurex CA setting, AppViewX supports authentication only via **Username and Password**. The corresponding value in the dropdown list is selected, by default.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Number of logins required**	Futurex issues multiple login credential sets to each account. For stronger security, users can be asked to login with more than one credential set. To set how many credentials a user must provide for authentication, enter the required number in this field. **Valid values**: **1** to **9**
***User Name**	Enter the username for connecting to Futurex KMES host API.
***Password**	Enter the password for connecting to Futurex KMES host API.
Add	To add the above configured CA setting to the FutureX CA settings inventory in AppViewX, click **Add**.
Client Certificate required	[Optional] To use a client certificate to communicate with the host API endpoint, turn on the **Client Certificate required** toggle. This will require users to provide a valid PKCS12 client certificate, in the **.p12** or **.pfx** format, for authentication before they are connected to the Futurex KMES host API.
Client Authentication Certificate	This field is displayed when the **Client Certificate required** security feature is enabled. **Note:** Only **.p12** and **.pfx** PKCS12 client certificates can be uploaded for authentication. To upload a client certificate for authentication: a. Click **Upload**. b. Navigate to the location of the client certificate file and select the required certificate file.
*: *Mandatory fields*	

6. To retrieve the complete list of issuance policies supported by this Futurex CA setting, click **Fetch Issuance Policies**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

An issuance policy defines the rules, restrictions, and configuration for how a Certificate Authority (CA) issues certificates. It controls the approval requirements, cryptographic settings, alerts, and other configuration parameters.

The retrieved list is displayed in a table below the **Fetch Issuance Policies** button.

7. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done manually.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
   The **Certificate Authority** page is displayed.
2. On the **Certificate Authority** page, from the CA list displayed in the left, select **Futurex**.
   The **Certificate Authority** page is updated to display an inventory of all Futurex settings onboarded in AppViewX.
3. In the **Connection Status** column of the inventory grid, click **Check** to validate the CA setting.
   The CA communication will be validated and the **Connection Status** will be updated to**Success**/**Failure**.

GlobalSign MSSL CA

Prerequisites

To configure a GlobalSign MSSL CA account in AppViewX, you will need:

- SSL URL
- GlobalSign administrator account
- Manager and Staff in charge user roles

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

For links to detailed instructions to get the above information from GlobalSign MSSL, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring GlobalSign MSSL

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GlobalSign**.
   The **GlobalSign** home page is displayed.
3. Click the **GlobalSign MSSL** tab.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **GlobalSign MSSL** configuration page is displayed.
5. Update the following details in the **General Information** section as described in the table.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. The name should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, server and clients
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

6. Update the following details in the **CA Configuration** section as described in the table.

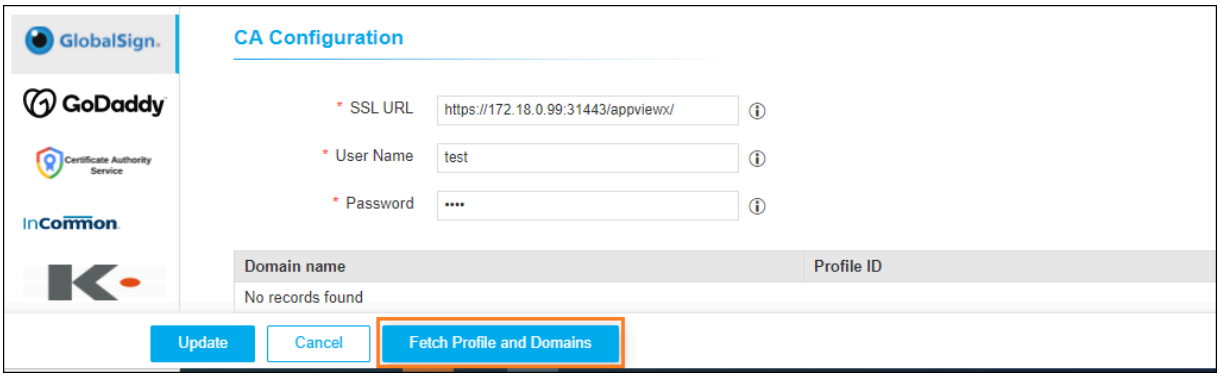
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***SSL URL**	Base URL of the SSL API
***User Name**	Provide a username of the GCC to communicate with the CA.
***Password**	Provide a password for the GCC to communicate with the CA.
**: Mandatory fields*	

7. Once all the details are configured, click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

8. In GlobalSign MSSL, we can now fetch profiles and domains by clicking on the **Fetch Profiles and Domain** button.

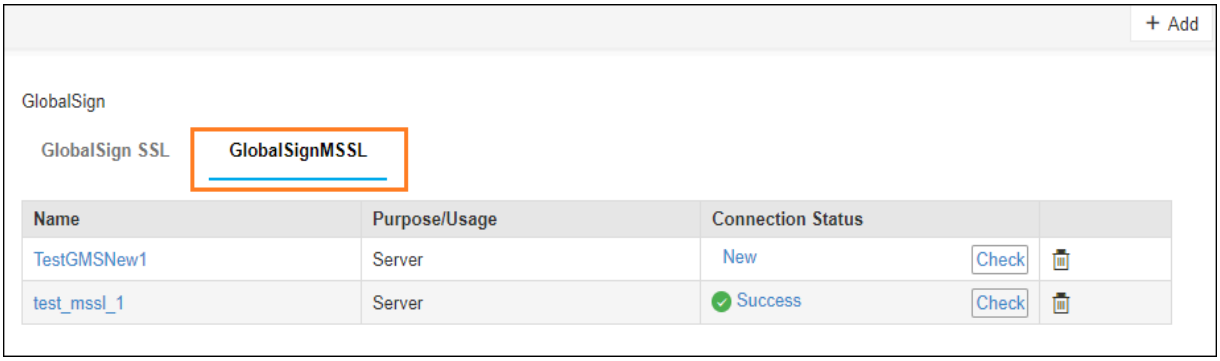


> **Note:** The supported CSR key types are RSA **2048-8192, ECC P-256, ECC P-384** .

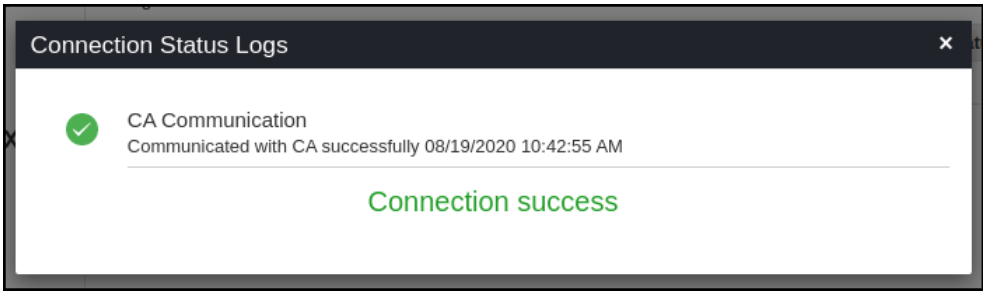
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Manually Validating the GlobalSign MSSL Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GlobalSign**.
   The **GlobalSign** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **GlobalSign MSSL** from the left pane of the page.
   The **GlobalSign MSSL** home page is displayed.



4. In the **Status** column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**



Limitations

Once the GlobalSign MSSL settings are added, validation needs to be done to check whether the connection between AppViewX and GlobalSign MSSL is properly configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Case/ Ticket number	Fix Description
CA Setting Update	Users need to click on the **Cancel** button once the MSSL domain/profile. ID details are fetched from the GlobalSign MSSL account. If the user clicks the Update button, MSSL domain/profile ID details will be removed from the associated policy. The steps to follow to update CA settings are as follows: 1. On the GlobalSign MSSL CA settings page, after adding/editing values, click the Update button. 2. Navigate back to updated CA settings and click the **Fetch Profiles and Domain** button. 3. Click the **Cancel** button instead of Update to bypass the existing issue.
Default CA policy mapping	The default CA policy is defined with all available values selected and validity data is mapped based on commonly used validity. Hence, it will not have values equivalent to API documents or CA portals. This can be modified or updated in the application accordingly to the default CA policy if changes are required.
Email Address	The email address provided in the email address field on the enrollment page is not considered as the primary email value during CLM actions, instead, the email address field defined in the contact information of the logged-in user will be used. The help info message besides the Email address field on enroll/edit page is as – “If the user email address is configured, that will be used for GlobalSign CA approval actions. If the user email is not configured, then the email address provided in this field will be used" - the second part is not valid anymore.

Vendor documentation for retrieving GlobalSign MSSL prerequisites:

- GlobalSign API Guide for MSSL Certificates

  Download the PDF and refer the section **API and WSDL URLs**.

- Contact the GlobalSign MSSL CA team for setting up the initial administrator account to be able to create user roles.
- Create new user accounts.

GlobalSign Atlas CA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

To configure a GlobalSign Atlas CA account in AppViewX, you will need:

- Base URL
- API key and secret key
- Client certificate

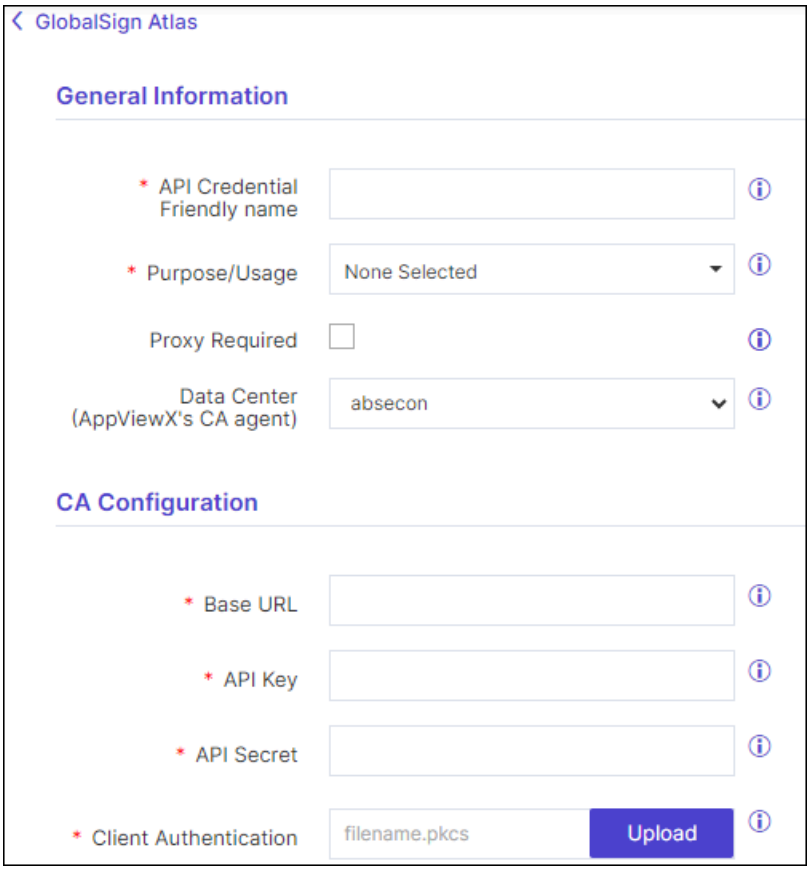
  For links to detailed instructions to get the above information from GlobalSign Atlas, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring GlobalSign Atlas

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GlobalSign**.
   The **GlobalSign** home page is displayed.
3. Choose the **GlobalSign Atlas** tab.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **GlobalSign Atlas** configuration page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



5. Update the following details in the **General Information** section as described in the table.

General Information - Field Description Table

Fields	Description
***API Credential Friendly name**	Enter the API Credentials Friendly name (which is the CA Account name that will be used for the CA Policy and Enrollment).
***Purpose/Usage**	Select the purpose of the certificate that can be requested using this account. **Note:** Users can select *Server*, *Client* or both.
Proxy Required	Select the checkbox if communication to the Certificate Authority (CA) has to use the proxy details provided in the general settings
Data Center (AppViewX's CA agent)	Select the data center that will be used to establish the communication with the CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

6. Update the following details in the **CA Configuration** section as described in the table.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	Enter the base URL required for constructing the API request.
***API Key**	Enter the API key which is the unique identifier used to authenticate a user. **Note:** The API Key will be displayed as asterisks (*)
***API Secret**	Enter the API secret to communicate with the CA. **Note:** The API Key will be displayed as asterisks (*)
***Client Authentication**	Upload the certificate for client authentication in the .p12 or .pfx format only.
*: Mandatory fields	

7. Click the **Fetch Validation Policy and Save** button.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the GlobalSign Atlas Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GlobalSign**.
   The **GlobalSign** home page is displayed.
3. Click **GlobalSign Atlas** from the left pane of the page.
   The **GlobalSign Atlas** home page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **Status** column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

GoDaddy CA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

To configure a GoDaddy CA account in AppViewX, you will need:

- GoDaddy Customer Number, API key, and secret for making API Requests from AppViewX in order to perform CLM (Certificate Lifecycle Management) operations

  For links to detailed instructions to get the above information from GoDaddy, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.
- Product units in your GoDaddy account to perform CLM operations

Configuring GoDaddy

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GoDaddy**.
   The **GoDaddy** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **GoDaddy** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. Example: Server, Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the GoDaddy CA APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	This URL will contain the Base URL of the GoDaddy CA API instance. For example: https://api.godaddy.com
***Customer Number**	Each user will have a unique customer number which is used to obtain the certificates from the GoDaddy CA account.
***API Key**	API key generated in the GoDaddy portal which is used for GoDaddy API communications.
***API Secret**	API Secret generated in the GoDaddy portal which is used for GoDaddy API communications.
First Name	First name of the GoDaddy Account user's name as provided in the portal to be used for certificate creation purposes.
Last Name	Last name of the GoDaddy Account user's name as provided in the portal to be used for certificate creation purposes.
Email Address	Email Id of the GoDaddy Account user's name as provided in the portal to be used for certificate creation purposes. **Note**: Valid email address.
Phone Number	Phone number of the GoDaddy Account user as provided in the portal to be used for certificate creation purposes. **Note:** Phone numbers must contain a minimum of 7 and a maximum of 15 numeric values.
**: Mandatory fields*	

6. Click **Save**.

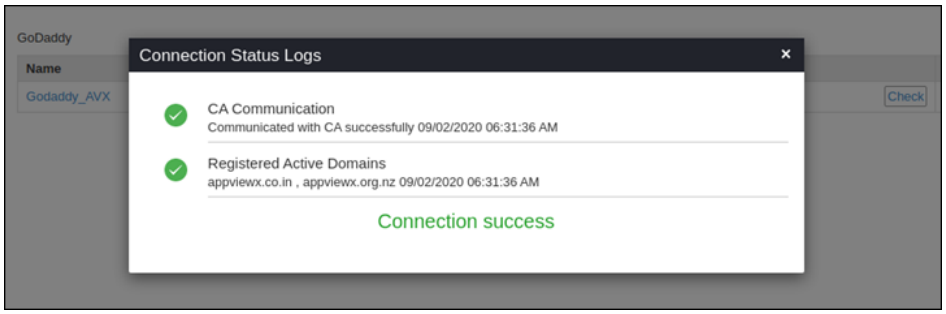
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the GoDaddy CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GoDaddy**.
   The **GoDaddy** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



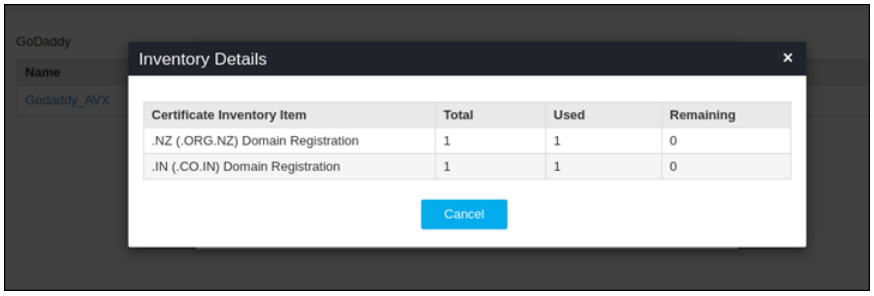
Viewing GoDaddy Product Units

Each GoDaddy account has different types of SSL products and units. The below steps will allow users to know the availability of the products and their remaining units.

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **GoDaddy**.
   The **GoDaddy** home page is displayed.
3. On the **GoDaddy** page, click **View** to fetch the product types and the units available for the GoDaddy account configured.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Once clicked, users can view the available and used product units.



References

Vendor documentation for retrieving GoDaddy prerequisites:

- Get Started with GoDaddy Setup

Google CA

Prerequisites

The prerequisites for configuring a Google CA account in AppViewX are as follows:

- Ensure all necessary setup is completed on the Google CA portal.

  For references, click here.
- A Google client certificate or Google client authentication Json for a user having necessary access for enrolling the certificates and for other Certificate Lifecycle Management (CLM) operations.
- AppViewX server should either have internet access or have a proxy configured in AppViewX general settings. Refer to the section Managing Proxy Settings in the Platform guides.
- The URL https://www.googleapis.com should be reachable from AppViewX.

Configuring Google

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **Google**.
   The **Google** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **Google** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. The name should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server and Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Configure either Certificate Upload or JSON Upload. These fields are necessary for invoking the Google CA APIs via Certificate Upload for Certificate Management. Select the Certificate Upload check box,
   Update the following details in the **CA Configuration** section as described in the table.

Fields	Description
***Certificate and Key**	Client authentication certificate for API communication.
***Email address**	Email address of the user
***Project Id**	Id of the project
**: Mandatory fields*	

6. Select the JSON Upload check box and configure a CA. Click the Upload button to upload the JSON file.
7. Click **Validate and Fetch**. The issuer names available for the CA account will be fetched along with the validity of the issuers from the Certificate Authority.

HashiCorp Vault CA

Prerequisites

To configure a HashiCorp Vault CA account in AppViewX, you will need:

- Login and password to access AppViewX
- Base URL, role ID, and secret key for the **AppRole** method
- Base URL, access key, secret key, and role name for the **AWS** method

  Please contact the HashiCorp Vault team for retrieving the above listed prerequisite values.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring HashiCorp Vault

Steps to Configure HashiCorp Vault CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **HashiCorp Vault**.
   The **HashiCorp Vault** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **HashiCorp Vault** configuration page is displayed.
4. Update the details in the General Information section as described in the table below:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-', and '_' are allowed. Names should not start with special characters.
***Purpose/Usage**	The dropdown contains checkboxes for the certificate type for which the CLM actions will be enabled. The values are: • Server • Client • Code Signing One or more values can be selected depending on the type of account users need to create.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the details in the **CA Configuration** section as described in the tables below. These fields are necessary for invoking the Hashicorp CA Secret Engine for Certificate Management. The fields displayed in the CA Configuration section depend on the value selected in the **Method** field. The two auth method values are
   - **APP ROLE** - The APP ROLE auth method allows machines or apps to authenticate with Vault-defined roles. An "AppRole" represents a set of Vault policies and login constraints that must be met to receive a token with those policies. An AppRole can be created for a particular machine, or even a particular user on that machine or a service spread across machines. The credentials required for successful login depend upon the constraints set on the AppRole associated with the credentials.
   - **AWS** - The AWS auth method provides an automated mechanism to retrieve a Vault token for IAM principals and AWS EC2 instances. Unlike most Vault auth methods, this method does not require manual first-deploying or provisioning of security-sensitive credentials (tokens, username/password, client certificates, etc), by operators under many circumstances.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Configuration for App Role - Field Description Table

Fields	Description
***Base URL**	The base of URL of the CA account.
***Method**	**APP ROLE**
***Role ID**	RoleID is an identifier that selects the AppRole against which the other credentials are evaluated. When authenticating against this auth method's login endpoint, the RoleID is a required argument at all times. By default, RoleIDs are unique UUIDs, which allow them to serve as secondary secrets to the other credential information.
***Secret Key**	Secrey Key (SecretID) is a credential that is required by default for any login and is intended to always be secret. They can be created against an AppRole either via generation of a 128-bit purely random UUID by the role itself or via specific, custom values. Similarly to tokens, Secret keys have properties like usage-limit, TTLs and expirations.
**: Mandatory fields*	

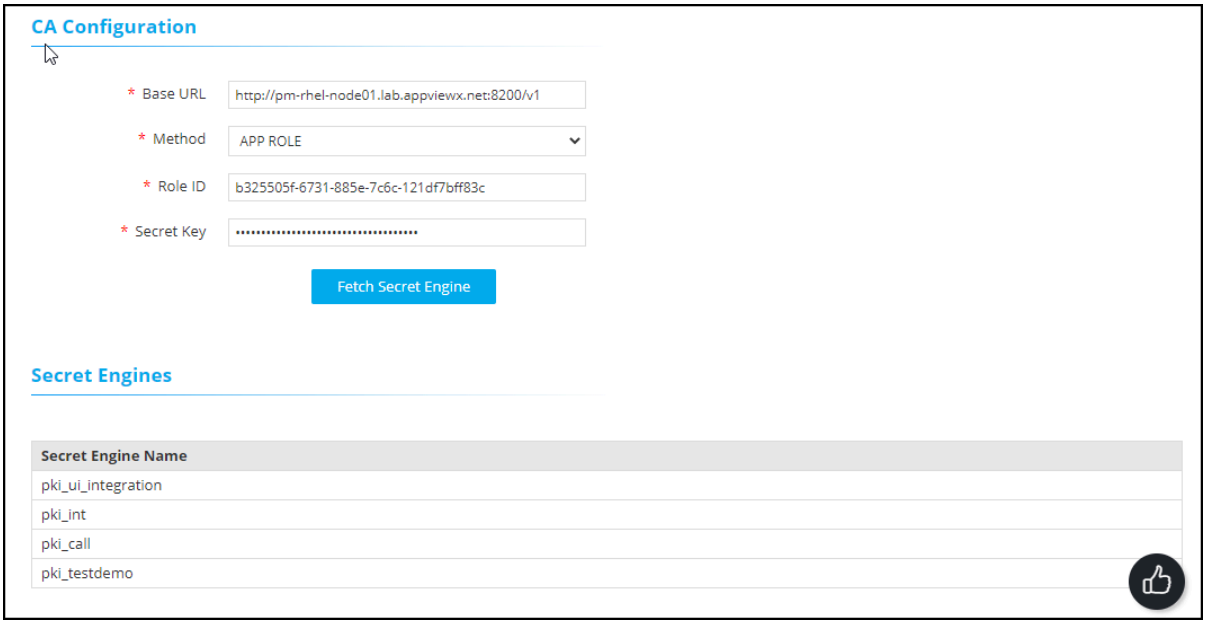
CA Configuration for AWS - Field Description Table

Fields	Description
***Base URL**	The base of URL of the CA account.
***Method**	**AWS**
***Access Key**	Access Keys are used to sign the requests that are sent. Access Key and Secret Key are used for programmatic (API) access to AWS services.
***Secret Key**	Secret Key (SecretID) is a credential that is required by default for any login and is intended to always be secret. Similar to tokens, SecretIDs have properties like usage-limit, TTLs, and expirations.
***Role Name**	The basic mechanism of operation (AWS authorization workflow) is per-role. Roles are registered in the method and associated with a specific authentication type that cannot be changed once the role has been created. Roles can also be associated with various optional restrictions, such as the set of allowed policies and max TTLs on the generated tokens.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The correct values entered in the fields establish a connection with the Hashicorp vault to be able to fetch the secret engine.

6. Click the **Fetch Secret Engine** button.
   A list of PKI secret engines is displayed. These will be presented to users in the policy. from where they can select the respective secret engines.



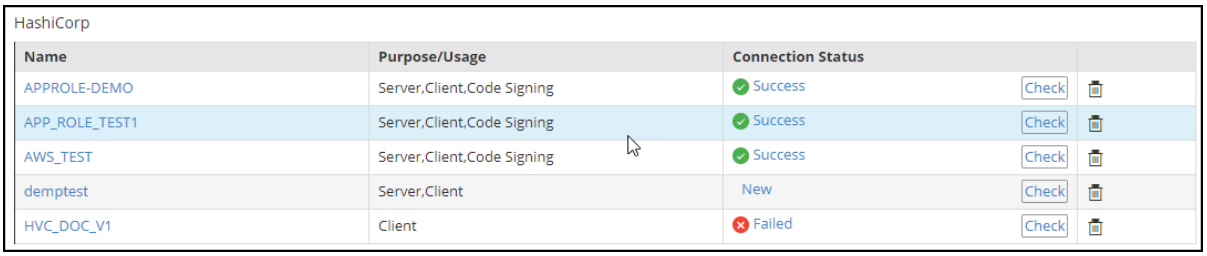
7. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Editing an Account

1. Go to the **HashiCorp Vault** CA account home page
   The list of Accounts is displayed in the grid.

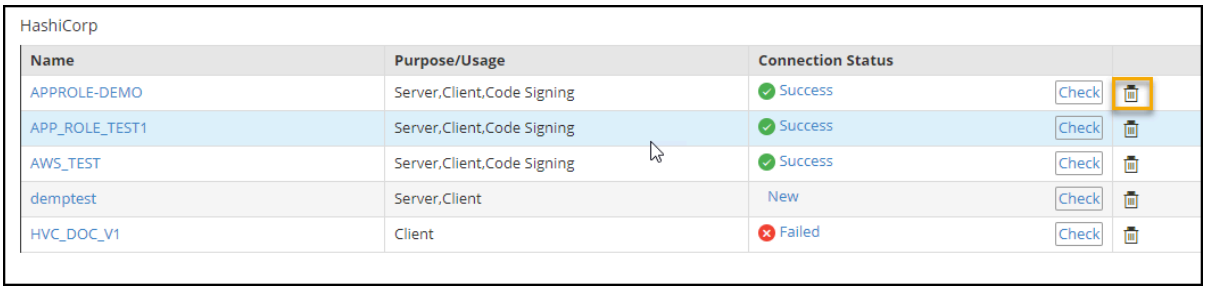
Copyright © 2025 AppViewX, Inc. All Rights Reserved.



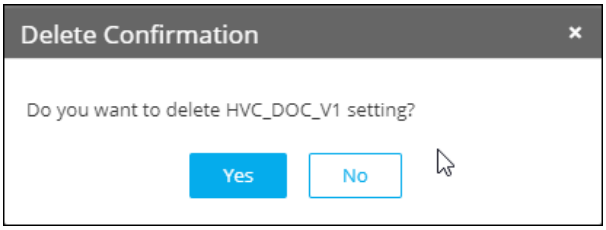
2. Click the account name from the ‘Name’ column in the grid.
   The General Information and CA Configuration sections are displayed with pre-populated values.
3. Change any of the editable fields and click the **Fetch Secret Engine** button.
4. Click the **Update** button.

Deleting an Account

1. Go to the **HashiCorp Vault** CA account home page
   The list of Accounts is displayed in the grid.



2. In the last column of the grid with the listed accounts, click the **Delete** or bin icon.
   The Delete Confirmation pop-up is displayed.



3. Click **Yes**.

Manually Validating the HashiCorp Vault CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **HashiCorp Vault**.
   The **HashiCorp Vault** home page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. In the Status column of the grid with the listed accounts, click the **Check** button.
   The Success or Failure value is displayed.
4. Update the account details accordingly to get a “success” status.

HydrantID CA

Prerequisites

To configure a HydrantID CA account in AppViewX, you will need:

- Base URL (already included in the AppViewX user interface)
- API key ID
- API key

  For links to detailed instructions to get the above information from HydrantID, see the **References** section.

  The API Key ID and API Key should be of the following user roles in HydrantID:
  - Account Auditor
  - Organization Admin
  - Organization Auditor
  - Requestor

  Once the organization (AppViewX) has subscribed for a HydrantID account, you will be provided with a **Username**, **Password**, and **Login URL** to create or update users/user roles.

  Users with role **Account Admin** in the HydrantID application can create the above roles. Only account admins can generate the API Key ID and API Key for the roles. Both values can be viewed for a limited time only. Ensure to note these values after the roles are added.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring HydrantID CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **HydrantID**.
   The **HydrantID** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The HydrantID CA details page is displayed.
4. Update the following details in the **General Information** section as described in the table:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. Permissible special characters are '.', '-','_'. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. Server, Client and Code-signing are the supported types.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the HydrantId APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	This URL will contain the hostname of the HydrantID CA instance and used for constructing the API requests. the default value is https://acm.hydrantid.com/api/v2
***API Key ID**	Enter the API Key ID generated in the HydrantID application. Its is a unique value specific to the user created in hydrant and is used to authenticate the user.
***API Key**	Enter the API Key generated in the HydrantID application. Its is a unique value specific to the user created in hydrant and used to authenticate and authorize requests.
**: Mandatory fields*	

6. Click **Fetch hydrantID policies**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

A list of policies associated with the account are displayed. These are made available from HydrantID and are used for requesting different types of certificates.

Note: Configuration can only be saved in AppViewX if the profiles are available.

7. Update the following details in the **Advanced Settings** section as described in the table.

Advanced Settings - Field Description Table

Fields	Description
Poll after CSR Submission	A check box field when selected will fetch the certificated immediately after CSR Submission on enrollment, renew, and reissue of certificate with the retry count and retry frequency as described below.
***Retry Count**	The number of times the polling will take place after CSR submission. Enter a value between 1 and 10.
***Retry Frequency**	The duration of the polling. enter the value between 1 and 30seconds.
**: Mandatory fields*	

8. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the HydrantID CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **HydrantID**.
   The **HydrantID** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**

Vendor documentation for retrieving HydrantID prerequisites:

- Managing API Keys

IDnomic CA

Prerequisites

To configure a IDnomic CA account in AppViewX, you will need:

- For the CA configuration:
  - CA Base URL
  - Partition name
  - Client authentication certificate
  - (Optional) SOAP signing authentication certificate

  To retrieve the above prerequisite values, please contact the IDnomic team. IDnomic will share these details via email or a shared file location.
- For the RA configuration:
  - RA base URL
  - RA client authentication certificate
  - Partition name

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To retrieve the above prerequisite values, please contact the IDnomic team. IDnomic will share these details via email or a shared file location.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Note: In the CA configuration page, if the checkbox **Use same certificate for signing SOAP requests** is selected, then **Client authentication certificate** is used as the **SOAP signing authentication certificate**.

Configuring IDnomic CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **IDnomic**.
   The **IDnomic** home page is displayed.
3. Click the **Configure Now** or **+Add** icon from the middle or top-right of the page respectively.
   The IDnomic configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table.

General Information - Field Description table

Fields	Description
***CA Account name**	A unique name to identify the CA setting No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. Example: Server, Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Enter/Select the **CA Configuration** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The IDnomic CA supports two configuration types:

- **CA** (Certificate Authority)

  In this configuration type, certificate discovery and CLM actions will be performed using certificate profiles configured in the Certificate Authority.

- **RA** (Registration Authority)

  In this configuration type, certificate discovery and CLM actions will be performed using RA workflows in the Registration Authority.

Field values entered/selected in the **CA Configuration** section define how AppViewX will connect with the IDnomic Certificate Authority (CA) or Registration Authority (RA).

CA Configuration - Field Description table

Fields	Description
Configuration Type	From the given options, select if AppViewX will connect with the IDnomic **CA** (Certificate Authority) or **RA** (Registration Authority). **Important:** Once selected, the **Configuration Type** for a CA setting cannot be changed. For field descriptions for configuring IDnomic CA in AppViewX with the CA setting, click here. For field descriptions for configuring IDnomic CA in AppViewX with the RA setting, click here.
**: Mandatory fields*	

Configuration Type = CA - Field Description table

Fields	Description
***CA Base URL**	Enter the base URL of the IDnomic CA API instance. For example: **https://ca-api-< >.axiadids.net/idca-server/services/soap/ca/2**
***Partition**	The name of the partition assigned to the organization's application. It is the workspace dedicated to the organization. The partitioning system allows implementing multi-tenancy within the IDnomic CA. Partitions

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	are defined in a tree structure, each node being a partitioning in which resources (e.g. Configurations, Certificate, etc) can be attached. According to the customer's needs we can isolate or share common resources.
***Client Certificate**	Upload the certificate for client authentication in the .p12 or .pfx format only.
SOAP Signing Required	If SOAP requests for certificate enrollment and revocation have to be digitally signed using the client certificate, turn on this setting. It is recommended to have this setting configured in accordance to the IDnomic CA portal.
Use same certificate for signing SOAP requests	To use the same certificate uploaded in the **Client Certificate** field for digitally signing the SOAP requests, select this checkbox.
***SOAP Signing Certificate**	This field is displayed only when the **Use same certificates for signing SOAP requests** option is disabled, which means a separate certificate (from the client certificate) has to be used for digitally signing the SOAP requests. Upload the certificate for soap signing authentication in the **.p12** or **.pfx** format only.
**: Mandatory fields*	

Configuration Type = RA - Field Description table

Fields	Description
***RA Base URL**	Enter the base URL of the IDnomic RA API instance. For example: **https://ra-api-< >.axiadids.net/idra-soap/soap/x509/ra/3.0**
***Partition**	The name of the partition assigned to the organization’s application. It is the workspace dedicated to the organization. The partitioning system allows implementing multi-tenancy within the IDnomic RA. Partitions are defined in a tree structure, each node being a partitioning in which resources (e.g. Configurations, Certificate, etc) can be attached. According to the customer's needs we can isolate or share common resources.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***RA Client Certificate**	Upload the certificate for RA client authentication in the **.p12** or **.pfx** format only.
**: Mandatory fields*	

6. Depending on the **Configuration Type** selected, click **Fetch Certificate Profiles/Fetch RA Workflows**.
   If **Configuration Type** = **CA**, the complete list of certificate profiles is displayed.

   If **Configuration Type** = **RA**, the complete list of RA workflows is displayed.
7. Click **Save**.
   The confirmation message **Certificate profiles fetched successfully/RA workflows fetched successfully** (depending on the selected configuration type) is displayed and the CA is created successfully.

   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

   Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the IDnomic CA Connection Status

1. Go to **(Menu) > CERT+ > ADMINISTRATION > Certificate Authority.**
2. From the displayed CA, Select **IDnomic**.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the Connection Status will be shown as either Success or Failure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Figure 1. RA Validation

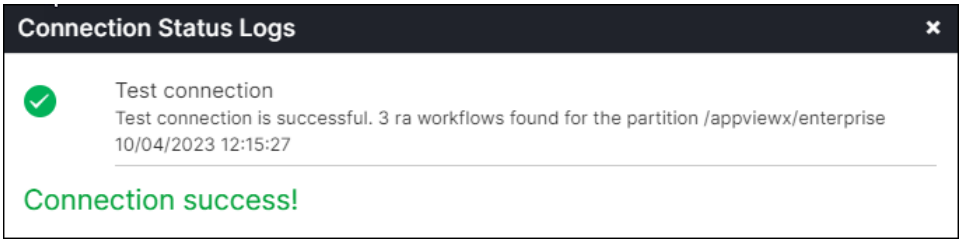

Figure 2. CA Validation

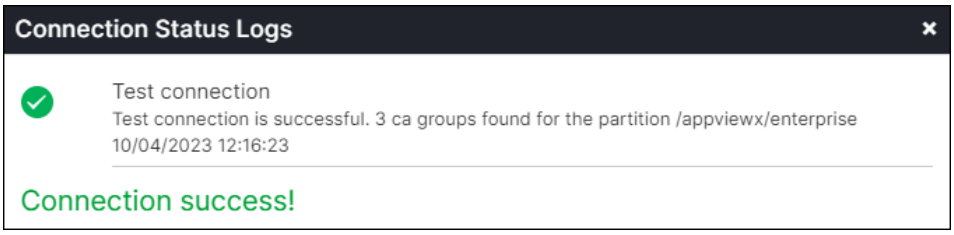


Known Limitations

Due to IDnomic API limitations, AppViewX is not notified when a certificate revocation request is declined. Hence, work orders for certificate revocation may still be shown as failing even if they are declined. This limitation will be addressed in the subsequent release versions.

InCommon CA

Prerequisites

To configure a InCommon CA account in AppViewX, you will need:

- Base URL and login URL
- Username and password for the following roles:
  - Master Registration Authority Officer
  - Registration Authority Officer
- Requisite credentials with access to certificate enrollment for InCommon Certificate Manager
- Organization ID

  For links to detailed instructions to get the above information from InCommon, see the **References** section.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring InCommon CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **InCommon**.
   The **InCommon** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **InCommon** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. The name must not start with special characters.
***Purpose/ Usage**	Certificate Type for which CLM actions will be enabled. Eg. Server, Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the InCommon CA APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	This URL will contain just the hostname of the InCommon CA instance. Eg -https://cert-manager.com/customer/<<customer_uri>>/ssl- here base URL is **https://cert-manager.com.**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. The name must not start with special characters.
***Login URL**	URI specific to the InCommon CA Customer Account. Eg https://cert-manager.com/customer/<<customer_uri>>/ssl- here URI is **customer_uri**.
***User Name**	User name for the account created with InCommon CA.
***Password**	Password for the account created with InCommon CA.
***Organization ID**	InCommon supports organization hierarchy. Id of the **Organization Unit/ Department** in which Certificates need to be managed has to be specified here. **CLM** actions done using this CA account will be specific to this particular organization's id/department.
**: Mandatory fields*	
Note: If the certificates from multiple organization's units/departments need to be managed, then a separate CA has to be configured for each organization unit/department in the Incommon CA setting page.	

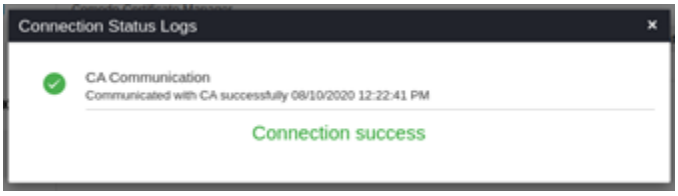
6. Select **Fetch Certificate Types**
   The Certificate types available for the CA account will be fetched from the Certificate Authority.
7. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Manually Validating the InCommon CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **InCommon**.
   The **InCommon** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



References

Vendor documentation for retrieving InCommon prerequisites:

Download the InCommon Certificate Manager Quick Start Guide.

In this PDF:

- For the base URL and login URI, refer the section to **Log in to InCommon CM**.
- To create an oragnization, refer the section to **Create Organizations and Departments**. Once you've created an organization, InCommon will assign you an organization ID.

  To review the organization details in the SCM, navigate to **Organizations**, select the organization in the list, and click **Edit**. This displays the **Edit Organization** dialog box.
- To create administrator roles, such as MRAO and RAO, refer the section to **Add Administrators**.

  Ensure that these roles have the following privileges:

Privileges	
Allow SSL details changing	Enables the new MRAO, RAO SSL, and DRAO SSL to change the details of SSL certificates by navigating to Certificates > SSL Certificates.
Allow SSL auto approve	SSL certificates requested by the MRAO are automatically approved, and those requested by a RAO SSL and DRAO SSL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Privileges	
	are automatically approved by the administrator of same level and await approval from higher level administrator.

To review the administrator details in the SCM, navigate to **Settings > Admins**, select the administrator in the list, and click **Edit**. This displays the Edit Client Admin dialog, Add/Edit the necessary privileges and click **Save**.

Let's Encrypt CA

Prerequisites

To configure a Let's Encrypt CA account in AppViewX, you will need:

- One of the following Let's Encrypt base URLs for certificate enrollment, as required:
  - Staging URL
  - Production URL

  For links to detailed instructions to get the above information from Let's Encrypt, see the **References** section.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Let's Encrypt CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Let's Encrypt**.
   The **Let's Encrypt** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The Let's Encrypt configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

General Information - Field Description Table

Fields	Description
***Name**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. The name must not start with special characters.
***Purpose/Usage**	The certificate types will be managed by these settings. For now, Let's Encrypt is having only one purpose **Server**.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the Let's Encrypt CA APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	Let's Encrypt certificate enrolment URL either staging or production based on the requirement.
***Email ID(s)**	Enter email ID(s) in this field to receive notifications from Let's Encrypt. Multiple email ID must be separated by comma (,).
**: Mandatory fields*	

6. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Manually Validating the Let’s Encrypt CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Let's Encrypt**.
   The **Let's Encrypt** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

- Staging URL
- Production URL

Microsoft Enterprise CA

Prerequisites

To configure a Microsoft Enterprise CA account in AppViewX, you will need:

- AppViewX Windows Gateway installer installed on a Windows machine, running and reachable from the AppViewX vendor plugin through the communication modes described here.
- **Windows Gateway URL**: It is the registered gateway URL of the server where the windows gateway is hosted/installed. The URL format is **https://hostname:portnumber/appviewx**. For example: https://10.10.10.10:8999/appviewx
- **Client Authentication Certificate**: It is the certificate (.p12 or .pfx format) that is shipped with the windows gateway agent installer.

  The Windows Gateway URL and the client authentication certificate will be made available only after installation of the AppViewX Windows Gateway is incomplete. Refer the AppViewX Windows Gateway Setup documentation here.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Microsoft Enterprise CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Microsoft**.
   The **Microsoft** home page is displayed.
3. Select the **Enterprise** tab.
4. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
5. Enter/Select the CA **General Information**.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. **Note**: No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. Example. Server, Client, Code Signing
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

6. Enter/Select the **CA Configuration** details.

CA Configuration - Field Description Table

Fields	Description
Windows Gateway Mode	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• **Integrated** This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode
***Windows Gateway URL**	For **Windows Gateway Mode** = **External**, enter the URL of the endpoint where the AppViewX Windows Gateway Agent is installed and running.
Command Execution Type	Select the command type that will be used for communication with the External AppViewX Windows Gateway Agent. **Note:** The integrated gateway uses only the PowerShell command execution type and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
Command execution host (IP/FQDN)	**Note:** This field is displayed when **Windows Gateway Mode** = **Integrated**. A command execution host is a Windows device needed to execute specific commands to fetch the CAs and templates available. The command execution host is expected to be a domain controller machine (primary) and will be used only once to fetch the list of available CAs. Enter the IP address/FQDN of the remote Windows device that the integrated gateway will use for CA communication. **Note:** If the Microsoft server is configured for the **Integrated Windows Gateway** mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
***Credential Type**	You will be required to enter credentials to access the command execution host/Windows device on which the gateway agent is running.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	From this dropdown list, select the mode through which the credentials will be entered (manually or fetched from a credential list).
***Username**	Enter the username for accessing the Windows device.
***Password**	Enter the password for accessing the Windows device.
Client Authentication Certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

7. Click **Fetch CA Names** to retrieve CAs accessible from Windows Gateway installed machine. Upon successful completion of Fetch CA Names, all reachable CAs listed in **Select CA**.
8. Click on one specific CA and proceed.

CA Details - Field Description Table

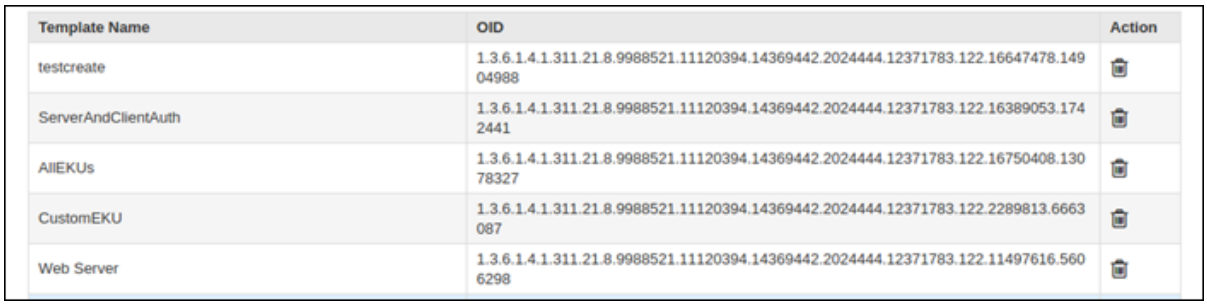
Fields	Description
Select CA	All the reachable CAs are listed here.
***CA Machine Hostname**	Host name of the CA Machine will be auto-filled. **Note:** • If the Microsoft server is configured for the **Integrated Windows Gateway** mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred. • The credentials used for Fetch CA will also be utilized for CA machine communication through the Integrated Gateway.
***CA Name**	Name of the CA chosen which will be auto-filled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
CA Manager Approval	Approves the pending enroll / Renew request submitted from AppViewX Certificate.
***Time Zone**	To perform scheduled and Optimized CA discovery, please provide time zone value.
**: Mandatory fields*	

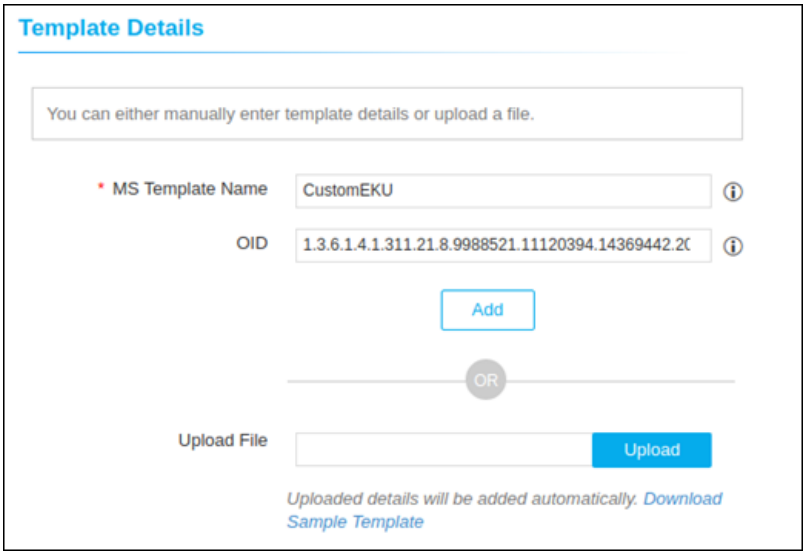
a. Configure the **Template Details**.

Once CA is selected from the **Select CA** list, the **Template** details should have auto-filled as shown below.



Note: If the desired template is not listed, it might not be published in AD. Users can add it manually through MS Template name and OID fields as shown below.

b. In the Template Details section, select/enter the details as shown below.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Click **Save.**
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Microsoft Enterprise CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Microsoft**.
   The **Microsoft** home page is displayed.
3. Select the **Enterprise** tab.
4. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

Microsoft Standalone CA

Prerequisites

To configure a Microsoft Standalone CA account in AppViewX, you will need:

- AppViewX Windows Gateway installer installed on a Windows machine, running and reachable from the AppViewX vendor plugin through the communication modes described here.
- **Windows Gateway URL**: It is the registered gateway URL of the server where the windows gateway is hosted/installed. The URL format is **https://hostname:portnumber/appviewx**. For example: https://10.10.10.10:8999/appviewx
- **Client Authentication Certificate**: It is the certificate (.p12 or .pfx format) that is shipped with the windows gateway agent installer.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The Windows Gateway URL and the client authentication certificate will be made available only after installation of the AppViewX Windows Gateway is incomplete. Refer the AppViewX Windows Gateway Setup documentation here.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Microsoft Standalone CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Microsoft**.
   The **Microsoft** home page is displayed.
3. Select the **Standalone** tab.
4. In the Status column of the grid with the listed accounts, click and then click **+Add** icon or **Configure Now** button.
5. Enter/Select the CA **General Information**.

General Information - Field Description Table

Fields	Description
Name	A unique name to identify the CA setting. **Note:** No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example: Server, Client, and Code Signing.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

6. Enter/Select the **CA Configuration** details.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Configuration - Field Description Table

Fields	Description
Windows Gateway Mode	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode
***Windows Gateway URL**	For **Windows Gateway Mode** = **External**, enter the URL of the endpoint where the AppViewX Windows Gateway Agent is installed and running.
Command Execution Type	Select the command type that will be used for communication with the External AppViewX Windows Gateway Agent. **Note:** The integrated gateway uses only the PowerShell command execution type and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
Command execution host (IP/FQDN)	**Note:** This field is displayed when **Windows Gateway Mode** = **Integrated**. A command execution host is a Windows device needed to execute specific commands to fetch the CAs and templates available. The command execution host is expected to be a domain controller machine (primary) and will be used only once to fetch the list of available CAs. Enter the IP address/FQDN of the remote Windows device that the integrated gateway will use for CA communication.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: If the Microsoft server is configured for the **Integrated Windows Gateway** mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
***Credential Type**	You will be required to enter credentials to access the command execution host/Windows device on which the gateway agent is running. From this dropdown list, select the mode through which the credentials will be entered (manually or fetched from a credential list).
Username	Enter the username for accessing the Windows device.
Password	Enter the password for accessing the Windows device.
Client Authentication Certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

7. Click **Fetch CA Names** to retrieve CAs accessible from Windows Gateway installed machine. Upon successful completion of Fetch CA Names, all reachable CAs listed in **Select CA**.
8. Click on one specific CA and proceed.

Dynamic Fields for Select CA Section

Fields	Description
Select CA	All the reachable CAs are listed here.
***CA Machine Hostname**	Host name of the CA Machine will be auto-filled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If the Microsoft server is configured for the **Integrated Windows Gateway** mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred. • The credentials used for Fetch CA will also be utilized for CA machine communication through the Integrated Gateway.
***CA Name**	Name of the CA chosen which will be auto-filled.
CA Manager Approval	Approves the pending enroll / Renew request submitted from AppViewX Certificate.
**: Mandatory fields*	

9. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Microsoft Standalone CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Microsoft**.
   The **Microsoft** home page is displayed.
3. Select the **Standalone** tab.
4. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.Success scenario for Native APISuccess scenario for PowershellSuccess scenario for WMI.

Nexus CA

Prerequisites

To configure a Nexus CA account in AppViewX, you will need:

- Base URL
- Client certificate, for communication between AppViewX and Nexus
- Organization ID

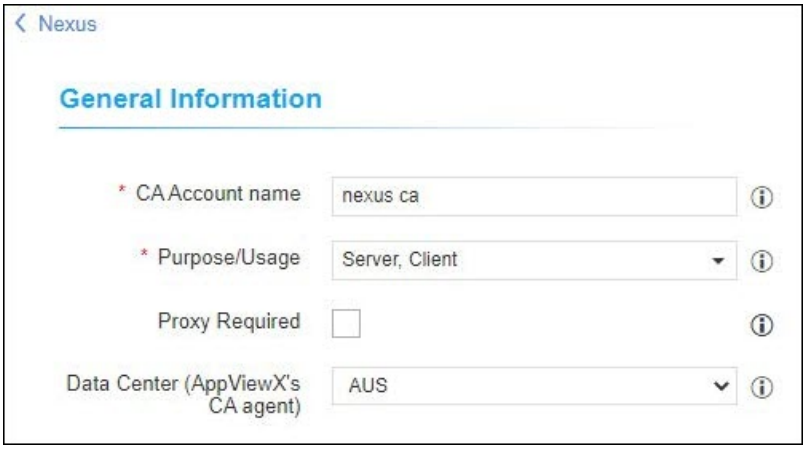
  Please contact the Nexus team for retrieving the above listed prerequisite values.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.
- CA certificates manually uploaded before certificate discovery or enrollment is initiated

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Configuring Nexus

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Nexus**.
   The **Nexus** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The Nexus configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table.

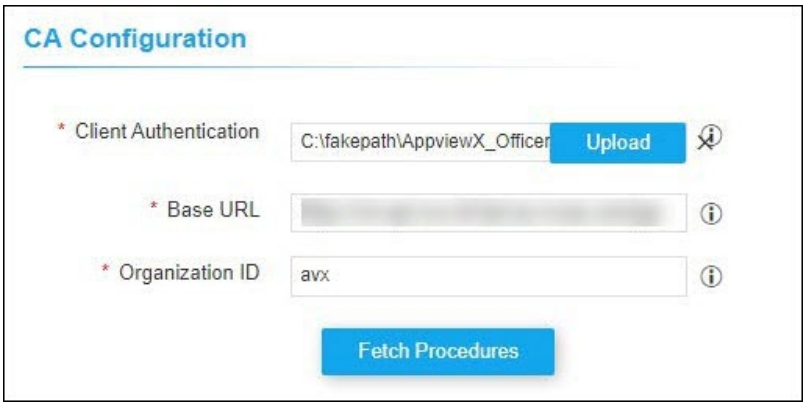


General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting. No special characters other than '.', '-','_' are allowed. The name should not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, server and clients
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

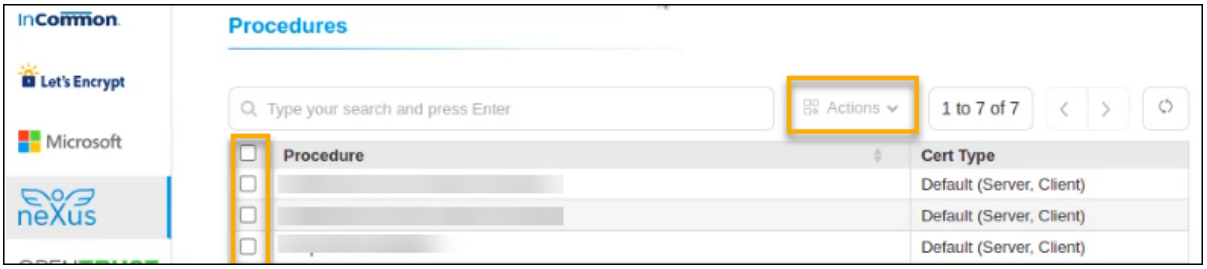


CA Configuration - Field Description Table

Fields	Description
***SSL URL**	Base URL of the SSL API
***User Name**	Provide a username of the GCC to communicate with the CA.
***Password**	Provide a password for the GCC to communicate with the CA.
**: Mandatory fields*	

6. Select **Fetch Procedures**.

   The procedures available in the Nexus CA account will be fetched and listed for the specific user.



7. To map the fetched procedures, click on one or many and click the **Actions** dropdown
   - **CASE 1** - If the user selects Server only in Purpose and Usage, then the fetched procedure by default will be of server/client both. The Action dropdown will only have - **Map as Server**. and **MAP as Default**
   - **CASE 2** - If the user selects Client only in Purpose and Usage, then the fetched procedure by default will be of server/client both. The Action dropdown will only have - **Map as Client**. and **MAP as Default**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

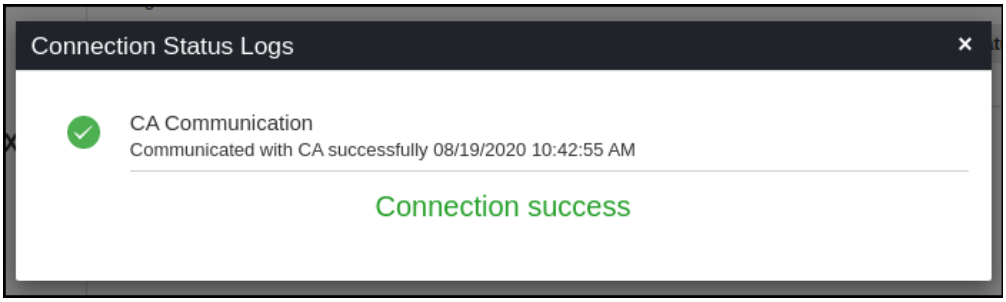
- **CASE 3** - If the user selects Server and Client both in Purpose and Usage, then the fetched procedure by default will be of server/client both. The Action dropdown will have both the actions **Map as Client** , **Map as Server**, and **MAP as Default**

8. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Nexus CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Nexus**.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the Connection Status will be shown as either Success or Failure.



Sectigo CA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

To configure a Sectigo CA account in AppViewX, you will need:

- Base URL and login URI
- Username and password for the following roles:
  - Master Registration Authority Officer
  - Registration Authority Officer
- Organization ID

  For links to detailed instructions to get the above information from Sectigo, see the **References** section.
- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Sectigo CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the list of CAs displayed on the left, select **Sectigo**.
   The **Sectigo** CA account inventory is displayed.
3. If it is your first DigiCert CA integration in AppViewX, click **Configure Now**.
   The **Configure Now** button is displayed only if this is the first integration instance.

   For the subsequent integrations, from the top-right corner of the page, click **Add**.

   The **Sectigo** configuration page is displayed.
4. Enter/Select the **General Information** details for the Sectigo CA configuration.

General Information - Field Description Table

Fields	Description
***CA Account name**	Enter a unique name for the Certificate Account (CA) account, which will be displayed during certificate enrollment and policy creation. **Constraints**: • Valid special characters: **.**, **-**, and _ • CA account name should not begin with a special character and/or a space.
***Purpose/Usage**	From the dropdown list, select the certificate type(s) for which CLM actions will be enabled.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Possible values: Server, Client
Proxy Required	For CA communication to happen via a proxy, select this checkbox. Proxy settings configured in the **Platform** module will be used for communication. To read more on how proxy settings are configured and managed, click here.
Data Center (AppViewX's CA agent)	From the dropdown list, select the data center through which the CA communication must happen.
**: Mandatory fields*	

5. To invoke the Sectigo CA APIs for certificate management, enter/select the **CA Configuration** details.

CA Configuration - Field Description Table

Fields	Description
***Base URL**	Enter the base URL for constructing the API requests. The URL will contain the hostname of the Sectigo CA instance.
***Login URI**	Enter the login URI for your Sectigo CA account for API authentication.
***Authentication Method**	To connect to the certificate authority, select an authentication method from the following options: • **Password**: A text-based credential will be used to verify identity and authenticate the connection to the CA. • **Client Certificate**: A digital certificate issued to the user is used to authenticate identity securely by validating the certificate.
***User Name**	Enter the Sectigo portal username to communicate with the CA.
***Password**	**Note:** This field is displayed when **Authentication Method** = **Password**. Enter Sectigo portal password to communicate with the CA.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Client Certificate**	**Note:** This field is displayed when **Authentication Method** = **Client Certificate**. Upload the client authentication **.pfx** file to communicate with the CA. To do this: a. Click **Upload** and navigate to the location of the certificate file. b. Select the required certificate file. The **Authentication Details** dialog box is displayed. c. In the **Enter Password** field, enter the selected certificate file's password and click**OK**. **Note:** Ensure that the end entity has access to enroll a certificate with the required CA.
***Organization ID**	Enter the organization ID used for the certificate lifecycle action. (You will find it in the **Organization** tab of the Sectigo portal.)
**: Mandatory fields*	

6. To fetch the certificate types assigned for you, click **Fetch Certificate Types**.
   AppViewX connects to Sectigo using the authentication method selected and fetches the certificate types based on the **Purpoe/Usage** selected. These certificate types will the be used throughout the product for certificate enrollment and policy creation.
7. Enter/Select the **Advanced Settings** for polling Sectigo after the CSR request is submitted.
   These settings ensure that AppViewX is efficiently and regularly checking for certificate issuance status (after CSR submission for enrollment/renewal/reissue requests) without sending excessive API requests to the CA.

Advanced Settings - Field Description Table

Fields	Description
Poll after CSR Submission	To enable AppViewX to automatically poll Sectigo after CSR submission, select this checkbox.
***Retry Count**	This field is displayed only when **Poll after CSR submission** is selected.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Enter the number of times AppViewX will retry polling Sectigo before it stops. For example, if **Retry Count** = 5, AppViewX will poll Sectigo 5 times before it stops. **Possible values**: Between 1 and 10
***Retry Frequency**	This field is displayed only when **Poll after CSR submission** is selected. Enter the interval (in seconds) between attempts. For example, if **Retry Frequency** = 10, AppViewX will wait for 10 seconds between each polling attempt. **Possible values**: Between 1 and 30 seconds
**: Mandatory fields*	

8. Click **Fetch Custom Attributes**.
   Custom attributes defined for the CA account will be fetched from the CA along with the CA and profile names. On successful retrieval, the message **CA and profiles fetched** is displayed.
9. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

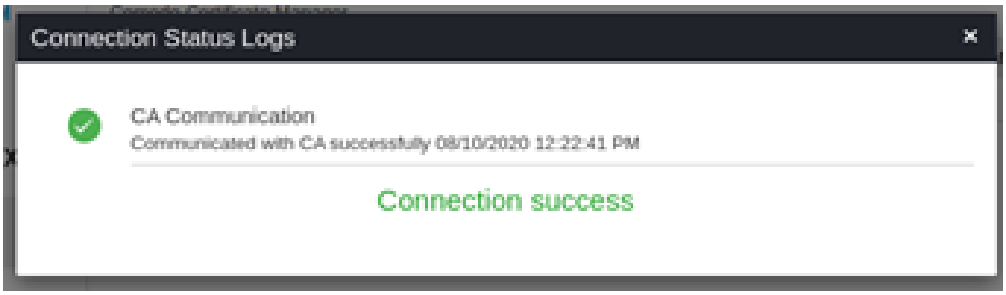
> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Sectigo CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Sectigo**.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.



References

Vendor documentation for retrieving Sectigo prerequisites:

Download the Sectigo Certificate Manager Quick Start Guide.

In this PDF:

- For the base URL and login URI, refer the section on **Logging in to SCM**.
- To create an oragnization, refer the section on **Adding organizations and departments**. Once you've created an organization, Sectigo will assign you an organization ID.

  To review the organization details in the SCM, navigate to **Organizations**, select the organization in the list, and click **Edit**. This displays the **Edit Organization** dialog box.
- To create administrator roles, such as MRAO and RAO, refer the section on **Adding Administrators**.

  Ensure that these roles have the following privileges:

Privileges	
Allow SSL details changing	Enables the new MRAO, RAO SSL, and DRAO SSL to change the details of SSL certificates by navigating to Certificates > SSL Certificates.
Allow SSL auto approve	SSL certificates requested by the MRAO are automatically approved, and those requested by a RAO SSL and DRAO SSL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Privileges	
	are automatically approved by the administrator of same level and await approval from higher level administrator.

To review the administrator details in the SCM, navigate to **Settings > Admins**, select the administrator in the list, and click **Edit**. This displays the Edit Client Admin dialog, Add/Edit the necessary privileges and click **Save**.

SwissSign CA

Prerequisites

To configure a SwissSign CA account in AppViewX, you will need:

- CA Base URL
- Username
- API key

The SwissSign team manages user creation and access controls for users. Users must have a level of **RAO (Registration Authority Officer)** or higher to perform actions like issuing, revoking, updating, and viewing certificates.

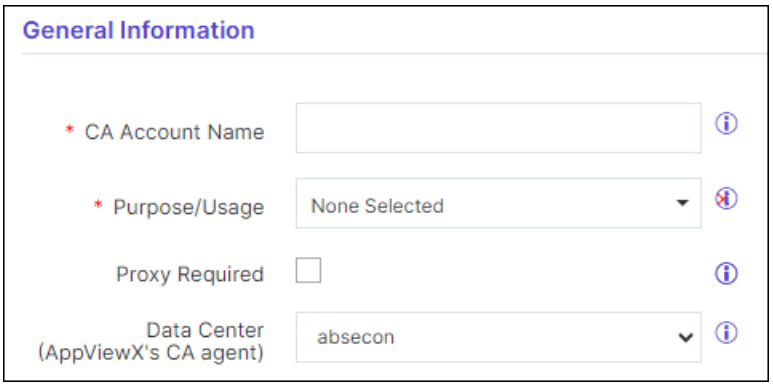
For links to detailed instructions to get the above information from Sectigo, see the **References** section.

- Internet access or a proxy configuration for the AppViewX server. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring SwissSign CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, Select **SwissSign**.
   The **SwissSign** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **SwissSign CA** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

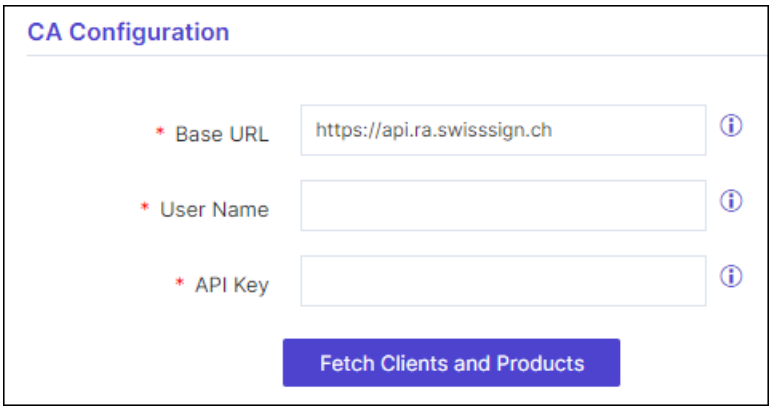


General Information - Field Description Table

Fields	Description
***CA Account name**	Enter a unique name in the text field to identify the CA account and be represented during certificate enrollment and policy creation. No special characters other than '.', '-','_' are allowed. Names should not start with special characters.
***Purpose/Usage**	Select the purpose of the certificate from the dropdown list for which CLM actions will be enabled. Example: Server, Client
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
*: *Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the CSC Global CA APIs for Certificate Management:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

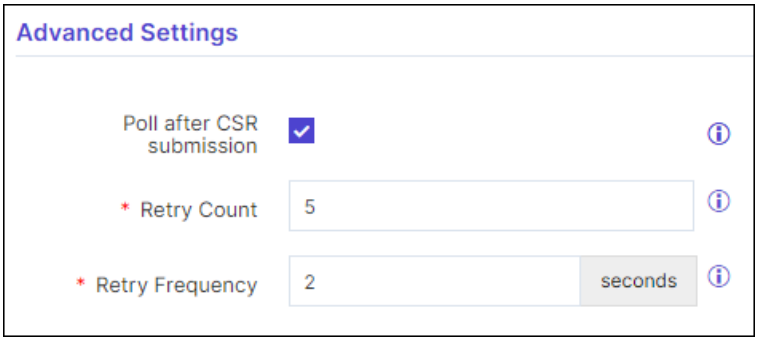


CA Configuration - Field Description Table

Fields	Description
***CA Base URL**	Enter the base URL that will be used to construct the API request. The value is *https://api.ra.swisssign.ch*
***Username**	Enter the service account username to communicate with the RA.
***API Key**	Enter the API key which is a unique identifier used to authenticate the user. The value entered will be masked and encrypted.
*: *Mandatory fields*	

6. Click **Fetch Clients and Products.**

   If the data provided is accurate the success message “Clients and Products fetched successfully“ will be displayed and a table is displayed with two columns - *Client* and *Product Name* (the product name is similar to the certificate profile).
7. Update the following details in the **Advanced Settings** section as described in the table.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Advanced Settings - Field Description Table

Fields	Description
***Poll after CSR submission**	Selecting the checkbox enables polling after CSR submission. It fetches the certificates immediately after CSR submission on enrollment, renew, and reissue with the retry count and retry frequency specified in the fields below.
***Retry Count**	Enter a value between 1 - 10.
***Retry Frequency**	Enter a value between 1 - 30 seconds.
*: *Mandatory fields*	

8. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case **Fetch Clients and Products** is not triggered before saving CA settings, this action can explicitly perform both these actions and update the CA.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the SwissSign CA Connection Status

1. On the SwissSign CA page, the above configured CA will be displayed with a **Check** button in the last column of the table.
2. Click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

Symantec CA

Prerequisites

The prerequisites for configuring a Symantec account in AppViewX are as follows:

- A Symantec client certificate for a user having the necessary access for enrolling the certificates and other Certificate Lifecycle Management(CLM) operations.
- AppViewX server should either have internet access or have a proxy configured in AppViewX general settings. Refer to the section Managing Proxy Settings in the Platform guides.
- Symantec users should be associated with the role **“w=VICE2 web services application”**.
- Required organization status should be “valid”.
- If the EV certificate type is enabled, then the EV status of the organization should be “Yes”.
- The required domain should be registered with the organization.
- The required certificate types should be enabled with the required values in the portal.
- Unit values should be available for the required certificate type.

Configuring Symantec CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Symantec**.
   The **Symantec** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The **Symantec** configuration page is displayed.
4. Update the following details in the **General Information** section as described in the table.

General Information - Field Description Table

Fields	Description
***CA Account name**	A unique name to identify the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: No special characters other than '.', '-','_' are allowed. The name must not start with special characters.
***Purpose/Usage**	Certificate Type for which CLM actions will be enabled. For example, Server and Client.
Proxy Required	Enable this field if the CA communication needs to happen via Proxy. The proxy details configured in general settings will be used for communication.
Data Center (AppViewX's CA agent)	Select the data center through which the CA communication needs to happen.
**: Mandatory fields*	

5. Update the following details in the **CA Configuration** section as described in the table. These fields are necessary for invoking the Symantec CA APIs for Certificate Management.

CA Configuration - Field Description Table

Fields	Description
***Certificate and Key**	Client authentication certificate for API communication. **Note:** Certificate must be a valid <.p12> or <.pfx> file.
***URL**	Symantec URL used for API communications. For example, **https://certmanager-webservices.websecurity.symantec.com/vswebservices/**
***Jurisdiction hash**	Jurisdiction hash of the Symantec account. Available in the top right corner of the Symantec portal.
***First name**	First name of the user.
***Last name**	Last name of the user.
**: Mandatory fields*	

6. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

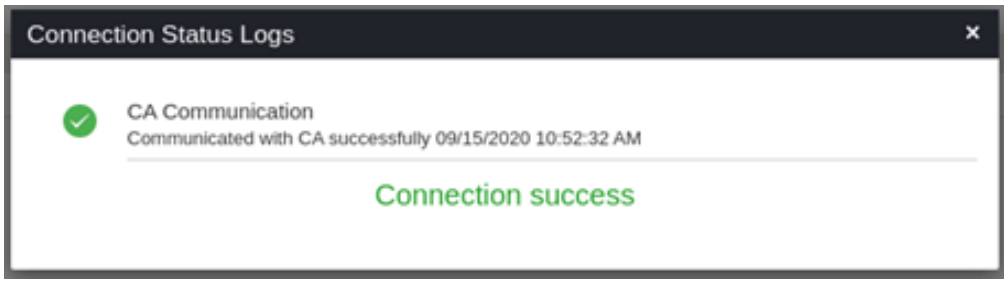
In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

Note: In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

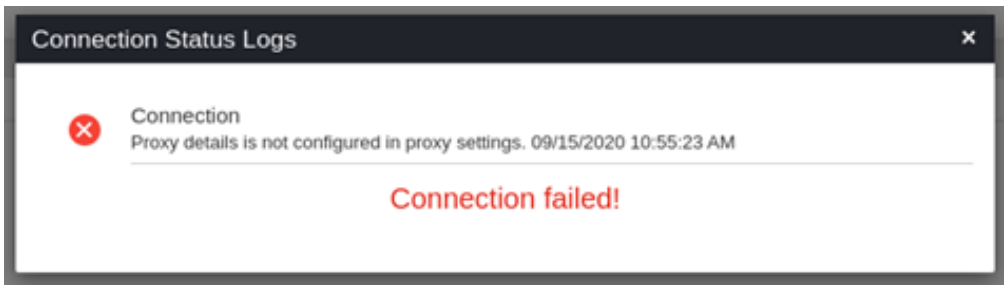
Manually Validating the Symantec CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Symantec**.
   The **Symantec** home page is displayed.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that has been created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

Success Scenario



Failed Scenario



Trustwave CA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

The prerequisites for configuring Trustwave CA account in AppViewX are as follows:

- Trustwave **API URL**. Ex: https://testapi.ssl.trustwave.com/3.0/.
- Valid credentials for communicating to Trustwave CA via API. The **Username** and **Password** are emailed when your account is set up by Trustwave. Additionally, users with admin access can create accounts in Trustwave by the following steps:
  1. Login to your Trustwave account and navigate to **Account Management** > **Manage Users**.
  2. Click **+Add User**
  3. In the **Add a User** pop-up, enter the relevant details and click **Add User**.

  Note: While assigning User Roles, minimum permissions are applicable to **View** and **Request** roles, and maximum permission are applicable to **Administer** and **Scan** roles.

- The **Reseller Id** is an identifier assigned by Trustwave that uniquely identifies each customer's account.
- Account details provided in Trustwave account such as Organization Name, Email address, Organization Address, City, State, Zip code, Country, and Phone number. (Details are available in your Trustwave account, **Account Management** > **My Account**.
- Reachability from AppViewX southbound to Trustwave API URL via proxy or direct internet connection. AppViewX server should either have internet access or have a proxy configured in AppViewX general settings. Refer to the section Managing Proxy Settings in the Platform guides.

Configuring Trustwave CA

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Trustwave**.
   The **Trustwave** home page is displayed.
3. Click the **Configure Now** button or **+Add** icon from the middle or top-right of the page respectively.
   The Trustwave CA details page is displayed.
4. Configure the **General Information** details as follows:

General Information - Field Description Table

Fields	Description
***CA Account name**	Provide an account name for the CA setting.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Purpose/Usage**	Choose the certificate categories that will be managed by this setting. Possible certificate categories could be: a. Server b. Code Signing
Proxy Required	Enable this field if the CA communication needs to happen via **Proxy**.
Data Center (AppViewX's CA agent	Choose the appropriate **Data Center**.
**: Mandatory fields*	

5. Configure the **CA Configuration** with information you want to configure:

CA Configuration - Field Description Table

Fields	Description
***API URL**	The Trustwave API URL to communicate. E.g.: https://testapi.ssl.trustwave.com/3.0/
***Username**	The username for API authentication.
***Password**	The password for API authentication.
***Reseller ID**	The Reseller Id for the account. An identifier assigned by Trustwave that uniquely identifies each customer's account.
**: Mandatory fields*	

6. Configure the **Account Details** with information you want to configure:

CA Configuration - Field Description Table

Fields	Description
***Name**	The Organization name given in the Trustwave account.
***Email Address**	The Administrator or organization email address given in the Trustwave account.
***Address**	The Organization Address given in the Trustwave account.
***City**	The city name given in the Trustwave account.
***State**	The state name given in the Trustwave account.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Zip code**	The zip code given in the Trustwave account.
***Country**	The country code given in the Trustwave account. E.g.: US.
***Phone number**	The phone number given in the Trustwave account.
**: Mandatory fields*	

7. Click **Save**.
   In the CA instance inventory, the connection status is initially set to **In Progress**. Twice after this, this status is automatically checked and refreshed every 5 seconds. Once the CA instance is successfully configured, the status is updated to **Success**. Status checks after the first two times have to be done via a manual refresh.

> **Note:** In case the connection fails, you can manually verify the connection status by clicking the **Check** button in the **Connection Status** field.

Manually Validating the Trustwave CA Connection Status

1. Go to **(Menu)** > **CERT+** > **ADMINISTRATION** > **Certificate Authority**.
2. From the displayed CA, select **Trustwave**.
3. In the Status column of the grid with the listed accounts, click **Check** to validate the CA setting that is created.
   The CA communication will be validated and the **Connection Status** will be shown as either **Success** or **Failure**.

CA Policy

You can enforce your organization standards by configuring **Certificate Policy** in **CERT+**. Thus the attributes of discovered certificates are compared against the certificate policy to ensure they are complaint. If the certificate attribute deviates, it is marked as non-complaint and notified to users. Users can request for a new certificate (in-line to organization standards) to Certificate Authority.

Before you Begin

Following are the prerequisites for configuring a CA based **Policy** in **CERT+**:

- Certificate Group(s) must be available to map the **Policy** to them.
- CA accounts (settings) must be available to which the policy is going to be created.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Key Algorithm, Encryption Type must be available under the CA accounts.

Configuring Policy Details

1. Go to (**Menu)** > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.

   Note: CERT+ is packaged with the following: default policies **Default** and **Certificate-Gateway**.

2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Enter the **Policy Details**.

Field description for Policy Details

Fields	Description
***Policy name**	Enter a unique name for the CA policy. • Only the following special characters are considered valid: **.**, **-**, and _. • The policy name cannot start with a special character (including the valid ones).
Description	Enter a description of the policy.
***Policy Enforcement Type**	Select **Strict** (default) or **Suggestive.** • **Strict** - Enforces standards defined in the policy where a user cannot modify any parameters. • **Suggestive** - Suggests policy parameters. A user can modify to the suggested values if required.
Certificate Requests Need Approval	To enforce peer approval process for any certificate requests raised, turn on the **Certificate Requests Need Approval** toggle. All CLM actions, such as certificate creation/renewal/regeneration/reissue/revocation, will now be executed after due approval is received. Peer approval for requests is defined in the approval workflow.
Enable Access to Private Key	When enabled, allows the user to download private keys from the holistic view.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Enable certificate push-bind access for a read-only user	Enabling this feature will allow a user from a read-only user group to perform certificate push, bind, and rollback operations from the holistic view.
Validate issuer and root certificate for compliance	Enabling this option will validate if the issuer and root of a certificate are also compliant with the standards defined in the policy.
Email Address mandatory for Client Certificate	Enabling this option will set the email address as mandatory during client certificate enrollment.
Enable Public Key Validation during CSR Upload?	To validate the public key included in the CSR uploaded for certificate enrollment, renewal, regenerate, or reissuance, turn on the **Enable Public Key Validation during CSR Upload?** toggle.
**: Mandatory fields*	

Note: You can configure the **Policy Details** section based on your organization's standards.

4. Under the **Group selection** section, select one or more groups to map to the policy.
5. Under the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

Configuring a CA Policy for Amazon CA

1. Go to (**Menu)** > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** pane in the left, select **Amazon** .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for Amazon CA Details

Fields	Description
***CA Accounts**	The Amazon CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
**: Mandatory fields*	

5. From the **CA Accounts** dropdown list., select the required CA account.
6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.
7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
8. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
9. Enter the **Certificate Parameters**.

Field description for certificate parameters

Fields	Description
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period).
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, **Regenerate**. **Note:** Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period)
**: Mandatory fields*	

10. Click the **Save CA Details** button to save the configuration. A green tick mark will be displayed in the **Certificate Authority** pane against the **Amazon** option to indicate that the details are successfully stored.

11. From the **Group selection**, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click the **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Amazon Private CA

Prerequisites:

- You must configure the CA setting with Amazon Private CA credentials.
- You must have validated and fetched the Amazon Intermediate CAs along with the issuer region details in the CA settings page.

1. Go to (**Menu)** > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Amazon Private CA**.
   The **CA Details** section is updated to display fields relevant to Amazon Private CA.
5. Enter the policy details for Amazon Private CA.

Field description to create CA policy for Amazon Private CA

Field	Description
***CA Accounts**	From the dropdown list, select the certificate authority account.
***Issuer Region**	From the dropdown list, select the issuer region.
***Issuer Name**	From the dropdown list, select the issuer name.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
***Bit Length - Key Type**	All the key types are listed with their corresponding bit length. You can select one or more than one bit length - key type pair from the dropdown list.

Field	Description
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforcedat the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period)
**: Mandatory fields*	

7. Click **Save CA Details**.
   A green tick mark is displayed in the **Certificate Authority** pane against **Amazon Private CA** to indicate that the details are successfully stored.
8. From the **Group selection**, select one or more groups to map to the policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

   Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

10. Click **Create Policy**.

    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Digicert CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.

   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.

   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **DigiCert**.

   The **CA Details** section is updated to display fields relevant to DigiCert.
5. Enter the policy details for DigiCert.

Field description for CA details

Fields	Description
***CA Account**	From the dropdown list, select an existing CA account for which this policy is to be created.
***Division**	Select the division from the dropdown list.
***Certificate Type**	Certificate types corresponding to the selected CA account are listed. Select one (or) more certificate types from the list to create the policy.
***Validity**	Enter a validity period for the certificate. The available options are: **Days** - You can enter more than one validity period in days, to choose one in certificate enrolment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Month - You can enter more than one validity period in Months, to choose one in certificate enrolment. **Year** - You can enter more than one validity period in Year, to choose one in certificate enrolment. **Year** - You can enter more than one validity period in Year, to choose one in certificate enrolment.
**: Mandatory fields*	

6. In the **Vendor Specific Details** section, select/enter the details as listed in the table

Field description for Vendor Specific Details

Fields	Description
***Server Type**	Select the server type from the dropdown list.
**: Mandatory fields*	

7. Click **Add**.
   The CA details are added to the table below the **Add** button and a confirmation message is displayed.

Note: You can use the **Edit** option in the table to modify the configuration and the **Remove** option to delete the configuration.

8. Select the **Bit Length -Key Type**, **ECDSA curve**, and the **Hash Function**.
9. Based on your organization's policies and standards, enter values for the **Certificate Parameters**.

Field description for certificate parameters

11. From the **Group selection** section, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message displays.

Configuring a CA Policy for Digicert One CA

DigiCert One CA allows creation of certificate profiles using certain generic template ids which are eventually used during enrollment.

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **DigiCert One**.
   The **CA Details** section is updated to display fields relevant to DigiCert.
5. Enter the policy details for DigiCert One.

Field description for CA details

Fields	Description
***CA Accounts**	From the dropdown list, select an existing CA account for which this policy is to be created.
***Certificate Profiles**	From the dropdown list, select a certificate profiles.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Certificate profiles are created in the DigiCert One instance and provide you with the list of fields that are mandatory for certificate issuance and also other configured settings that have static values or allow multiple values. Values in the dropdown lists for the subsequent fields will be populated based on what is specified in the selected certificate profile.
***Validity**	Using the **Days**, **Months**, and **Years** dropdown lists, select a validity period for the certificate. **Days**: You can enter more than one validity period in days, to choose one in certificate enrolment. **Months** - You can enter more than one validity period in Months, to choose one in certificate enrolment. **Year** - You can enter more than one validity period in Year, to choose one in certificate enrolment. **Year** - You can enter more than one validity period in Year, to choose one in certificate enrolment. These dropdown lists are populated according to the certificate profile selected.
***Bit Length - Key Type**	From the ***Bit Length - Key Type** dropdown list, select the required bit length- key type pair(s). The discovered certificate's Key Type and Bit length will be compared against the selected bit length- key type pair(s) to check for compliance with the policy. The selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **Enroll**, **Renew**, **Regenerate**.
***Hash Function**	From the ***Hash Function** dropdown list, select one (or more) hash functions. The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The

The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *(Asterisk), - (hyphen), . (period)
*: Mandatory fields	

10. Click **Save CA Details** to save the configuration.
    A green tick mark is displayed in the **Certificate Authority** pane against **EJBCA** to indicate the details are successfully stored.

11. From the **Group selection**, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Entrust CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Entrust**.
   The **CA Details** section is updated to display fields relevant to Entrust.
5. Enter the CA details for Entrust.

Field Description for CA Details

Fields	Description
***CA Accounts**	The Entrust CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Certificate Type**	The **Certificate Types** corresponding to the selected CA account are listed. Select one (or) more certificate types from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. In the **Vendor Specific Details** section, select/enter the details as listed in the table:

Fields	Description
Additional Emails	Enter the valid email address in the field.

7. Click **Add**.
   The CA details are saved to the table and the confirmation message displays.

   You can use the **Edit** option in the table to modify the configuration and **the Remove** option to delete the configuration.
8. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
9. From the ***Hash Function** dropdown list, select one (or more) hash functions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.

10. Enter the **Certificate parameters to be Compared or Enforced**.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Use this toggle button to restrict the creation of wild card certificates using the policy.
Disable CT Logs	For Entrust CA, AppViewX lets you disable sending certificate data to the Certificate Transparency logs everytime a certificate is enrolled, renewed, regenerated, and/or reissued. To do this: • At the time of configuring the Entrust CA policy , turn on the **Disable CT Logs** button. Now, every time this Entrust policy is used to enroll/renew/ regenerate/reissue a certificate, its CT logs will not be generated and the contents of the certificate, including host names, will not be publicly visible.
Host Name	Enter the host name. The host name cannot start and end with a **.** (period)
Allowed Domain Names	Enter from the list of whitelisted domain names. To add multiple domain names, press **Enter** after adding each domain name.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

11. Click **Save CA Details** to save the configuration.
    A green tick mark will be displayed in the **Certificate Authority** pane against **Entrust** option to indicate that the details are successfully stored.
12. From the **Group selection**, select one or more groups to map to the policy.
13. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

    Note: A scheduled compliance check will run periodically based on the settings defined in the **Job Scheduler**.

14. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Entrust MPKI CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Entrust MPKI**.
   The **CA Details** section is updated to display fields relevant to Amazon Private CA.
5. Enter the policy details for Entrust MPKI.

Field description for CA details

Fields	Description
***CA Accounts**	Select a CA account from the list to create the policy. The selected CA account will be listed in the **CA Accounts** table.
***Bit Length - Key Type**	From the dropdown list, select one (or more than one), bit length-key type pair(s). The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
***Hash Function**	From the dropdown list, select one (or more) hash functions. The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
**: Mandatory fields*

6. Enter the **Certificate parameters** values.

Field description for certificate parameters

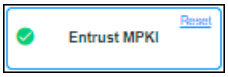
Fields	Description
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period) .
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Click **Save CA Details** to save the configuration.
   A green tick mark is displayed in the **Certificate Authority** pane against **Entrust MPKI** to indicate that the details are successfully stored.



8. From the **Group selection**, select one or more groups to map to the policy.
9. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

10. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Futurex

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy : Create** page is displayed.
3. Enter/Select the **Policy Details**.
   These details define the rules and templates for a certificate policy to ensure that certificate attributes are in compliance with the organization.

Field description for Policy Details

Fields	Description
***Policy name**	Enter a unique name for the CA policy. **Constraints**: • Only the following special characters are considered valid: **.**, **-**, and _. • The policy name cannot start with a special character (including the valid ones).
Description	Enter additional details related to the rules and guidelines enforced by the policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Policy Enforcement Type	The policy enforcement type defines whether users can modify the policy parameters. Depending on your requirement, select one from the following values: • **Strict**: This selection will enforce the standards defined in the policy, not allowing users to modify any parameters. • **Suggestive**: This selection will suggest policy parameters, allowing the user to modify the suggested values as required.
Certificate Requests Need Approval	To enforce peer approval process for any certificate requests raised, turn on the **Certificate Requests Need Approval** toggle. All CLM actions, such as certificate creation/renewal/regeneration/reissue/revocation, will now be executed after due approval is received. Peer approval for requests is defined in the approval workflow.
Enable Access to Private Key	To allow the user to download private keys from the holistic view and the certificate inventory, turn on the **Enable Access to Private Key** toggle..
Enable certificate push-bind access for a read-only user	To allow users with only read-only access to perform the certificate push, bind, and rollback operations from the holistic view, turn on the **Enable certificate push-bind access for a read-only user** toggle.
Validate issuer and root certificate for compliance?	To validate the issuer and root of a certificate for compliance with the policy standards, enable the **Validate issuer and root certificate for compliance?** toggle.
Email Address mandatory for Client Certificate	At the time of client certificate enrollment, to set the email address field as mandatory, turn on the **Email Address mandatory for Client Certificate** toggle.
Enable Public Key Validation during CSR Upload?	To validate the public key included in the CSR uploaded for certificate enrollment, renewal, regenerate, or reissuance, turn on the **Enable Public Key Validation during CSR Upload?** toggle.
**: Mandatory fields*	

4. In the **CA Details** section:

   a. From the **Certificate Authority** list on the left, select **Futurex**.
   The section is updated to display the fields required to configure a Futurex policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

b. Enter/Select the CA details.

Field description for CA Details

Fields	Description
***CA Accounts**	From the dropdown list, select the CA account names of the CA settings that will be mapped to this policy.
***Issuance Policy**	From the dropdown list, select one from the list of issuance policies retrieved for the CA account name selected above. The issuance policy selected defines the set of rules and conditions under which certificates can be issued using this policy. This may include constraints like key length, usage, subject naming, and validity period.
***Root CA**	From the dropdown list, select the root CA for this certificate. This is the trusted root certificate authority that anchors the certificate chain. All issued certificates will ultimately chain up to this root.
***Signing CA**	From the dropdown list, select the Certificate Authority that will sign the requested certificate.
***Validity**	Using the **Days**, **Months**, and **Years** dropdown lists, select a validity period for the certificate. **Days**: You can enter more than one validity period in days, to choose one in certificate enrolment. **Months**: You can enter more than one validity period in Months, to choose one in certificate enrolment. **Year**: You can enter more than one validity period in Year, to choose one in certificate enrolment.
***Bit Length - Key Type**	From the ***Bit Length - Key Type** dropdown list, select the required bit length- key type pair(s). The discovered certificates' key type and bit length will be compared against the selected bit length- key type pair(s) to check for compliance with the policy. The selected bit length- key type pair(s) is enforced while performing any certificate request operations.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Hash Function**	From the dropdown list, select one (or more) hash functions. The discovered certificates' key hash algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is/are enforced while performing any certificate request operations.
**: Mandatory fields*	

c. Click **Add**.
The CA details are added to the table below the **Add** button and a confirmation message is displayed.

Note: You can use the **Edit** option in the table to modify the configuration and the **Remove** option to delete the configuration.

d. Enter/Select the **Certificate Parameters** for the policy.
The parameters of a discovered certificate will be compared the values entered in this section to assess its compliance with this policy.

Field description for CA Details

Fields	Description
Restrict Wild Card Certificate	To restrict the creation of wild card certificates using this policy, turn on the **Restrict Wild Card Certificate** toggle. A **wildcard certificate** is a type of SSL/TLS certificate that secures **a domain and all its subdomains** using a single certificate. This could possess a security risk considering that if this certificate is compromised, all its subdomains become vulnerable.
Host Name	Enter a host name that will be used to identify the domain secured by the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Constraints: • The host name cannot start and end with a **.** (period). • If a host name is not specified here, the user is allowed to enter a host name of their choice at the time for creating certificate requests for CLM actions.
Allowed Domain Names	Enter the domain names that must be whitelisted for this policy. Multiple domain names can entered, separated by the **Enter** key. If this field is left blank, by default, all domains will be whitelisted for the CLM actions that use this policy.
Blocked Domain Names	Enter the domain names that must be blacklisted for this policy. Multiple domain names can entered, separated by the **Enter** key. If this field is left blank, by default, all domains will be blacklisted for the CLM actions that use this policy.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificates' **Subject Organization** is checked for compliance with this value. The organization name is enforced while performing any certificate request operations.
Organization Unit	Enter the name of the business unit of the organization.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The discovered certfiicates' **Subject Organization Unit** is checked for compliance with this value. The organization unit name is enforced while performing any certificate request operations.
Locality	Enter the organization's locality name. The discovered certfiicates' **Locality** is checked for compliance with this value. The locality name is enforced while performing any certificate request operations.
State	Enter the name of the state in which the organization is located. The discovered certfiicates' **State** is checked for compliance with this value. The state name is enforced while performing any certificate request operations.
Country code	Enter the organization's country code. The discovered certfiicates' **Country Code** is checked for compliance with this value. The state name is enforced while performing any certificate request operations.
Email	Enter the organization unit's official email address. The email address specified for the discovered certfiicates' is checked for compliance with this value. The value is enforced while performing any certificate request operations.
Subject Alternative Name	Enter the subject alternative name (SAN) applicable for this policy. The SAN helps enforce additional domains for which a certificate can be requested. It is enforced at the time of performing certificate request operations. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period)

Fields	Description
*: Mandatory fields	

e. Click **Save CA Details**.
A green tick mark is displayed in the **Certificate Authority** list against **Futurex** to indicate that the details are successfully stored.

5. Under the **Group selection** section, select one or more groups to map to the policy.
6. Under the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

7. Click **Create Policy**.
The policy is created and a confirmation message is displayed.

Configuring a CA Policy for GlobalSign Atlas CA

Before You Begin: The prerequisites for configuring the policy are as follows:

- Certificate group(s) must be available to map the policy to them.
- CA accounts (settings) must be available to which the policy is going to be created.
- AppViewX permissionis required (**Accounts** > **Roles** - Click here to check Accounts Management).

To configure policy for GlobalSign Atlas CA:

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
The **CA Policy** page is displayed.

   CERT+ is packaged with the following default policies: **Default** and **Certificate-Gateway**.

> **Note:** The **Default** CA Policy will have the **GlobalSign Atlas CA** details.

2. Click **+ Create** to configure GlobalSign Atlas custom policy.
The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Policy Details**
- **Group Selection**
- **Compliance Check**

4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **GlobalSign Atlas**.
   The **CA Details** section is updated to display fields relevant to GlobalSign Atlas.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The GlobalSign Atlas CA accounts configured in the CA settings screen are listed here. Select a CA account from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
***Bit Length - Key Type**	From the dropdown list, select one (or more than one), bit length- key type pair(s). The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
***Hash Function**	From the dropdown list, select one (or more) hash functions. The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
**: Mandatory fields*	

The updated fields for the CA are displayed on the right.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. Click **Add**.
   The CA details are saved in the table and the confirmation message is displayed.

   You can use the **Edit** (pencil)option in the table to modify the configuration and the **Remove** (bin) option to delete the configuration.

7. Enter the **Certificate parameters** values.

Field description for certificate parameters

Field	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period) .
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Field	Description
	Note: Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

8. Click **Save CA Details** to save the configuration.
   A green tick mark is displayed in the **Certificate Authority** pane against **GlobalSign MSSL** to indicate that the details are successfully stored.
9. From the **Group selection**, select one or more groups to map to the policy.
10. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

    Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

11. Click **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for GlobalSign CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **EJBCA**.
   The **CA Details** section is updated to display fields relevant to EJBCA.
5. In the **Vendor Specific Details** section, select/enter the details as listed in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field description for vendor specific details

Fields	Description
***Incorporating Agency Reg. No**	Enter the agency registration number.
***Designation**	Enter the designation.
***Business Category**	Select the business category from the dropdown list.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use the **Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
8. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
9. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the white-listed domain names.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *(Asterisk), **-** (hyphen), **.** (period) .
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

10. Click **Save CA Details** to save the configuration.
    A green tick mark is displayed in the **Certificate Authority** pane against **GlobalSign** to indicate that the details are successfully stored.
11. From the **Group selection**, select one or more groups to map to the policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

    Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for GlobalSign MSSL CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** to configure a GlobalSign MSSL based policy.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **GlobalSign MSSL**.
   The **CA Details** section is updated to display fields relevant to GlobalSign MSSL.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The GlobalSign MSSL CA accounts configured on the CA settings screen are listed. Select a CA account from the list to create the policy.
* **Product Type**	All Managed SSL Product Types require that the Organization's information and at least one Domain be registered in the Managed SSL account prior to ordering.
***Signature Algorithm**	Select the signature algorithm from the dropdown list list.
* **MSSL Profile Allowed Domain Name**	Select the **MSSL Profile Allowed Domain Name** from the dropdown list list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use **Edit** option in the table to modify the configuration and the **Remove** option to delete the configuration.

7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
8. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

9. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period) .

Fields	Description
*: Mandatory fields	

10. Click **Save CA Details** to save the configuration.
    A green tick mark is displayed in the **Certificate Authority** pane against **GlobalSign MSSL** to indicate that the details are successfully stored.
11. From the **Group selection**, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for GoDaddy CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **GoDaddy**.
   The **CA Details** section is updated to display fields relevant to GoDaddy.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Account**	The GoDaddy CA accounts configured in CA settings screen are listed. Select a CA account from the list to create the policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Certificate Type**	The **Certificate Types** corresponding to the selected CA account are listed. Select one (or) more **Certificate Type** from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
7. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
8. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use **Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
9. Enter the certificate parameters.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the * (asterisk) for the host part of the FQDN to enforce the domain. 11. From the **Group selection**, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Google CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy : Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Google**.
   The **CA Details** section is updated to display fields relevant to Google.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The Google CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Issuer Location**	The issuer locations corresponding to the selected CA account are listed. Select an issuer location from the list to create the policy.
***Issuer Name**	The issuer names corresponding to the selected CA account are listed. Select an issuer name from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

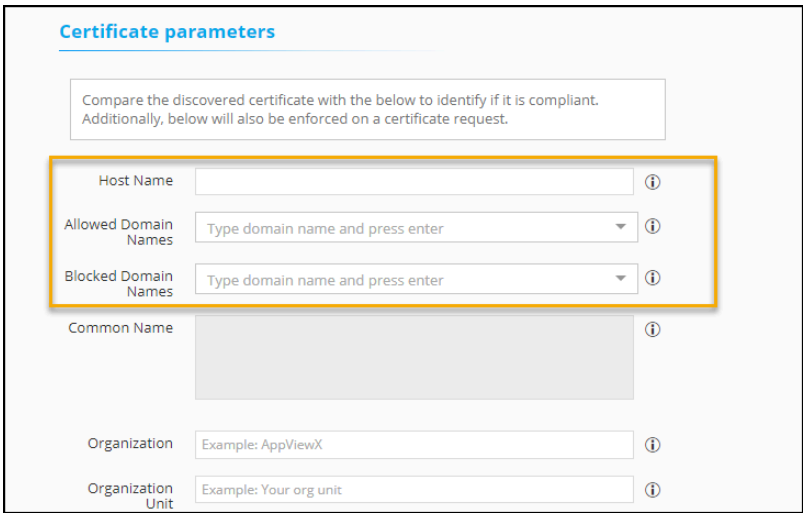
Fields	Description
	You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
***Bit Length - Key Type**	From the dropdown list, select one (or more than one), bit length-key type pair(s). The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
***Hash Function**	From the dropdown list, select one (or more) hash functions. The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
**: Mandatory fields*	

6. Enter the certificate parameters.

   For **Policy Enforcement Type** = **Strict**

   For **Policy Enforcement Type** = **Suggestive**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



Field description for certificate Parameters

Field	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Hostname	This text field is displayed if the **Policy Enforcement Type = Strict** or **Suggestive**. Enter the unique name or label for the host. The field is **mandatory** only when the **Policy Enforcement Type = Strict**. **Note:** The hostname should not start or end with a dot.
Allowed Domain Name	This text field is displayed if the **Policy Enforcement Type = Strict** or **Suggestive**. The field is **mandatory** only when the **Policy Enforcement Type = Strict**. Enter the valid domain name (two parts separated by a dot, such as example.com).
Blocked Domain Name	This text field is displayed only if the **Policy Enforcement Type = Suggestive** Enter the domain names (two parts separated by a dot, such as example.com) that need to be blocked

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the * (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period).
Organization	You can provide the organization's name. The discovered certificate's **Subject Organization** will be compared against the organization provided in the policy to identify if they are complaints. The organization is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	You can provide an organization unit. The discovered certificate's **Subject Organization Unit** will be compared against the organization unit provided in the policy to identify if they are Complaint. Organization Unit is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	You can provide a locality. The discovered certificate's **Locality** will be compared against the locality provided in the policy to identify if they are complaints. The locality is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	You can provide state. The discovered certificate's **State** will be compared against the state provided in the policy to identify if they are complaints. The state is enforced

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	You can provide a country code. The discovered certificate's **Country code** will be compared against the country code provided in the policy to identify if they are complaints. Country code is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	You can provide an organization unit mail address. The discovered certificate's **mail address** will be compared against the email address provided in the policy to identify if they are Complaint. Mail address is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	You can provide the subject alternative name (SAN) It helps enforce additional domains for which a certificate can be requested. Subject Alternative Name is enforced while performing certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use Asterisk (*) for the host part of the FQDN to enforce the domain. For example, *.domain.com will only allow users to request certificates with domain domain.com. Allowed Special Characters: Asterisk (*), Hyphen (-), Period (.), At (@).
**: Mandatory fields*	

You can use the **Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

CA Accounts	Issuer Location	Issuer Name	validity	Edit	Remove
Google CA	us-east1	AppViewX-Enterprise-Pvt-Root-CA-1023	view		
Google CA 1	us-central1	AppViewX-Enterprise-Pvt-Root-CA-1029	view		

7. Click **Save CA Details** to save the configuration.
   A green tick mark is displayed in the **Certificate Authority** pane against **Google** to indicate the details are successfully stored.
8. From the **Group selection**, select one or more groups to map to the policy.
9. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

10. Click **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for HashiCorp Vault CA

Before You Begin

- Certificate Group(s) must be available to map the Policy to them.
- CA accounts (settings) must be available to which the policy is going to be created.
- Key Algorithm, Encryption Type must be available under the CA accounts.
- AppViewX permission required (Accounts > Roles - Click here to check Accounts management).

To configure a Hashicorp Vault CA policy:

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed with a list of policies and their associated groups.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: A **Default** policy will always be present in the list. Most of the roles are mapped to this policy. This policy can be used for any of the configured CAs.

2. To create a custom policy, click **+Create** from the top-right corner of the **CA Policy** page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **HashicorpVault**.
   The **CA Details** section is updated to display fields relevant to HashicorpVault.
5. Enter the CA details.

Field Description for CA Details

Fields	Description
***CA Accounts**	Select a CA account from the list to create the policy.
***Secret Engine**	The single-select dropdown contains all the secret engines associated with the account. In a secret engine, a role describes an identity with a set of permissions, groups, or policies you want to attach to a user of the secret engine. User identity is often mapped to a specific role. Hence, a single secret engine needs to be selected to populate role (below) specific to it.
***Role**	The dropdown list contains all the roles mapped to the secret engine.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

CA Settings	Secret Engine	Role	View	Edit	Remove
APPROLE-DEMO	pki_int	Server-Certificate	View		
APPROLE-DEMO	pki_int	certificate-role	View		

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Multiple values can be configured based on the available CA settings and secret engines with different bit length - key type and hash function. The supported values include:

- **Key Type**: RSA, EC
- **Bit Length:**
  - *RSA key type*: 2048 (default), 3072, or 4096
  - *EC key type*: 224, 256 (default), 384, or 521
- **Hash Function**: SHA-256, SHA-384, SHA-512

The CA Details table has options to **View**, **Edit**, and **Delete**.

a. To view the CA details, click the **View** link in the **View** column. The CA account details are displayed in a pop-up window with the **Bit Length - Key Type** and **Hash Function.**
b. To update the CA details, click the edit icon in the **Edit** column.
c. To delete the CA details, click the delete icon.

7. Enter the certificate parameters.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

8. Click **Save CA Details**.
   A green tick mark is displayed in the **Certificate Authority** pane against the **Hashicorp Vault** option to indicate that the details are successfully saved.
9. In the **Group Selection**, select one or more groups to map to the policy. Refer to the **Certificate Group** section to add/update groups.
10. Under the **Compliance Check** section, enable the **Perform Compliance Check** option to perform an immediate compliance check.
11. Click **Create Policy** button.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for HydrantID CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **HydrantID**.
   The **CA Details** section is updated to display fields relevant to HydrantID.
5. Enter the CA details.

Field Description for CA Details

Fields	Description
***CA Accounts**	The HydrantID CA accounts configured in the CA settings screen are listed here. Select a CA account from the list to create the policy.
***HydrantID Policy**	Policies associated with the account will be displayed here. Select a policy from the dropdown (single select).
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use the **Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
7. From the ***Bit Length - Key Type** dropdown list, select the required encryption algorithm (key type) and the corresponding key size (bit length) for key generation
   For discovery, the discovered certificate's key type and bit length will be compared against the selected bit length- key type pair(s) to check for compliance with the policy. The selected bit length-key type pair(s) is enforced while performing any certificate request operations such as **Enroll**, **Renew**, **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. When **EC** is the selected key type, from the ***ECDSA curve** dropdown list, select the elliptic curve that will be used for key generation.
9. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
10. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: ***(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing

Fields	Description
	any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is

	enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

11. Click **Save CA Details** button to save the configuration.
    A green tick mark will be displayed in the **Certificate Authority** pane against the **HydrantID** CA option to indicate that the details are successfully stored.
12. From the **Group selection**, select one or more groups to map to the policy.
13. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

    Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

14. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for IDnomic CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed with a list of policies and their associated groups.

   Note: A **Default** policy will always be present in the list. Most of the roles are mapped to this policy. This policy can be used for any of the configured CAs.

2. To create a custom policy, click **+Create** from the top-right corner of the **CA Policy** page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Policy Details**
- **Group Selection**
- **Compliance Check**

4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **IDnomic**.
   The **CA Details** section is updated to display fields relevant to IDnomic.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The IDnomic CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Certificate Management Profile**OR ***Certificate Workflows**	If the selected CA Account is configured with a certificate profile then the field label is Certificate Management Profile and displays only certificate profiles. If configured with a registration authority (RA) the field label is Certificate Workflows and displays the certificate workflows. The Certificate Types corresponding to the selected CA account are listed. Select one (or) more Certificate Type from the list to create the policy.
***Validity**	Enter the validity period for the certificate. The available options are: • **Days** - You may enter more than one validity period in days, to choose one in certificate enrollment. • **Month** - You can enter more than one validity period in Months, to choose one in certificate enrollment. • **Year** - You can enter more than one validity period in Year, to choose one in certificate enrolment.
***Bit Length - Key Type**	All the Key Types are listed with corresponding Bit Length. You can select one (or) more than one Bit Length - Key Type(s) from the dropdown list. The discovered certificate's Key Type and Bit length will be compared against the selected Bit Length - Key Type(s) to identify if they are compliant with the policy. Selected Bit Length - Key Type(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Hash Function**	Supported Hash Function(s) are listed here. You can select one (or) more Hash Function(s) from the dropdown list. The discovered certificate's Key Hash Algorithm will be compared against the selected Hash Function(s) to identify if they are compliant with the policy. Selected Hash Function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed. You may use the **Edit** (pencil) option in the table to modify the configuration and the **Remove** (bin) option to delete the configuration.
7. Enter the certificate parameters.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Restrict users of the associated group policy from requesting Wildcard Certificates. Choosing this option will not allow Common Name or DNS starting with *.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

	Note: Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code. The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
**: Mandatory fields*	

8. Click **Save CA Details**.
   A green tick mark is displayed in the **Certificate Authority** pane against the **IDnomic** option to indicate that the details are successfully saved.
9. In the **Group Selection**, select one or more groups to map to the policy. Refer to the **Certificate Group** section to add/update groups.
10. Under the **Compliance Check** section, enable the **Perform Compliance Check** option to perform an immediate compliance check.
11. Click **Create Policy** button.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Let's Encrypt CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **LetsEncrypt**.
   The **CA Details** section is updated to display fields relevant to LetsEncrypt.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The Let's Encrypt CA accounts configured in CA settings are listed here. Select a CA account from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
Note: The asterisk (*) symbol indicates a mandatory field.	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use the **Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
8. From the ***Hash Function** dropdown list, select one (or more) hash functions.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.

9. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. Configuring a CA Policy for Nexus CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Nexus**.
   The **CA Details** section is updated to display fields relevant to Nexus.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The Nexus CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate. You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. Once the CA account and the validity fields are populated, a new section called **Vendor Specific Details** is enabled. Select the **Procedure** field from the dropdown list list and click **Add** to save the CA details to the table. You can also use the **Remove** option to delete the configuration.
   Select the details as follows:
   a. **Case 1 -** Select **Server** check box, the procedures listed in the **Procedures** dropdown will be - Mapped to servers and default procedures.
   b. **Case 2 -** Select **Client** check box, the procedures listed in the **Procedures** dropdown will be - mapped to client and default procedures.
   c. **Case 3 -** Select **Server** and **Client** check box, the procedures listed in the **Procedures** dropdown will be - mapped to server, client, and default procedures.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: The procedures displayed in the dropdown should have the **cert type** appended in the value. For example: - *Procedure name_Server/client/default/Code-Signing*.

7. Click **Add**. The CA details are saved to the table and the confirmation message displays.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use **the Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
8. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
9. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
10. From the ***Hash Function** dropdown list, select one (or more) hash functions.
    The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
11. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com**

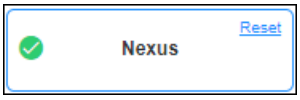
Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period) .
**: Mandatory fields*	

12. Click **Save CA Details** button to save the configuration.
    A green tick mark will be displayed in the **Certificate Authority** pane against **Nexus** to indicate that the details are successfully stored.



13. From the **Group selection**, select one or more groups to map to the policy.
14. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

15. Click **Create Policy** to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for OpenTrust CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **OpenTrust**.
   The **CA Details** section is updated to display fields relevant to OpenTrust.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Account**	The OpenTrust CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Certificate Management Profile**	Select the certificate management profile from the dropdown list.
***Zone**	Select the zone from the dropdown list.
**: Mandatory fields*	

6. Enter the **Profile Parameters**.

Field Description for profile parameters

Fields	Description
***Common Name**	Enter a common name for the policy.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Organizational Unit	Enter the organizational unit.
Organization	Enter the name of the organization.
**: Mandatory fields*	

7. Click **Add** button.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use the **Remove** option to delete the configuration.
8. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
9. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
10. From the ***Hash Function** dropdown list, select one (or more) hash functions.
    The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
11. Enter/Select the **Certificate parameters** values.

Field description for certificate parameters

Field	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field	Description
	Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com** This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the * (asterisk) for the host part of the FQDN to enforce the domain. 14. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

    Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

15. Click **Create Policy** to create a new policy.

    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Sectigo CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.

   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.

   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Sectigo**.

   The **CA Details** section is updated to display fields relevant to Sectigo.
5. Enter the CA details.

Field description for CA details

Fields	Description
***CA Accounts**	The Sectigo CA accounts configured in the CA settings screen are listed. Select a CA account from the list to create the policy.
***Certificate Type**	The certificate types corresponding to the selected CA account are listed. Select one (or) more certificate type(s) from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use **the Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, **Regenerate**.
8. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
9. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
10. Enter the **Certificate parameters** values.

Field description for certificate parameters

13. From the **Group selection**, select one or more groups to map to the policy.
14. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

> **Note:** A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

15. Click **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring a CA Policy for Trustwave CA

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **CA Policy**.
   The **CA Policy** page is displayed.
2. Click **+ Create** from the top-right corner of the page.
   The **CA Policy :: Create** page is displayed.
3. Refer the Configuring Policy Details section to configure the following:
   - **Policy Details**
   - **Group Selection**
   - **Compliance Check**
4. In the **CA Details** section, from the **Certificate Authority** list in the left, select **Trustwave**.
   The **CA Details** section is updated to display fields relevant to Trustwave.
5. Enter the CA details.

Field description for CA Details

Fields	Description
***CA Account**	The Trustwave CA accounts configured in CA settings screen are listed. Select a CA account from the list to create the policy.
***Certificate Type**	The certificate types corresponding to the selected CA account are listed. Select one (or) more certificate type(s) from the list to create the policy.
***Validity**	In the **Days**, **Month**, and **Year** dropdown lists, enter the validity period(s) for the certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	You can enter more than one validity period in days/months/years, and one can then be chosen from the entered values at the time of certificate enrollment.
**: Mandatory fields*	

6. Click **Add**.
   The CA details are saved to the table and the confirmation message is displayed.

   You can use **the Edit** option in the table to modify the configuration and **Remove** option to delete the configuration.
7. From the ***Bit Length - Key Type** dropdown list, select one (or more than one), bit length- key type pair(s).
   The discovered certificate's Key Type and Bit length will be compared against the selected B bit length- key type pair(s) to check for compliance with the policy. The Selected bit length- key type pair(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
8. From the ***Hash Function** dropdown list, select one (or more) hash functions.
   The discovered certificate's Key Hash Algorithm will be compared against the selected hash function to check for compliance with the policy. The selected hash function(s) is enforced while performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
9. Enter the **Certificate parameters** values.

Field description for certificate parameters

Fields	Description
Restrict Wild Card Certificate	Slide toggle switch to the ON position to restrict the creation of wild card certificates using the policy.
Host name	Enter the host name. The host name cannot start and end with a **.** (period)
***Allowed Domain Names**	Enter only the whitelisted domain names. Press enter after adding the domain name. Multiple domain names can be added.
Common Name	Enter the common name. For example, ***.domain.com**

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	This enforces domains for which a certificate can be requested. The common name is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period).
Organization	Enter the organization name. The discovered certificate's subject organization will be compared against the organization provided in the policy to check for compliance. The organization is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Organization Unit	Enter the organization unit. The discovered certificate's Subject Organization Unit will be compared against the organization unit provided in the policy to check for compliance. Organization Unit is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Locality	Enter the locality name. The discovered certificate's locality will be compared against locality provided in the policy to check for compliance. The locality is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
State	Enter the state. The discovered certificate's state will be compared against the state provided in the policy to check for compliance. The state is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Country code	Enter the country code.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The discovered certificate's country code will be compared against the country code provided in the policy to check for compliance. Country code is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Email	Enter the email address of the organization unit. The discovered certificate's email address will be compared against the email address provided in the policy to check for compliance. The email address is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**.
Subject Alternative Name	Enter the subject alternative name (SAN). It helps enforce additional domains for which a certificate can be requested. The SAN is enforced at the time of performing any certificate request operations such as **New**, **Renew**, and **Regenerate**. **Note:** Use the ***** (asterisk) for the host part of the FQDN to enforce the domain. For example, ***.domain.com** will only allow users to request certificates with domain.com. Allowed special characters: *****(Asterisk), **-** (hyphen), **.** (period) .
**: Mandatory fields*	

10. Click **Save CA Details** button to save the configuration.
    A green tick mark is displayed in the **Certificate Authority** pane against **Trustwave** to indicate that the details are successfully stored.

11. From the **Group selection**, select one or more groups to map to the policy.
12. From the **Compliance Check** section, to perform an immediate compliance check, enable **Perform Compliance check**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: A scheduled compliance check will run periodically based on the settings defined in the job scheduler.

13. Click **Create Policy** button to create a new policy.
    The policy is created and a confirmation message is displayed.

Configuring Certificate Groups

Prerequisites for Configuring Groups

Know the following before starting the **Certificate Groups** configuration:

- **Certificate Groups** are used to categorize the certificates according to various **business units.**
- In some organizations, **Certificate Groups** are also used to assign access permissions. Only privileged users (inherits from Resource > User Group) can view the respective **Certificate Groups**.
- Users should be assigned to a **Role** (inherited from Role > User Group) that has access to perform the below actions:
  - View a group
  - Assign a group
  - Unassign a group
- With these actions, users can assign a group during **Certificate Discovery** to avoid movement of certificates post-discovery.
- Along with the view, assign, and unassign options, administrators should be assigned to a **Role** that has access for additional actions:
  - Create/ modify a group
  - Delete a group
  - Edit Default group

Creating a Group

Assign the user to a user group that (inherits from resource and role) have access to certificate group.

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **Groups**.
   The Group inventory is displayed. **CERT+** is packaged with default certificate groups **Default** and **Certificate-Gateway.**
2. Click the **+ Create** button in the command bar to create a new group.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Enter the **Group Details**.

Field descriptions for Group Details

Field	Description
***Select Group Hierarchy**	From the dropdown list, select the parent group to which the new group should be associated: • **Default** • **Certificate Gateway** • **Private CA Certificates** • **Public CA Certificates**
***Group Name**	Enter a unique name for the new group. **Constraints**: • Group name should not begin with a special character and/or a space. • Group name should not end with a space. • Valid special characters: **( )**, **.**, **-**, **/**, **+**, **&**, _
Display Name	Enter a unique name for the new group. You can use this display name to filter the group while configuring expiry alerts. **Constraints**: • Group name should not begin with a special character and/or a space. • Group name should not end with a space. • Valid special characters: **.**, **-**, _
Application ID	Enter the organization ID (if any) to associate with the new group.
Description	Enter the purpose of the certificate group.
**: Mandatory fields*	

4. Enter the **Other Details** for the new certificate group, based on the organization's requirement.

Field descriptions for the Other Details

Name	Description
First Name	First name of the point of contact
Last Name	Last name of the point of contact

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
Contact Name	Provide contact person to whom changes should be intimated
Line of Business Name	Provide the name of the business unit
Email	Provide contact mail address
Alternative Email(s)	Provide alternative contact mail address
Environment Name	Provide environment name
Phone Number	Provide a phone number for contact
Inventory Number	Enter the inventory number.
Cost Center/ Hierarchy	Enter the cost center code/ label.
Push Certificate Automatically	Select this checkbox to enable the auto push feature for this certificates that will be assigned to this group. **Important:** The auto-push feature works only when it is enabled at the connector level and disabled at the group level. If enabled at the group level but disabled at the connector level, the feature will not function. The auto push feature is a mechanism that automatically pushes renewed/regenerated certificates to their target endpoints without any manual intervention. When this checkbox is selected, certificates assigned to this group will be pushed to their target endpoints as soon as they are renewed/ regenerated.
Select Application Connectors to Exclude from Cloning	From the dropdown list, select a status value to exclude the corresponding application connectors from cloning after certificate renewal, regeneration, and reissue.
Renew Automatically	To automatically renew certificates assigned to this group, turn on the **Renew Automatically** toggle.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
	Important: This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates).
***Start Renewing**	This field is displayed when **Renew Automatically** is enabled. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the renewal process should start. Valid range for number of days: **1** to **120**
Approval Required	This field is displayed when **Renew Automatically** is enabled. To ensure that the group inherited renewal configuration overwrites the certificate level renewal configuration (specified at the time of enrollment), select this checkbox.
Subscribe Email Alerts for Auto-Renewal	This field is displayed when **Renew Automatically** is enabled. To receive email notifications every time certificates belonging to this group are auto-renewed, select this checkbox. The email notification includes certificate details, the type of auto action (renewal, in this case), and the outcome (success/failure). These notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, all certificates in this group will inherit the setting. You can override it at the certificate level, unless group-level overrides are enforced.
Regenerate Automatically	To automatically regenerate certificates assigned to this group, turn on the **Regenerate Automatically** toggle.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
	Important: • This feature can be enabled only for valid certificates (not for revoked/suspended and expired certificates). • When **Regenerate Automatically** is enabled, by default, the **Renew Automatically** feature is disabled. • To enforce AppViewX as the default CSR generation source everytime certificates in this group are regenerated, execute the following db script: `db.cert_metadata.insertOne ({"_id":"CERT_AUTO_REGENERATE_DEFAULT_APPVIEWX_CSR", "flag":true})`
***Start Regenerating**	This field is displayed when **Regenerate Automatically** is enabled. In the **Days Before Expiry** field, specify how many days prior to a certificate's expiry the regeneration process should start. Valid range for number of days: **1** to **120** **Note:** This value can exceed the certificate's validity in case of short-lived certificates.
Approval Required	This field is displayed when **Regenerate Automatically** is enabled. To ensure that the group inherited regeneration configuration overwrites the certificate level regeneration configuration (specified at the time of enrollment), select this checkbox.
Subscribe Email Alerts for Auto-Regenerate	This field is displayed when **Regenerate Automatically** is enabled. To receive email notifications every time certificates belonging to this group are auto-regenerated, select this checkbox. The email notification includes certificate details, the type of auto action (regeneration, in this case), and the outcome (success/failure). These

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
	notifications help administrators stay informed of automated lifecycle actions, reducing the overhead to manually track them. If enabled here, all certificates in this group will inherit the setting. You can override it at the certificate level, unless group-level overrides are enforced.
Override	For a certificate, auto renewal/regeneration can be configured at the group level as well as at the certificate level at the time of certificate enrollment. To enforce group level auto renewal/regeneration settings across all certificates in the group, select the **Override** checkbox. Selecting this checkbox will override any changes made to the auto renewal/reconfiguration settings at the time of certificate enrollment.
***Associated Policy**	From the dropdown list, select the certificate policy that will be associated with this certificate group. This association helps enforce consistent standards for certificate issuance, renewal, and compliance across all certificates within the group.

5. Click **Create** button to create the group.
   Users can view the group only if it is associated with the **Resource** of their **User Group**. To associate the **Group** to a **Resource** click the **Update Group and Configure the Resources for User Access** button instead of **Create** button. This will create the group and navigates to **Resource**.
   The newly created **Group** is added to the Group inventory. Click the **Name** (Group name) to view the group details.

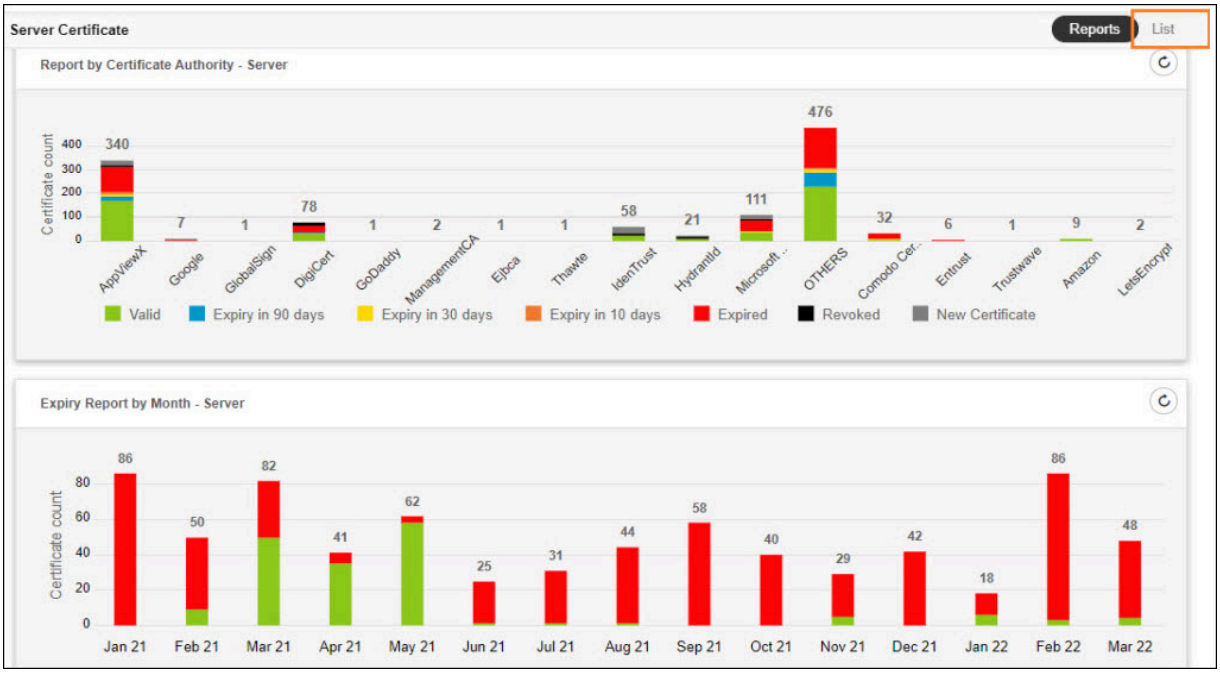
   Post certificate discovery, you can view the count of certificates (Server, Client, Device, and Code Signing) associated with this group.
6. Click the count in the Server Certificates column to view the certificates.

Assigning a Certificate to a Group

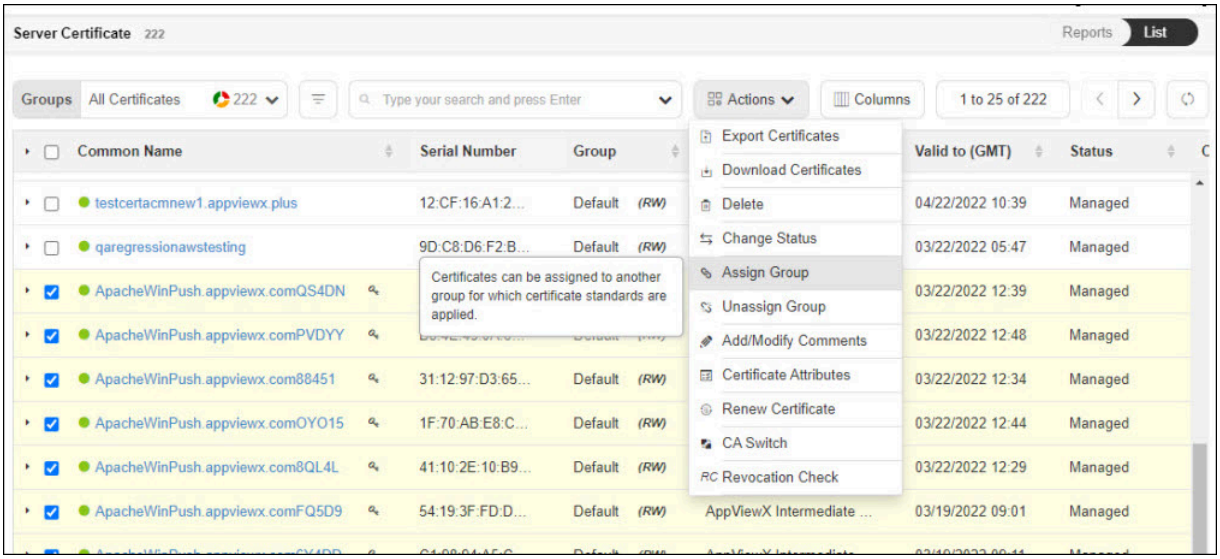
1. Go to (**Menu**) > **CERT+**.
   The **Server Certificate** Inventory is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click **List** from the upper right corner of the server certificate inventory screen.



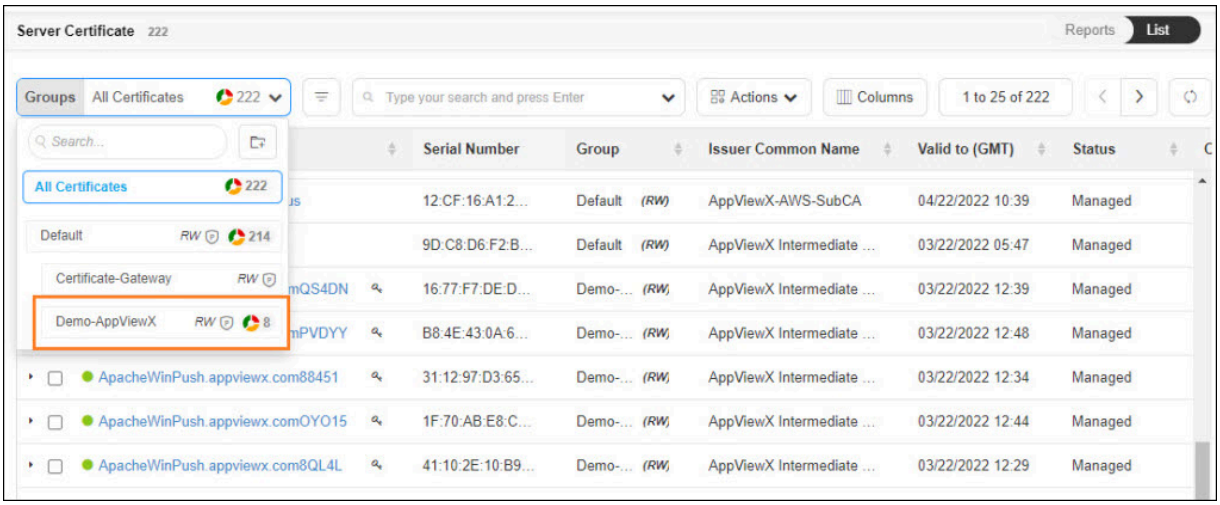
3. Select the check box against the certificate(s) you want to assign to a group.
4. Click the **Actions** dropdown list and select the **Assign Group** option from the dropdown list.



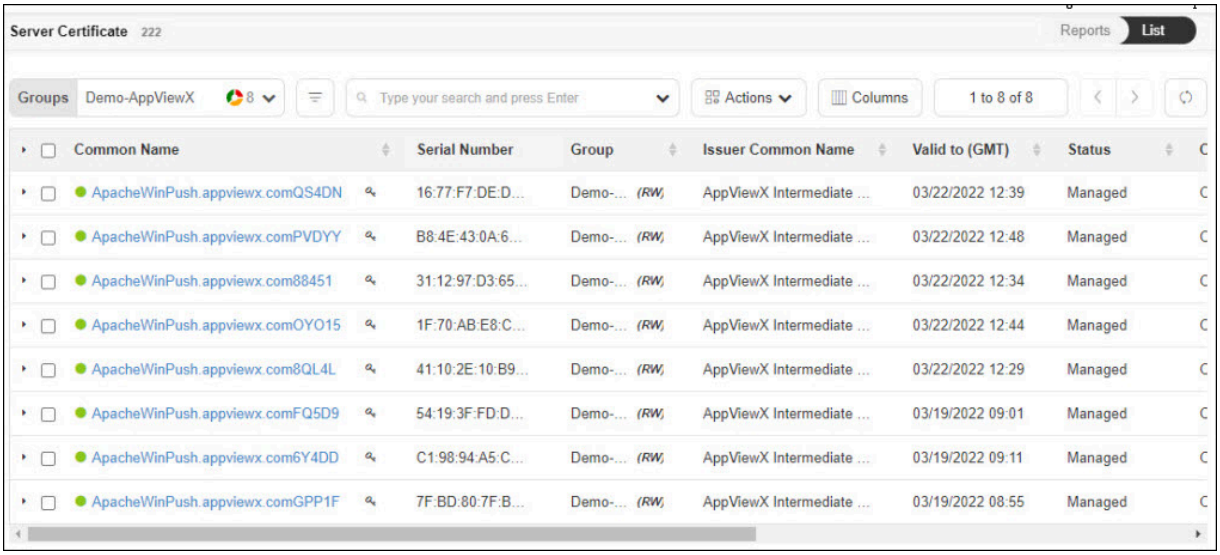
The **Assign to Group** pop-up is displayed.

5. Select **Group** from the list.
6. Click **Assign** to move the certificate(s) to the selected **Group.**
7. From the **Groups** dropdown list, select the required **Group** .

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



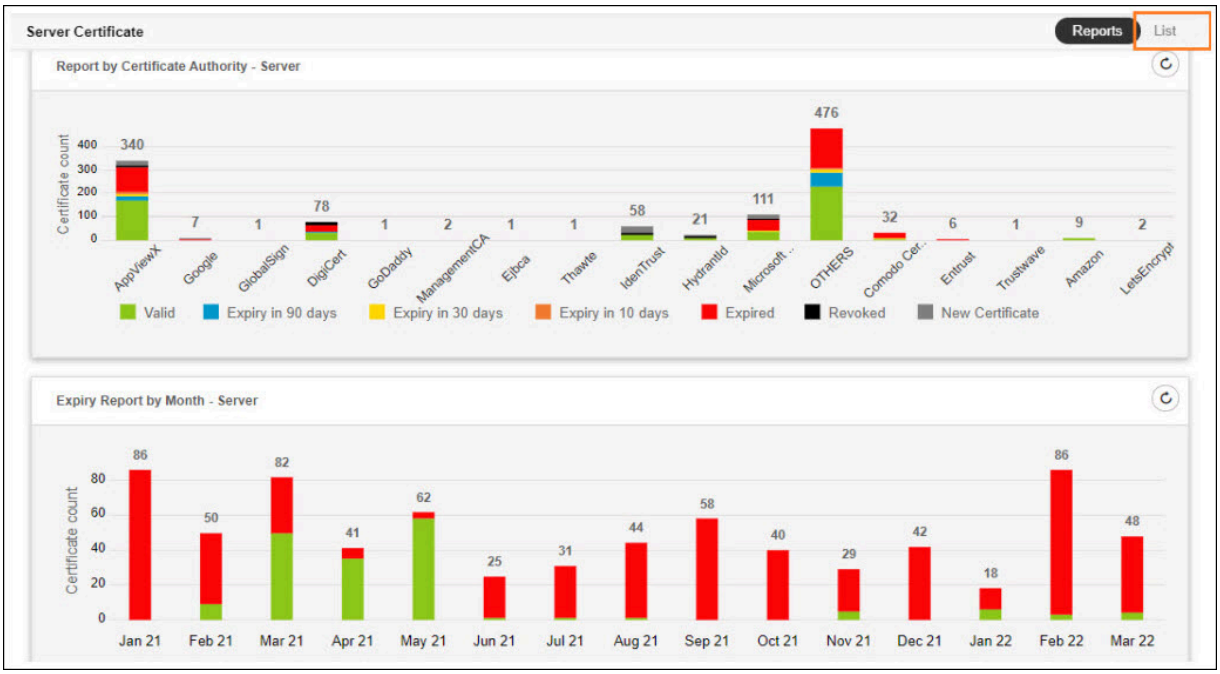
You can view the certificate(s) assigned to the **Group**.



Unassigning a Certificate from a Group

1. Go to (**Menu**) > **CERT+**.
   The **Server Certificate** Inventory is displayed.
2. Click **List** from the upper right corner of the server certificate inventory screen.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



3. From the **Groups** dropdown list, select the required **Group**.
4. Select the checkbox against the certificate you want to unassign from the group.
5. From the **Actions** dropdown list, select **Unassign Group** .
   The certificate is unassigned from your **Group** and automatically assigned to the **Default Group**.

What to do next?

A certificate should always assign to a **Group** to compliance with the **Policy**. Certificate unassigned from a group will automatically assign to **Default Group** and compliance against **Default Policy**.

Modifying a Group

Assign the user to a user group that (inherits from resource and role) have access to the certificate group

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **Groups**.
   The Group inventory is displayed. **CERT+** is packaged with default certificate groups **Default** and **Certificate-Gateway.**
2. Click the **Name** (Group name) to view the group details.
3. Modify required fields in the group and click the **Update** button. You can refer to the field descriptions explained in the Creating a Group section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Deleting a Group

1. Go to (**Menu**) > **CERT+** > **GROUPS & POLICIES** > **Groups**.
   The Group inventory is displayed. **CERT+** is packaged with default certificate groups **Default** and **Certificate-Gateway.**
2. In the group inventory, select the check box against the group you want to delete.
3. Click the (**Delete**) icon in the command bar to delete the Group.
   A confirmation pop-up is displayed. Click the **Yes** button to proceed.

   The group is deleted and a confirmation message displays.

Configuring Certificates

• Configuring Certificate Settings
• Configuring Certificate Attributes
• Configuring Certificate Profiles
• Managing Certificate History
• Managing Expired Certificates

Configuring Certificate Settings

Configuring Password Vault

The password vault option is used to store all certificate passwords of the selected ADC devices. All the password-protected certificates that are discovered, will be decrypted and pushed to the discovery grid in the AppViewX Inventory. This happens only if passwords are matched with passwords that are stored in the vault.

Before you Begin

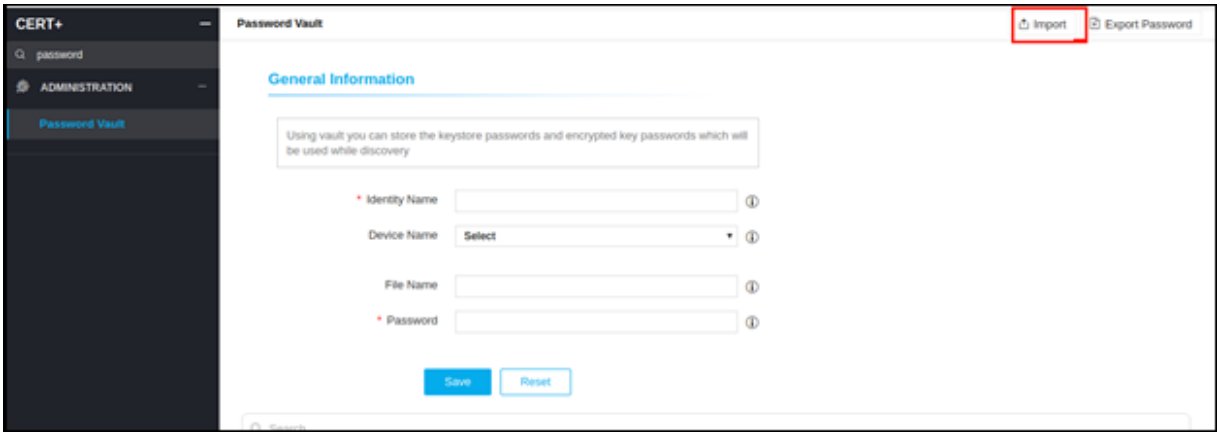
The prerequisites for configuring the Password Vault in AppViewX as are follows:

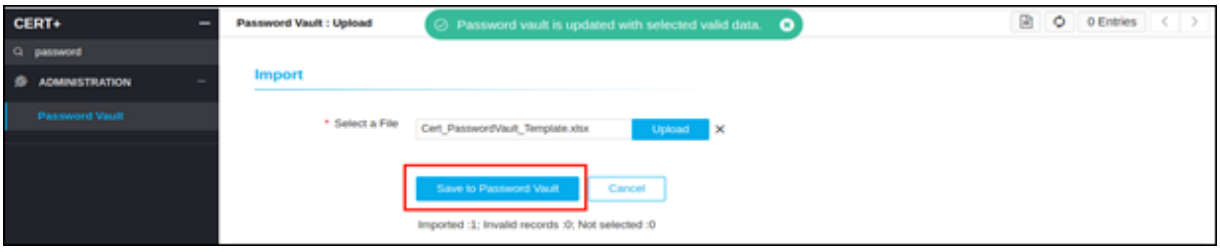
• A valid certificate password for password-protected certificates to decrypt.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** and click **Password Vault**.
2. On the screen that is displayed, enter an **Identity Name** of the password you want to add in the vault.
3. From the **Device Name** dropdown list, select the ADC device whose password-protected certificate details you want to store.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. In the **File Name** field, enter a certificate file name to help users identify it.
5. In the **Password** field, enter the password that is associated with the certificate.
6. Click **Save**.
7. To import a file (in XLS or CSV format) with a list of all certificate passwords, on the top-right corner, click **Import**. This option is used to store the certificate passwords directly in the vault instead of adding them manually.





8. Click **Export Password** on the top-right to export all stored certificate passwords from the vault as a zip file to your computer.
9. To modify the existing details, Click **Edit.**
10. To update the password, click **Update.**
11. To delete the password details, click **Delete.**

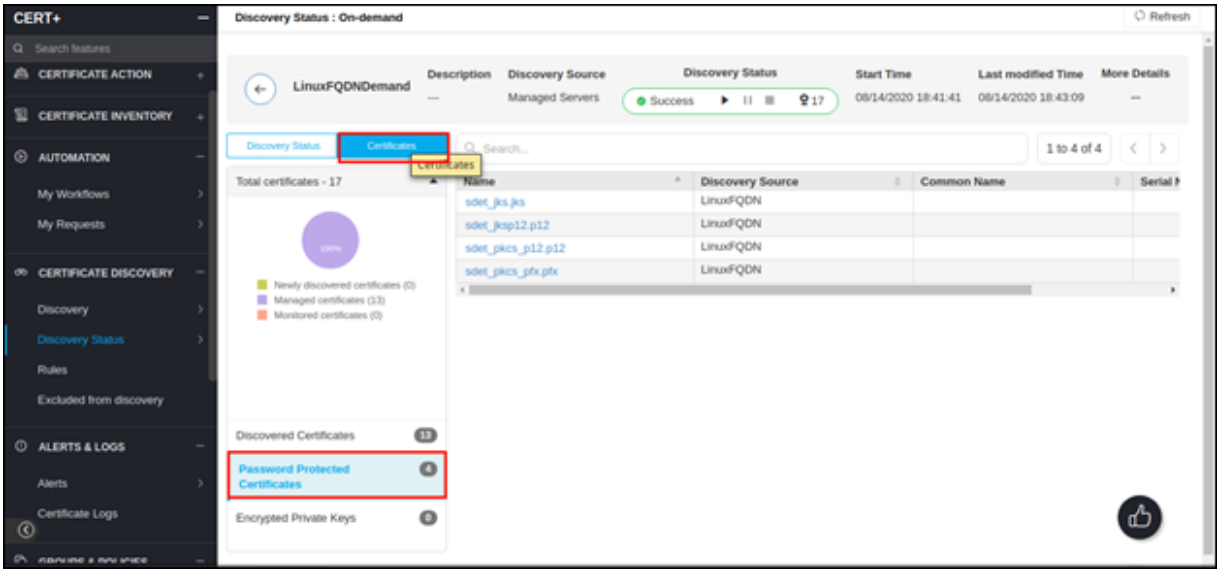
Password Protected Certificates

Password mismatch or password unavailable in the vault for the password-protected certificates that are discovered will be under the password-protected certificates section.

1. Go to (**Menu**) > **CERT+** > **CERTIFICATE DISCOVERY** > **Discovery Status** > **OnDemand**.
2. Click on the **discovery name** under discovery inventory.
3. Click **Certificates** under the tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. To view all password-protected certificates, click **Password Protected Certificates.**



Configuring Certificate Attributes

Certificate Attributes are a way of creating additional placeholder fields which can be used to track a certificate. An administrator can create one or more fields that a requester enrolling a certificate can fill and use for future tracking.

Prerequisites for Creating and Configuring Certificate Attributes

The prerequisites for configuration the certificate attributes are as follows:

- Certificate attributes are CA or organization-specific attributes, apart from the CSR parameters.

  Once configured, these attributes will be shown to collect values during certificate enrollment.

  Business unit-specific parameters can be stored for quick filtering and auditing.

Understanding the Certificate Attributes Inventory

To view the certificate attributes inventory, go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Attributes**.
The **Certificate Attributes** page is displayed.

For the certificate attributes added, the inventory displays the following details:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Uunderstanding the Certificate Attributes Inventory

Fields	Description
Label Name	Attribute name that will be displayed in the certificate enrollment form
Key ID	Unique identifier key assigned to the attribute
Mandatory	Indicates if the attribute is a mandatory field
Expiry Configuration Associated	
Actions	Given below is a description of what each icon in the **Actions** field stands for: • : This indicates the certificate attribute will not be displayed on the certificate enrollment page. This is only an indicative icon and not clickable. • : This indicates the certificate attribute will be displayed on the certificate enrollment page. This is only an indicative icon and not clickable. • : To edit the details of a certificate attribute, click this icon. • : To delete a certificate attribute, click this icon.

Creating Certificate Attributes

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Attributes**.
   The **Certificate Attributes** page is displayed.
2. From the **Certificate Attributes** section, click **Add New**.
   The **Certificate Attributes** dialog box is displayed.
3. For the attribute to be added, enter/select the corresponding details.

Field descriptions for Certificate Attributes

Fields	Description
***Label Name**	Attribute name which will be shown during certificate enrollment. E.g. Email Contact, Owner.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Label name should not start with special characters. No special characters except -, _ and spaces are allowed.
***Key ID**	Unique key for the attribute. Key ID must not start with special characters. No special characters except -, _ are allowed. **Important:** Once specified, the **Key ID** cannot be updated.
Field Type	From the dropdown list, from the following options, select the input field type: • **Text** • **Dropdown** • **Date**
Mandatory	Enable if this field needs to be mandatory.
Default Value	This field is displayed when **Field Type** = **Text**. Enter the default text that will be pre-populated in the text field.
***Default Value(s)**	This field is displayed when **Field Type** = **Dropdown**. Enter a comma-separated list of values that will be displayed in the dropdown list.
Default Date	This field is displayed when **Field Type** = **Date**. Use the calendar widget ( ) to select the default date and time values that will be displayed for the field.
Show in Enrollment Form	To show this attribute in the **Certificate Attributes** section of the certificate enrollment form, turn on this toggle button.

4. Click **Save**.
   The attribute is listed in the **Certificate Attributes** inventory (explained here). The attributes can b displayed on the certificate enrollment page as well as in the certificate inventory.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Modifying Certificate Attributes

To edit the details of a certificate attribute:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Attributes**.
   The **Certificate Attributes** page is displayed.
2. From the certificate attributes inventory, for the required attribute, from the **Actions** column, click .
   The **Certificate Attributes** dialog box is displayed with the existing certificate attribute details.
3. Modify the details, as required, and click **Update**.

> **Important:** The **Key ID** field is disabled for editing.

Deleting Certificate Attributes

To delete a certificate attribute:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Attributes**.
   The **Certificate Attributes** page is displayed.
2. From the certificate attributes inventory, for the required attribute, from the **Actions** column, click .
   The **Certificate Attributes** dialog box is displayed with the message **Do you want to delete the certificate attribute?**
3. Click **Delete**.

Configuring Certificate Profiles

AppViewX Cert+ offers administrators capability to define the type or purpose of a certificate through Certificate Profiles. An administrator can configure multiple Profiles defining the Key Usage and Extended Key Usage for a certificate enrolled through AppViewX. The Profiles defined are applicable on Certificates enrolled through AppViewX CA or Custom CA.

An Administrator can white label AppViewX CA through Custom CA.

Prerequisites

Following are the points needed to be known before starting to configure Certificate profile -

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Certificate profiles configure Key usage extensions that define the purpose of the public key contained in a certificate.
- Once configured, these profiles would be used to define Key Usage and Enhanced Key Usage while the signing a CSR through AppViewX CA and white labeled AppViewX CA or Custom CA.
- System comes prebuilt with three profiles corresponding to a standard Server Authentication, Client Authentication and CodeSigning Certificate.

Configuring Certificate Profiles

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Profile**.
2. Click **+ Add** icon on the top right corner.
3. Configure the **General Information** details as follows:

General Information - Field Description Table

Field	Description
***Name**	Unique name to identify the profile. Profile name should not start with special characters. Can contain only alphanumeric characters, no special characters except -, _, . are allowed.
***Purpose/Usage**	Certificate Type to which the Key Usage extensions are signed with. For example: Server or Client.
**: Mandatory fields*	

4. Configure the **Key Usages** as given below.

Key Usages - Field Description Table

Field	Description
***Critical**	Enable this field to sign the Key Usage extensions as **critical**.
***Key Usage(s)**	Key Usage extensions along with which the CSR is signed.
**: Mandatory fields*	

5. Configure the **Extended Key Usages** as given below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Extended Key Usages - Field Description Table

Field	Description
***Critical**	Enable this field to sign the Extended Key Usage extensions as **critical**.
***Extended Key Usage(s)**	Extended Key Usage extensions along with which the CSR is signed.
Enable Custom	To enable custom OID for the certificate profile, select this checkbox. Here, a custom Object Identifier (OID) is used to define custom policies for the certificate profile that certificates must adhere to.
***Custom EKU Values**	This field is displayed only when the **Enable Custom** checkbox is enabled. Enter the custom OID(s) that will be applied to this certificate profile. To specify more than one OID for the profile, enter a comma-separated list of the custom OIDs.
**: Mandatory fields*	

6. To enable additional **Custom Extensions** for this certificate profile, turn on the **Enable Custom Extensions** toggle.
   Custom Extensions in digital certificates refer to additional, non-standard attributes added to a certificate to support specific organizational or application requirements. These extensions extend the functionality of certificates beyond the standard fields and extensions defined in X.509 specifications.
7. In the **Policy ID** section, enter the policy id in the field..
8. Click **Save**.
   At the time of certificate enrollment, if you choose a certificate profile with custom OID and/or extensions:
   a. Choose this profile at the time of certificate enrollment.
   b. Complete certificate enrollment.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

c. In the holistic view, click

to view the certificate details.

In the certificate details, the **CRL distribution points** field will give you the custom OID details and the **Authority Information Access** field will give you the custom extension details, as applicable.

Updating a Certificate Profile

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Profile**.
2. Under Administration, select **Certificate Profile**.
3. Click on the profile that needs to be edited.
4. Edit existing values.
5. Click **Update.**

Deleting a Certificate Profile

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Certificate Profile**.
2. Click (**Delete**) against the Profile to be deleted.
3. Click **Yes** in the **Delete Confirmation** pop-up.

Managing Certificate History

AppViewX lets you manage certificate status values after certificate renewal, reissuance, regeneration, or revocation. Certificate history is a record of a certificate's lifecycle, including details of its issuance, renewal, reissuance, regeneration, and revocation. Maintaining certificate history helps organizations track changes, audit compliance, and manage security effectively. The corresponding user interface settings in AppViewX help determine whether historical records are maintained and how certificates transition between different statuses.

Viewing Certificate History

1. Go to (**Menu**) > **CERT+** > **Certificate Inventory** > certificate type (for example, **Server**). Certificate inventory for the selected certificate type is displayed.
2. To open the holistic view of a certificate (where certificate history can be viewed), click the **Common Name** of the required certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. In the certificate holistic view, from the toolbar, click **History**.
   The **Certificate History** dialog box is displayed.

Managing Certificate History

> **Important:** If auto-archival settings have been enabled for renewed/regenerated certificates, the original certificates are moved to the Archived Inventory, rather than being deleted. Currently, reissued certificates are excluded from the scope of auto-archival settings.

To retain the history of a certificate:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **History of Certificates**.
2. In the **Manage Certificate History** section, for **Do you want to maintain the history of certificate after its renew/reissue/regeneration?**, select **Yes**.
3. From the end of the page, click **Save**.

Managing Certificate Status

> **Important:** If auto-archival settings have been enabled for renewed/regenerated/revoked certificates, the original certificates are moved to the Archived Inventory. Currently, reissued certificates are excluded from the scope of auto-archival settings.

For Renewed/Reissued/Regenerated Certificates

AppViewX lets you move renewed/reissued/regenerated certificates from the **Managed** state to the **Monitored** state after a fixed number of days after renewal/reissue/regeneration. This helps free up license space, thus resulting in optimal license usage.

To manage the certificate status for renewed/reissued/regenerated certificates:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **History of Certificates**.
2. In the **Manage Renewed/Reissued/Regenerated Certificate Status** section:

   a. For **Do you want to move Renewed/Reissued/Regenerated certificates from Managed to Monitor?**, select **Yes**.

   b. In the **Number of days after Renewal/Reissuance/Regeneration** (mandatory) field, enter how many days after renewal/reissue/regeneration should a certificate's status change from **Managed** to **Monitored**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Valid values for this field: **0** - **1999**

> **Note:** The certificate status transition is timestamp-driven and triggered by a scheduler cron job. For certificates renewed, reissued, or regenerated, the status transition will occur based on the configured **Number of days after Renewal/Reissuance/Regeneration**.
> - If the configuration is set to **0 days**, the transition happens immediately after the cron job executes.
> - For existing certificates (renewed, reissued, or regenerated prior to this configuration), the status transition will not be immediate even if **Number of days after Renewal/ Reissuance/Regeneration** = **0**. Their status will transition only after the cron job executes at its scheduled time.

3. From the end of the page, click **Save**.

For Revoked Certificates

To manage the certificate status for revoked certificates:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **History of Certificates**.
2. In the **Manage Revoked Certificate Status** section:

   a. For **Do you want to move Revoked certificates from Managed to Monitor?**, select **Yes**.

   b. In the **Number of days after revocation** field, enter how many days after revocation should a certificate's status change from **Managed** to **Monitored**.
   Valid values for this field: **0** - **1999**

> **Note:** The certificate status transition is timestamp-driven and triggered by a scheduler cron job. For certificates renewed, reissued, or regenerated, the status transition will occur based on the configured **Number of days after revocation**.
> - If the configuration is set to **0 days**, the transition happens immediately after the cron job executes.
> - For existing certificates (renewed, reissued, or regenerated prior to this configuration), the status transition will not be immediate even if **Number of days after revocation** = **0**. Their status will transition only after the cron job executes at its scheduled time.

3. From the end of the page, click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Managing Expired Certificates

Deleting Expired Certificates

Important: If auto archival settings have been enabled for expired certificates, the expired certificates are not deleted; instead, they are moved to the Archived Inventory.

To set up automatic deletion of expired certificates:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Expired Certificates**.
2. In the **Expired certificate** section, for **Do you want to delete the expired certificates?**, select **Yes**.
3. From the end of the page, click **Save**.

Managing Expired Certificate Status

Important: If auto archival settings have been enabled for expired certificates, expired certificates are moved to the Archived Inventory; there is no change in the certificate status.

To set up automatic certificate status management for expired certificates:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Expired Certificates**.
2. In the **Manage Expired Certificate Status** section:
   a. For **Do you want to move Expired certificates from Managed to Monitor?** option, select **Yes**.
   b. In the **Number of days after expiry** (mandatory) field, enter how many days after expiry should a certificate's status change from **Managed** to **Monitored**.
   Valid values for this field: **0** - **1999**

Note: Certificate status will change only after the scheduled job has successfully run, based on the **Number of days after expiry** configured.

Deleting Expired Root and Intermediate Certificates

Note: Currently, root and intermediate certificates are excluded from auto-archival settings, which apply only to end-entity certificates.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

To automatically delete expired root and intermediate certificates:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Expired Certificates**.
2. In the **Expired root and intermediate certificate** section, for **Do you want to delete the expired root and intermediate certificates?**, select **Yes**.
3. From the end of the page, click **Save**.

Configuring and Managing Devices

Note: For prerequisites to manage ADC, Servers, Firewall, Cloud devices into AppViewX Device inventory, click here.

Managing a device in the AppViewX device inventory allows administrators or users of the platform to discover certificates currently in use on the devices. Also, an administrator or user can provision or push a certificate to the device through the platform.

Adding A10 Device

To add an A10 device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **A10** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Type	Description	Validation
Module	Check box	SLB / GSLB Module.	NA
Device name	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
Communication	Radio button	Devices can be accessed using an IP address or FQDN.	NA
IP Address	Text	The IPv4 address of the device.	The IP address should be in the right format.
FQDN	Text	The FQDN of the device.	the FQDN should be in a valid format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
Cert Sync	Radio button	Managed: The certificates of the device can be managed. Monitored: The certificates of the device can be monitored. Ignored: The certificate sync can be ignored.	NA
AppViewX Group Sync	Check box	This should be enabled if the user wants to sync the devices within the device group.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credential List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry:** The user should enter the username and password. **Credential List:** The user can select the credential details which are already stored in the credential inventory page.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
***Username**	Text	If manual entry is selected, the user name should be entered by the user.	NA
***Password**	Text	If manual entry is selected, the password should be entered by the user.	NA
Enable password	Text	Enable password of the A10 device.	NA
**: Mandatory fields*			

6. Enter the field information in the **Secondary device information** section.
7. The following table provides the field description for adding ADC device details in the **Secondary device information** section:

Secondary device information Section - Field and Description Table

Name	Type	Description	Validation
Secondary device information	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

8. Click **Save**.

Adding Akamai Device

To add an Akamai device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **Akamai** from the left sidebar.
4. Enter the required details for the device addition.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Device Addition - Field and Description Table

Name	Type	Description	Validation
***Device name**	Text	Unique name of the device to be added.	Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
***Client token**	Text	Client token of the Akamai device.	NA
***Client secret**	Text	Client secret of the Akamai device.	NA
***Access token**	Text	Access token of the device.	NA
***URL**	Text	Valid URL of the Akamai device.	NA
**: Mandatory fields*			

5. Click **Save**.

Adding Amazon ELB

To add an Amazon ELB:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select Amazon ELB from the left sidebar.
4. Enter the field information in the **Basic information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Basic information Section - Field and Description Table

Name	Type	Description	Validation
***Account name**	Text	The account name of the AmazonELB device.	NA
***Account number**	Text	Account number of the AmazonEB device.	Numbers only.
Device description	Text	Description about the AmazonELB account.	NA
Cert Sync	Radio button	**Managed**: The certificates of the device can be managed. **Monitored**: The certificates of the device can be discovered and can only be monitored. **Ignored**: The certificate sync can be ignored.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Mandatory	Description	Validation
***Credential type**	Dropdown	Yes	**Manual entry**: The user should enter the Access key ID and Secret access key. **Credential List**: The user can select the credential details which are already stored in the credential inventory page.	NA
***Access key id**	Text	Yes	Access key id of the AmazonELB device.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Mandatory	Description	Validation
***Secret access key**	Text	Yes	Secret access key of the AmazonELB device.	NA
**: Mandatory fields*				

6. Enter the field information in the **Key information** section.

Key information Section - Field and Description Table

Name	Type	Description	Validation
***Service region**	Dropdown	Service region of the AmazonELB device.	NA
**: Mandatory fields*			

7. Click **Save**.

Adding Array Device

To add an Array device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **Array** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Description
***Modules**	Select modules checkbox. The values are • SLB • GSLB
***Device name**	Unique name of the device to be added. **Note:** Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
Data center	Enter the Datacenter name where the device is configured. The default value is Absecon. **Note:** Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
Communication	Select the communication method for accessing devices, either through an IP address or FQDN.
***IP Address**	Enter the IPv4 address of the device. **Note:** The IP address must be in the correct format.
***API Port**	Enter the communication port of the device. **Note:** Only the numbers are allowed.
Cert Sync	Select the certificate sync option: • **Managed**: The certificates of the device can be managed. • **Monitored**: The certificates of the device can be monitored. • **Ignored**: The certificate sync can be ignored.
LB Sync	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.
**: Mandatory fields*	

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Description
***Credential type**	**Manual entry:** The user should enter the username and password.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
	Credential List: The user can select the credential details which are already stored in the credential inventory page.
***Username**	Enter the user name of the device.
***Password**	Enter the password of the device.
**: Mandatory fields*	

6. Enter the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

Name	Description
***Secondary / Failover / Sync group**	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.
**: Mandatory fields*	

7. Click **Save**.

Adding AVI Device

To add an AVI device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **AVI** from the left sidebar.
4. Enter the field information in the **General information** section.

Name	Type	Description	Validation
LB Sync	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.		
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password. **Credential List**: The user can select the credential details which are already stored in the credential inventory page.	NA
***Username**	Text	If manual entry is selected, the user name should be entered by the user.	NA
***Password**	Text	If manual entry is selected, the password should be entered by the user.	NA
Enable password	Text	Enable password of the AVI device.	NA
**: Mandatory fields*			

6. Enter the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

Name	Type	Description	Validation
Secondary device information	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
		Manual entry: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	

7. Click **Save**.

Adding BigIQ Device

To add a BigIQ device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **BigIQ** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Type	Description	Validation
***Device name**	Text	Unique name of the device to be added.	Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
***IP Address**	Text	IP Address of the BigIQ device.	IP address should be in IPv4 format.
Data center	Text	Datacenter name where the device is configured. Default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password. **Credential List**: The user can select the credential details which are already stored in the credential inventory page.	NA
***Username**	Text	Username of the BigIQ device.	NA
***Password**	Text	Password of the BigIQ device.	NA
**: Mandatory fields*			

6. Click **Save**.

Adding Cisco Device

To add a Cisco device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **Cisco** from the left sidebar.
4. Enter the field information in the **General information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General information Section - Field and Description Table

Name	Type	Description	Validation
***Module**	Check box	SLB Module.	NA
***Device name**	Text	Unique name of the device to be added.	Device name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
***IP Address**	Text	IP Address of the BigIQ device.	IP address should be in IPv4 format.
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Cert Sync**	Radio button	**Managed**: The certificates of the device can be managed. **Monitored**: The certificates of the device can be discovered and can only be monitored. **Ignored**: The certificate sync can be ignored.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

7. Click **Save**.

Adding Cloudflare Device

Before You Begin

Prerequisites

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites for Managing Cloudflare devices on AppViewX are:

- **Version Supported**: v4
- **IP Address/FQDN**: NA
- **User Privilege**: Api Token

Note:

When creating a Cloudflare API token for managing load balancing, the following minimum permissions should be granted:Permissions:

1. **Zone-level Permissions**: Load Balancing: Read/Edit
   This permission allows the token to manage and modify load balancer configurations within specified zones.
2. **Account-level Permissions**: Load Balancing Pools and Monitors: Read/Edit
   This permission enables the token to manage and modify load balancing pools and health monitors within specified accounts.

Resources:

Account Resource: Include the specific account(s) that should be accessible using this token.

Zone Resource: Include all zones where load balancing management is required.

- **Enable Password**: NA
- **License Check**: No
- **Services and Ports for AppViewX Communication**: Port 443, Outbound Internet access is required to manage the cloudflare
- **Internet Access/Proxy if Required**: Required
- **Location from which Certificates are discovered if managed**: NA

Web Browser Requirement

Browsers	Version
Internet Explorer	v11.0.9600.18817 or later
Firefox	118.0.1 (64-bit) or later
Google Chrome	117.0.5938.134 (Official Build) (64-bit) or later

ACF Permission

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Ensure the following ACF permission is available to add and manage devices:

- ADC > Inventory > Add / Modify
- ADC > Device group > Add / Modify

You can check this under any of the following menus:

- **Old menu**: menu > Accounts > Role
- **New menu**: menu > Platform > IDENTITY > Role

To associate ACF permissions with a role, see Platform User Guide.

Adding Cloudflare Device

To add a Cloudflare device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **Cloudflare** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Description
***Device name**	Unique name of the device to be added. **Note:** Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Access Url	Access URL of Cloudflare.
***Account Id**	Account ID of Cloudflare.
Data center	Datacenter name where the device is configured. The default value is Absecon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Description
	Note: Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
LB Sync	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.
**: Mandatory fields*	

5. Enter the field information in the **Credentials** section.

Credentials Section - Field and Description Table

Name	Description
***Credential type**	**Manual entry**: The user should enter the API token.
***Api Token**	API token. Required token permissions are: • Zone Level: Load Balancing • Account Level: Load Balancing Pool and Monitors
**: Mandatory fields*	

6. Click **Save**.

Validating the Cloudflare Device Addition

After adding the device, you can validate the device by searching device in the device inventory.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
2. Search the device name and validate whether the device is added successfully.

What's Next

• Check the Logs for transaction ID and details

Adding F5 Device

To add an F5 device:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, click the **F5** icon.
4. Enter the field information in the **General information** section.

   a. For the device type **Device/Tenant**:

General information Section for "Device/Tenant" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Device/ Tenant, you will need to provide the relevant device information in the following fields.	NA
***Module**	Check box	LTM / BIG-IP DNS Module.	NA
VCMP Guest	Check box	To add a device as a vcmp guest, this checkbox should be checked.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
***Cert Sync**	Radio button	**Managed**: The certificates of the device can be managed. **Monitored**: The certificates of the device can be monitored. **Ignored**: The certificate sync can be ignored.	NA
DNSSEC sync	Radio button	By default, the Ignored option is selected. If your ADC acts as an authoritative DNS server, then select the Managed option to manage the DNSSEC Zones and Keys (KSK and ZSK).	
AppViewX Group Sync	Check box	This should be enabled if the user wants to sync the devices within the device group.	NA
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

b. For the device type **Host**:

General information Section for "Host" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Host, you will need to provide the relevant device information in the following fields.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
Host Type	Radio button	Select any of the following host types: • vCMP Host - Enables the running of multiple virtual instances of BIG-IP software on a single physical device • rSeried Host - A host type representing the F5 rSeries hardware platform, designed for high-performance application delivery and security. • Velos Partition - A logical partition on the F5 VELOS platform, allowing for the segmentation of resources and management of multiple tenants within a single VELOS chassis.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
**: Mandatory fields*			

c. For the device type **Controller**:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General information Section for "Controller" Device Type - Field and Description Table

Name	Type	Description	Validation
Device Type	Drop-down	When you select Device Type as Controller, you will need to provide the relevant device information in the following fields.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Data center	Text	Data center name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The ipv4 address of the device.	The IP address should be a valid IPv4 format.
***FQDN**	Text	The FQDN of the device.	the FQDN should be in a valid format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password. **Credential List**: The user can select the credential details which are already stored in the credential	NA

Name	Type	Description	Validation
		inventory page. For more details on secure authentication, refer to Platform User Guide.	
***Username**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
Token based authentication	Toggle button	To access the device REST API using token.	NA
**: Mandatory fields*			

6. Enter the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

Name	Type	Description	Validation
Secondary device information	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

7. Click **Save**.

Adding F5XC Device

Before You Begin

Prerequisites

- **Version Supported**: NA
- **IP Address/FQDN**: FQDN
- **User Privilege**: admin
- **Enable Password**: NA
- **License Check**: No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- **Services and Ports for AppViewX Communication**: NA
- **Internet Access/Proxy if Required**: Internet access required
- **Location from which Certificates are discovered if managed**: NA

Web Browser Requirement

Browsers	Version
Internet Explorer	v11.0.9600.18817 or later
Firefox	118.0.1 (64-bit) or later
Google Chrome	117.0.5938.134 (Official Build) (64-bit) or later

ACF Permission

Ensure the following ACF permission is available to add and manage devices:

- ADC > Inventory > Add / Modify
- ADC > Device group > Add / Modify

You can check this under any of the following menus:

- **Old menu**: menu > Accounts > Role
- **New menu**: menu > Platform > IDENTITY > Role

To associate ACF permissions with a role, see Platform User Guide.

Adding F5XC Device

To add an F5XC device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is selected.
2. Click the **(Add)** icon.
3. From the **Device details** page, select **F5XC** from the Vendors list.
4. Enter the field information in the **General information** section.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

General information Section - Field and Description Table

Name	Description
***Device name**	Enter a unique name of the device to be added. Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
***Device URL**	Enter URL to access the device.
Data center	Select a data center name where the device is configured from the list or enter a new datacenter name. The default value is Absecon. Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
Cert sync	Choose from any of the following: • **Managed -** AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • **Monitored -** AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • **Ignored -** AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
LB Sync	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.
**: Mandatory fields*	

5. In the **Services** section, select from **Distributed App** or **DNS Management** service type.

Note:
- More than one service type can be selected but **Cert Sync** feature is applicable only for **Distributed App** service type.
- Only on selecting **Distributed App** service, certificates are discovered and profiles created.

6. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential Type**	Dropdown	**Manual entry**: The user should enter the username and password. **Credential List**: The user can select the credential details which are already stored in the credential inventory page. For more details on secure authentication, refer to Platform User Guide.	NA
***User Name**	Text	The user name of the device.	NA
***Token Auth**	Text	Authentication token to access the device REST API using token.	NA
**: Mandatory fields*			

7. In the **Vendor Specific Details,** enter namespace(s) to scope for CLM operation. Namespaces must start with a letter, can contain lowercase letters, numbers, hyphens, and must end with a letter or number.

> **Note:** The **Namespace** field is optional. If specified, CLM operations (certificate discovery, profile creation, etc.) are limited to the listed namespaces. If not, certificates are discovered from all namespaces, profiles created, and CLM operations performed for all namespaces.

8. Click **Save**.

> **Note:** On adding an F5XC device (F5XC_test), it will appear as the primary device while the service (F5XC_test_Distributed_App) is also displayed as shown:
>
> >
>
> Click the **Refresh** button if you do not see the service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Discovering Certificates

- To discover certificates (on-demand/scheduled), enable **Distributed App** service.
- Certificates and connectors are discovered from either all namespaces or a specific provided namespace on the F5XC device. This includes certificates from the root, intermediate, and server inventories, as well as their associated connectors within those namespaces.

> **Note:** Discovered certificates cannot be re-pushed to other namespaces due to lack of private keys.

- Profiles are created considering the namespaces, HTTP, and TCP LB. Sample profiles:
  - deviceName:{tenant_id}:{name_space_name} - Default profile
  - deviceName:{tenant_id}:{name_space_name}:http_lb:{lbname}
  - deviceName:{tenant_id}:{name_space_name}:tcp_lb :{lbname}

> **Note:**
> - Discovery does not export private keys.
> - One LB can have multiple certificates.
> - The same certificate can be mapped to multiple HTTP and TCP LB.

- Default profile is created for a namespace to support push operation.
- Load balancer profile is created for a namespace to support bind operation.
- Config sync triggers a discovery and manages the profiles based on the cert sync status.
- Filters and rules can be applied for the discovery.

Pushing Certificates

Certificate naming convention

- The certificate name must be unique within the namespace. It cannot be changed during an update.
- If certificate with same name already exists for a given namespace, you will see, *Object already exists,* message.
- The **certificate name** field must start with an alphabet, contain lower case alphanumeric characters or "-", and end with an alphanumeric character.

Certificate Push Format

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Certificates must be pushed in the **PEM format**, including the PEM headers.
- You can push a certificate along with its private key.

Private Key Handling

- The request must include the private key. If not provided, the request will be rejected.
- Supports `private_key: clear_secret_info`

Limitations

- The API does not support blindfolding private keys (i.e., encrypting them with `blindfold_secret_info_internal`).

Trust Chain Push Options

- You can optionally include root and intermediate certificates during a server certificate push.

  Root and intermediate certificates can be pushed separately by enabling the support from the respective inventory.
- By default, only the server certificate is pushed (root and intermediate are unchecked by default).
- When enabled, users can choose:
  - To push the certificate as a bundle (server, intermediate, and root certificates).
  - To use the trust chain already available in the F5XC inventory for the selected profile namespace.

Intermediate Certificate Chain Push Behavior

- The **Push as Intermediate Certificate Chain** option is available only if:
  - The selected profiles belong to the same namespace, device, and tenant.
  - If profiles from multiple namespaces/devices/tenants are selected, this option will be disabled.
- If a user selects this option and later adds a new profile that is incompatible (e.g., from a different namespace), the connector cannot be saved.
- When selected:
  - The user can choose an existing trust chain from a dropdown.
  - If no trust chain data is available, the option cannot be selected.

Certificate Overwrite and Replacement

- If a certificate with the same name already exists in the namespace, the operation will fail—regardless of whether the content is identical or not.
- In such cases, check if **`overwrite`** is enabled in the request:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Direct removal of a certificate association from a load balancer is **not supported**—only replacement and re-binding are allowed.

Note: The system supports flexible certificate deployment strategies aligned with trust chain management in F5XC.

Binding Certificates

- Load Balancers (LBs) do not store certificates directly. Instead, they reference certificate objects by name.
  - If a certificate with the same name is already associated with one or more LBs, updating or rotating the certificate will automatically apply the changes to all referencing LBs—no additional binding is required.
- When updating a certificate object, the LBs referencing it will immediately start using the updated version, since the reference by name remains unchanged.
  - For a selected LB profile, if the certificate name is already bound, re-binding is not necessary.
- The system only supports overwriting and binding a new certificate to the LB.
  - Unbinding or removing a certificate from an LB is **not supported** as part of the push-and-bind operation.
- Multiple certificates can be attached to the same load balancer.
- A single certificate can also be used by multiple load balancers (within the same namespace).
- When F5XC certificate bind fails, it will display, *Certificate is invalid*, message.

Backing Up Certificates

As the private key cannot be exported—and is mandatory for certificate push—backing up the certificate is not applicable.

Backup is performed only in specific use cases, especially when a new certificate is pushed. In such cases, the backup operation checks whether the certificate is newly pushed or if it already existed before setting the rollback eligibility to **true**. This **partial backup** occurs **only** when the certificate is new and is **not already associated** with the load balancer.

Rolling Back Certificates

When certificates are pushed to the system, a rollback mechanism can be used if the pushed certificates are not successfully bound to a load balancer. This ensures that only fully applied and active certificate changes are retained.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating F5XC Device Addition

After adding the device, you can validate the device by searching the device in the device inventory.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
2. From the device inventory page, search for the added F5XC device name.

Adding HAProxy Device

Prerequisites

1. Ensure that the following packages are installed on the HAProxy machine:
   - socat
   - systemctl
   - ps
   - sftp
   - setfacl (optional)
2. As **SFTP** is used for file transfers (certificate push), it is crucial to ensure that SFTP is properly configured for the logged-in user.
   a. From the cloud connector, use the `sftp` command to test the connection to an SFTP server. Open your terminal and type:

      ```
      sftp username@hostname
      ```

   b. Use the `put` command to upload the file to the remote server: put localfile /path/to/remote/directory
3. Do not limit SFTP sessions to a single connection. Allowing only one SFTP session at a time can lead to failures during push operations. To prevent this, it is advisable to modify the settings in `/etc/security/limits.conf` to permit up to 5 simultaneous connections.

   Add `sftptest hard nproc 5` to the limits.conf. Log out and log back in to validate the SFTP connections. If this does not work, restart the SSH service and retry the use case.

   If the above step does not work, add or modify the *MaxSessions* to 5 in the sshd_config or any included file in the sshd_config.
4. Ensure that the target IP/FQDN is accessible from the cloud connector (SaaS) or from vendor pods (on-prem) and the port is open.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. Certificates located in paths without the necessary user permissions cannot be detected. Therefore, either update the configuration files to reference certificates in accessible paths or modify the file permissions to ensure the certificates are accessible.
6. The user must have appropriate access to the configuration file and certificates. If direct access is not permitted, elevated privileges must be granted for the commands listed in the Commands requiring Access Elevation section.

Adding HAProxy Device

To add an HAProxy device:

1. Go to (**Menu**) > **CERT+** > **Device Management**.
   By default, the ADC tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **HAProxy** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Type	Description	Validation
***Modules**	Checkbox	Select a module.	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication	Radio button	The communication mode that ADC devices can be added to AppViewX.	NA
***SSH Port**	Text	Communication port of the device.	Numbers only.
***IP Address**	Text	The IPv4/IPv6 address of the device.	IP address must be a valid IPv4/IPv6 address.
***FQDN**	Text	FQDN/hostname of the device.	FQDN value must be a valid FQDN/hostname.
Data center	Dropdown	Datacenter name where the device is configured. The default value is *absecon*.	Data center name can only contain alphanumeric

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
			characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
***Cert Sync**	Radio button	• **Managed:** The certificates of the device can be managed. • **Monitored:** The certificates of the device can be monitored. • **Ignored:** The certificate sync can be ignored.	NA
LB Sync	Toggle button	The LB Sync toggle button is enabled and modifiable only with an ADC+ license. In environments with a CERT+ only license, the toggle is disabled.	NA
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential Type**	Dropdown	• **Manual entry**: The user should enter the username and password. • **Credential List - AppViewX**: The user can select the credential details which are already stored in the credential inventory page.	NA

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
		Note: • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the Credentials will be displayed in the dropdown. • If **Credential list - AppViewX** is selected, the *Credentials list dropdown field is displayed. Select any of the preconfigured credential values. • If **Credential list - HashiCorp** is selected, the *Credentials list dropdown field is displayed with credential type by default	
***User Name**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
**: Mandatory fields*			

6. Enter the fields in **Vendor Specific Details.**

Vendor Specific Details Section - Field and Description Table

Name	Type	Description	Validation
***Access Elevation**	Dropdown	• **None**: By default, None is selected. • **sudo**: sudo enablement is supported for CLM actions. LB operations do not currently support this functionality.	NA
***File Upload Temp Path**	Text	This field is displayed when **Access Elevation = sudo**. The path specified here will be used for push, bind, and CSR generation.	It must either be left empty or set to a valid Linux folder with an absolute path. The path should

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
			begin with a forward slash (/), and all folder separators must also use forward slashes.
*: Mandatory fields			

7. Click **Save**.

CSR Generation

When pushing a certificate where the private key is generated on the end device, ensure that the **Private key at end device** checkbox is selected, and specify the same location for the private key in the push screen.

Note: The key generated at the endpoint during CSR generation will permit read-only access for the owner of the file; no other user in the same user group or anyone else will have any permission.

Backing Up Certificates

- Copy the content of the configuration file and parse it to find the certificate locations.
- Download the certificates from the locations bind to SSL configurations under the frontend.
- Parse the certificates and store them under the backup properties.

Pushing Certificates

- After the push, a single file will be pushed to the endpoint, which has the content of the certificate chain (root, intermediate and server certs) appended with the private key.
- The following order of content is followed as a standard:
  - Server certificate
  - Intermediate certificate(s)
  - Root certificate
  - Private key

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

There is a provision to re-order the content. As the PEM file content requires the private key to appear at the beginning, a database script must be run to meet this requirement:

```
db.cert_metadata.update({_id:"CERT_VENDOR_BASED_CONDITIONS"},{"$set":
        {"map.adc_haproxy_push_private_private_key_at_first" : "true"}})
```

- A file is created at the haproxy endpoint in the user-configured location and the content will be written in that PEM file.
- When you choose the private key on the device, provide the absolute path of the server-generated private key on the UI screen.

Binding Certificates

Copy the config file content (haproxy.cfg) and update the certificate location using regex for the profile that is associated with an SSL bind directive under the front end. Upload the updated config file to the original location.

Note: If certificate and config file exist, file permissions are retained.

Restarting/Reloading Service

Once the new certificate is successfully bound in the configuration file, it will be used after the configuration is restarted or reloaded.

- **Restart**: Kills the process by closing all the connections immediately and starting a new process.
- **Reload**: It will not accept any new connections (stops listening on all the respective ports) and gracefully reloads the haproxy service.

Rolling Back Certificates

The rollback process follows the same push and bind flow, with certificate details retrieved from the backup properties created during the backup.

Commands requiring Access Elevation

```
find
mkdir
touch
stat
openssl
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
cat

rm

chmod

chown

ps

systemctl

cp

setacl (Optional)
```

Adding InfoBlox Device

To add an InfoBlox device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **Infoblox** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Type	Description	Validation
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
***Communication**	Radio button	Devices can be accessed using an IP address or FQDN.	NA
***IP Address**	Text	The IPv4 address of the device.	The IP address should be in the right format.
***FQDN**	Text	The FQDN of the device.	The FQDN should be in a valid format.
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
LB Sync	Checkbox	Enable this toggle button to discover and manage the load balancer configurations.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry**: The user should enter the username and password. **Credential List**: The user can select the credential details which are already stored in the credential inventory page.	NA
***Username**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
**: Mandatory fields*			

6. Enter the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

Name	Type	Description	Validation
Secondary / Failover / Sync group	Radio button	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

7. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Adding NginxPlus Device

To add an NginxPlus device:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab is displayed.
2. Click the **(Add)** icon.
3. In the **Device details** page, select **NginxPlus** from the left sidebar.
4. Enter the field information in the **General information** section.

General information Section - Field and Description Table

Name	Type	Description	Validation
***Modules**	Check box	SLB	NA
***Device name**	Text	Unique name of the device to be added.	Device names can only contain alphanumeric characters, '-' , '_' , '.' , '*' , '|' , '!' and spaces.
Communication	Radio button	Devices can be accessed using an IP address or FQDN.	No
***IP Address**	Text	The IPv4 address of the device.	The IP address should be in the right format.
***SSH Port**	Text	Communication port of the device.	Numbers only.
Data center	Text	Datacenter name where the device is configured. The default value is Absecon.	Data center name can only contain alphanumeric characters, '-' , '_' , '.' , '*' , ':' , '|' and spaces.
Cert Sync	Radio button	**Managed**: The certificates of the device can be managed. **Monitored**: The certificates of the device can be monitored. **Ignored**: The certificate sync can be ignored.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
LB Sync	Checkbox	By default, this option is enabled to discover and manage the load balancer configurations. If not required, you can disable this option.	
**: Mandatory fields*			

5. Enter the field information in the **Credentials** section. You can select **Manual Entry** or **Credentials List**.

Credentials Section - Field and Description Table

Name	Type	Description	Validation
***Credential type**	Dropdown	**Manual entry:** The user should enter the username and password. **Credential List:** The user can select the credential details which are already stored in the credential inventory page.	NA
***Username**	Text	The user name of the device.	NA
***Password**	Text	The password of the device.	NA
**: Mandatory fields*			

6. Enter the field information in the **Authenticaion details** section.

Authenticaion details Section - - Field and Description Table

Name	Type	Description	Validation
Sudo Auth	Checkbox	Select the **Sudo Auth** checkbox in the to enable the Sudo authentication for a non-root user credentials.	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Name	Type	Description	Validation
API Auth	Dropdown	This option allows the basic or token based authentication for API enabled devices. The options are: • **Basic Auth** - select this option to configure HTTP authentication with password. You can choose device credentials or manual entry. • **Token Auth** - select this option to enter the JSON Web tokens for token based authentication.	

7. Enter the field information in the **Secondary device information** section.

Secondary device information Section - Field and Description Table

Name	Type	Mandatory	Description	Validation
Secondary / Failover / Sync group	Radio button	Yes	**Auto detect**: The user should select this option to auto-detect and add the peer devices in the inventory page. **Manual entry**: The user can use this option to add the peer devices manually. **Ignore**: The user can use this option to ignore the auto-detection of the peer devices.	NA

8. Click **Save**.

Configuring and Managing Servers

Configuring servers in the AppViewX Certificate Management module is essential for enabling secure, automated management of certificates across systems. Proper configuration ensures that servers can seamlessly integrate into the certificate lifecycle, reducing manual intervention and improving operational efficiency.

To provide guidance on how to set up servers for handling certificate operations to securely manage certificates and perform tasks efficiently, this section covers instructions for:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Adding a Server
- Deleting a Server
- Importing a Server
- Exporting a Server
- Managing a Server
- Unmanaging a Server
- Executing Fetch Config for Server
- Adding Device Credentials
- Configuring Device Setting

Adding a Server

This section describes the process of onboarding IIS and non-IIS web servers into AppViewX.

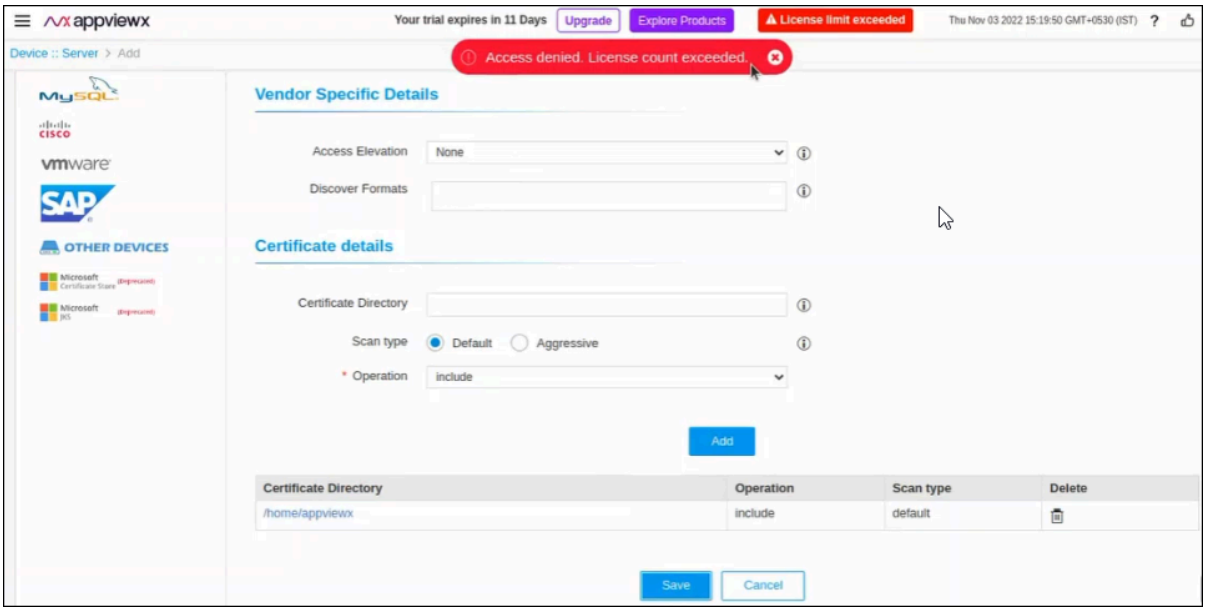
- Akamai
- Apache (Linux)
- Apache (Windows)
- Arbor
- CISCO
- Dell
- HP-ILO
- IBM
- JBoss
- Generic Linux
- Microsoft IIS
- Microsoft PC
- Microsoft Server
- Microsoft SQL
- MySQL
- NGINX
- Oracle
- Other Devices
- RabbitMQ
- SAP

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- Tomcat (Linux)
- Tomcat (Windows)
- VMware
- Gigamon
- PingFederate

License Enforcement

AppViewX has enabled a feature to set a limit for the licensed certificates. If the number of certs exceeds this limit then the additional certs added to the inventory will be moved into the **Monitored** status.



- A red indicator labeled "**License Limit Exceed**" is displayed on the title bar of the page, if the limit has exceeded.
- A pop-up message "**Access denied. License count exceeded.**" is displayed on the click of the **Save** button while adding a new server device.
- All the new on-boarded server certs (Server/ADC/Firewall/WAF Device config sync) into the inventory will be mapped to the **Monitored** state.

Akamai

The Akamai CPS (Certificate Provisioning System) provides full life cycle management of SSL/TLS certificates for Akamai Secure Delivery Network applications.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- Create authentication credentials. before using the API.
- To enable this API, choose the **Certificate Provisioning System** API service, and set the access level to **READ-WRITE**.
- Ensure your API credentials have the following grants: **CPS** and **Contracts-API_Contracts**.

Onboarding Akamai CPS Device

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Akamai** logo from the Vendors list.
   The **Akamai** server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the server name, a unique name for the device addition.
***IP address/ FQDN**	Enter the valid IP address or FQDN for device communication and integration with the Akamai CPS.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Akamai server.
Proxy	Select the checkbox to enable the secure proxy service.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

6. In the **Credentials** section, enter details as mentioned below.

Credentials - Field Description Table

Fields	Description
***Client token**	Enter the client token as provided by the vendor.
***Client secret**	Enter the client secret as provided by the vendor.
***Access token**	Enter the access token as provided by the vendor.
***API Version**	Enter the value, example cps/v2. (The same value is provided as the placeholder.)
*: Mandatory fields	

7. Click **Save**.
   The Akamai CPS device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Apache (Linux)

Prerequisites

1. Ensure that application/service users have the appropriate read/write permission to perform the CLM actions on the server device, if the access elevation is selected as **None**.
   When the access elevation is **sudo** or **dzdo**, all the commands used to perform the CLM operations will be executed with sudo or dzdo.
2. Verify that the commands needing sudo or dzdo access have been enabled on the server.
3. Ensure that the following packages are installed to facilitate device addition:
   - sudo/dzdo (optional, as per the access elevation selected)
   - timeout
   - base64
4. Ensure that the target IP address is accessible from the cloud connector and the port is open.
5. Make sure that the language setting for the Apache Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
6. Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
7. SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
8. Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.
9. Verify the existence of **httpd.conf** file in the system by scanning from root directory. Use the command: find / -name “httpd.conf”.
10. Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing Apache server installed on the Windows machines).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Apache (Linux) Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Linux** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select the **Apache** radio button.
***Server name**	Enter the name of the designated Linux server.
***IP address/ FQDN**	Enter the IP address of the Apache Server or its fully qualified domain name (FQDN) that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the Apache server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache server device.

   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - AppViewX* • *SSH* **Note:** • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - cloudAccount*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. (The field label changes to ***Account Name** if **SSM** is the communication mode)
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Access Elevation**	Select from the following:. • *sudo* - to execute with root privileges using sudo access • *dzdo* - to execute with root privileges using dzdo access **Note:** SSH key-based authentication doesn't support password enabled sudo/ dzdo.
File Upload Temp Path	This field is displayed when the *Access Elevation* = *sudo or dzdo*. Enter the temporary directory/path where certificates or keys are stored during certificate push actions. *Example*: /tmp/files **Note:** It is used as an intermediate location to store the actual keystore and then perform actions on the certificates in the keystore. The keystore is then moved back to the original location after performing the actions.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
Account number	Enter the 12-digit AWS account number. *Example*: 012345678901

8. In the **Certificate details** section, enter the details as indicated below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
Certificate location	Enter the actual directory/path where certificates are stored in the Apache server. *Example*: /cert/files
Key location	Enter the actual directory/path where keys are stored in the Apache server. *Example*: /key/files
Intermediate location	Enter the temporary or intermediate directory/path where certificates and keys are stored in the Apache server. *Example*: /inter/files

9. Click **Add**.
   Once the server is added successfully, the certificate location will be listed in the table.
10. *(optional step)* Click the (Delete) icon, if you want to delete the certificate details from the list.
11. Click **Save**.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.
- If you want to troubleshoot apache linux, see Troubleshooting Apache Linux.

Apache (Windows)

Prerequisites

1. Ensure that application/service users have the appropriate read/write permission to perform the CLM actions on the server device, if the access elevation is selected as **None**.
   When the access elevation is **sudo** or **dzdo**, all the commands used to perform the CLM operations will be executed with sudo or dzdo.
2. Verify that the commands needing sudo or dzdo access have been enabled on the server.
3. Ensure that the following packages are installed to facilitate device addition:
   - sudo/dzdo (optional, as per the access elevation selected)
   - timeout
   - base64
4. Ensure that the target IP address is accessible from the cloud connector and the port is open.
5. Make sure that the language setting for the Apache Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
6. Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
7. SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
8. Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Verify the existence of **httpd.conf** file in the system by scanning from root directory. Use the command: find / -name “httpd.conf”.
10. Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing Apache server installed on the Windows machines).

Onboarding Apache (Windows) Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Apache Microsoft** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select the **Apache** radio button.
***Server name**	Enter the name of the designated Apache server.
***Hostname**	Enter the hostname of the Apache Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL related information that is to be retrieved from the Apache server.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Apache server. Gateway is the preferred communication mode.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Apache server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - AppViewX **Note:** If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
*: Mandatory fields	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\Apache-Tomcat-8.5.35
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\Apache-Tomcat-8.5.35
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

8. Enter the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production. **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • **Remote** **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

9. Click **Save**.
   The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.
- If you want to troubleshoot apache windows, see Troubleshooting Windows Apache Server.

Arbor

Onboarding Arbor

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Arbor** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter a unique name for the designated Arbor server to be onboarded.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Arbor server.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Arbor server device.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.

Vendor Specific Details - Field Description Table

Fields	Description
***Base URL**	Enter the base URL where the Arbor service is hosted.
***HSM Username**	Enter the username used to access the HSM device where the SSL/TLS certificates are stored.
***API Token**	Enter the API token to authorize the communication between AppViewX and the Arbor.
***HSM Password**	Enter the secure password used to access the HSM device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

8. Click **Save**.
   The Arbor device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

CISCO

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

CISCO CUCM

For CISCO CUCM, access privileges are needed for executing the CLM commands corresponding to the supported CLM features (discovery, CSR generation, push, and bind).

For executing these commands, ensure that the admin user has an access privilege of level 1 (read and write access)

For links to detailed documentation on the commands and access privileges, see the References section.

CISCO ISE

- Ensure that at least one node is designated as the primary node.

  Cisco ISE can have one primary PAP node and multiple secondary nodes. AppViewX will always discover certificates from the primary node.

  In the absence of a designated primary node, certificates will not be discovered from Cisco ISE.

  If a primary node is designated but is disabled, only trust certificates will be discovered.
- Ensure that the API setting is enabled for both ERS and OpenAPI.

  Cisco ISE recommends to use port 443 for both ERS and OpenAPI.
- Ensure that the onboarding user has been mapped to the ERS Admin group

For links to detailed documentation for ISE installation and configuration, see the References section.

CISCO IOS

For CISCO IOS, access privileges are needed for executing the CLM commands corresponding to the supported CLM features (discovery). Each user is assigned a privilege level between 1 and 15, and each command has an associated level. The privilege level determines what commands a user can execute.

For links to detailed documentation on the commands and access privileges, see the References section.

Onboarding CISCO

The CISCO device can be on-boarded by four server types,

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- UCS
- CUCM
- ISE
- IOS.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **CISCO** logo from the Vendors list.
   The **CISCO** server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

   a. Select the **Server Type = UCS**, and enter the details of the fields mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select Server type from the dropdown (UCS).
***Server name**	Enter the server name, a unique name for the device addition.
***IP address/ FQDN**	Enter the valid IP address or FQDN for device communication and integration with CISCO.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Cisco server.
***SSH Port**	Enter the SSH port number. Default value is 22.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

b. Select the **Server Type = CUCM**. All the fields mentioned above (in step a) will be displayed along with the additional fields as below:

Server Details - Field Description Table

Fields	Description
Cert sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.

c. Select the **Server Type = ISE**. All the fields mentioned above (in step a) will be displayed along with the additional fields as below:

Server Details - Field Description Table

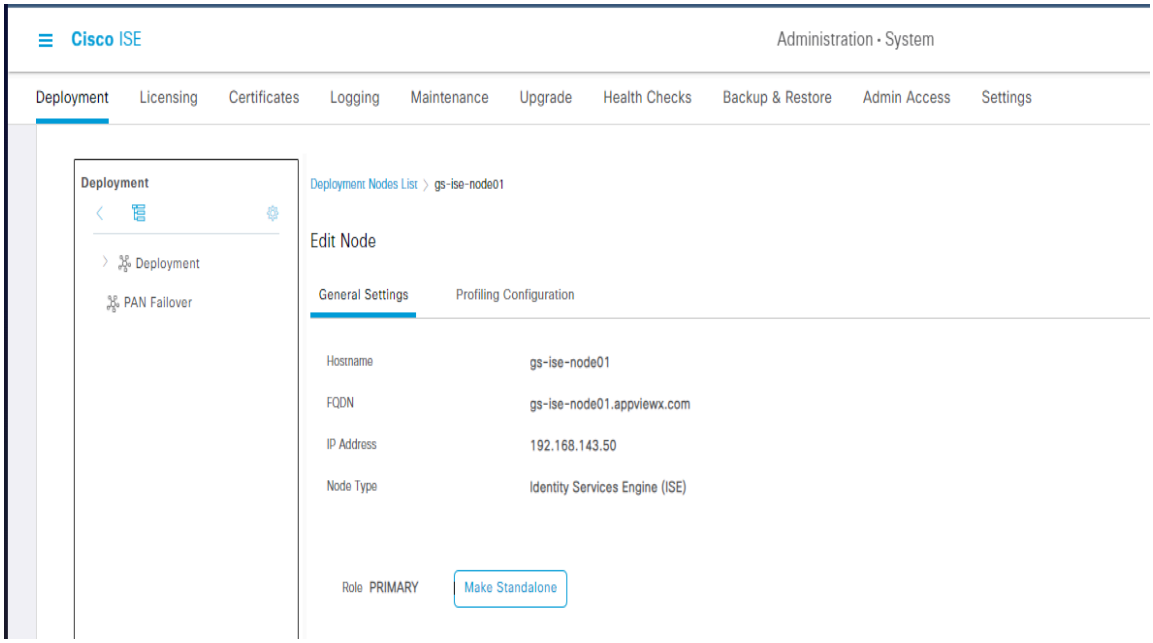
Fields	Description
ERS API Port	The Cisco Identity Services Engine (ISE) API uses ERS and OpenAPI port for communication. These port requirements can be modified during the installation or configuration of the ISE, depending on the network and security requirements. The default value for ERS API Port is **9060**.
Open API Port	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	The default value for Open API Port is **443**.
Proxy Required	The checkbox is not selected (false) by default. To enable communication through proxy servers select the checkbox (true).
Cert sync	Select the required cert sync. The possible options are • Managed (*default selection*) • Monitored • Ignored

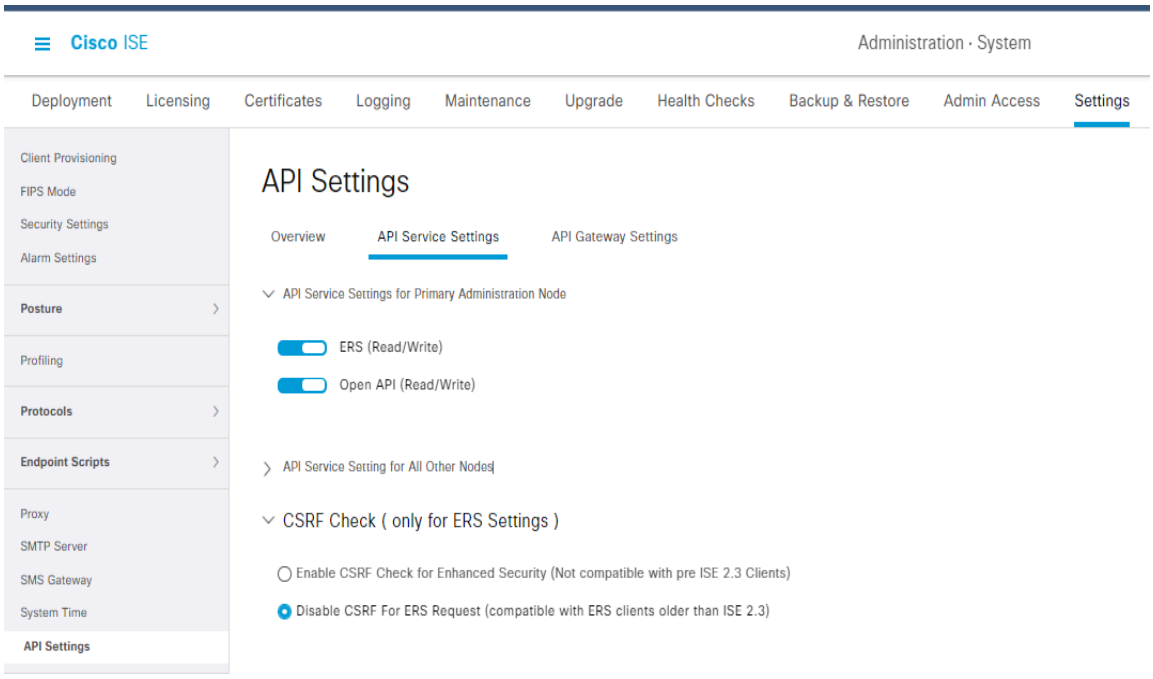
Cisco ISE Device Onbording - Prerequisite

i. Make sure that one of the nodes is designated as the Primary node. If no Primary node is set, server certificates will not be discovered from Cisco ISE. When disabled, only trust certificates will be discovered.



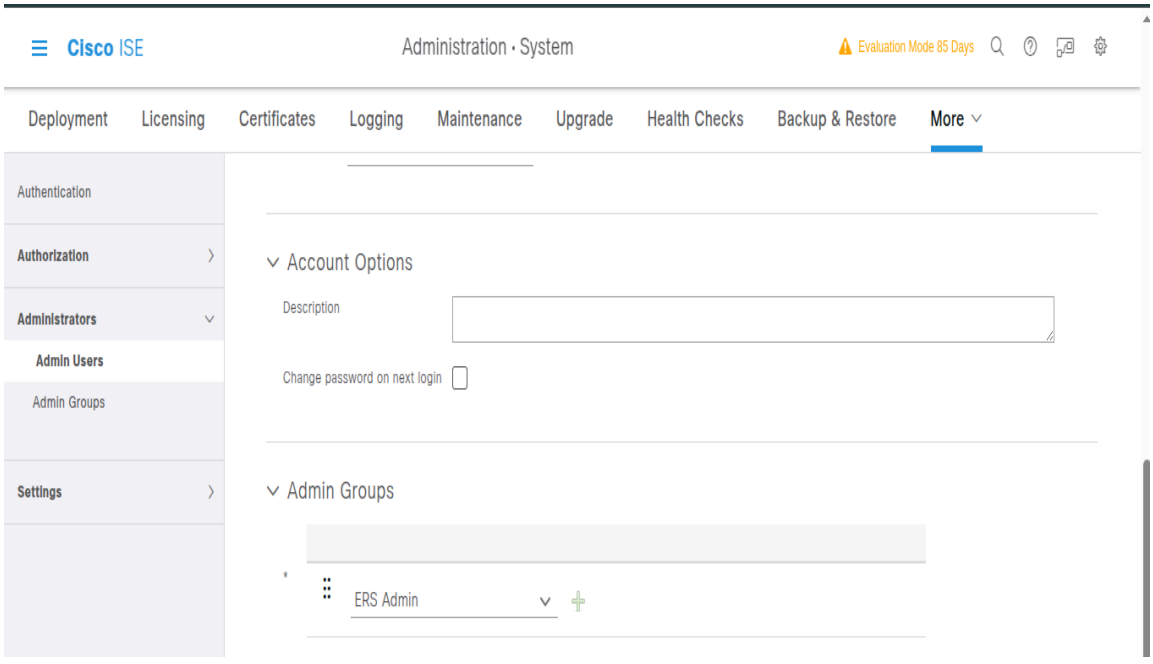
ii. Make sure the API setting is enabled for both ERS and OpenAPI. API services are disabled by default. To enable it, navigate to **Administration** > **System** > **Settings** > **API Settings** > **API Service Settings**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.



iii. Cisco ISE recommends to use port 443 for both ERS and OpenAPI.

iv. Make sure the onboarding user has been mapped to the ERS Admin group.



v. Cisco ISE can have one primary PAP node and multiple secondary nodes. AppViewX will always discover certificates from the primary node.

Additional Fields Support for Rest API based vendors

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Additional Fields	Supported in AppViewX
Proxy Required	Yes
The Cisco Identity Services Engine (ISE) API uses ERS and OpenAPI port for communication	
ERS Port	443 or 9060 (External Restful Services)
Open API Port	443

Discovery

i. AppViewX discovers all trust certificates and system certificates from the primary node.
ii. AppViewX would also show the certificate associatation to the role details in the discovery response and also in the app connector.
iii. A profile will be created for the primary node, along with dedicated profiles for each existing certificate.
   - 1. If the profile name follows the format `{deviceName}:{primary_node_name}`, it is used for pushing certificates to Cisco ISE but cannot be used to map certificates to any role.
   2. If the profile name follows the format `{deviceName}:{primary_node_name}:{commaSeparatedRoleName}:{friendlyName}`, the profile can be used to renew, push, and bind the certificate to the specified roles.

Push Format Support

Push Format	Supported in AppViewX
PEM	Privacy Enhanced Mail (PEM)

AppConnector

Field Name	Details
Friendly Name	Enter a friendly name for the certificate. If no name is specified, Cisco ISE automatically creates a name in the format **common-name**, **Subject-Alternative-Name#issuer#nnnnn** where **<nnnnn>** is a unique five-digit number.

i. If the trust certificate already exists in Cisco ISE, pushing it again is not required.
ii. If the admin profile is selected, the application server will restart automatically.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

> **Note:** It is recommended to include both the FQDN and IP address of the ISE server in the SAN field of the ISE system certificate.

iii. The private key is required to push the certificate to Cisco ISE.
iv. If no role or 'Used By' value is defined, the certificate will be pushed to the Cisco ISE system certificate but will remain in a **Not In Use** state.
v. Users cannot uncheck the pre-selected role from the discovered certificate. However, additional roles can be added based on the role selection rules.
vi. During the push process, users can select multiple roles for the certificate, in accordance with the rules defined in Cisco ISE.
vii. The SAML role cannot be combined with any other role.
viii. If the ISE Messaging service role is selected, users should not be allowed to select any other roles from the dropdown.
ix. If the portal role is selected, the **Default Portal Certificate Group** is used as the `portalGroupTag`; custom groups cannot be selected from the AppViewX application.
x. Each role can be associated with only one system certificate. Assigning a new certificate will remove the role from the existing certificate.
xi. Users can utilize the existing configuration to push and bind the certificate.
xii. By default, the use of existing configuration is enabled on the Add/Edit App Connector screen.
xiii. Users can disable the 'Use Existing Configuration' option and provide a new Friendly Name and Roles for the certificate.
xiv. Certificate push operations always upload the certificate to the primary node. Customers must manually transfer the certificate from the primary node to the respective target node.
xv. If the user selects the Node profile to push a new certificate to a role, the existing certificate bound to that role cannot be identified, so a backup cannot be taken. As a result, the backup step will be skipped with the comment: 'No data available,' and rollback will not be possible.
xvi. Cisco ISE does not allow pushing a new certificate with the same public key and will throw the following exception. Therefore, the user must regenerate the certificate before proceeding with the push. Found a certificate with matching public key.

Limitation

- CSR generation at the Cisco ISE endpoint is not supported.

d. Select the **Server Type = IOS**. All the displayed fields are as mentioned in **step b**.

6. In the **Credentials** section, select/enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • Manual entry • Credential List - AppViewX • Credential List - BeyondTrust • Credential List - Thycotic **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the assigned username. (This field is displayed for Manual entry only)
***Password**	Enter the secure password. (This field is displayed for Manual entry only)
***Privilege Password**	Enter the privilege password for using the privilege mode.
**: Mandatory fields*	

7. Click **Save**.

Note: The Cisco device can be configured through the Import option, by downloading the .csv or .xlxs templates, Additional columns (ERS API Port and Open API Port) have been added for Cisco ISE. These can be left blank; the default values, 9060 and 443 respectively will be considered.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Dell

Prerequisites

- iDRAC integration is enabled using the Redfish API. Redfish API is enabled by default in most iDRAC9 and iDRAC10 firmware versions. However, if it is disabled or access is restricted, enable it via the iDRAC GUI , navigate to:**iDRAC Settings > Services > Redfish**.
- The onboarding user for iDRAC must have the **Operator** role assigned.
- Verify that the target server's **FQDN** or **IP Address** is reachable from the cloud connector.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Dell

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Dell** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select Server type has default value **iDRAC** (Integrated Dell Remote Access Controller).
***Server name**	Enter the name of the designated Dell iDRAC server.
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) of the device being onboarded. It is used for device communication and integration with the server.
HTTPS Port	Use the HTTPS Port enabled in the iDRAC webserver setting. **Note:** Default value is 443.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the SAP server.
Proxy required	To enable communication through proxy servers select the checkbox. **Note:** By default, the checkbox is not selected.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *All supported Internal and external vault* **Note:** If the **Credential Type** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.
***Password**	Enter the secure password.
**: Mandatory fields*	

7. Click **Save**.

   The Dell iDRAC device is onboarded successfully.

Enroll Certificate

Prerequisites and Validation Rules for Endpoint CSR generation:

The following fields are **mandatory** and must be validated:

- Common Name
- Organization

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- City
- State
- Country
- Organizational Unit

Note: All the above fields are required. Missing any field will result in a validation error with a user-friendly message.

Validation Rules

- All the above fields are required. Missing any field should result in a validation error with a user-friendly message.
- Alternative Names:
  - Valid DNS entries.
  - Can only include letters, numbers, and dots (.), and must not contain spaces, underscores (_), or other special characters.
- Common Name, Organization, City, State, and Country must:
  - Only letters, numbers, dots (.), spaces, and underscores (_) are allowed.
  - Other special characters are not permitted.
- Key Type and Size Constraints (iDRAC-specific):
  - iDRAC primarily supports the **RSA** key type.
  - **DSA** and **Elliptic Curve (EC)** key type is not supported
  - By default, iDRAC uses **RSA 2048-bit** keys with **SHA-256** for cryptographic operations.

Discovery Certificate

AppViewX discovers the certificate from the iDRAC SSL/TLS settings and creates the following profiles.

- {deviceName}:@adminPortal
- {deviceName}:@adminPortal:@customSigningCertificate

Note: Private keys cannot be exported.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Push Certificate

- Use `{deviceName}:@adminPortal` profile will be used to push both SSL/TLS Certificate Signing Request and SSL/TLS Custom Certificate
- Use the `{deviceName}:@adminPortal:@customSigningCertificate` profile to push only the custom signing certificate. Once pushed, iDRAC will generate a self-signed certificate that is signed using the provided custom signing certificate
- After the certificate is pushed, iDRAC automatically performs a reset. During this process, iDRAC may be temporarily unavailable for a few minutes.

> **Note:** The existing certificate remains active until the reset is completed.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

HP-ILO

Onboarding HP-ILO

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select the **HP** logo from the Vendors list.
5. In the **Server details** section, select/enter the details as follows

Server Details - Field Description Table

Fields	Description
***Server Type**	The value is set to ILO.
***Server name**	Enter the name of the designated HP server.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name (FQDN) of the server that is to be onboarded.
HTTPS Port	Enter the HTTPS port number used for secure communication.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the HP server.
Cert Sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. Click **Save**.

Note: Multiple devices can be configured for the same vendor.

The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Device Status Log pop-up is displayed.

5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

IBM

Prerequisites

1. Ensure that application/service users have the appropriate read/write permission to perform the CLM actions on the server device, if the access elevation is selected as **None**.
   When the access elevation is **dzdo**, all the commands used to perform the CLM operations will be executed with dzdo.
2. Verify that the commands needing dzdo access have been enabled on the server.
3. [Websphere Linux] Ensure that the following packages are installed to facilitate device addition:
   - dzdo (optional, as per the access elevation selected)
   - SFTP
4. Ensure that the target IP address is accessible from the cloud connector and the port is open.
5. Make sure that the language setting for the Websphere Server is set to English. Ensure that the dzdo prompt string follows the standard Linux format, which is typically "[dzdo] password for <your_username>:"
6. Only certifiticates in p12 and .jks formats and key files are discovered.
7. SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
8. Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Confirm that the WebSphere instance is properly configured with the necessary profiles, servers, and management scope, including the correct cell and node details.
10. Ensure the `security.xml` file is present, the WebSphere server is running, and the user can successfully login to the `wsadmin.sh` script using the required WebSphere wsadmin credentials.

Note: We currently do not support WebSphere management scopes that lack either cell or node information. Please ensure that all management scopes contain this information.

Onboarding WebSphere (Linux)

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server details - Field description table

Fields	Description
***Server Type**	Select the **Websphere (Linux)** from the dropdown field.
***Server name**	Enter the name of the designated websphere server.
***IP address**	Enter the IP address of the IBM Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the server.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the IBM server device.

Credentials - Field description table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - AppViewX • *Credential List* - HashiCorp • *SSH* **Note:** • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the **Credentials** will be displayed in the dropdown. • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If **Credential list - HashiCorp** is selected, the ***Credentials list** dropdown field is displayed with credential type by default. • If SSH is selected, enter the ***Username**, ***Upload key** file, and optionally enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Service account credentials** section, enter the details as indicated below. These credentials are used by the WebSphere application server to perform various tasks, such as accessing files, interacting with the operating system, and communicating with other applications and services.
   If the interactive mode is not enabled for the service account on the Linux machine, the configured service account will switch the session from the logged-in SSH account to the service account using the command: `su - {serviceUserName}`. Once the session is switched, all subsequent commands will execute within the context of the service account session.

   Service account credentials - Field description table

Fields	Description
***Username**	Enter the designated username for authentication.
***Password**	Enter the secure password.
**: Mandatory fields*	

> **Note:** The SSH user, or the service account (if service credentials are enabled), must have read and write access to the WebSphere configuration and cert directory where certificates will be/are deployed.

8. In the **WSadmin credentials** section, enter the details as indicated below. These credentials are used to authenticate the wsadmin tool with the WebSphere Application Server so that it can execute administrative commands and access the necessary resources.
   Irrespective of the SSH user or service account user configuration, **wsadmin** credentials are required for us to open an **interactive administrative scripting session** where we can execute WebSphere management commands. In **WebSphere Application Server (WAS)**, **wsadmin** is the standard and recommended way to manage configurations like SSL, keystores, and bindings — because these changes are part of the **WebSphere configuration repository (config cells, nodes, servers, etc.)**.

   WSadmin credentials - Field description table

Fields	Description
WSadmin User name	The administrative user account for IBM WebSphere Application Server that has the privileges to access and interact with the wsadmin interface.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
WSadmin Password	The password corresponding to the WebSphere administrative user. This account must have permissions to execute wsadmin commands for configuration and management tasks.
WSadmin directory path	The absolute path to the root directory where IBM WebSphere Application Server is installed. This path is required to locate and run the wsadmin tool. **Example path:** /opt/IBM/WebSphere/AppServer/

9. Click **Add**.
   The WSadmin details are listed in the table.
10. *(optional step)* Click the delete icon, if you want to delete the WSadmin details from the list.
11. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	Select from the following:. • *None* • *dzdo* - to execute with root privileges using dzdo access **Note:** SSH key-based authentication doesn't support password enabled sudo/dzdo.
Temporary Push Location	Enter the temporary directory/path where certificates or keys are temporarily stored during certificate push actions. If service account credentials are being used, ensure that both the SSH user and Service user have read, write, and execute (RWX) permissions for the specified temporary directory. *Example*: /tmp/files

12. In the **Certificate details** section (optional to discover non-profile certificate), enter the details as indicated below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
Key store location	Enter the location of the java keystore that contains the private key and an associated certificate. *Example*: /tmp/certs/sample.jks
Key store password	Enter the key store password to access the keystore location.
Trust store location	Enter the location of the java keystore that contains the CA certificates. *Example*: /tmp/certs/sample.jks
Trust store password	Enter the trust store password to access the keystore location.

13. Click **Add**.
    The certificate details are listed in the table.
14. *(optional step)* Click the delete icon, if you want to delete the certificate location from the list.
15. Click **Save**.
    The device is onboarded successfully.

Websphere (Linux) Commands for CLM Operations

Operation	Command	Description	Dzdo Configuration Required?
Session configuration commands (Executed post creation of ssh session for all use-cases)	bind 'set enable-bracketed-paste off'	Disable the bracketed-paste configuration for the current session	No
	export PS1="bash-4.3~"	Set the ssh session prompt string	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	`uname -a`	To identify the OS details (AIX OS has some changes in the command fomat)	No
PreConfig fetch	ps -eaf|grep 'websphere'"	This would return all the running WebSphere processes in the device.	No
	/opt/IBM/WebSphere/AppServer/bin/versionInfo.sh |grep -w 'Name ' --color=never	To check if the given installation has **IBM WebSphere Application Server** installed.	No
	/opt/IBM/WebSphere/AppServer/bin/versionInfo.sh | grep -w 'Version ' --color=never	This would return the version details of the installed WebSphere instance.	No
Config fetch (For each installation path)	./manageprofiles.sh -listProfiles	This command in WebSphere Application Server is used to display a list of all profiles currently configured on the server	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	./wsadmin.sh -lang jython -user USERNAME -password PASSWORD	Opens an **interactive administrative scripting session** where we can execute WebSphere management commands.	No
	print AdminConfig.list('Security')	Prints the **Security configuration object(s)** currently defined in WebSphere Application Server.	No
	cat /opt/IBM/WebSphere/AppServer/profiles/TestServer01/config/cells/TestCell01/security.xml	Displays the WebSphere Application Server **security configuration XML** for profile TestServer01 and for the cell `TestCell01`. This is required to identify the keystore locations and assist in framing the profile settings.	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Discovery	SFTP Protocol	SFTP is used to retrieve certificates from the keystore location. When the service account is enabled, the certificate is first copied to a temporary directory. After that, the certificate content is fetched using the SFTP protocol.	No
Csr Generation	openssl req -nodes -newkey {keyType}:{bitLength} -{hashFuntion} -days {validityInDays} -keyout {keyFileName}.key -out {csrFileName}.csr -subj '/C={country}/ST={state}/L={location}/O={organisation}/OU={organisationUnit}/CN={commonName}/emailAddress={email}/' -config <location>/{csrConfFileName}	1. RSA as key type To generate csr and key at Websphere endpoint. 2. DSA as key type To generate csr at Websphere endpoint.	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	openssl req -nodes -new -{hashFuntion} -days {validityInDays} -key {keyFileName}.key -out {csrFileName}.csr -subj '/C={country}/ST={state}/ L={location}/O={organisation}/OU={organisationUnit}/ CN={commonName}/emailAddress={email}/' -config <location>/{csrConfFileName}	The command used to generate csr for EC or ECDSA as key type.	No
	openssl dsaparam -out {keyFileName}.key {bitLength}	Command used to generate key at endpoint if key type is dsa	No
	openssl ecparam -name {algorithm} -genkey -noout -out {keyFileName}.key	Command used to generate key at endpoint if key type is ec or ecdsa	No
Push	find /opt/IBM/WebSphere/AppServer -type f -name keytool 2> /dev/null | head -1	Running a command to **find the first occurrence of the** `keytool` **binary** inside the WebSphere installation directory.	No
	Sftp protocol	We will use SFTP to upload the certificate generated by AppViewX to the temporary directory on the target WebSphere device. After	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

		that, we will import the certificate into the target keystore using the keytool command.	
	/opt/IBM/WebSphere/AppServer/ jre_8.0.8010.20230917_1318/jre/bin/keytool -changealias -alias 'cn=appviewx123.test.com, sn=be:1b:39:fc:d1:44:ca:59:b9:c2:00:dd:2e:3b:f7:63' -destalias 'webspheredefaultpush' -storepass appviewx@123 -keystore '/tmp/ appviewx123.test.comBE1B39FCD144CA59B9C200DD2E3BF763.jks'	First, we generate the certificate in AppViewX and upload it to the temporary location. If the user has provided a custom alias name, we then update it using this command. Otherwise, it will have the default alias name framed from the CN	No
	/opt/IBM/WebSphere/AppServer/ jre_8.0.8010.20230917_1318/jre/bin/keytool -importkeystore -noprompt -srckeystore '/tmp// appviewx123.test.comBE1B39FCD144CA59B9C200DD2E3BF763.jks' -destkeystore '/Location/webspheredefaultpush.jks' -srcstorepass appviewx@123 -deststorepass appviewx@123	Copying certificates, private keys, and trusted entries from a source keystore to a destination keystore.	No
	rm -rf	remove temp files	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Bind	"AdminTask.createKeyStore('[-keyStoreName keyStoreName -scopeName managementScopeName -keyStoreType "keyStoreType -keyStoreLocation keyStoreLocation -keyStorePassword keyStorePassword -keyStorePasswordVerify keyStorePassword -keyStoreIsFileBased true -keyStoreInitAtStartup true -keyStoreReadOnly false]')"	The AdminTask.createKeyStore command in WebSphere is used to create a new keystore in the server configuration with specified settings	No
	AdminTask.modifySSLConfig('[-scopeName managementScope -alias storeName -clientKeyAlias " trimmedAliasName -serverKeyAlias trimmedAliasName -keyStoreName keyStoreName -trustStoreName trustStoreName -keyStoreScopeName managementScope -trustStoreScopeName managementScope -securityLevel HIGH]')	The AdminTask.modifySSLConfig command in WebSphere is used to modify the SSL configuration for a specified management scope. This command allows you to set various SSL properties, including keystore and truststore details	No
	print AdminConfig.list('Server')"	The AdminConfig.list('Server') command in WebSphere is used to retrieve a list of all server configuration	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

		objects in the WebSphere Application Server environment. This command provides detailed information about each server, such as its name, type, and associated settings.	
	"AdminTask.modifyKeyStore(' -keyStoreName keyStoreName -keyStoreLocation keyStoreLocation -keyStoreType type -keyStorePassword keyStorePassword'")	The command AdminTask.modifyKeyStore is used in IBM WebSphere Application Server to modify the attributes of an existing key store. A key store is a repository of security certificates and private keys used to establish secure communications.	No
	AdminTask.modifySSLConfigGroup('[-name sslConfigGroupName -direction inbound -certificateAlias trimmedAliasName -scopeName managementScope	The command AdminTask.modifySSLConfigGroup is used in IBM WebSphere	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

	-sslConfigAliasName storeName -sslConfigScopeName "managementScope]')	Application Server to modify the settings of an SSL configuration group. SSL configuration groups allow you to manage multiple SSL configurations collectively, making it easier to handle security settings for various applications and services.	
	AdminConfig.save()	The AdminConfig.save() command is used in IBM WebSphere Application Server's administrative scripting environment (wsadmin) to persist any changes made to the configuration.	No
Service Restart	./startServer.sh SERVERNAME	This script, located in the	No

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

		bin directory of a WebSphere profile, is the utility for starting WebSphere server instances.	
	./stopServer.sh -user USERNAME -password PASSWORD	This script, located in the bin directory of a WebSphere profile, is the utility for stoping WebSphere server instances.	No

Onboarding Websphere (Windows)

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows:

Server details - Field Description Table

Fields	Description
***Server Type**	Select the **Websphere (Windows)** from the dropdown field.
***Server name**	Enter the name of the designated websphere server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Communication mode	Select *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the IBM server. Gateway is the preferred communication mode.
***Hostname**	Enter the hostname of the IBM Windows server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Apache server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the IBM server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) • *Credential List* - AppViewX • *Credential List* - HashiCorp

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the **Credentials** will be displayed in the dropdown. • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If **Credential list - HashiCorp** is selected, the ***Credentials list** dropdown field is displayed with credential type by default.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - cloudAccount* **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Windows gateway details** section, enter the details as indicated below. (This section is displayed only if **Communication mode = Gateway**)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Windows gateway details - Field Description Table

Fields	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value *Remote* is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway)
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway)
Client authentication certificate	Click **Browse** and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway)
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway)
**: Mandatory fields*	

8. In the **WSadmin credentials** section, enter the details as indicated below. These credentials are used to authenticate the wsadmin tool with the WebSphere Application Server so that it can execute administrative commands and access the necessary resources.

WSadmin credentials - Field description table

Fields	Description
***WSadmin User name**	The administrative user account for IBM WebSphere Application Server that has the privileges to access and interact with the wsadmin interface.
***WSadmin Password**	The password corresponding to the WebSphere administrative user. This account must have permissions to execute wsadmin commands for configuration and management tasks

9. Click **Add**.
   The WSadmin details are listed in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. In the **Vendor Specific Details** section, enter the details as indicated below. (This section is displayed only if **Communication mode = SSM**)

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

11. *[Optional]* Click the **Delete** icon, if you want to delete the WSadmin details from the list.
12. In the **Directory** section, enter the details as indicated:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Directory section - Field description table

Fields	Description
WSadmin directory path	The absolute path to the root directory where IBM WebSphere Application Server is installed. This path is required to locate and run the wsadmin tool. **Example path:** C:\IBM_WAS9\WebSphere\AppServer

13. In the **Certificate details** section (optional to discover non-profile certificate), enter the details as indicated:

Certificate Details - Field Description Table

Fields	Description
Key store location	Enter the location of the java keystore that contains the private key and an associated certificate. *Example*: C:\keystore\samle.jks
Key store password	Enter the key store password to access the keystore location.
Trust store location	Enter the location of the java keystore that contains the CA certificates. *Example*: C:\keystore\samle.jks
Trust store password	Enter the trust store password to access the keystore location.

14. Click **Add**.
    The certificate details are listed in the table.
15. *[Optional]* Click the **Delete** icon, if you want to delete the certificate location from the list.
16. Click **Save**.
    The device is onboarded successfully.

Onboarding Data Power

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server details - Field description table

Fields	Description
***Server Type**	Select the **Data Power** from the dropdown field.
***Server name**	Enter the name of the designated Data Power server.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name of the IBM Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the server.
***Rest Port**	Retain the value 22; it is the default port used for the communication.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the IBM server device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field description table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List- Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
Is Https?	Select the checkbox to enable the secure mode.

8. Click **Save**.
   The device is onboarded successfully.

Onboarding Domino

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Server details - Field description table

Fields	Description
***Server Type**	Select the **Domino** from the dropdown field.
***Server name**	Enter the name of the designated domino server.
***Hostname**	Enter the hostname of the IBM Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the IBM server device.

Credentials - Field description table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List- Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory**	Enter the directory/path where the application is installed. *Example*: </Installation_directory/>/domain-registry.xml

8. In the **Windows gateway details** section, enter the details as indicated below.

Windows Gateway Details - Field Description Table

Fields	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value Remote is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway).
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway).
Client authentication certificate	Click **Browse** and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway).
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway).
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

9. Click **Save**.
   The device is onboarded successfully.

Onboarding MQServer (Linux)

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server details - Field description table

Fields	Description
***Server Type**	Select the **MQServer (Linux)** from the dropdown field.
***Server name**	Enter the name of the designated MQServer.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name of the IBM Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the server.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the IBM server. SSH is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the IBM server device.
   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx • *SSH* **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
Region	Enter the geographic region of the AWS instance. *Example*: us-east-2
Instance id	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
SSM document name	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
SSM document version	Specify the version of the SSM document to be executed. *Example*: 1
S3 bucket name	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

7. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Certificate location	Enter the directory/path where the certificates are stored. *Example*: /etc/pki/java/cacerts

8. Click **Add**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The certificate details are listed in the table.

9. *(optional step)* Click the delete icon, if you want to delete the certificate location from the list.
10. Click **Save**.

    The device is onboarded successfully.

Onboarding MQServer (Windows)

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.

   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.

   The **Device details** page is displayed.
4. Select **IBM** from the Vendors list.
5. In the **Server details** section, enter the details as follows.

Server details - Field description table

Fields	Description
***Server Type**	Select the **MQServer (Windows)** from the dropdown field.
***Server name**	Enter the name of the designated MQServer.
Communication mode	Select the *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the IBM server. Gateway is the preferred communication mode.
***Hostname**	Enter the hostname of the IBM Server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.

***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway).
**: Mandatory fields*	

8. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Certificate location	Enter the directory/path where the certificates are stored. *Example*: /etc/pki/java/cacerts

9. Click **Add**.
   The certificate details are listed in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

10. *(optional step)* Click the delete icon, if you want to delete the certificate location from the list.
11. Click **Save**.
    The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.
- If you want to troubleshoot websphere linux, see Troubleshooting Websphere Linux.
- If you want to troubleshoot websphere windows, see Troubleshooting Websphere Windows.

JBoss

JBOSS can be configured on two types of machines: Linux and Windows. Developed by JBOSS, this server can be deployed on both operating systems, providing flexibility and compatibility for various environments.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Prerequisites

- Ensure that the following packages are installed to facilitate device addition for linux:
  - sudo/dzdo (optional, as per the access elevation selected)
  - timeout
  - base64
- Ensure that the target IP address is accessible from the cloud connector and the port is open.
- Make sure that the language setting for the JBoss Server is set to English. Ensure that the sudo prompt string follows the standard Linux format, which is typically "[sudo] password for <your_username>:"
- Only certifiticates in .pem, .crt, and .cer formats and key files are discovered.
- SSH private keys cannot be used in conjunction with password-enabled sudo/dzdo settings. Therefore, if an SSH key is used for authentication, ensure that the sudo/dzdo configuration is set to passwordless.
- Certificates are not identified from the path that does not have the required permission such as 640 for the user. Ensure that the file is the same as configured in device addition; hence, configure the certificates in the config files with accessible path or change file permissions to make the files accessible.
- Verify that the commands needing sudo or dzdo access have been enabled on the server.
- Check for the ServerRoot location in the **httpd** file. Make sure it holds forward slashes(/) as path separator as in other Linux-based file locations. (This might lead to failure in managing JBoss server installed on the Windows machines).

Onboarding JBoss Linux

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **JBoss** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Operating system type**	Select the **Linux** radio button.
***Server name**	Enter the name of the designated JBoss Linux server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the JBoss server.
Communication mode	Select the SSH or SSM protocol to be used for communication between the AppViewX node and the JBoss server. **SSH** is the preferred communication mode.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name (FQDN) of the server that is to be onboarded.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the JBoss server device.
   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx • *SSH*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	By default, application uses none. You can change the command if needed. **Note:** SSH key-based authentication doesn't support password enabled sudo/dzdo.

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

8. Click **Save**.
   The JBoss Linux device is onboarded successfully.

Onboarding JBoss Windows

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **JBoss** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Operating system type**	Select the **Windows** radio button.
***Server name**	Enter the name of the designated JBoss Windows server.
***Hostname**	Enter the hostname of the windows server that is to be onboarded.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the JBoss server. **Gateway** is the preferred communication mode.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the JBoss server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the JBoss server device.

   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If the **Communication mode = Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\JBoss-Tomcat-8.5.35
**: Mandatory fields*	

If the **Communication mode = SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Installation directory path**	Enter the directory/path where the application is installed. *Example*: C:\Tomcat8\JBoss-Tomcat-8.5.35
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

8. In the **Windows gateway details** section, enter the details as indicated below. (This section is not displayed if **Communication mode = SSM**)

Windows Gateway Details - Field Description Table

Fields	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value Remote is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway)
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway)
Client authentication certificate	Click Browse and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway)
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway)
**: Mandatory fields*	

9. Click **Save**.

   The JBoss Windows device is onboarded successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Generic Linux

Prerequisites

1. Ensure that SSH users have the required read and write permissions to perform CLM actions on the server device when access elevation is set to "**None**."
   If access elevation is configured as "**sudo**" or "**dzdo**," all commands for CLM operations will be executed using sudo or dzdo.
2. If sudo/dzdo access elevation is enabled on the device onboarding page, ensure that the user has the necessary permissions to execute the sudo command provided below.
3. Ensure that the following packages are installed to facilitate device addition:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- sudo/dzdo (Only applicable if access elevation is selected as sudo/dzdo in the device onboarding page)
- timeout
- base64

4. Ensure that the OpenSSL toolkit on the Linux machine is installed.

> **Note:** This package is essential for supporting endpoint enrollment. However, if endpoint enrollment is not required, the package is optional.

5. Ensure the server's resource health remains above the 50% threshold.
6. Ensure that the target IP address is accessible from the cloud connector and the port is open.

> **Note:** To SSH into a machine using a specific port, you can use the following command:
>
> ```
> ssh -p <port_number> <username>@<hostname_or_ip_address>
> ```

7. Ensure that the SFTP is configured.

> **Note:**
> Avoid restricting SFTP sessions to a single connection, as this may cause failures in push use cases. To prevent such issues, adjust the settings in `/etc/security/limits.conf` to allow up to 5 connections.

8. Ensure that GSKit is installed on the server to work with the KDB certificate.
   For the KDB use case, one of the available packages is utilized.

   To verify if the package is installed on the machine, use the following commands:

```
dspmqver -p 64

gsk8capicmd -version | grep FileVersion

gsk8cmd -version | grep FileVersion

gsk7capicmd -version | grep FileVersion

gsk7cmd -version | grep FileVersion
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- The command gsk8capicmd_64 -version will be supported in the future release v2024.2.0.0.
- The first successfully executed command determines the package to be used.

9. To discover a password-protected certificate, ensure the password is added to the password vault at **CERT+** > **ADMINISTRATION** > **Password Vault**.
10. SSH private keys are incompatible with password-enabled sudo/dzdo settings. Therefore, when using an SSH key for authentication, ensure that sudo/dzdo is configured for passwordless access.
11. Certificates cannot be identified from the mounted paths /boot, /bin, /dev, /lib, and /sbin. It is recommended to move the certificate to an alternative location.
12. Host-level configurations take precedence over global settings, allowing you to override global settings at the host level.

Note: The global setting can be configured in the **CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **(Device Settings)**.

13. Port scanning is disabled by default during Linux discovery. However, configurations are enabled at both the host level and global level to control this feature.
14. If device onboarding fails due to host key algorithm mismatches, activate the required algorithms on the client or server. Add deprecated algorithms only if necessary.
15. It is recommended to exclude the NAS mount paths from certificate scanning which might consume additional resources during scanning and might affect the server performance.

Supported Linux Feature

1. On-demand or scheduled certificate discovery.
2. CSR generation on the end device.
3. Certificate deployment to Linux servers, supporting various certificate types.
4. Delta discovery to identify new or modified certificates.
5. Nightly configuration synchronization job.
6. Authentication via manual entry, SSH, SSM, or external vaults.
7. Service account usage for CLM operations.
8. Global settings for including/excluding file paths in certificate discovery.
9. Configurable port scanning for Linux discovery (disabled by default).
10. Discovery of certificates with case-insensitive file extensions (for example, fileName.kdb or fileName.KDB).

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

11. Mapping certificates to specific certificate groups and applying discovery filters.
12. Bulk push support for root and intermediate certificates to one or more devices is now enabled for the Generic Linux vendor.
13. The capability to modify permissions, ownership, group ownership, and other user permissions for pushed certificates is now enabled for Generic Linux in JKS, Keystore, PFX, PEM, and P12 formats.
14. The discovery of extension less trust certificates will be performed if the path is configured with the aggressive scan type during device onboarding. Additionally, the scan will be limited to a maximum depth of 1, and no nested directory scanning will be performed.

Limitations

1. When the same issuer certificate exists in multiple locations, the first one found is prioritized. As a result, even if a renewed certificate is available in another location, only the initial match is considered.
2. In the AIX operating system, identifying certificates located in folders or files with spaces in their names is not supported. However, this functionality is available on non-AIX platforms.
3. The exclusion or inclusion of files using wildcard paths at the global or host level is not supported.
4. Support for elliptic curve (EC) certificates, used in elliptic curve cryptography (ECC), is unavailable in IBM MQ versions prior to version 9.0. This feature is introduced in IBM MQ version 9.0 and later.
5. The push of auto-renewed, regenerated, or discovered password-protected certificates is not supported.
6. App connector cert details cannot be updated when the discovered certificate has a file extension in uppercase.

Onboarding Linux

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select the **Linux** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter a unique name for the designated Linux server that is to be onboarded

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) for device communication and integration with the Linux server.
Data center	Choose the desired data center.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the Linux server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *Credential List - HashiCorp* • *SSH*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • All other vault settings (BeyondTrust, Cyberark, Hashicorp Vault, Thycotic, and so on.) configured in the **Credentials** will be displayed in the dropdown. • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If **Credential list - HashiCorp** is selected, the ***Credentials list** dropdown field is displayed with credential type by default. • If SSH is selected, enter the ***Username**, ***Upload key** file, and optionally enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication. **Note:** This field appears when the credential type is selected as Manual entry or SSH.
***Password**	Enter the secure password. **Note:** This field appears when the credential type is selected as Manual entry.
**: Mandatory fields*	

7. In the **Service account credentials** section, select/enter the details as indicated below. If interactive mode is not enabled for the service account on the Linux machine, the configured service account will switch the session from the logged-in SSH account to the service account using the command: `su - {serviceUserName}`. Once the session is switched, all subsequent commands will execute within the context of the service account session.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Service account credentials - Field description table

Fields	Description
Username	Enter the designated username for authentication. **Note:** The service account is not used for authentication; instead, it is used to switch the session from the logged-in SSH user account to the service account.
Password	Enter the secure password.
**: Mandatory fields*	

8. In the **Vendor Specific Details** section, enter details as mentioned below.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	Select from the following:. • *None* (default) • *sudo*- to execute with root privileges using sudo access • *dzdo*- to execute with root privileges using dzdo access. **Note:** SSH key-based authentication does not support password-enabled sudo/dzdo.
Discover Formats	The Discover Formats fields contain all the possible certificate formats that are applicable to the 'Default' scan type. The formats include KBD(*.kbd), PEM(*.crt), PEM(*.cer), PEM(*.pem), DER(*.der) DER(*.cer), PKCS#7(*.p7b), PKCS#7(*.p7c), PKCS#12(*.p12), PKCS#12(*.pfx), JKS(*.JKS), JKS(*.keystore). To delete the certificate format from the scan, click the 'x' icon in the respective cert type. To delete all the certificate formats from the scan, click 'Clear' on the top-right of the field.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
File Upload Temp Path	This field is displayed if the Access elevation value is selected as sudo or dzdo. Enter the path of the temp folder *Example*: /cert/temp This field is applicable for Push and CSR generation operations. This directory must have common access (RW) for the logged-in user and the service admin user if Service Account credentials are entered.
Enable access elevation for the service account?	When enabled, the commands are executed with selected access elevation. **Note:** • By default, this field is disabled. • This field is enabled only for a service account user when an Access Elevation type, such as sudo or dzdo, is selected.
Enable Network Scan	Select the checkbox to perform a network scan in addition to the managed device discovery scan for these devices. **Note:** • By default, this field is disabled and can be enabled through a global device setting. [**CERT+** > **ADMINISTRATION** > **Device Management** > **Server** > **(Device Settings)]**
**: Mandatory fields*	

9. In the **Certificate details** section, enter the details as indicated below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Certificate Details - Field Description Table

Fields	Description
Certificate Directory	Enter the actual directory/path where certificates are stored in the Linux server. *Example*: /cert/files
Scan Type	Select any of the following: • *Default* - System scans for all certificate formats and adds them in the certificate inventory. **Note:** It scans the provided directory and subdirectory as well. • *Aggressive* - System scans for all keystore files with non-standard SSL extensions and also scans for trust certificates from extension less files. **Note:** It scans only the given directory.
***Operation**	Select the value *include* or *exclude* from the dropdown field. It indicates that the specified certificate directory will be included/excluded from the certificate scan process.
**: Mandatory fields*	

10. Click **Add**.
    The certificate location will be listed in the table.
11. *(optional step)* Click the (Delete) icon if you want to delete the certificate details from the list.
12. Click **Save**.
    The Linux device is added successfully.

Device Settings

Configuring a Global Device setting requires specifying certificate paths to include or exclude from Device Certificate Discovery and Config Sync operations. When enabled for Linux servers, these settings are applied to all added Linux servers.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the ( ) device settings icon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **Device Settings** page opens.

4. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Certificate Directory	Enter the actual directory/path where certificates are stored in the Linux server. *Example*: /cert/files
Scan Type	Select any of the following: • *Default* - System scans for all certificate formats and adds them in the certificate inventory. • *Aggressive* - System scans for all keystore files with non-standard SSL extensions.
***Operation**	Select the value *include* or *exclude* from the dropdown field. It indicates that the specified certificate directory will be included/excluded from the certificate scan process.
**: Mandatory fields*	

5. Click **Add**.

The certificate location will be listed in the table.

6. *(optional step)* Click the (Delete) icon, if you want to delete the certificate details from the list.
7. In the **Vendor Specific details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Enable Network Scan	Enable this checkbox to perform Network Scan along with Managed Device Discovery Scan for these devices.
Certificate Ownership & Permission	Enable the toggle button to customize certificate ownership and file permissions at the App Connector level.
**: Mandatory fields*	

8. Click **Save**.

The Linux device is added successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fetch Config

A prerequisite check evaluates the server's health. If the server is deemed unhealthy, the device is marked as unresolved, blocking discovery for healthy devices. The check monitors average server idle CPU usage, and if it falls below 50%, the sync fails, and the device is marked as unmanaged.

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Select the device from the list to trigger fetch config.
3. Click the (

) **Fetch Config** icon.
   The pop-up message is displayed as **Fitch config has been triggered for the device (s)**.
4. To override the default threshold value, execute the following script in the "cert_metadata" collection.

```
db.getCollection('cert_metadata').updateOne(
{ "_id" : "SERVER_HEALTH_CHECK_CAP"},{ $set:{
    "_id" : "SERVER_HEALTH_CHECK_CAP",
    "map" : {
        "LinuxServer" : "50"
    }
}},{upsert: true})
```

CSR Generation at the End Device

In the CSR generation use case at the end device, the private key will be generated directly on the device. When the private key is generated on the device, the "Private Key at End Device" checkbox will be automatically set to true, and the "Private Key Location" field will be pre-filled in the push app connector.

Certificate Push

1. The Linux push operation allows certificates to be pushed to the Linux server.
   - KDB
   - CRT
   - CER
   - PEM
   - DER
   - P7B

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- P7C
- P12
- PFX
- JKS
- Keystore.

2. For JKS, PEM, and PKCS12 certificates, the capability to modify Certificate Ownership and Permissions after the certificate is pushed has been introduced. This feature is disabled by default and can be enabled by navigating to: **CERT+** > **Device Management** > **Server** > **Device Settings**.
3. If no specific permissions are configured, the pushed certificate will default to 640 permissions. If the file already exists, its existing permissions will be retained.

Possible Error Messages with Linux CLM Use-case

Communication to 192.168.143.30 has failed. Caused by: net.schmizz.sshj.userauth.UserAuthException: Exhausted available authentication methods.	Authentication failure. Check the credentials used for the authentication.
java.lang.Exception: No agent is available as all registered agents are either paused, rejected or deleted or agent resource limit exceeded.	The possible reason(s) could be CC is down or busy processing the other request.
Communication to <ip/fqdn> has failed. Caused by: java.net.SocketException: Network is unreachable (connect failed)	IP/FQDN provided is not reachable. Check manually by establishing an SSH session to the target device with the provided IP/FQDN.
Device prerequisite check failed: -bash: sudo: command not found. Install the necessary packages (base64, timeout, sudo) to on-board the Server.	The base64, timeout, and sudo packages are required to proceed to onboard the Linux server into AppViewX.
Beyond trust vault response parsing failed:: ["Managed Account not found"].	Verify that the Linux device hostname or IP address is configured for the user in BeyondTrust.
Thycotic vault access token denied / not generated.	Verify the Thycotic vault integration with AppViewX.
No matching password object was found for the query. Ensure a password object exists in the Vault that meets the query criteria and verify that	Verify the Thycotic vault integration with AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

both the Provider and the application user have the necessary permissions to access and use the password.	
CredentialStore(s) does not exist.	Verify that the Linux device hostname or IP address is configured for the user on the Thycotic server.

Linux Commands

Operation	Command	Description	Sudo/Dzdo Configuration Required
Session configuration commands (Executed post-creation of ssh session for all use cases)	bind 'set enable-bracketed-paste off'	Disable the bracketed-paste configuration for the current session.	No
	ulimit -s unlimited	This would set the stack size limit to unlimited for the current shell session or user.	No
	export SUDO_PROMPT='[sudo] password for %p: '	Set the sudo password prompt to the standard value for the current session. **Note:** This will be executed only when the access elevation is set as sudo or dzdo.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	export LANG=en_US.UTF-8	Defaulting the session language to English	
Config fetch	su - {serviceAccountUserName}	Switch to the service account	Yes
	• timeout --version • sudo --version (Optional, based on the access elevation defined in the device onboarding page) • base64 --version	Mandatory package availability prerequisite verification.	No
	uname	To fetch the OS Name	No
	sudo sar 2 5 | tail -1 | awk {'print $NF'}	Server health check for **Linux**	Yes
	sudo sar 2 5 | tail -1 | awk {'print $5'}	Server health check for **AIX** OS	Yes
Discovery	Timeout 120 sudo find <discovery_path> (-path */AvxTempCertDiscovery -prune) -o -type f -iname '*.kdb' 2> /dev/	Find command to identify the KDB Certificates with its checksum.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	null | xargs timeout 120 sudo cksum 2> /dev/null	**Note:** This will be executed only when the KDB cert type is selected	
	• dspmqver -p 64 • gsk8capicmd -version | grep FileVersion • gsk8cmd -version | grep FileVersion • gsk7capicmd -version | grep FileVersion • gsk7cmd -version | grep FileVersion.	The toolkit version is retrieved based on a specified order of preference. Once a version is identified from one of the toolkits, subsequent commands in the sequence are not executed.	Yes
	sudo <toolkit> -cert -list -db <key_database_path> -stashed	List certificates in a specified Key Database (KDB).	Yes
	sudo <kdbtoolkit> -cert -export -db <key_database_path> -stashed -type cms -target_type pkcs12 -target /root/ LinuxServerAvxTempCertDiscovery_1693815850667/ click1602636522.p12 -target_pw #####	Convert KDB certs into p12	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	sudo find '<scan_directory>' -type d 2 > /dev/null -printf "%d\n" | sort -nr | head -n 1	To identify the depth of the directory. Depth search is not available in AIX.	Yes
	Timeout 120 sudo find /<directory> -mindepth 5 -maxdepth 8 \(-path */*AvxTempCertDiscovery* -prune \) -o -type f -iname '*.crt' -o -iname '*.cer' -o -iname '*.p7c' -o -iname '*.p7b' -o -iname '*.key' -o -iname '*.jks' -o -iname '*.pem' -o -iname '*.pfx' -o -iname '*.der' -o -iname '*.p12' -o -iname '.keystore' -o -iname '*.keystore' 2> /dev/null | xargs timeout 120 sudo cksum 2> /dev/null	Use the command to identify a file's path along with its checksum.	Yes
	output="["; for a in '/opt/enrollrabitmq.key' ; do value=$(sudo base64 "$a" 2>/dev/null | tr -d '\n\r'); if [-z "$value"]; then error=$(sudo base64 "$a" 2>&1 >/dev/null); output="${output} {\"file\":\"$a\", \"error\": \"$error\" },"; else	Download cert content from the Linux server in base64 format.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	output="${output} {\"file \":\"$a\", \"value\": \"$value\" },"; fi done; output=${output%,}; output="${output}]"; echo "$output"		
	for p in sudo netstat -anlt | grep tcp | awk -F " " '{print $4}' | awk -F ":" '{print $NF}' | sort | uniq ;do echo "port: $p"; timeout 5 openssl s_client -showcerts -servername server -connect localhost:$p < /dev/null;echo "exit status $?"; done	Network scan	Yes
Temp directory when sudo or service account is used. **Note:** This is used during the CSR generation at endpoint and push operation.	sudo mkdir -p {temp_directory}	Create temp directory	Yes
	chmod 700 {temp_directory} && setfacl -m u:appviewx:rwx -m u:serviceUserName:rwx {temp_directory} **AIX OS Specific Command**: chmod 700 {temp_directory} && (aclget	To address security concerns raised by AppViewX EIS regarding 777 permissions, we are leveraging ACL commands to grant access to both the SSH/SFTP user and the service account user for the temp directory.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	{temp_directory}; echo -e "extended permissions: \nenabled\npermit rwx u:sshUserName \npermit rwx u:serviceUserName") | aclput {temp_directory}	This ensures secure access while allowing uploaded files in the temp directory to be copied to the configured target location. **Note:** The service account username will only be used when the service account is enabled for device onboarding. As a fallback for any failure in executing this command, chmod 777 is applied to the temporary directory created by AppViewX. Once the transaction is complete, the temporary folder is deleted.	
	sudo cp /{temp_directory}/csr_1700139913719.cnf /home/appviewx/	From the temp directory, the uploaded files will be copied to the configured target location.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	sudo rm -rf /{temp_directory}	Remove the temp directory which is created by AppViewX.	Yes
CSR Generation at endpoint	sudo openssl req -nodes -newkey rsa:2048 -sha256 -days 366 -keyout /home/appviewx/report.key -out /home/appviewx/report.csr -subj '/C=/ST=/L=/O=/OU=/CN=report.appviewx.com/emailAddress=/' -config /home/appviewx//csr_1700139913719.cnf	Generating a Certificate Signing Request (CSR)	Yes
Push Cert	sudo find /home/appviewx/devtestcsrgen.keysudo find /home/appviewx -type f -name 'devtestcsrgenkeystore.jkssudo find /home/appviewx -type f -name 'devtestcsrgentruststore.jks'	Verify that the certificate is already present in the target location. If the "Private Key at Endpoint" option is selected and the key does not exist at the specified location, the push operation will fail.	Yes
	sudo stat -c \"%a \" /home/appviewx/existingkeystore.jks sudo stat -c \"%U:%G \" /home/appviewx/existingkeystore.jks	Commands to retrieve the permission and user and user group of the existing Keystore.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

(continued)

Operation	Command	Description	Sudo/Dzdo Configuration Required
	sudo mkdir -p {push_path} ; sudo touch {push_path}	Verify if the target directory is editable.	Yes
	sudo echo $HOME	Identify the Home directory	Yes
	sudo openssl pkey -pubout -in /home/appviewx/devtestcsrgen.key | openssl md5	Cert And Key Compatibility Check	Yes
	sudo test -e /home/appviewx/report.pem && echo file exist || echo file not exist	Verify that the certificates already exist in the target location.	Yes
	sudo cp -f '/home/appviewx/devtestcsrgen.key' '/home/appviewx/avx_cert_backup//devtestcsrgen_20230908132855.key'	Take backup if the cert already exists with the same name.	Yes
	sudo openssl pkcs12 -export -in '/home/appviewx/avx.pem' -inkey '/home/appviewx/devtestcsrgen.key' -out '/home/appviewx/p12pushtolinux.p12' -passout ##### -name 'p12pushtolinux'	Export command in case of p12 push.	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Sudo-enabled Commands

When sudo is enabled, "sudo" is prefixed to all the command executions listed below.

- su
- sar
- find
- mkdir
- netstat **(only if port Scan is enabled)**
- chmod
- chgrp
- chown
- openssl
- base64
- rm
- mv
- touch
- echo
- test
- cp
- cksum
- stat
- setfacl
- "runmqakm", "gsk8capicmd", "gsk8cmd", "gsk7capicmd", "gsk7cmd" , “dspmqver“ **(only if .kdb certs are required, depending on the tool kit currently installed)**.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The **Server Inventory** page is displayed.
3. Check that the device name appears in the inventory (name column) with the specified Status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Device Status Log pop-up is displayed.

5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Microsoft IIS

The Microsoft IIS (Internet Information Services) server is a web server developed by Microsoft. It is used to host and serve web applications and websites on Windows Server operating systems. In a typical deployment, an IIS server device is configured with SSL/TLS certificates to secure communications and establish trust between the server and its clients.

Prerequisites

- Both the Windows gateway agent and the windows machine running Microsoft IIS must have administrative privileges.
- Ensure that PowerShell and WinRM tools are installed and running on the Windows machine.
- Verify that Microsoft IIS services are active on the Windows machine.
- At least one website must be configured on the Microsoft IIS server.
- If the Gateway type is selected as WMI, ensure that WMI is properly configured (optional).
- The user must have **read and write permissions** for the folder specified as the **discovery path** and the **push location**.
- The user must have the right **access permissions** to the drive, and the drive must be **configured in sharing mode** to allow discovery and push operations.
- To discover and push the certificate to the store, user should have **Read and write access to the trust store** (to discover and push certificates).

Onboarding Microsoft IIS

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Microsoft IIS** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the name of the designated Microsoft IIS server.
***Hostname**	Enter the hostname of the Microsoft IIS server that is to be onboarded. **Note:** If the Microsoft IIS server is configured for the integrated Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Microsoft IIS server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Microsoft server device.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description

***Credential Type**	Select the credential type from the dropdown.
	• *Manual entry* (default)
	• *Credential List - Appviewx*
	• *Gateway credential*
	• All supported external vaults
	
	Note:
	• If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
	• If **Gateway credential** is selected no other fields are displayed.
	• AppViewX supports the following external credential types:
	  • HashiCorp
	  • CyberArk
	  • BeyondTrust
	  • Thycotic

Certificate Location Details	By default, only the **Certificate store** option is selected for certificate discovery. If the user wants to discover certificates from the **Centralized file system**, they must select the corresponding checkbox, specify the certificate location. The certificate location supports both a shared path and a local file system directory; however, only one of these can be configured at a time. From the given location `pfx and p12 certificates will be discovered.` Choose a pre-configured password vault from the dropdown menu to parse the password protected certificates.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry only)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. Enter/Select the **Windows gateway details**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Gateway location**	From the following options, select the gateway location: • Remote • LocalSystem **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***FQDN**	**Note:** This field is displayed when **Gateway location** = **LocalSystem**. Enter the FQDN of the local system on which the Windows Gateway Agent will be installed.
***Port**	**Note:** This field is displayed when **Gateway location** = **LocalSystem**. Enter the port number of the local system on which the Windows Gateway Agent will be installed.
***Select gateway**	**Note:** This field is not displayed when **Windows Gateway Mode** = **Integrated**. From the following options, select the gateway: • New • Existing
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway**.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

Microsoft IIS Discovery

The discovery process for Microsoft IIS can leverage multiple sources, as outlined below:

- **File System Discovery**: Requires at least one file path to be specified during device addition.
- **Microsoft Certificate Store Discovery**: Automatically scans the server's certificate store for available certificates.
- **Shared Network Path Discovery:**IIS supports discovery through shared network paths. This means that within the network of the managed IIS device, the logged-in user can be granted access to a shared folder on another system. By specifying that shared network path in the certificate location, the discovery process can be performed successfully.

The **AppConnector** is created dynamically based on the discovery method used.

Connector Behavior for IIS

For certificates discovered from the File System in Microsoft IIS, both Push-only/Default connectors and detailed profile connectors are created. The available profiles depend on the selected push certificate type in the application connector.

Push Certificate Type Options

When adding or updating certificates in Microsoft IIS using the app connector, users can select the desired Push Certificate Type:

a. **Push Certificate:** You can only push certificates to the Certificate store or Centralized File System.
   - Only the Device Name profile is displayed for selection.
   - Profile naming convention:

     `{device_name}`

b. **Push and Bind Certificate:** You can push a certificate to the Certificate store and bind it to the IIS site.

   All detailed profile connectors are displayed for selection, using the convention described below:

   `MS IIS::<siteName>::<host/IP>:<port>:<hostname (optional)>:CS[:(SNI or protocol)]`

   - `<siteName>`: IIS site name or wildcard (*)
   - `<host/IP>`: Hostname or IP address, or *
   - `<port>`: Port number (e.g., 80, 443)
   - `<hostname (optional)>`: FQDN or specific hostname, if applicable
   - `CS`: Certificate Store indicator
   - `:(SNI or protocol)`: *(SNI)* if SNI enabled, *(http)* for HTTP profile, as applicable

   Examples:

   - `MS IIS::test:*:8090:CS`
   - `MS IIS::test:*:443:CS`

Copyright © 2025 AppViewX Inc. All Rights Reserved.

8. In the **Certificate location details** section, enter the details as indicated below.

Certificate Location Details - Field Description Table

Fields	Description
***Location type**	Select to the checkbox for *Certificate store* or *Centralized file system* or both as the location type.
***Certificate location**	Enter the directory or path where the certificate is stored. *Example*: C:\Cert\folder
***Password vault**	Select any of the preconfigured password vault values. None is selected by default.
**: Mandatory fields*	

9. In the **Folder credential details** section, enter the details as indicated below.

Folder Credential Details - Field Description Table

Fields	Description
***Folder credentials**	Select from • Use gateway credential • New • Use device credential (disabled by default)
***Credential type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *Credential List - CyberArk* • *Credential List - Thycotic* • *Credential List - Hashicorp* • *Credential List - BeyondTrust* **Note:** If **Credential list - Appviewx** or **Credential list - CyberArk** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

10. Click **Save**.
    The Microsoft IIS device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Microsoft PC

Onboarding Microsoft PC

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Microsoft PC** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the name of the designated Microsoft PC server.
***Hostname**	Enter the hostname of the Microsoft PC server that is to be onboarded. **Note:** If the Microsoft PC server is configured for the integrated Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Microsoft server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Microsoft server device.

Credentials - Field Description Table

Fields	Description
Credential Type	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
Username	Enter the designated username for authentication.. (field displayed for manual entry only)
Password	Enter the secure password. (field displayed for manual entry only)

7. Enter/Select the **Windows gateway details**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production. **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • Remote **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	From the following options, select the gateway: • New • Existing
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway** and is non-editable.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
**: Mandatory fields*	

8. Click **Save**.
   The Microsoft PC device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Device Status Log pop-up is displayed.

5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Microsoft Server

Prerequisites

- You must be a local admin user
- You must have **read and write permissions** for the folder specified as the **discovery path** and the **push location**.
- You must have the **access permissions** to the drive, and the drive must be **configured in sharing mode** to allow discovery and push operations.
- You must have **Read and write access to the trust store** to discover and push certificates to the store,.
- If the Gateway type is selected as WMI, ensure that WMI is properly configured.
- The **iisreset.exe** file is expected at the default location. (C:\Windows\System32) to support IIS Service restart

Microsoft Server Discovery

The discovery process for Microsoft servers can leverage multiple sources as outlined:

- **File System Discovery**: Requires at least one file path to be specified during device addition.
- **Microsoft Certificate Store Discovery**: Automatically scans the server's certificate store for available certificates.
- **Port Scan Discovery**: Identifies certificates by scanning specified ports on the server.

The **AppConnector** is created dynamically based on the discovery method used.

Connector Behavior

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- For certificates discovered from the **File System**, a **Push-only/Default Connector** is created by default.
- Profile Naming Convention:
  - deviceName
  - deviceName::StoreName
- You can only push certificates to the Certificate store or Centralized File System.
- If the customer wants to perform **custom operations** (such as validations, service-related activities, backup, etc) **before the push** or **after a successful push operation**, they need to configure and use the **Pre-Script** and **Post-Script Execution** options.
- One or more Store profiles can be selected to push the certificate to the respective store.

Custom Certificate Order for Microsoft Server (PEM Format Push)

When pushing certificates in the **PEM** format to a Microsoft Server, the certificate chain order is controlled through metadata stored in the database.

1. The default format is server:inter:root.
2. If a non-standard certificate order is required, this can be enabled and defined via metadata:

```
db.cert_metadata.update({_id:"CERT_VENDOR_BASED_CONDITIONS"},{"$set": {"map.server_microsoft_server_push_certificate_order" :
"server:root:inter"}})
```

Supported Certificate types for File System Push

- JKS
- Default JKS (creates the JKS file with default password ***changeit*** in the Catalina basepath)
- PEM (*.pem, *.cer and *.crt)
- DER (*.der and *.cer)
- PKCS#12 (*.p12 and &.pfx)
- PKCS#7 (*.p7b and *.p7c)

Onboarding Microsoft Server

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the ADC tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The Device details page is displayed.
4. Select **Microsoft Server** logo from the Vendors list. The following screen is displayed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

5. In the **Server Details** section button, enter details as mentioned below.

Server Details - Fields Description Table

Field Name	Description
Server Type	Select Server Type as **Microsoft Server**.
***Server name**	Enter the name of the designated Microsoft server.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Apache server.
Communication mode	Select the *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the Microsoft server. Gateway is the preferred communication mode.
Host name	Enter the hostname of the server to be onboarded. **Note:** If the Microsoft Server is configured for the **integrated** Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
Cert sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.

   If **Communication mode** = **Gateway** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Field Name	Description
Credential Type	Select the type of credential from the dropdown list. • Manual entry • Gateway credentials • Credential List - AppViewX AppViewX also supports the following external credential types: • HashiCorp • CyberArk • BeyondTrust • Thycotic If **Communication mode** = **SSM**, then **Credential list - cloudAccount** is supported.
***Username**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the username for authentication. **Note:** The username must be added with the domain in the following format: <username>@<domain>.
***Password**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the password for authentication.
***Credential List**	This field is displayed only if **Credential Type** = **Credential List - AppViewX**. Select the configured credentials value or Default from the dropdown list.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Field Name	Description
Credential Type	Select the type of credential from the dropdown list that will be entered in the username and password field. • Manual entry • Gateway credentials • Credential List - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext **Note:** Click the (**Settings**) icon next to the field to configure the ARN Advanced Settings.
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Name	Description
	Note: Click the (**Settings**) icon next to the field to configure the S3 Advanced Settings.
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

7. Enter the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode **Note:** The integrated gateway functionality is not compatible with the following feature: • Server addition using the **import** feature
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • Remote **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	From the following options, select the gateway: • New • Existing
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway** and is non-editable.
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	From the dropdown list, select an existing Windows gateway.
**: Mandatory fields*	

8. In the **Vendor Specific Details** section, select/enter the details as follows.

   If **Communication mode** = **Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Services**	Select checkbox values as **MS Server**, or **Exchange Server**, or **Windows Gateway** or all. The default value is **MS Server**. **Note:** • Selecting all of the services will discover the certificates from MS Server, Exchange Server, and Windows Gateway. • If no services are selected, the service implementation will default to MSServer and CSR generation will be disabled. • The **Exchange Server** option is not supported for **Windows Gateway Mode** = **Integrated** and **SSM**. • Windows Gateway service can be used to enable the CLM support for the Windows GW certificate.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***Services**	For SSM the default services enabled is **MS Server**. (Exchange Server is not supported in the cloud).
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance Id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: i-02573cafcftext **Note:** Click the (**Settings**) icon next to the field to configure the ARN Advanced Settings.
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2 **Note:** Click the (**Settings**) icon next to the field to configure the S3 Advanced Settings.
Proxy Required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

9. In the **Certificate details** section, select/enter the details as follows.

Note: The **Certificate details** section will not be displayed if **Communication mode** = **Gateway** and **Services = Exchange Server** (in the Vendor specific details)

Certificate Details - Field Description Table

Fields	Description
***Keystore Credential Type**	Select the type of credential from the dropdown list. • Manual entry • Credential List - Thycotic **Note:** If **Credential list - Thycotic** is selected, the ***Keystore Credential Name** dropdown field is displayed. Select any of the preconfigured credential values.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Certificate location	Enter the directory/path where the application is installed. *Example*: C:\Microsoft\ADFS\
Certificate Password	Enter the certificate password. This field is only displayed for Keystore Credential Type = Manual entry)
**: Mandatory fields*	

10. Click **Add.**
    Once the server is added successfully, the path will be listed in the table.
11. *(optional step)* Click the (Delete) icon, if you want to delete the server path from the list.
12. Click **Save**
    The device is onboarded successfully.

Onboarding ADFS Server

The ADFS server can now be on-boarded into the AppViewX inventory. To onboard the ADFS server,

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the ADC tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The Device details page is displayed.
4. Select **Microsoft Server** logo from the Vendors list. The following screen is displayed.
5. In the **Server Type** radio button, select/enter the details below.

Server Details - Fields Description Table

Field Name	Description
Server Type	Select Server Type as **ADFS Server**.
***Server name**	Enter the name of the designated Microsoft ADFS server.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Microsoft ADFS server.
Communication mode	Select the *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the Microsoft server. Gateway is the preferred communication mode. (SSM is disabled by default)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Field Name	Description
Host name	Enter the hostname
Cert sync	Choose from the any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. (This option is disabled by default). • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials Section - Field Description Table

Field Name	Description
Credential Type	Select the type of credential from the dropdown list that will be entered in the username and password field. • Manual entry • Gateway credential • Credential List - AppViewX
***Username**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the username for authentication.
***Password**	This field is displayed only if **Credential Type** = **Manual Entry**. Enter the password for authentication.
***Credential List**	This field is displayed only if **Credential Type** = **Credential List - AppViewX**. Select the configured credentials value or Default from the dropdown list.
**: Mandatory fields*	

7. In the **Windows gateway details** section, select/enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Windows Gateway Details - Field Description Table

Field Name	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value Remote is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway)
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway)
Client authentication certificate	Click Browse and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway)
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway)
**: Mandatory fields*	

8. Click **Save**
   The device is onboarded successfully

The ADFS Server device can also be onboarded by the import functionality using the standard .xlxs and .csv templates available.

To onboard the ADFS server into the AppViewX inventory using the import functionality:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
2. Click the **Server** tab.
3. Click the **Import** button. The Import details page is displayed.
4. Click on the **CSV** or **XLSX** icons in the **Uploader Info** section. The sample templates are downloaded and saved at the default file location.
5. Open the CSV or XLSX templates, enter the relevant information for onboarding the ADFS server, and save the file.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note: Ensure all the mandatory and relevant fields are entered in the .csv or .xlsx template.

6. Click the upload icon in the **Import** section, and select the .csv or .xlsx file from the file dialog box. The status of the uploaded file is displayed in the **File Histories** section.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Limitation

CSR enrollment at endpoint is not supported.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Microsoft SQL

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Onboarding Microsoft SQL

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Microsoft SQL** from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the name of the designated Microsoft SQL server.
Communication mode	Select the Gateway or SSM protocol to be used for communication between the AppViewX node and the Microsoft SQL server.
***Hostname**	Enter the hostname of the Microsoft SQL server that is to be onboarded. **Note:** If the Microsoft SQL server is configured for the **integrated** Windows Gateway mode, ensure that the hostname used is resolvable in the cloud connector. The usage of FQDN is preferred.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Apache server.
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Microsoft SQL server device.
   If **Communication mode** = **Gateway** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* **Note:** The dropdown displays the credential types configured in the Device Credential section. Additionally, AppViewX supports the following external credential types: • HashiCorp • CyberArk • BeyondTrust • Thycotic.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. Enter/Select the **Windows gateway details**.

Note: This section is displayed only when **Communication mode** = **Gateway**.

Windows Gateway Details - Field Description Table

Fields	Description
***Windows Gateway Mode**	For communicating with Windows-based devices, from the following options, select the gateway agent mode to be used: • **External** This mode will use the AppViewX Windows Gateway Agent that is set up on a Windows device. • **Integrated** Tech Preview This mode will use the prepackaged gateway that is integrated in the AppViewX Cloud Connector (enabled only in the SaaS and Managed Kubernetes installations). Prerequisites for using the Integrated Windows Gateway mode

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: This is only a tech preview, which means the feature is under development. The tech preview has been released for testing and evaluation by the general audience. Necessary improvements will be made before the official release. Currently, this feature is not recommended for production. **Note:** The integrated gateway functionality is not compatible with the following features: • Server addition using the **import** feature • Endpoint CSR generation
***Gateway type**	From the following options, select the required gateway type: • PowerShell • WMI **Note:** The integrated gateway uses only the PowerShell gateway command execution mode and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Gateway location**	From the following options, select the gateway location: • Remote **Note:** By default, the integrated gateway is remotely located. and therefore, this field is not displayed when **Windows Gateway Mode** = **Integrated**.
***Select gateway**	From the following options, select the gateway: • New • Existing
***Windows gateway name**	For **Windows Gateway Mode** = **External** and **Select gateway** = **New**, enter a name for the Windows Gateway. For **Windows Gateway Mode** = **Integrated**, this field is auto-populated with the value **integrated-gateway** and is non-editable.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Windows gateway URL**	**Note:** This field is displayed only when **Windows Gateway Mode** = **External**. Enter the URL of the Windows Gateway endpoint.
Client authentication certificate	**Note:** This field is displayed only when **Windows Gateway Mode** = **External** and **Select gateway** = **New**. Upload the client certificate used while installing Windows Gateway. You can use the default client certificate (**ClientCertificateGateway.pfx**) or a custom certificate.
***Windows gateway**	**Note:** This field is displayed only when **Select gateway** = **Existing**. From the dropdown list, select an existing Windows gateway.
**: Mandatory fields*	

8. In the **Vendor Specific Details** section, enter the details as indicated below. This section is displayed only if **Communication mode** = **SSM**.

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

9. Click **Save**.
   The Microsoft SQL device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.
- If you want to troubleshoot Microsoft SQL, see Troubleshooting Microsoft SQL Windows.

MySQL

Prerequisites for Onboarding MySQL

- Ensure that the SFTP package is installed to facilitate device addition.
- Confirm that the target IP address is accessible from the AppViewX Cloud Connector and the corresponding port is open.
- Ensure that the language setting for the MySQL server is set to English.
- Ensure that certificates in the config file are configured with accessible paths. If not, modify the file permissions to make them accessible.

  If certificates do not have the requisite permissions, they cannot be identified from the path.
- Verify that the commands necessitating access have been enabled on the server.
- Verify that the MySQL instance is correctly configured with servers and is running.
- Ensure that the my.cnf file is available at the configured location and the user has all required access to it.

Onboarding MySQL

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the + **(Add)** icon.
4. Select **MySQL** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter a unique name for the designated MySQL server that is to be onboarded
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) for device communication and integration with the MySQL server.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the MySQL server.
Communication mode	Select the *SSH* or *SSM* protocol to be used for communication between the AppViewX node and the MySQL server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the MySQL server device.

   If **Communication mode** = **SSH** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* • *SSH* **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
Config path	Enter the directory/path where configuration files are stored. *Example*: /tmp/files
*: Mandatory fields	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
Config path	Enter the directory/path where configuration files are stored. *Example*: /tmp/files
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Example: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.

8. In the **Certificate details** section, enter the details as indicated below.

Certificate Details - Field Description Table

Fields	Description
Certificate location	Enter the actual directory/path where certificates are stored in the Linux server. *Example*: /cert/files
**: Mandatory fields*	

9. Click **Add**.
   The certificate location will be listed in the table.
10. *(optional step)* Click the (Delete) icon, if you want to delete the certificate details from the list.
11. Click **Save**.
    The MySQL device is added successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified CertSync status (Status Column).
   The status column will have the value Managed/Monitored/Ignored based on the CertSync status if the connection is successful or displays Failed/Unresolved in case of failure.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. From the Status column, click the Managed/Monitored.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

NGINX

Onboarding NGINX

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
   The **Device details** page is displayed.
4. Select **Nginx** (Green N icon) from the Vendors list.
5. In the **Server details** section, select/enter the details as follows.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter a unique name for the designated Nginx server to be onboarded.
***IP address/ FQDN**	Enter the IP address or the fully qualified domain name (FQDN) of the server that is to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the Nginx server.
Communication mode	Select the SSH or SSM protocol to be used for communication between the AppViewX node and the Nginx server. **SSH** is the preferred communication mode.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode. (The field is not displayed for SSM communication mode.)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Cert Sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as indicated below. The credentials entered in this section are used to authenticate the session between the AppViewX node and the Nginx server device.
   If **Communication mode** = **SSH** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - Appviewx • *SSH* **Note:** • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List* - cloudAccount **Note:** If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine.
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, select/enter the details as indicated below.
   If **Communication mode** = **SSH** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	Select from the following:. • *sudo* - to execute with root privileges using sudo access • *dzdo* - to execute with root privileges using dzdo access • *None* **Note:** SSH key-based authentication doesn't support password enabled sudo/dzdo.
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Vendor Specific Details - Field Description Table

Fields	Description
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.

8. Click **Save**.
   The Nginx device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The Server Inventory page is displayed.

3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

Oracle

Onboarding WebLogic (Linux)

Prerequisites

1. Ensure that the following packages are installed to facilitate device addition:
   a. dzdo (Optional, as per the access elevation selected)
   b. SFTP
   c. base64
2. Ensure that the target IP is accessible from the cloud connector and that the port is open.
3. Make sure that the language setting for the WebLogic Server is set to English.Ensure that the sudo/dzdo prompt string follows the standard Linux format, which is typically **"[sudo] password for <your_username>:"**
4. SSH private keys cannot be used with password-enabled dzdo settings. Therefore, if an SSH key is used for authentication, ensure that `dzdo` is configured for passwordless operation.
5. Certificates located in paths without the necessary user permissions cannot be identified, so ensure to either place the certificates in configuration files with accessible paths or adjust the file permissions for accessibility.
6. Ensure that the commands requiring sudo/dzdo privileges are enabled on the server.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

7. Ensure that the WebLogic instance is properly configured with the necessary profiles, servers, and SSL certificates.
8. Ensure that the `config.xml` file is present, the WebLogic server is running, and the user can log onto the `wlst.sh` script using the required WebLogic credentials.
9. Ensure access to the `wlst.sh` script as it is used across multiple stages of device onboarding and CLM operations. Below are the key use cases:
   - **Vendor Validation**

     The `wlst.sh` script is run to verify the WebLogic installation. A successful launch without errors confirms the vendor setup.

   - **Version Fetch**

     The WebLogic version is retrieved by executing specific commands within the `wlst.sh` script.

   - **Decrypting Domain Credentials**

     To obtain the WebLogic domain username and password, values are decrypted using commands executed within `wlst.sh`.

   - **Certificate Binding**

     During the certificate binding process, a series of commands are executed through `wlst.sh` to bind the server certificate to the target WebLogic server.
10. The SSH user or service account (if configured) must have **execute (`x`) permission** on the path containing `wlst.sh`, as a `cd` (change directory) operation is performed. Even with access elevation is enabled (e.g., sudo or dzdo), the user must have `x` permission since `sudo` or `dzdo` commands cannot be used with the `cd` command. Ensure the user has all necessary minimum access permissions as mentioned in the next step.
11. The OpenSSL toolkit is required for private key and CSR generation at the target device, so ensure to install it on the Linux machine.
12. **Minimum Permission Required**
    - The SSH user or service account (if configured) must have the necessary permissions to access the path containing `wlst.sh`, with or without `sudo` privileges.
    - The user must have read (r) permission for the `config.xml` and `boot.properties` files, as well as their respective directories. Otherwise, elevated access is required.
    - Additionally, the user must have read and write (rw) permissions for the configured keystores and their directories. Otherwise, elevated access is required.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- The user must have read and write (rw) permissions on the target location to push the keystore. Otherwise, elevated access is required.
- An SFTP connection is set up for the current user, who might not have the necessary access to the service account's directory. It is recommended to choose a File Upload Temp Path in the UI that allows both the current user and the service account user to read and write.

13. Recommended practices to use AppViewX efficiently:
    - **Config.xml Guidelines:**
      - If the configuration file (`config.xml`) lacks sufficient details to determine the protocol and port, AppViewX defaults to the T3 protocol and its standard port.

        To prevent misconfiguration, ensure the following entries are explicitly defined in `config.xml`:

        - Admin server port
        - Administration protocol enabled
        - Protocol type (for example, HTTP, HTTPS) - if applicable
        - Administration port - if applicable
        - Listen address - recommended for clarity and accuracy.
    - **Java Truststore:**
      - Do not customize the password for the default Java truststore, as WebLogic only recognizes the default password: `changeit`.
      - If a custom truststore path is used, it requires running `./wlst.sh` with specific arguments which is not supported by WebLogic.
      - AppViewX supports pushing certificates only to the default Java truststore location: `/java_path/lib/security/cacerts`.
    - **Server Certificate and Keystore Configuration:**
      - For successful client-side authentication, WebLogic validates the `SSLSocketFactory` hostname verifier.
      - When using T3S or HTTPS protocols, the server certificate must include the WebLogic server's fully qualified domain name (FQDN) in either the Common Name (CN) or the Subject Alternative Name (SAN).
      - Store the server certificate, private key, and full certificate chain in a single keystore entry.
      - Maintain a separate truststore for root and intermediate certificates.

To configure WebLogic (Linux) server:

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

4. Select **Oracle** logo from the Vendors list.
   The Oracle server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server type**	Select **WebLogic (Linux)** from the dropdown field.
***Server name**	Enter the name of the designated **WebLogic (Linux)** server.
***IP address**	Enter the valid IP address of the server being onboarded.
Data center	Select the desired data center from the dropdown list. It holds all the SSL What can you do next? that is to be retrieved from the server.
***SSH Port**	Enter the SSH port number. By default, 22 is the port used for the SSH communication mode.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) • *Credential List - AppViewX* • *SSH*

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential List from the dropdown menu. **Note:** • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the ***Username**, ***Upload key** file, and enter the **Passphrase** for authentication. • If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
***Username**	Enter the designated username for authentication. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Service account credentials**section enter the details as follows.

Service account credentials - Field Description Table

Fields	Description
Username	Enter the designated username for authentication.
Password	Enter the secure password.

8. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
WebLogic Installation directory	Enter the path where the WebLogic domain-registry.xml file is saved. *Example:*/WL_installation_directory/

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Access Elevation**	Select the type of access elevation from the dropdown list. By default, it is None.
File Upload Temp Path	Enter the temporary file upload path. This field is applicable only for push operations and is enabled when access is elevated using **sudo** or **dzdo**. **Note:** This field is enabled if you access elevation as sudo or dzdo.
**: Mandatory fields*	

9. Click **Add**
   The WebLogic Installation directory is added successfully in the table.
10. (Optional) Click the (Delete) icon, if you want to delete the directory location from the table, or add more WebLogic Installation directories.
11. In the **Certificate details** section (required to discover any additional non-profile certificate), enter the details as follows.

Certificate Details - Field Description Table

Fields	Description
Key store location	Enter the location of the jks keystore in Oracle Linux that contains the private key and an associated certificate. *Example*: /tmp/certs/sample.jks
Key store password	Enter the key store password to access the keystore location.
Trust store location	Enter the location of the jks trust store in Oracle Linux that contains the CA certificates. *Example*: /tmp/certs/sample.jks
Trust store password	Enter the trust store password to access the keystore location.

12. Click **Add**
    The keystore location is added successfully in the table.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

13. *(optional step)* Click the (Delete) icon, if you want to delete the certificate location from the list, or add more keystore locations.
14. Click **Save**.
    The Oracle WebLogic (Linux) device is on-boarded successfully.

WebLogic (Linux) Commands for CLM Operations

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
Session configuration commands (Executed post creation of ssh session for all use-cases)	`bash`	Used to set the prompt string for the logged-in user	No	-
	`bind 'set enable-bracketed-paste off'`	Disable the bracketed-paste configuration for the current session	No	-
	`export SUDO_PROMPT='[sudo] password for %p: ' ; export LANG=en_US.UTF-8` **Note:** This command is executed only when access elevation is enabled.	Set the sudo password prompt to the standard value for the current session and update the session language as English US	Yes	-
	whoami	Executed to know the logged-in user	No	-
Pre-config fetch	`ps -eaf|grep 'weblogic'|grep -v grep`	This command is used to check if a WebLogic server process is running on the system.	No	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script

	`cd wlst_path`
	eg:
	`cd/home/appviewx/Oracle/Middleware/Oracle_Home/oracle_common/common/bin`
		Change the current directory to the wlst path	Yes	-

	`find -name 'wlst.sh'`	To find the location of the wlst.sh script	Yes	-
	`./wlst.sh`	The wlst.sh script is used to launch WebLogic Scripting Tool (WLST), which is a command-line utility for managing and automating WebLogic Server administration.	Yes	-
	`print version`	This command is used to find the version of the WebLogic server.	-	Yes
	`exit()`	This command is used to close the wlst.sh script.	-	Yes
Config fetch	`cat 'domain-registry-xml_path/domain-registry.xml'`	This command is used to read the contents of domain-registry.xml file.	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	`cat 'config_xml_path/config.xml'`	This command is used to read the contents of config.xml file	-	Yes
	`cat 'boot_properties_path/boot.properties'`	This command is used to read the contents of boot.propertiesl file	Yes	-
	`service = weblogic.security.internal.SerializedSystemIni.getEncryptionService('"domainPath "')"`	This command is used in WebLogic Scripting Tool (WLST) to retrieve the encryption service for a WebLogic domain	No	Yes
	`encryption = weblogic.security.internal.encryption.ClearOrEncryptedService(service)`	The ClearOrEncryptedService class in WebLogic allows you to handle encrypted values within WebLogic Server. This is typically used for encrypting and decrypting passwords stored in configuration file.	No	Yes
	`encryption.decrypt('encrypted_password')`	In WebLogic Scripting Tool (WLST), the encryption.decrypt() function is	No	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
		used to decrypt an encrypted password stored in WebLogic.		
	`encryption.decrypt('encrypted_username')`	In WebLogic Scripting Tool (WLST), the encryption.decrypt() function is used to decrypt an encrypted username stored in WebLogic.	No	Yes
Tempora Directory Creation (Only for access elevated user)	`<access-elevation> mkdir -p <temporary-directory>`	A temporary folder is created to upload files into the end machine.	Yes	-
	`uname -a`	To check if the OS is AIX.	No	-
	`<access-elevation> chmod 700 <temporary-directory> && <access-elevation> setfacl -m u:<username>:rwx <temporary-directory>`	Modify access for the current session user.	Yes	-
	`<access-elevation> chmod 700 <temporary-directory> && <access-elevation> setfacl -m`	Modify access for the current session user and service account user.	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	u:<username>:rwx -m u:<SERVICEACCOUNT>:rwx <temporary-directory> sudo chmod 700 '/tmpfileloc//weblogicLinuxPush_1739432147548' && sudo setfacl -m u:appviewx:rwx '/tmpfileloc//weblogicLinuxPush_1739432147548'			
	<access-elevation> chmod 777 <temporary-directory> sudo chmod 777 '/tmpfileloc//weblogicLinuxPush_1739432147548'	Modify the access to rwx for every user for the temporary account only if the above Access fails.	Yes	-
	<access-elevation> rm -rf <temporary-directory> sudo rm -rf /tmpfileloc//weblogicLinuxPush_1739432147548	Remove the temporary folder after the clm operation scope is finished.	Yes	-
Discovery	base64 '/home/appviewx/oracle_cert1.jks'	Read the content of keystore file using base 64 method.	Yes	-
Csr Generation	<access-elevation> mkdir -p <target-file-directory>;	Test if the folder exists; else, create	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	<access-elevation> touch <target-file-directory>	a folder (both for CSR and key files)		
	<access-elevation> chown $(id -un):$(id -gn) <csr-config-file>	Change ownership to the logged-in user	Yes	-
	openssl req -nodes -newkey {keyType}:{bitLength} -{hashFuntion} -days {validityInDays} -keyout {keyFileName}.key -out {csrFileName}.csr -subj '/C={country}/ST={state}/L={location}/O={organisation}/OU={organisationUnit}/CN={commonName}/emailAddress={email}/' -config <location>/{csrConfFileName}	1. RSA as the key type To generate CSR and key at weblogic endpoint. 2. DSA as the key type To generate CSR at weblogic endpoint.	Yes	-
	openssl req -nodes -new -{hashFuntion} -days {validityInDays} -key {keyFileName}.key -out {csrFileName}.csr -subj '/C={country}/ST={state}/L={location}/O={organisation}/OU={organisationUnit}/CN={commonName}/emailAddress={email}/' -config	This command is used to generate CSR for EC or ECDSA as the key type.	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	<location>/{csrConfFileName}			
	openssl dsaparam -out {keyFileName}.key {bitLength}	This command is used to generate a key at the endpoint if the key type is DSA.	Yes	-
	openssl ecparam -name {algorithm} -genkey -noout -out {keyFileName}.key	This command is used to generate a key at the endpoint if the key type is ec or ecdsa.	Yes	-
	<access-elevation> base64 <csr-file-path> sudo base64 / home/appviewx/test/testingweblogic.conf	Command executed to fetch CSR generated at end device.	Yes	-
	<access-elevation> chmod 640 <target-key-file-path>	Update the key file access permission to 640.	Yes	-
	<access-elevation> rm -rf <files>	Executed to remove the cnf(csr config) and csr files created at the endpoint.	Yes	-
Push	<access-elevation> stat -c %a <keystore-location>	To fetch the permission of the file if it exists in the server.	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	<access-elevation> stat -c %U:%G <keystore-location>	To fetch the ownership of the file if it exists in the server	Yes	-
	<access-elevation> cp <temporary-file-path> <target-location>	Copy the file (keystore) from the temporary location to the target location.	Yes	-
	<access-elevation> chmod <permission-received from stat command/600> <target-keystore-file-path>	Update the file access with existing permission or set it to 600	Yes	-
	<access-elevation> rm -f <temp-file>	Remove the temperory file (This command is executed only in case of enrollment of key at end-point).	Yes	-
Bind	date +%s%3N	This command returns the current timestamp in milliseconds.	Yes	-
	perl -MTime::HiRes -e 'printf(\"%.0f\\n\", Time::HiRes::time() *1000)'	This command returns the current timestamp in milliseconds.	Yes	-

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	./wlst.sh	-	Yes	-
	connect(USERNAME,PASSWORD,LISTENADRESS)	This function in WebLogic Scripting Tool (WLST) is used to establish a connection to a WebLogic Server.	No	Yes
	edit() startEdit()	This commands are used when making configuration changes to the WebLogic domain.	-	Yes
	cd(TARGET_SERVER_PATH)	The cd() command in WLST (WebLogic Scripting Tool) is used to navigate the hierarchical MBean tree of a WebLogic domain.This command moves into the AdminServer MBean, allowing you to view and modify its attributes.	-	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	`cmo.setKeyStores('CustomIdentityAndCustomTrust')`	cmo refers to the Current Management Object, which represents the MBean of the currently navigated configuration. setKeyStores('CustomIdentityAndCustomTrust') sets the keystore type for SSL configuration.	-	Yes
	`cmo.setCustomIdentityKeyStoreFileName(KEYSTORE_ABSOLUTE_PATH)`	This command is used in WebLogic Scripting Tool (WLST) to set the absolute path of the custom identity keystore for a WebLogic Server instance.	-	Yes
	`cmo.setCustomIdentityKeyStorePassPhrase(PASSWORD)`	This command is used in WebLogic Scripting Tool (WLST) to set the password of the custom identity keystore for a WebLogic Server instance.	-	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
	`cmo.setCustomTrustKeyStoreType('jks')`	This command sets the keystore type for SSL configuration.	-	Yes
	`save()`	This command is used to save the configuration changes to WebLogic.	-	Yes
	`cd(PATH_TO_SSL_SERVER)`	This command moves into the AdminServer MBean, allowing you to view and modify its attributes.	-	Yes
	`cmo.setServerPrivateKeyAlias(PRIVATE_KEY_ALIAS_NAME)`	This command is used in WebLogic Scripting Tool (WLST) to specify the alias of the private key inside the identity keystore for a WebLogic Server instance.	-	Yes
	`cmo.set('ServerPrivateKeyPassPhrase',PASSPHRASE)`	This command is used in WebLogic Scripting Tool (WLST) to set the passphrase for the server’s private	-	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Operation	Command	Description	Sudo/Dzdo Configuration Required?	Executed in wlst Script
		key stored in the custom identity keystore.		
	cmo.setEnabled(true)	This command is used in WebLogic Scripting Tool (WLST) to enable SSL for a WebLogic Server instance.	-	Yes
	activate()	This command is used to commit and apply configuration changes made in the edit session.	-	Yes
	disconnect()	This command closes the WLST session and disconnects from WebLogic Server.	-	Yes
	cmo.getServerPrivateKeyAlias()	This is a getter method used to retrieve the alias of the private key for the server's SSL configuration.This alias refers to a private key entry in the server’s keystore	-	Yes

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Note:

- All commands referenced here are executed using the latest version. In legacy versions, some commands may differ or may have been introduced only in the most recent release.
- **Limitations**
  - The **P12** extension is not supported for certificate push.
  - Execute permission is required for the `wlst.sh` path as a `cd` operation is performed to access that directory.
  - Currently, the **t3s** protocol is not supported for server connections. Configure the WebLogic server to use the **t3** protocol instead.

Onboarding WebLogic (Windows)

Prerequisites

- The gateway must be installed within the same domain.
- The WebLogic instance on Windows must be up and running.
- Ensure config.xml is available in the domain directory and the user must have access to it.
- To avoid misconfiguration, ensure that the following details are explicitly defined in the `config.xml`:
  - Admin server port
  - Administration protocol enabled
  - Listen address (recommended for clarity and accuracy)

Access Requirements

If the WebLogic Server instance is running under a service account that is not *Local System* or a member of the *Administrators* group:

- **For a Domain Service Account**: Add the account to the Administrators group on the server.
- **For a Built-in Account (e.g., Network Service):** If the service account user cannot be added to the admin group, then use the **Default connector** to push the certificate. You can then use the **post-script execution** to perform the bind operation.

Best Practice Recommendation

If the same issuer certificate is available in multiple paths, then the first find is considered. Hence, it is recommended to maintain the trust certificates in one common location.

To configure WebLogic (Windows) server:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Oracle** logo from the Vendors list.
   The Oracle server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server type**	Select **WebLogic (Windows)** from the dropdown field.
***Server name**	Enter the name of the designated WebLogic (Windows) server.
Communication Mode	Select the *Gateway* or *SSM* protocol to be used for communication between the AppViewX node and the Oracle server. Gateway is the preferred communication mode.
***Hostname**	Enter the hostname of the Oracle WebLogic (Windows) server that is to be onboarded. This field is not mandatory if Communication mode is SSM.
Data center	Select the desired data center from the dropdown list. It holds all the SSL What can you do next? that is to be retrieved from the server.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.
   If **Communication mode** = **Gateway** the fields are as follows:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) • *Credential List - AppViewX* • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential List from the dropdown menu. **Note:** • If **Credential list - AppViewX** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) • *Credential List* - cloudAccount • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential List from the dropdown menu.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values. • If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
***Access key**	Enter the access key to login to the EC2 instance of the AWS cloud machine. This field is displayed only when Communication mode is SSM.
***Secret key**	Enter the secret key to login to the EC2 instance of the AWS cloud machine. This field is displayed only when Communication mode is SSM.
**: Mandatory fields*	

7. In the **Windows gateway details** section, enter the details as indicated below. (This section is not displayed if **Communication mode = SSM**)

Windows Gateway Details - Field Description Table

Fields	Description
***Gateway type**	Select to use the *PowerShell* or *WMI* commands as the gateway communication mode.
***Gateway location**	The value Remote is selected by default.
***Select gateway**	Select the *New* or *Existing* gateway to be used. The below fields are enabled/ disabled according to the selection.
***Windows gateway name**	Enter the new gateway name. (Enabled when *New* is selected as gateway)
***Windows gateway URL**	Enter the URL for the new gateway. (Enabled when *New* is selected as gateway)
Client authentication certificate	Click **Browse** and upload the client authentication certificate for the new gateway. (Enabled when *New* is selected as gateway)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Windows gateway**	Select any of the existing configured gateways from the dropdown list. (Enabled when *Existing* is selected as gateway)
**: Mandatory fields*	

8. In the **Vendor Specific Details** section enter the details as follows.
   If **Communication mode** = **Gateway** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***WebLogic Installation directory**	Enter a directory where domain-registry file is located. *Example:*/WL_installation_directory/domain-registry.xml
**: Mandatory fields*	

If **Communication mode** = **SSM** the fields are as follows:

Vendor Specific Details - Field Description Table

Fields	Description
***WebLogic Installation directory**	Enter a directory where domain-registry file is located. *Example:*/WL_installation_directory/domain-registry.xml
***Region**	Enter the geographic region of the AWS instance. *Example*: us-east-2
***Instance id**	Enter the unique identifier for an EC2 instance in AWS. It is required to perform actions or execute commands on a specific EC2 instance *Example:* i-02573cafcftext
***SSM document name**	Enter the name of the SSM document that contains the script or action to be executed on the EC2 instance. *Example*: **AWS-RunShellScript** is an SSM document that allows you to execute shell scripts on EC2 instances.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***SSM document version**	Specify the version of the SSM document to be executed. *Example*: 1
***S3 bucket name**	Enter the S3 bucket name used to store command output or logs executed in the EC2 instance. *Example*: avxdiscoverydocument-c2
Proxy required	Select the checkbox to enable the secure proxy service.
**: Mandatory fields*	

9. [Optional] In the **Certificate details** section, enter the details as indicated below.

Note: You can skip this section as it will be deprecated in the next release.

Certificate Details - Field Description Table

Fields	Description
Key store location	Enter the location of the jks keystore in Oracle that contains the private key and an associated certificate. *Example*: C:\keystore\samle.jks
Key store password	Enter the key store password to access the keystore location.
Trust store location	Enter the location of the jks trust store in Oracle that contains the CA certificates. *Example*: C:\keystore\samle.jks
Trust store password	Enter the trust store password to access the keystore location.

10. Click **Add**.
    The keystore location is added successfully in the table.
11. [Optional] Click the **Delete** icon to delete the certificate location from the list, or add more keystore locations.
12. Click **Save**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The Oracle WebLogic (Windows) device is onboarded successfully.

Note:

Limitations

- The **P12** extension is not supported for certificate push.
- Currently, the **t3s** protocol is not supported for server connections. Configure the WebLogic server to use the **t3** protocol instead.

Pushing Certificates

1. There is an option to deliver the certificate to the WebLogic server in the following formats:
   - JKS
   - keystore
2. When you choose the private key on the device, provide the absolute path of the server-generated private key on the UI screen.

Sample Configuration File

Following is a sample configuration file for config.xml:

```
<server>
  <name>AdminServer</name>
  <ssl>
    <name>AdminServer</name>
    <enabled>true</enabled>
    <hostname-verifier xsi:nil="true"></hostname-verifier>
    <hostname-verification-ignored>true</hostname-verification-ignored>
    <export-key-lifespan>500</export-key-lifespan>
    <client-certificate-enforced>false</client-certificate-enforced>
    <listen-port>7002</listen-port>
    <two-way-ssl-enabled>false</two-way-ssl-enabled>
    <server-private-key-alias>ws</server-private-key-alias>
    <server-private-key-pass-phrase-encrypted>{AES256}Y6nGhqZXlUv+76dQt+w5uOqWrQMUxusqPV3kx4nzi7g=</server-private-key-pass-phrase-encrypted>
    <ssl-rejection-logging-enabled>true</ssl-rejection-logging-enabled>
    <inbound-certificate-validation>BuiltinSSLValidationOnly</inbound-certificate-validation>
    <outbound-certificate-validation>BuiltinSSLValidationOnly</outbound-certificate-validation>
    <allow-unencrypted-null-cipher>false</allow-unencrypted-null-cipher>
    <use-server-certs>false</use-server-certs>
```

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

```
  </ssl>
  <machine>machine_1</machine>
  <listen-port>7001</listen-port>
  <listen-port-enabled>true</listen-port-enabled>
  <listen-address></listen-address>
  <java-compiler>javac</java-compiler>
  <client-cert-proxy-enabled>false</client-cert-proxy-enabled>
  <key-stores>CustomIdentityAndCustomTrust</key-stores>

Probable Error Messages and Causes for WebLogic CLM Use Case

Error message	**Description**
Communication to <ip/fqdn> has failed. Caused by: net.schmizz.sshj.userauth.UserAuthException: Exhausted available authentication methods	Authentication failure. Kindly check the credentials used for the authentication.
Beyond trust vault, response parsing failed::["Managed Account not found"]	Kindly check whether the weblogic device hostname or IP address is configured for the user in the Beyond Trust.
Thycotic vault access token denied or not generated	Check the Thycotic vault integration with AppViewX.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Password object matching query was not found. Please check that there is a password object that answers your query in the Vault and that both the Provider and the application user have the appropriate permissions needed to use the password	Check the Thycotic vault integration with AppViewX
CredentialStore(s) does not exist.	Kindly check whether the weblogic device hostname or IP address is configured for the user in the Thycotic server.

Onboarding iPlanet

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Oracle** logo from the Vendors list.
   The Oracle server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

Server Details section - Field Description Table

Fields	Description
***Server type**	Select **iPlanet** from the dropdown field.
***Server name**	Enter the name of the designated **iPlanet** server.
***IP address**	Enter the valid IP address of the server being onboarded.
Data center	Select the desired data center from the dropdown list. It holds all the SSL What can you do next? that is to be retrieved from the server.
***SSH Port**	Enter the SSH port number. 22 is the default port used for the SSH communication mode.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, enter the details as follows.

Credentials section - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown: • *Manual entry* (default) • *Credential List - AppViewX* • If external credential types such as Thycotic, BeyondTrust, CloudAccount, or AppViewX Vault are configured, then this credential type will be listed in the device addition screen. Choose the appropriate Credential List from the dropdown menu. **Note:** • If **Credential list - cloudAccount** is selected, the ***Account name** dropdown field is displayed. Select any of the preconfigured credential values. • If authentication relies on an external credential, ensure that the hostname, FQDN, or IP address used for device communication is configured in the corresponding external credential vault.
***Username**	Enter the designated username for authentication. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

7. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
***WADM User name**	Enter the username for the WADM CLI (Command line interface) utility. WADM defines all the commands that are supported for configuring and administering the server.
***WADM Password**	Enter the password for the WADM CLI utility.
***WADM directory path**	Enter the file location/directory path to where the WADM utility is stored.
*: Mandatory fields	

8. In the **Certificate Details** section enter the details as follows.

Certificate Details- Field Description Table

Fields	Description
Database path	Enter the file location/directory path of the database where the certificates are stored.
Password	Enter the password for the certificates database.

9. Click **Add**
   The database path is added successfully in the table.
10. *(optional step)* Click the (Delete) icon, if you want to delete the database path from the list, or add more accordingly.
11. Click **Save**.
    The Oracle iPlanet device is on-boarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.
- If you want to troubleshoot WebLogic linux, see Troubleshooting WebLogic Linux.
- If you want to troubleshoot WebLogic windows, see Troubleshooting WebLogic Windows Server.

Other Devices

Onboarding Other Devices

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **Other Devices** logo from the Vendors list.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	The server type has a fixed value **Other devices**.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
***Server name**	Enter a unique name of the designated server to be onboarded.
***IP address/ FQDN**	Enter the valid IP address of the device to be onboarded.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the VMware server.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • *Manual entry* (default) • *Credential List - Appviewx* **Note:** If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry only)
***Password**	Enter the secure password. (field displayed for manual entry only)

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
*: Mandatory fields	

7. Click **Save**.
   The device is onboarded successfully.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

RabbitMQ

Onboarding RabbitMQ

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select **RabbitMQ** logo from the Vendors list.
   The RabbitMQ server configuration screen is displayed.
5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server name**	Enter the server name.
***IP address/ FQDN**	Enter the valid IP address or FQDN
Data center	Select the desired data center from the dropdown list.
Communication mode	Select the required communication mode. The possible options are: • SSH • SSM
***SSH Port**	Enter the SSH port number **Note:** This field is displayed only if the Communication mode selected is SSH.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. This option is **disabled** by default. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the type of credential from the dropdown list that will be entered in the username and password field. • Manual entry • Credential List - AppViewX • Credential List - CyberArk • SSH
***Username**	Enter the username.
***Password**	Enter the password.
**: Mandatory fields*	

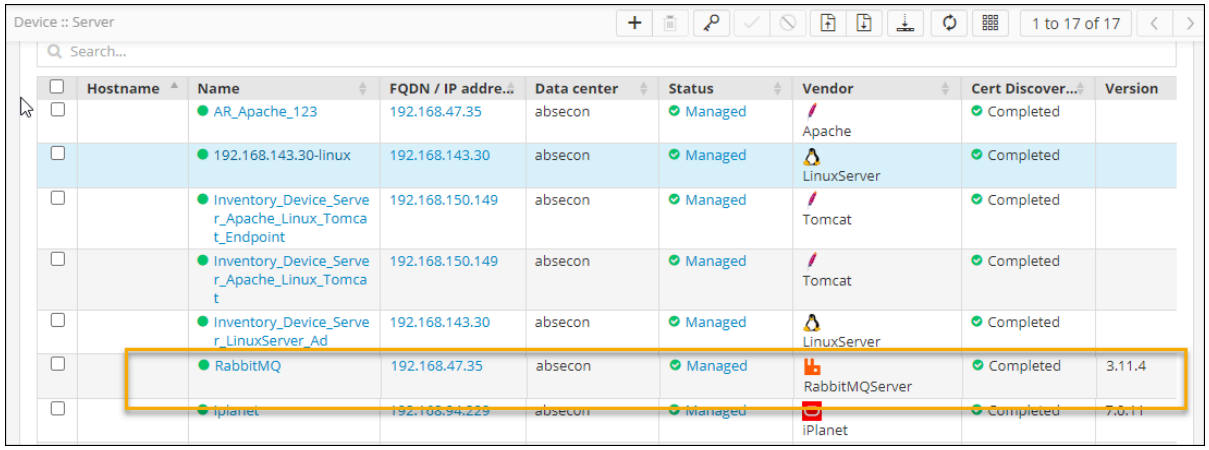
7. In the **Vendor Specific Details** section enter the details as follows.

Vendor Specific Details - Field Description Table

Fields	Description
Config path	Enter the path where the config file is saved. *Example:*etc/rabbitmq/rabbitmq.config
**: Mandatory fields*	

8. Click **Save**.

   The device is on-boarded successfully and the version number in the **Version** column will contain the value **3.11.4**.



Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Validating the Device

After the device is onboarded successfully, follow the steps to validate the device communication with AppViewX:

1. Go to **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
   The Server Inventory page is displayed.
3. Check that the device name appears in the inventory (Name column) with the specified status in the status column.
   The status column will have the value Managed/Monitored/Ignored if the connection is successful or displays Failed/Unresolved in case of failure.
4. From the Status column, click the Managed/Monitored/Ignored/Failed/Unresolved.
   Device Status Log pop-up is displayed.
5. Expand each value in the pop-up to know the **Device communication**, **Device Version**, **Instance Information**, and **Certificate Discovery From Device**.

What's Next

Once you have onboarded and validated the device connection, you are ready to proceed with the any of the following certificate actions:

- If you want to discover certificates from the onboarded device, see Managed Devices Scan.
- If you want to enroll a new server certificate, see Enrolling a Server Certificate.

SAP

Prerequisites

WebDispatcher

- Ensure the target server IP is accessible from the cloud connector and the port is open.
  1. To SSH into a machine using a specific port, use:

     ```
     ssh -p <port_number> <username>@<hostname_or_ip_address>
     ```

- If **access elevation is set to *None***, the application or service users must have the necessary read/write permissions to perform CLM actions on the target server. Commands in this case are executed using the following format:

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

- `su - {sid}adm -c "some_command"`
  - If the SAP SID is configured with password authentication, the command will prompt for it. In such cases, ensure the password is provided in the user interface.
- When **access elevation is set to *sudo* or *dzdo***, the application runs commands using the following format:
  - `sudo su - sidadm -c "some_command"`
  - This means the current SSH user needs permission to run `su - {SAPSID}adm` via `sudo`.
  - Make sure the ssh user is added to the sudoers file to execute the sudo/dzdo command.
  - AppViewX supports both password-enabled and passwordless sudo execution.
- The installation path is based on the user ID. The user ID will be <SAPSID>adm.
- We use **SFTP** for file transfers (certificate push), so it's crucial to ensure that SFTP is properly configured for the logged-in user
  1. From the cloud connector: You can use the `sftp` command to test the connection to an SFTP server. Open your terminal and type:

     ```
     sftp username@hostname
     ```

  2. Use the `put` command to upload the file to the remote server:

     ```
     put localfile /path/to/remote/directory
     ```

ABAP

Create a Web Service for the Function Module

- SOAMANAGER has to be enabled to create a custom function module in the ABAP to bind the certificate. Authentication details have to be provided on the device onboarding page.
- Use **Basic Authentication** with an SAP technical user (e.g., SAP_RFC) and **HTTPS** for transport security.
- `<protocol>://<deviceIp>:<Web Service Port>/sap/bc/srt/rfc/sap/zws_update_ssl/{Client ID}/zws_update_ssl/zbind_update_ssl`

Onboarding SAP

1. Go to (**Menu**) > **CERT+** > **ADMINISTRATION** > **Device Management**.
   By default, the **ADC** tab opens.
2. Click the **Server** tab.
3. Click the **(Add)** icon.
4. Select the **SAP** logo from the Vendors list.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

The **SAP** server configuration screen is displayed.

5. In the **Server Details** section, enter details as mentioned below.

Server Details - Field Description Table

Fields	Description
***Server Type**	Select Server type from radio button options. • ABAP • WebDispatcher
***Server name**	Enter the name of the designated SAP server.
***IP address/ FQDN**	Enter the valid IP address or fully qualified domain name (FQDN) for device communication and integration with the SAP.
Data center	Choose the desired data center. It holds all the SSL What can you do next? that is to be retrieved from the SAP server.
***SSH Port**	Retain the value 22; it is the default port used for the SSH communication mode.
Cert sync	Choose from any of the following: • *Managed* - AppViewX performs the config fetch operations and the certificates are discovered and managed in the inventory. CLM actions (push & bind, rollback etc.) can be performed on them. • *Monitored* - AppViewX performs the config fetch operations and the certificates are downloaded in the inventory in the read-only state. CLM actions cannot be performed on them. • *Ignored* - AppViewX only performs the config fetch operations for the devices. There is no certificate discovery performed.
**: Mandatory fields*	

6. In the **Credentials** section, select/enter the details as follows.

Credentials - Field Description Table

Fields	Description
***Credential Type**	Select the credential type from the dropdown. • Manual entry (default) • All supported Internal and external vault • SSH

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	Note: • If **Credential list - Appviewx** is selected, the ***Credentials list** dropdown field is displayed. Select any of the preconfigured credential values. • If SSH is selected, enter the username, upload the key file, and enter the passphrase (if the private key is password-protected) for authentication.
***Username**	Enter the designated username for authentication.. (field displayed for manual entry and SSH)
***Password**	Enter the secure password. (field displayed for manual entry only)
**: Mandatory fields*	

7. In the **Vendor Specific Details** section, enter details as mentioned below.

Vendor Specific Details - Field Description Table

Fields	Description
Access Elevation	Select *sudo or dzdo* to execute with root privileges using sudo access. The default value is *None.* AppViewX supports both password-enabled and password-less sudo/dzdo execution. **Note:** SSH key-based authentication does not support password-enabled sudo/dzdo.
***Client ID**	**Note:** All these fields are enabled when the **Server Type = ABAP**.
***Web Service User ID**	
***Web Service Password**	
***Web Service Port**	Enter the following details: • Client ID • Web Service User ID

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Fields	Description
	• Web Service Password • Web Service Port The following fields are required to invoke the web service to bind the certificate into the selected profile. The values entered in the fields are used to frame and invoke the API with the credential. **Note:** For push and bind operations, details of all these fields must be provided.
Is Https?	Select the checkbox to frame the API with http or https.
File Upload Temp Path	Enter the valid file upload directory. The default value is `/tmp/`. **Note:** Both the SSH user and SAP user should have read, write, and execute permission.
**: Mandatory fields*	

8. In the **SAP SID Details** section, enter details as mentioned below.

SAP SID Details - Field Description Table

Fields	Description
***SAP SID Details**	Enter the three digit character code SAP System Identification (SAP SID). It corresponds to the identifier for an SAP system. Enter the values in upper case only.
Password	Enter the valid password. This is required when None access elevation is selected and switching to SAP SID is a password-enabled configuration.
**: Mandatory fields*	

9. Click **Save**.
   The SAP device is added successfully.

Copyright © 2025 AppViewX, Inc. All Rights Reserved.

Pre-Config Fetch

Device communication check

Command	Description	Are the commands executed with `sudo` or `dzdo` when access elevation is enabled in the UI?
`bind 'set enable-bracketed-paste off'`	To disable bracketed paste mode for the current session	No
`su - {sid}adm -c "echo sap"`	The command is used to check the communication	Yes

Config Fetch

Perform **status and configuration checks** for a SAP Web Dispatcher instance.

Command	Description	Are the commands executed with `sudo` or `dzdo` when access elevation is enabled in the UI?
`su - {sid}adm -c "ps -ef | grep {sid}adm | grep sapstartsrv | grep -v grep"`	Check if the SAP Web Dispatcher service (sapstartsrv) is running under the {sid}adm user and collect the SAP instances	Yes
`su - {sid}adm -c "test -d /usr/sap/{SID}/{instance} && echo exist || echo not exist"`	This command verifies the existence of a specific SAP Web Dispatcher instance directory using the `{sid}adm` user. It is executed for each result obtained from the previous command.	Yes
`su - {sid}adm -c "sapcontrol -nr {instanceNr} -function GetVersionInfo | grep sapstartsrv | grep -v grep | cut -d, -f2,3"`	Command retrieves the **version information of the** `sapstartsrv` **process** for the SAP Web Dispatcher instance, using the `{sid}adm` user.	Yes
